#### I. PROTECTION OF HEALTH

#### A. COMMUNICABLE DISEASES

#### 0100 - GENERAL

The mortality rate for infectious diseases in Latin America decreased by 48% between the years 1956-66 in the group under five years of age. The diseases of the gastrointestinal tract - mostly due to gastroenteritis - dropped by 44% and the diseases of the respiratory tract for the same period of time and mainly due to pneumonia and influenza, by 26%. In spite of the significant reduction observed, infectious diseases are still an important public health problem.

In 13 countries the percentage of deaths from infectious and parasitic diseases in relation to the total deaths from well-defined causes is more than 30, and in another two countries this percentage is between 20 and 29. The diseases susceptible to prevention through the use of vaccines represent more than 8% of the mortality from all well-defined causes in eight countries, and in six more it is between 4 and 7%.

These statistics indicate the seriousness of communicable diseases as public health problems and give rise to the goal of control of communicable diseases as one of the principal objectives of PAHO. Priority activities are (1) eradication of the diseases for which practical measures of elimination exist and for which the Governing Bodies have adopted resolutions on eradication (malaria, smallpox, yaws) and the eradication of Aedes aegypti, vector of urban yellow fever and dengue; (2) control of diseases susceptible to prevention through vaccines; (3) programs which are both technically and economically feasible for combating such diseases as tuberculosis, leprosy, and venereal diseases; (4) control of diseases posing serious problems in certain areas of the Americas, such as plague, epidemic typhus, Chagas' disease, filariasis, schistosomiasis, hydatidosis, onchocerciasis, cutaneous leishmaniasis, and other parasitic diseases; (5) research and epidemiological surveillance of diseases produced by viruses and rickettsias; (6) development or improvement of health infrastructures and complementary services which support research, control, or eradication of communicable diseases; and (7) development or improvement of an epidemiological surveillance system as a standard component of programs for control of eradication.

The Ministers of Health of the countries of the Region of the Americas, in their special meeting held in Chile in 1972, established goals to be reached in the decade of the seventies. For those diseases preventable by vaccination, the goals are to reduce the mortality rate for measles, whooping cough, and tetanus to 1.0, and 0.5 per 100,000 inhabitants, respectively, and to reduce the morbidity for diphtheria and poliomyelitis to 1.0 and 0.1 per 100,000 inhabitants, respectively, at the same time maintaining the smallpox morbidity rate at zero level. These goals will be pursued by the countries of the Region in the coming years.

0200 - MALARIA

The Ministers of Health of the Americas, in their meeting in Santiago, Chile, in October 1972, set a goal for malaria eradication in the Hemisphere. It was concluded that, with sufficient resources, it will be possible to eradicate malaria by the end of the decade in areas with 168.2 million inhabitants (90.7% of the population of the originally malarious area). Final solution of the problem in the remaining areas (9.3% of the population) depends upon the application of more efficient methods against the vector and the parasite, or the protection of susceptible persons, using a flexible strategy adapted to epidemiological conditions in each area.

As of 31 December 1972, malaria eradication had been achieved in areas with 86.1 million inhabitants (45.3% of those living in the originally malarious areas); 42.0 million (22.1%) were in areas in consolidation phase; and 61.8 million (32.6%) were in attack phase. In terms of political units, 12 have eradicated the disease and in three (Argentina, the Canal Zone, and Guyana), consolidation phase has been reached in their entire territory. The remaining 19 units are applying attack measures in the areas where malaria transmission still exists, although the majority of these units have parts of their territories in maintenance or consolidation phases. In five political units (Belize, Costa Rica, the Dominican Republic, Panama, and Paraguay) steady progress has been made towards malaria eradication in the last two years, and the prospect is good for achieving malaria eradication within a determined period.

In five programs (Bolivia, Ecuador, Mexico, Surinam, and Venezuela), malaria incidence was reduced and notable progress observed in 1972. In another five programs (Brazil, Colombia, French Guiana, Haiti, and Peru), the situation of malaria remained about the same as in 1971. Finally, in the four countries in Central America (El Salvador, Guatemala, Honduras, and Nicaragua), where serious technical problems had interfered with normal progress, considerable improvement was observed in 1972 through the use of propoxur in areas where the vector is resistant to DDT. Further progress is expected to be achieved by continuing the application of propoxur.

