I. Executive Summary

Over the past 30 years, the Latin American and Caribbean System on Health Sciences Information (Regional System) and BIREME have successfully developed the capacity of the countries of the Region to create and operate national scientific and technical information systems, in tandem with the emergence of new organizational and information management paradigms. In recent years, the demand for technical cooperation with respect to Internet-based products and services has required a new change in BIREME and the Regional System.

The obsolescence of the current model coincided with the establishment of the BIREME External Evaluation Commission by the Director of PAHO in July and August 1997, which stated in its report that BIREME had moved away from its mission as the Coordinating Center of the Regional System. However, it recognized the fundamental role that BIREME has played and recommended its leadership in promoting technical cooperation be strengthened.

The proposal to create and implement the Virtual Health Library (VHL) under the leadership of BIREME, represents the adoption of a new organizational and information management paradigm that will consistently respond to the recommendations of the External Evaluation Commission and to the new demand for technical cooperation.

The VHL represents an expansion of the current model of technical cooperation, since it promotes the decentralized production and operation of multimedia information sources, connected through networks, with direct and universal access without geographical and scheduling restrictions.

BIREME has established a plan of action for the implementation of the VHL based on 5 lines of action: promotion and marketing; realignment of traditional products and services; production of electronic publications; development of tools for integrating and locating information; and development of other VHL components. The plan of action will be implemented over the three-year period between April 1998 and March 2001.

II. BIREME and the Regional System: 30 Years of Evolution

The Latin American and Caribbean Region (LAC) is notable for the high degree of development it has achieved in the area of scientific and technical health information.

This development during the past 30 years can be measured by the steady increase in the flow of information at the national and regional levels which, in turn, is the result of the enhancement of the countries' ability to create and operate library systems and documentation centers with increasingly advanced information products and services.

The decentralized and cooperative production of the LILACS database system, which

references the scientific literature on health generated in the Latin American and Caribbean countries, constitutes the best example of the remarkable progress the region has made in information management. The LILACSCD-ROM compact disk, which integrates and publishes the results of this cooperative effort, has been updated and published regularly three times a year since it was launched nine years ago. This is a significant achievement!

Also worthy of attention are the countless national and international electronic health information products that the countries of the Region have been developing, acquiring, operating, and disseminating in recent years, significantly expanding the availability of information for the community of health professionals. The vast majority of libraries and information centers are already fully connected to the Internet or will be in the next two years.

This ongoing development is doubtless the result of the coordinated policy of PAHO and the countries of the Region. Jointly and in cooperation, they have mobilized significant investments and efficiently applied them toward human resource education and the updating of collections of information sources and information technology infrastructure in an environment characterized by limited resources and economic crisis.

PAHO has played a key role in this development, chiefly through the ongoing action of BIREME, which has become PAHO's operational arm for technical cooperation in scientific and technical information.

BIREME's activity in the Region can generally be divided into three stages, each lasting approximately 10 years. Each stage has been characterized by a principal orientation in the promotion of technical cooperation, in keeping with the current organizational and management information paradigms.

Thus, in the first stage, between 1967 and 1976, BIREME's activity was centered on the operation of regional medical library services with a view to responding, on a priority basis, to the needs of the medical libraries of the Region for access to scientific literature.

In the second stage, between 1977 and 1986, BIREME's activity was directed toward the creation and implementation of a network of libraries in the Region, in pursuit of efficient organization and the shared use of their collections. At the same time, bibliographic control of the Latin American journals found in the publication *Index Medicus Latinoamericano* was implemented through centralized processing. The expansion and enrichment of BIREME's role beyond that of a library was reflected in the change, in 1982, of its original name, Regional Library of Medicine for the Latin American and Caribbean Center on Health Sciences Information.

In the third stage, that is, the past 10 years, BIREME's activity has been geared toward the creation and implementation of the Latin American and Caribbean System on Health Sciences Information, with the active participation of the libraries and information

centers. In the second half of the 1980s, BIREME brought extraordinary progress with the creation and dissemination of the LILACS methodology for the decentralized management of scientific literature, the creation of the Descriptors in Health Sciences vocabulary in three languages, the mass introduction of information technologies and, in particular, the LILACSCD-ROM project and the operation of LILACS and MEDLINE on BIREME's own computers. To expand the coverage and efficiency of the Regional System's operation, BIREME encouraged the creation and implementation of specialized systems in different areas of the health sciences. This progress was consolidated in the 1990s. It should be noted that BIREME's Internet connection and the holding of regional Congresses, together with the mass participation of health information professionals of the Region and the developed countries, have contributed to an extraordinary exchange of information and sharing of experiences.