PAHO research on malaria continues to be directed towards finding solutions for the problems that hamper the progress of eradication programs. Investigation of vector response to propoxur continues; in addition, studies of alternate attack measures and new insecticides which could be applied economically and effectively, such as landrin (OMS-597), will be carried out in 1973. A research project continued in El Salvador, in coordination with the Government, aimed at finding effective and economic means to interrupt malaria transmission in areas where the vector is resistant to DDT. Serological studies, experiments in chemotheraphy, and studies on the resistance of malaria parasites to chloroquine continued in Brazil in 1972; in 1973 such studies will be extended to Colombia, Costa Rica, and other countries.

PAHO continued to collaborate with the International Training Course on Malariology and Environmental Sanitation in Venezuela through the provision of fellowships for malaria eradication professional personnel. It also continued to supply antimalaria drugs for presumptive and radical-cure treatments, essential materials, and equipment for the countries to undertake research activities and field experiments and, within the availability of funds, certain laboratory supplies.

Technical assistance by PAHO was continued through medical officers, engineers, entomologists, advisers in administrative methods, parasitologists, laboratory advisers, and technical officers. In two countries, PAHO medical officers were assigned as co-directors of the National Malaria Eradication Services, sharing executive responsibilities of the respective programs. Grants were provided to a university to continue investigations in the development of an active immunization technique; PAHO will continue the grant in 1973.

0300 - SMALLPOX

The smallpox eradication campaign was begun in the Americas in 1967 when the disease was prevalent in five countries. During the 1967-71 period a total of 18,136 cases were reported, 99.7% of which were from Brazil. Since April 1971 no new cases have been reported, in spite of an intensive search made by special teams in areas where the last cases were found in 1970-71, and in regions considered to be of high risk because of poor maintenance of the vaccination programs. This investigation was particularly exhaustive in Brazil during the three-month period when the peak of smallpox cases used to occur. As a result of the policy adopted by the United States of America by which smallpox vaccination was discontinued, most countries are not pressing hard enough for good coverage in the maintenance programs.

In 1972, smallpox vaccinations carried out in the countries having agreements with PAHO were Argentina, 950,000; Bolivia, 211,313; Brazil, 14,077,397; Chile, 675,616; Colombia, 986,553; Costa Rica, 30,797; Cuba, 17,964; Ecuador, 353,209; Guatemala, 140,822; Panama, 29,410; Paraguay, 272,046; Peru, 1,134,824; Uruguay, 166,171; and Venezuela, 939,944. In Brazil, 92% of the estimated population was vaccinated between 1968 and 1972. Seven of the countries produce lyophilized smallpox vaccine of excellent quality. Annual production was 59 million doses in 1966, 135.7 million in 1970, 69 million in 1971, and 57.4 million in 1972. Since the attack phase is over, the production of vaccine has been decreased. In 1972 about five million doses of smallpox vaccine were donated from this Region to the WHO supply.

To assure the detection and control of any suspicious case, PAHO is promoting the enforcement of epidemiological surveillance activities. Special epidemiological surveillance courses for public health officers were conducted in the United States of America (Center for Disease Control of the Public Health Service) and Venezuela, sponsored by PAHO and the Covernments of both countries. PAHO also cooperated with the governments through advisory and reference services on the quality of the vaccine.

## 0400 - TUBERCULOSIS

Tuberculosis continues as a major public health problem in the Region. In 1971, there were 39,160 new cases of the disease in the United States of America and Canada and about 155,000 in Latin America and the Caribbean area. Even though not all cases were confirmed bacteriologically, the numbers demonstrate the importance of this disease from an operational point of view, giving as they do an indication of the numbers of new cases needing medical attention and treatment.

Transmission of the tuberculosis bacilli is the principal factor determining the present and future epidemiological problem. From among the various methods that can be elected to diminish the incidence of tuberculosis, vaccination with BCG has priority as the most efficient in relation to resources invested. From the point of view of social benefit, bacteriological examination of patients with respiratory symptoms and the chemotherapeutical treatment of ambulatory cases discovered would be the methods of choice. The general policy of the program, because of coverage and cost, must be based on the integration of control programs with the general health services.

The objectives of the tuberculosis control program for the present decade, approved by the III Special Meeting of Ministers of Bealth of the Americas, are vaccination with BCG of 80% of the population under 15 years of age; bacilloscopic examination of 60 to 75% of persons with respiratory symptoms; and treatment of all cases discovered, principally utilizing techniques and activities of ambulatory medical care services. These objectives were reaffirmed by the II Regional Seminar on Tuberculosis in November 1972.

#### 0500 - LEPROSY

There are about 10,000 new cases of leprosy reported annually from 29 countries and territories of the Americas. In order to more effectively control this disease, it is proposed to increase the promotion of control programs to include 14 countries and to provide technical assistance to design, implement, or evaluate leprosy control programs and epidemiological surveillance in six countries. To increase the accuracy of clinical diagnosis and classification of the disease, the Third International Seminar on the Histopathology of Leprosy for pathologists will be held. This should provide better data for epidemiological studies and the determination of disease patterns and trends.

The Advisory Committee on Leprosy, meeting in July 1971, observed that "the leprosy problem of the Americas is not yet fully and precisely defined," that "it is becoming obvious that our past approaches to (1) data collection and analysis and (2) leprosy control are not functioning uniformly well, and that, therefore, there is a real need for developing and evaluating new methodologies." The Committee recommended that "a coordinated Hemisphere-wide effort in leprosy control, training, and research through the development of a PAHO International Center for Training and Research in Leprosy and Related Diseases be established." It is proposed to establish at least two collaborating centers for field studies in leprosy control and rehabilitation.

New discoveries in immunology, treatment, and the use of the armadillo as an animal model to study leprosy, while promising an improvement in diagnosis, treatment, and control of the disease, nonetheless indicate the need to assure the implementation of the most effective control measures, properly administered, if control is to be realized. To be effective, control programs must make greater and greater use of ambulatory (domiciliary) services for leprosy patients. At present too many countries continue to expend large sums of money for unnecessary institutional care which detracts from, rather than contributes to, effective control. Reallocation of these funds will be necessary in order to plan and implement effective control programs and reduce incidence.

## 0600 - VENEREAL DISEASES

Venereal diseases continue to be the most frequently and increasingly reported infectious disease in the Americas, with a few exceptions. Where reporting is reliable, gonorrhea in particular has continued to rise precipitously.

Before the incidence of these diseases can be reduced, it will be necessary to stop the continued rise in new infections. Programs in the countries of this Hemisphere vary from very good to the bare provision of clinical services at the convenience of the provider. It is proposed, therefore, to promote the planning for or the implementation of programs for venereal disease control in 12 countries and to assist the governments in four countries to design, implement, or evaluate venereal disease programs and epidemiological surveillance. The training of personnel and the promotion of epidemiological and administrative research are to be included.

The IV International Course on the Epidemiology and Control of the Venereal Diseases is to be held in Chile in 1973. Fellowships are provided by PAHO for venereal disease control personnel from the countries, who then return to put on a similar course for other national venereal disease control personnel.

0700 - ZOONOSES

Those diseases which are transmitted from animals to man, the zoonoses, are found in every country of the Americas. The zoonoses representing hazards of the greatest significance to human and animal health are rabies, brucellosis, bovine tuberculosis, hydatidosis, and the arbovirus zoonoses. Control of these diseases is an integral part of livestock development. They cause direct losses to human health and to animal populations, and indicate losses of essential animal protein for adults and children already suffering from protein deficiency in most of the countries.

The ministries of agriculture and health of the Americas are developing joint programs to bring about control of these diseases. External financing from international lending agencies has provided the capital for achieving the reality of national control programs. Veterinary public health and animal health units responsible for zoonoses control are administering these programs. The Pan American Zoonoses Center has expanded its program of technical assistance, research, and training on a regional basis, in order to meet the increasing requests from the ministries and governments operating control programs. The Center serves as the biological and reference center for zoonoses investigations in the Americas.

#### 0800 - FOOT-AND-MOUTH DISEASE

Foot-and-mouth disease is the most important infectious animal disease in the countries of South America and is the most serious threat to animal health in the countries of the Hemisphere that are free of the disease. This threat results principally from its highly contagious nature and the rapidity with which it spreads among livestock, and the severe economic losses of animals, animal products, and animal protein, with the additional handicaps of being prohibited from participating in the world market. The governments of the affected countries, in recognizing its significance on the import and export of livestock, have developed national programs to combat the disease and have joined together in a multinational effort with the objective to be free of the disease. External financing from international lending agencies has provided the means to achieve the reality of these programs and to place hope of eradication in the philosophy of these governments.