Meanwhile, in the past 3 years, with the growth of the Internet and its WWW service as a means of organizing and disseminating information, the operational model of BIREME and the Regional System have been proven to be progressively less able to sustain the level of development of information products and services in the Region achieved in the late 1980s and early 1990s.

It is true that information methodologies, products, and services created by BIREME at the end of the last decade and related mainly to the scientific and technical literature published in hard copy, are still valid. However, the current demand of the countries is for a new type of technical cooperation that revolves around the creation and operation of decentralized information sources through the Internet—cooperation that is broader in scope and multimedia in nature, with more value added to serve the needs of specific groups of users and with less mediation through interfaces, making the direct interaction of users with information sources a viable undertaking.

The obsolescence of the BIREME and the Regional System's operational model coincided with the establishment by the Director of PAHO of the BIREME and Regional System External Evaluation Commission, whose work was carried out during July and August 1997. In its report, the Commission points out the key role that BIREME has played, mainly in the implementation of the Regional System, and recommends its consolidation and enhancement as the coordinating center for the Regional System, together with the strengthening of its leadership in promoting technical cooperation in scientific and technical information.

With the objective of analyzing and monitoring the recommendations of the report of the BIREME External Evaluation Commission, in early October 1997 a working group convened by HDPPAHO prepared a document that proposes the foundations for a plan of work for PAHO technical cooperation in health information, based on the creation and implementation of the Virtual Health Library, originally proposed to the External Evaluation Commission during its examination of BIREME.

BIREME intends to adopt the proposal of the Virtual Health Library as the platform for the promotion of technical cooperation in information for the coming years, in harmony

with the new organizational and information management paradigms established by the Internet. Thus, BIREME will continue to play a leadership role in the Region.

The creation and implementation of the Virtual Health Library is planned as the fourth stage in the evolution of BIREME and the Regional System.

III. The Virtual Health Library for Latin America and the Caribbean

The creation and implementation of the Virtual Health Library (VHL) is the strategy that BIREME intends to adopt for the promotion of technical cooperation in information toward and among the countries of Latin America and the Caribbean. The objective is to provide an organized and efficient response to the emerging needs of the countries to produce and operate health information sources through the Internet.

The Virtual Health Library is envisioned as the broad database of scientific and technical knowledge in health--entered, organized, and stored in electronic format in the countries of the Region, universally accessible on the Internet and compatible with the international databases.

The VHL is simulated in a virtual space on the Internet and consists of a collection or network of health information sources in the Region. Users from different levels and locations will be able to interact and navigate in the space of one or more information sources, regardless of their physical location. The information sources are generated, updated, stored, and manipulated on the Internet by producers, integrators, and intermediaries, in a decentralized manner using common methodologies for their integration into the VHL.

The VHL information sources include health information products and/or services, which are divided into six basic types:

a. Traditional information sources, realigned to operate in a network on the Internet:

- The LILACS system databases and other databases of bibliographic references, made available in their entirety on the Internet, with specific elements to serve the different health sciences specialties, and enriched with connections to complementary information sources, particularly databases with full texts and on-line services providing hard copies of documents;
- Databases of directories of health entities in the region, such as people, institutions, and projects, made available on the Internet, with links to the referenced sites when they exist, and provided, by stages, with interfaces for decentralized updating by those responsible for the referenced entities;
- Factual databases, such as those describing chemical substances;
- Numerical health databases, generated by health management systems, vital statistics systems, epidemiological systems, surveys and demographic censuses, etc.

b. Electronic publications, including the traditional types of scientific and technical literature (journals, monographs, government documents, annals of congresses, theses,

and unconventional documents) enriched with hypermedia and organized in on-line hypertext databases. This is the most important component with respect to the expansion of the traditional library of scientific and technical literature;

c.Multimedia and methodological tools to support education and decision-making. In particular, the VHL will promote the development and operation of tools to support continuing education and distance learning;

d.PushSelective Dissemination of Health Information services, aimed at responding to the information needs of specific user communities; countless services will be created and operated regionally and in a decentralized manner utilizing the VHL databases;

e.News and lists of discussions on national and international health information, particularly on the implementation of the VHL throughout the Region;

f.Integrating components of the VHL:

- DeCS - Descriptors in Health Sciences, health science terminology that will be utilized to index the VHL information sources in a compatible manner. The DeCS contains more than 23,000 terms, organized and classified, in three languages. In addition to the categories defined in the Medical Subject Headings (MeSH) of the National Library of Medicine, the DeCS includes specific public health categories that are necessary for describing the scientific and technical literature of PAHO and the countries of the region. Under continuous development to respond to the dynamic of the health sciences, the DeCS is an integral part of the Unified Medical Language System (UMLS) of the NLM which includes, in addition to the hierarchical organization of the concepts and terms, semantic networks with a view to contributing to the development of specialized systems, particularly with respect to access to information sources. Upon promoting the use of the DeCS as the common language of description of VHL information sources, and upon ensuring its compatibility with the MeSH, it will be possible in the future to use the user-friendly interfaces and specialized systems that are in development in research centers in various parts of the world;

- HIL–Health Information Locator, which includes, on the one hand, the common reference methodology for entering information sources in the VHL and, on the other, tools for searching for and/or locating health information sources through the VHL, regardless of their location, organization, media, and operational interface. In order for the LIS to work, each information source should have its own reference registry. The LIS, operating on this basis of reference, becomes the tool for integration and navigation among the information sources. As an analogy, in the VHL the HIL plays a role similar to that of a traditional library reference service. The LIS reference registry and search tools will be compatible with the methodologies for locating information sources from the governments of the developed countries and will permit integration of the VHL with the global information infrastructure. Thus, the HIL will permit navigation between the VHL and international information sources;

- common standards and methodologies directed toward the development of information sources; this includes guidelines, manuals, software, etc. that are in common use for the creation, maintenance, and operation of VHL information products and services.

These six types of VHL components constitute the basic models for information products and services to be provided by both the regional and national centers. Their scope will be able to cover local, national, and regional data and needs.

It will also be possible to enrich, program, reformulate, and/or translate the basic information sources into new information products and services, with value added, in order to meet more efficiently the information needs of users from specific communities, for example, scientific research and education, health authorities and administrators at the different levels, direct medical care in its different specialties, communications media, the general public, etc.

The VHL does not represent a break with, opposition to, or a negation of the information achievements, methodologies, products, and services currently operated by BIREME, the Regional System, and other national and regional entities. Nor does it represent the end of BIREME and the Regional System. On the contrary, the VHL represents the expansion of the entire infrastructure for the information already amassed in the Region. This expansion is not linear. It represents the gradual adoption of a new paradigm of information management that in a variety of ways solves unsolvable problems or problems with very expensive solutions in the current operating model of BIREME and the Regional System. The following are some of the main aspects of this expansion or change in paradigm:

- access to the information sources without scheduling limitations;
- access regardless of the geographical location of the user and the information sources;
- integration of the functions of storage, preservation, and publication; for example, the collection of the issues of an electronic journal in the VHL simultaneously represents the traditional functions of publication, cataloguing, storage, and preservation;
- a supply of “copies” of documents for everyone all the time, overcoming the limitation of the ratio of one document to one reader at a given time;
- coexistence of information sources on traditional media and in hypertext format, including multimedia components;
- the VHL will permit the establishment national and regional policies and

mechanisms for organizing and maintaining the products in electronic format, ensuring their preservation for the future;

- creation of a coherent, highly efficient platform for technical cooperation through the use of common methodologies and technologies that facilitate and cut the cost of human resources education and the large-scale provision of information products and services;

- promotion of the necessary and sought after integration of different disciplines, specialties, systems, and initiatives in information and health in the design, creation, and operation of information products and services;

- a driving force for achieving the integration, organization, and dissemination of the information resources generated by the research and education systems, the health program management systems, and vital statistics and other statistical systems;

- existence of quality control mechanisms for the selection of information sources for the Library;

- rapid updating of information sources by minimizing the mechanisms that mediate their generation and publication;

- provision of integrated mechanisms in the information sources for the evaluation of their use and impact;

- platform for the creation, development, adaptation, acquisition, and dissemination of information technologies suited to the different conditions and needs of the countries of the region, maximizing their use in promoting implementation and decreasing the information gaps within the countries, among the countries of the region, and outside the region;

- new opportunity and model to support the learning curve in the use of information technologies to replace the current BIREME and Regional System model;

- opportunity to facilitate and promote the transition between the old and new paradigms of information management in the Region;

- mediating element for the coexistence of the old and new paradigms of information management in the region;

- institutions and/or users without access or with limited access to the Internet will also be able to benefit from the VHL through products and services offered on paper, diskettes, CD-ROM, CD-R, and DVD-ROM.