The Pan American Foot-and-Mouth Disease Center in Brazil is collaborating with these countries by providing technical assistance, training, and research. It also provides technical assistance to the countries free of the disease in their programs to prevent re-entry. The activities of the Center are coordinated with the programs of activities to control FMD in the various countries. The Center collaborates with these countries by providing assistance which is based upon the status of the disease in each country, the progress of the national campaign, and the capacity of the country to achieve its objectives.

0900 - OTHER COMMUNICABLE DISEASES

Some vector-borne diseases with intermediate hosts require special attention in the Americas. Plague in particular is enzootic in Argentina, Bolivia, Brazil, Ecuador, Peru, the United States of America, and Venezuela and represents a constant threat in the seaports of these countries. From 1963 to 1972, 4,698 cases of human plague were reported; 298 of these occurred in 1972.

Epidemics of Junin hemorrhagic fever have been recurrent in Argentina since 1943, with epidemics reaching a peak morbidity of 60 per 100,000 and a case fatality of 6%. In Bolivia, Machupo virus, having a rodent reservoir, has been the source of several outbreaks, totalling 1,434 cases with high fatality rates, between 1959 and 1972.

Among the arboviruses, dengue fever and Venezuelan equine encephalitis (VEE) present the most serious problems. The frequency of dengue outbreaks in the Caribbean area has been steadily increasing in the past ten years, and the latest epidemic in Colombia affected at least 416,000 people. Besides Colombia, three countries and eight territories in the Caribbean reported 86,948 cases of dengue between 1963 and 1972. VEE, primarily a disease fatal to horses, has steadily moved northward, from Ecuador to the United States of America, since 1969. Over 16,800 human cases and 17,500 equine deaths were reported in Mexico in 1971 and at least 2,845 human cases in 1972. In Venezuela, 29,102 cases of VEE in human beings have been reported since 1962. The cost of controlling the disease after it moved into the United States of America was estimated at \$10-15 million.

Louse-borne typhus remains an important endemic disease in the highlands of Bolivia, Ecuador, and Peru. Over the period 1962-72, nine countries reported 3,551 cases.

With the objective of acquiring more knowledge to permit more effective control of these diseases, PAHO collaborates with the governments in the investigation of the ecological factors which lead to the creation of enzootic foci and epizootic spread of the diseases and their persistence. PAHO provides fellowships and consultant services to stimulate, orient, and coordinate research and investigation and collaborates with the countries in the improvement of the surveillance services and control of these diseases.

#### 1000 - PARASTTIC DISEASES

Of the parasitic diseases in the Americas, Chagas' disease and schistosomiasis are the most important. About 10,000,000 persons have the former and about 7,000,000 the latter. The social and economic losses caused by these two diseases are very great. In Brazil alone, a conservative estimate indicates that the annual economic loss due to schistosomiasis is many millions of dollars. In the case of Chagas' disease, many persons die each year in the acute phase of the disease, and, by conservative estimate, at least 1,000,000 persons have chronic cardiopathy due to the infection.

Onchocerciasis affects thousands of persons in Guatemala, Mexico, and Venezuela. Cutaneous leishmaniasis causes severe disfigurement and disability among rural populations in many areas. The other parasitic infections, including amebiasis, cysticercosis, ancylostomiasis, and fascioliasis, also take their toll of lives, reduce vitality, and interfere with economic development.

Only six out of ten countries with a high prevalence of Chagas' disease (Argentina, Brazil, Chile, Peru, Uruguay, and Venezuela) have either control programs under way or plans to start these activities. The other four (Bolivia, Guatemala, Mexico, and Paraguay) have no plans or activities. None of seven countries with a low prevalence of Chagas' disease are providing any control activities. Concerning schistosomiasis, in spite of the fact that control is feasible using available measures, only Puerto Rico and Venezuela have adequate activities. Another four countries carry on poor control activities, and three countries and territories have no control project at all.

The program seeks to assist governments in the development and improvement of national control and evaluation programs and to stimulate research and training activities. The program aims to incorporate parasitic disease control into regional aconomic development programs, such as agriculture and river basins and dams, to avoid the risk of increasing the problems, particularly of schistosomiasis, Chagas' disease, and leishmaniasis, as a result of ecological changes produced by such conditions. Standard serum for diagnosis of Chagas' disease is at the disposal of the countries, as a result of the recommendation made by an expert group on Chagas' disease which met in Costa Rica.

## B. ENVIRONMENTAL SCIENCES

2100 - GENERAL

In the countries in the Americas not only is the population increasing at a rate without precedent, but so are the exploitation of resources and technological development. Even though half the population of Latin America still lives in rural conditions, some of the largest urban complexes in the world may be developing on the Continent. The magnitude of this growth of the principal cities, both in density of population and in industrial development, poses problems in environmental degradation and in alteration of ecological equilibrium similar to those experienced by highly industrialized countries. The ecological problems can become critical, up to the point of affecting the survival of man.

In 1961 the Governments of Latin America and the Caribbean area agreed to provide water and sewerage services to 70% of the urban and 50% of the rural population by 1971. During the III Meeting of Ministers of Health in 1972, these goals were reviewed and concrete measures added in respect to collection and disposal of solid wastes, environmental pollution, occupational health and hygiene, and health aspects of regional development. The results achieved in the urban and rural water supply programs during the decade 1961-71 have in turn stimulated the strengthening of national infrastructures in their efforts to improve the quality of water, air, soil, and food and to prevent dangers occasioned by products and byproducts derived from modern technology.

PAHO cooperates with Member Governments in planning, carrying out, and evaluating programs destined to reverse and prevent deficient environmental and ecological conditions. Programs are carried out within parameters and points of reference that can serve to define alternative courses of action, as well as to provide bases for cost estimates. Engineers are assigned to various projects to work in this area, as are the specialists assigned to the Pan American Sanitary Engineering Center in Peru.

This Center began operations in 1969 and in essence provides consultant services, produces and disseminates technical information, supports training of high level personnel, and promotes and assists applied research in problems that affect the urban and rural environment.

# 2200 - WATER SUPPLIES

It was estimated in 1972 that about 56% of the total population of Latin America and the Caribbean area were served by water supply systems, but only 24% of the same population had adequate sewerage services. The rural and urban population served with water supply systems by either house connections or public hydrants was 79% and 27%, respectively. The great effort on the part of the countries to reach these figures of service has meant, during the period 1961-72, an investment of over \$3 billion in construction of new works or expansion and remodeling of existing systems. About one-third of this amount was provided by international or bilateral lending agencies, while two-thirds was funded by the countries themselves.

The III Special Meeting of Ministers of Health established the following goals for the decade of the 1970's: (1) to provide water through house commections to 80% of the urban population or, as a minimum, to supply half the population now without services; (2) to provide water supplies to 50% of the rural population or, as a minimum, to supply 30% of the population now without service; (3) to install sewerage systems to serve 70% of the urban population or, as a minimum, to reduce by 30% the proportion of the population now without such service; (4) to install sewerage systems or other means of sanitary disposal of excreta for 50% of the rural population or, as a minimum, to reduce by 30% the proportion of the population now without such services. It is estimated that to meet these goals the countries must invest \$10 billion in the next 10 years to serve an additional population of 130 million with water and of 100 million with sewerage service. To do this, it will be necessary to train some 10,000 technicians at the intermediate level and 20,000 administrators and managers of water and sewerage services.

PAHO will continue to cooperate in the planning, design, construction, operation, and maintenance of water and sewerage systems; in the planning, execution, and evaluation of national programs in rural and urban areas; in the improvement of agencies responsible for these programs; in training personnel; in applied research in cost reduction and simplification of systems; and in negotiations with international agencies for financing the projects.

#### 2300 - AEDES AEGYPTI ERADICATION

In the Americas in 1972 there were 53 cases of jungle yellow fever reported in six countries, 22 of them in an epidemic outbreak that affected the southwestern region of Venezuela. The total number of cases of the disease reported in the last 20 years years (1953-72) in the Region was 1,509, all sylvatic except for four urban cases in Trinidad in 1954.

Dengue in the last 12 years has been the cause of epidemics in the countries of northern South America and the Caribbean, more than 600,000 cases being registered. Identification of dengue virus type I and type II in the Americas in recent years has increased the concern over the possibility of a sudden epidemic in the hemorrhagic form with the shock syndrome.

At the end of 1972 the area free of Aedes aegypti in the Americas encompassed 8.6 million km² (73% of the area initially infested), i.e., Argentina, Belize, Bermuda, Bolivia, Canal Zone of Panama, Cayman Islands, Chile, Ecuador, Nicaragua, Paraguay, Peru, and Uruguay. Brazil has eliminated the reinfestation from its Northern Region. Guatemala and Panama, even though considered free of the vector, each has a focus of reinfestation. Mexico has an extensive area free of the vector, but a part of its territory is reinfested. The area in the Americas still infested with Aedes aegypti is 3.2 million km² (27% of the area initially infested), which includes 31 countries and territories in the Caribbean, part of northern South America, the United States of America, and regions of Mexico and Central America.