The implementation of the VHL and its development until it acquires its own momentum will demand political mobilization and increased awareness on the part of the health

authorities and institutions of the countries of the Region to ensure that the information initiatives and resources are directed toward the VHL on a priority basis.

Cooperation between the authorities and the PAHO leadership is indispensable for making this mobilization a reality. As an operational arm of PAHOWHO information policy, BIREME will act as a leading center at the regional level in the promotion and implementation of the VHL, through the creation of strategic alliances and consortia.

Thus, technical cooperation provided by PAHO in regard to scientific and technical information, especially through the activities of BIREME, should be redirected toward implementation of the VHL. In particular, it will fall to BIREME to promote discussion and promotion of the VHL in the centers of the Regional System, so the national systems begin their transition as soon as possible toward the creation and operation of the VHL with local information products and services.

BIREME has established the following lines of action for the implementation of the VHL, in close cooperation with the countries and the PAHO programs:

a. Mass promotion of the VHL in the countries, at PAHO, and in the region as a whole, with a view to establishing alliances, redirecting resources, and mobilizing new resources, including:

- the Latin American and Caribbean System on Health Sciences Information;
- the various PAHO agencies involved in technical cooperation in information, including the Programs, the Pan American Centers, and Representative Offices;
- the national authorities in the sphere of health;
- the national science and technology institutions;
- regional technical cooperation institutions related to science and technology;
- national and international health promotion agencies.

b. Realignment of the information products and services that currently exist in the region, so they work within the VHL, including:

- access to databases via the Internet WWW utilizing a common operating interface;
- implementation of the procedure for requesting photocopies via the Internet;
- human resources education to support the realigned products and services.

c. Development of electronic publications in the Region utilizing a common methodology

for their preparation, storage, dissemination, and evaluation, including, on a priority basis:

- human resources education in electronic publications methodology;
- creation of the electronic journal database on health sciences;
- creation of databases of government publications on health in electronic format.

d.Development of the Health Information Locator, including:

- establishment of the common reference registry of information sources;
- development of the search tools;
- implementation of the HIL.

e.Forging of alliances and development of consortia for establishing and implementing projects for the development of the other components of the Virtual Health Library, including:

- tools to support education and decision-making;
- push servicess elective dissemination of information;
- health information news centers and agencies.

Each of these lines of action involves different degrees of development and adaptation of the information methodologies and technologies appropriate to the Region, mobilization of institutions and professionals, training of human resources, and improvement of the national health information infrastructures.

IV. Plan of Action for Implementation of the Virtual Health Library

This plan of action is on the lines of action established by BIREME for implementation of the Virtual Health Library and the proposal contained in the document, "Toward the Virtual Health Library: Foundations for a Work Plan for Cooperation in Health Information."

The plan is centralized with respect to the actions considered essential for VHL implementation. It is not a question of an exclusive plan, since the VHL's operation, at least in principle, is decentralized and autonomous. In this regard, the main objective of the plan is to implement the VHL and sustain its initial development until it acquires its own momentum.

This plan will be discussed within several PAHO entities and at the Regional System Meeting in Costa Rica, with a view to its improvement.

The plan is organized along five lines of action:

- PPromotion and marketing of the Virtual Health Library
- PRealignment of traditional products and services
- PElectronic publications
- PDevelopment of the HIL—Health Information Locator
- PDevelopment of the other components of the Virtual Health Library

Each line of action is comprised of a series of related macro activities.

For their implementation, BIREME will group the activities of the plan into different projects that will each include a detailed timetable of activities, implementation methodology, and financial resources.

The plan is expected to be implemented over a three-year period, beginning in April 1998, after the Regional System Meeting in Costa Rica. By the end of the period 30 March 2001, the Virtual Health Library should be fully operational.