At the beginning of 1973, the following countries and territories had active eradication programs: Anguilla, Antigua, Barbados, Brazil, Colombia, Costa Rica, Cuba, Dominica, French Guiana, Grenada, Guatemala, Guadaloupe, Martinique, Mexico, Montserrat, Netherlands Antilles, Panama, St. Lucia, St. Vincent, and Trinidad. Limited campaigns are under way in the Bahamas, El Salvador, Guyana, Jamaica, Surinam, and Venezuela. Campaigns are being planned in the British Virgin Islands, St. Kitts, and Nevis. Honduras began the reorganization of its campaign with a budget approved for 1973. Infested countries without activities are the Dominican Republic, Haiti, Puerto Rico, Turks and Caicos Islands, the United States of America, and the U. S. Virgin Islands.

#### 2400 - HOUSING

Housing, as a part of the human environment, influences both the health and the welfare of human beings. Thus, the problem of housing must be related not only to its material aspects but also to its sociocultural aspects, since there is a necessity for adequate space to avoid the effects of overcrowding, with basic sanitary services, in a community and a neighborhood that permits a compatible social life. The problem is aggravated by urban sprawl and migrations from rural areas to the ciries.

Latin America, with its annual population growth of 3% and its deficit of 25 million houses, must find new solutions to its housing problems. The basic difficulty is the low income of the population for acquiring housing, even at low cost. At the same time, many of the governments are not in position to finance the large-scale programs needed, thereby allowing little hope that focusing on traditional construction would give the desired results. The present need is to find a means of helping the low income groups construct housing, with minimum elements and services, at about 5% to 10% of conventional prices.

The improvement of housing conditions can only be achieved on a significant scale if present patterns of construction are changed to patterns of mutual or self-help through new efforts integrated with present socioeconomic developments, new materials, or actions that commit the population to the process of development. In Latin America, where the population is primarily agricultural, the economic stabilization of the rural area is an indispensable condition for urban-industrial development. Programs of low-cost housing, urbanization, colonization, and settlements in areas where agrarian reform programs are being carried out must take into account the general plan of development and the process of physical planning by regions.

In the last few years PAHO, through CEPIS, together with other interested international agencies, has collaborated with Member Governments in the physical planning for housing in urban and rural areas, principally with respect to health and welfare. The Center's efforts are directed towards (1) formulation of urban and regional planning projects; (2) establishing or improving institutions responsible for programs of housing and regional development; (3) adoption of interdisciplinary solutions to problems in housing and developmental programs; and (4) studies oriented toward eliminating or controlling certain vectors of disease.

#### 2500 - AIR POLLUTION

Air pollution created by emissions of particles and gases from domestic and industrial activities and motor transport is on the rise throughout the world and has begun to seriously affect developing countries. High rates of population growth and rapid increase in size of cities in almost all the Region are aggravating the problem. Since 1965 PAHO has been co-operating in programs for the control of air pollution. In June 1972 the United Nations Conference on the Human Environment recommended that a worldwide network be established to monitor the environment, including carbon dioxide, sulfur dioxide, oxidants, nitrogen oxides, heat, and particulates. The III Meeting of Ministers of Health of the Americas in 1972 set as a goal for the decade 1971-80 the formulation of programs for the control of atmospheric pollution in urban areas of more than 500,000 inhabitants and in other cities where industrialization or other considerations justify them. This is a formidable task, requiring tenacious efforts on the part of the countries.

Excluding Canada and the United States of America, there are some 45 urban areas that already have or will have over 500,000 population by 1980, including 15 with over a million population and four with over 5 million. There are at least 29 other cities with a growing rate of industrialization. The problem areas are distributed through 22 countries, and it will be necessary to develop an infrastructure adequate to handle the magnitude and seriousness of the air pollution problem. During the past decade, three cities have initiated programs and five or six more are in the advanced planning stage.

Following the mandate of the 1966 Directing Council, a network of 62 air sampling stations has been established to determine the magnitude of the air pollution problem, and 35 stations are being installed.

Through CEPIS and various country projects, PAHO cooperates in the evaluation of problems and in the formulation of programs of air pollution surveillance and control. It also provides short-term consultant services in specific cases and collaboration in training personnel and in preparation of legislation and regulations. These and related activities are to continue, having as the ultimate objective reaching the goals set by the Ministers' Meeting.

#### II. PROMOTION OF HEALTH

#### A. GENERAL SERVICES

#### 3100 - GENERAL PUBLIC HEALTH

The Ministers of Health of the Americas, at the III Special Meeting held in Santiago, Chile, in October 1972, drew up a Ten-year Health Plan for the Americas. Specific targets were established for the development and strengthening of the general health services of the countries of the Region by 1980. These targets were based on the main goals of extending the coverage, including minimum comprehensive services, to all the population living in accessible communities of less than 2,000 inhabitants and of providing basic and specialized services to the rest of the population through a regionalized health system. The actual population living in communities of less than 2,000 inhabitants was estimated to be 45% of the total population of Latin America and the Caribbean area, to become 40% by 1980. The estimation of the present coverage by at least minimum health services was considered to be approximately 63% of the total population of those same areas. The definition in each individual country of a health policy in the light of its economic and social development, clearly specifying the objectives and structural changes necessary to achieve them, was considered to be a basic requirement for achieving the goals.

To assure the achievement of the proposals under the Plan, the following objectives were thought to be essential: to establish and develop health systems through research and planning; to improve the operational capacity of the system; and to develop human, technological, physical, and financial resources, supported by adequate legislation, in line with the institutional development expected. The assistance to be given to Member Governments by the projects for health services throughout the period will be guided by and consistent with these restatements of objectives, and by the available means for expansion and strengthening of a system of general health services for each country, as the supporting infrastructure to carry on the specific health programs.

Such projects are already in operation in 25 countries and 14 territories and form the core of the advisory services to the governments. The long-range nature of the processes of building up an efficient system of health services in developing countries make these projects long-term in character, so their emphasis will vary from one problem to another and at different times. It is expected that during the decade two-thirds of the countries of the Region will have taken action through these projects toward the achievement of the goals of the Ten-year Health Plan.

#### 3200 - NURSING

Lack of the quantity and quality of nursing care required constitutes a major problem for the delivery of health care and its extension to rural populations. The Ministers of Health, recognizing the seriousness of the situation, established goals which would contribute to the diminution of this deficiency. The goals to be attained by the end of the decade are (1) the establishment in 60% of the countries of the Region of a system of nursing in which the role of nursing personnel in the delivery of health care, as related to the achievement of health program objectives, is clearly defined, indicating the number and type of personnel, the educational programs for their preparation, and the administration, organization, and information required for adequate functioning; (2) the insurance of the provision of the minimal level of safe nursing care in at least 60% of hospitals of over 100 beds and in community health centers; (3) increasing the active work forces to 19 nursing personnel per 10,000 population (4.5 nurses and 14.5 nursing auxiliaries), which represents an increment in Latin America of 184% for nurses and 134% for total nursing personnel; and (4) the adjustment, improvement, and development of the subsystem of nursing education to provide the nursing manpower required.

The policy of PAHO is to assist the countries in the achievement of the goals, specifically through (1) definition and development of the system of nursing; (2) programming to provide the nursing care needs of the different services; (3) improvement of nursing care in general, as well as in the various clinical specialties, through definition and application of standards of care and the development of the administration and organization practices and structure required; and (4) development of the nursing manpower required through basic, postbasic, continuing education, and in-service training programs.

#### 3300 - LABORATORY

In the majority of the countries of Latin Americs and the Caribbean area, there is a great need to modernize the services of health laboratories, to increase their coverage, and to improve efficiency and productivity. It is estimated that only about 10% of the health services for ambulatory patients have some type of clinical laboratory, whereas this percentage rises to a range of 70 to 95 for hospital services. A lack of personnel of all types, as well as a lack of adequate physical facilities, equipment, and technical standards, is apparent.

PAHO cooperates with the Member Governments in programming and developing national laboratory systems, in training personnel, in strengthening both routine and reference diagnostic services, and in reinforcing laboratories for the control of water, food, biological products, and drugs. It also promotes operational and epidemiological research, as well as the training of professional, technical, and auxiliary personnel.

The principal objective of these activities for the present decade is the development of basic services by health laboratories in 24 countries in the Region.

# 3400 - HEALTH EDUCATION

The Ten-year Health Plan for the Americas calls for the organization of health education as part of the process of active and informed participation of communities in all activities for the prevention and cure of disease.