The following pages present the lines of action of the plan, including a description of the main actions and institutions involved

Line of Action I. Promotion and Marketing of the Virtual Health Library

#	Description of the principal actions	Responsibility and countries involved	Timetable and Budget in US\$ by period Contribution from BIREME and other sources					
			April 98–March 99		April 99 - March 2000		April 2000 - March 2001	
			BIREME	Others	BIREME	Others	BIREME	Others
2000 - March 2001								
1	Preparation of a background document on the concept of the VHL and the Plan of Action, "Toward the Virtual Library" for presentation and discussion at the VI Meeting of the Latin American and Caribbean System on Health Sciences Information, to be held in San José, Costa Rica, at the end of March 1998. This document, to be prepared by BIREME, will be complemented by documents and presentations by the Centers of the Regional System on specific aspects of VHL implementation. Based on this document, the national systems will prepare the national plans and projects for creation and implementation of the VHL with national health information sources. Similarly, the specialized regional systems, the information systems linked to PAHO programs, and the PAHO information centers can prepare plans and projects for their integration into the VHL. In addition, this document will serve as a reference for the preparation of articles and lectures to spread the word about the VHL.	BIREME Regional System	--	--	--	--	--	--
2	Preparation and implementation of a VHL promotion and marketing plan to familiarize professionals and the health and information area authorities of the region and national and international technical cooperation agencies with the concept and the proposed Plan of Action. This will include marketing activities, products, and strategies. Program implementation will be carried out by BIREME, the Regional System Centers, and the PAHO programs, and will include all possible dissemination mechanisms, such as direct mail, congresses and meetings, posters, Internet sites, etc.	BIREME Regional System PAHO Programs	15,000	--	10,000	--	5,000	--
3	Sensitization of national authorities at the different levels to the importance of	Director	--	--	--	--	--	--

the VHL, with a view to accelerating a redirection of activities and resources toward its construction and development.
Sensitization of health promotion and cooperation agencies, with a view to directing project approval and the investment of new resources toward the VHL.

I. Promotion and marketing of the Virtual Health Library	30,000	--	30,000
II. Realignment of products and services	80,000	140,000	220,000
III. Electronic publications	330,000	880,000	1,210,000
IV. Implementation of the Health Information Locator	90,000	70,000	160,000
V. Implementation of the other VHL components	220,000	125,000	345,000
	750,000	1,215,000	1,965,000

*** Others:** National Centers, PAHO Promotion Agencies, etc.

The VHL implementation plan has already made progress and taken constructive preliminary steps that make it possible to anticipate a high degree of success in its implementation:

a. Progress in the formulation of the VHL for Latin America and the Caribbean as the platform for technical cooperation in health information among and toward the countries of the region. The reaction to the VHL has been extraordinarily positive in the various presentations that BIREME has made to specialized audiences;

b. The emerging demand of the countries of the region for technical cooperation that the VHL will efficiently address, mainly with regard to overcoming and reducing information gaps among the countries of the region and between them and countries outside the region, using appropriate technologies;

c. BIREME's development of methodologies and technologies for operating Internet information sources makes it feasible to begin an immediate realignment of the traditional products and services of the regional system centers so they operate in a network;

d. The methodology for the preparation, storage, dissemination, and evaluation of electronic journals, whose development BIREME is completing jointly with FAPESP and 10 Brazilian scientific editors, makes it possible to put the databases of electronic health science journals into immediate operation;

e. Together with the CCNs of the Regional System, BIREME is promoting cooperative programs for the development of VHL components;

f.Implementation of the project for the cooperative development of the Health Information Locator (HIL) by the National Coordinating Center of Cuba and BIREME;

g.BIREME is participating in a consortium with the library systems of the public universities of São Paulo for the procurement and operation of electronic journal collections from commercial publishers; this project involves a total of approximately US\$1.5 million; the experiences in the implementing this consortium will be transferred and shared, as will information on other activities in the region;

h.The preparation of the BIREME internal reorganization plan. Implementation of this plan will promote the redirection of human and financial resources to units devoted to technical cooperation, minimizing the activities connected with the local library;

i.BIREME is updating its entire information technology infrastructure with the PAHO extrabudgetary funds provided at the end of 1997; this will make the efficient operation of databases and the regional cooperative services a viable undertaking.

Finally, we should point out the ability of BIREME and the Regional System, demonstrated over the past 30 years, to promote the changes necessary for the adoption of new paradigms, as is the case with the creation and implementation of the VHL.