Health education services are available in all except three of the countries in the Region. However, the operational levels of health education programs are limited, and these shortcomings interfere in the continuity and effectiveness of community education activities. There are also weaknesses in the planning of the educational component of health programs due to a shortage of human, financial, and material resources assigned to health education services. At present, three Latin American public health schools train an average of 65 specialists annually among them. Only six countries have systematically included instruction in health education in their general education curricula.

PAHO cooperates with the governments in the reorganization and consolidation of health education units in order to enable them to channel the educational process so that it contributes to increased participation of the community in health actions. This also includes the health education training of specialists and other personnel of health and related agencies.

#### 3500 - STATISTICS

The broad objective of the health statistics program is to have available essential data of good quality and coverage to plan, administer, and evaluate local, national, and international health programs. Analysis of health statistics systems reveals that in most countries coverage, completeness, quality, and utilization of data are deficient. This assessment applies to statistics on births and deaths, to morbidity data, and to information on health resources and services rendered. Personnel resources for these systems are inadequate, as are their training and remuneration. Advisory services, supervision, and evaluation are sporadic.

With advances in health systems and medical technology and the extension of medical care services to larger proportions of the population, more and more statistical information is required to plan and evaluate programs. Computer technology will make it possible to process and analyze data in greater depth than previously, but this should not take precedence over improvement of the quality and coverage. Research is needed on methods for improving statistical systems and data production, for developing indicators of health status and changes taking place, and for supplementing data available from routine statistical systems. Although improvement of statistical systems is the long-term endeavor, efforts must also be directed to more immediate ways to obtain and interpret data.

The goal in each country is to establish a health statistics system or to strengthen the existing system to assure the flow of information from local sources (civil registration offices, hospitals, health units) to regional and national units for processing, analysis, and distribution to users. Standard forms and manuals for guidance at all levels, effective supervision of activities of collection and transmission, and coordination of agencies with related responsibilities in order to integrate data from all sources, will contribute to improving the systems. Emphasis should be directed to the improvement of the quality, coverage, and completeness of the vital and health statistics.

Through 12 statistical consultants assigned to zone and country projects, advisory services are provided to the countries in establishing or improving health statistical systems. Six posts are available for medical records administrators who render advisory services on the organization of medical record departments in hospitals, as well as on the development of courses for personnel in this specialty. The Computer Science Section and the Computer Center in Argentina are the source of consultant services in this technical field - on the feasibility of acquiring computer resources, on systems analysis, and on computer programming.

The health statistics program of PAHO also has responsibility for regional activities in collecting and disseminating information at the international level. Jointly with WHO, weekly data on communicable diseases are collected and annual data on mortality, morbidity, and health resources and services are obtained and analyzed. The reports published by WHO include the World Health Statistics Report, the World Health Statistics Annual, and the Weekly Epidemiological Record. PAHO publishes the Weekly Epidemiological Report, the annual series Reported Cases of Notifiable Diseases in the Americas, and periodically Health Conditions in the Americas and Facts on Health Progress.

Activities on the International Classification of Diseases (ICD) are also part of the regional program in health statistics. Staff of the Department of Health Statistics, together with the Latin American Center for Classification of Diseases and the ministries of health of the Region, plan for the preparation of volumes in Spanish and Portuguese, including supplementary volumes for use in hospital indexing, surgery, and dentistry. Courses on the use of the Classification are given each year and training materials are developed.

Research is an indispensable part of the program in health statistics. Plans to establish health demography laboratories are currently being made. Data from the Inter-American Investigation of Mortality in Childhood, as well as from the related probability sample of households, will continue to be analyzed. The final report of the study was published in April 1973.

3600 - ADMINISTRATIVE METHODS

During the past decade, the countries of the Americas have made progress in improving public administration. Nevertheless, the results do not meet the expectations, particularly in the health sector, where management problems continue to be the most important single factor affecting the returns on investments, despite major contributions toward streamlining present organizational structures and administrative machinery. PAHO continues to promote and assist governments and health sector institutions in updating administrative processes, streamlining infrastructure, and training the personnel required by the health services in order to achieve their goals.

The institutional development of health services constitutes the overall objective of this program. Attainment of this goal requires the definition of policies and programs, adequate infrastructure, modern administrative methods and procedures, determination of resources required, and development of a system of positive control. The services provided under this project are closely coordinated with those under the health planning programs.

3700 - HEALTH PLANNING

During the last decade the Governments of the Americas began to emphasize the processes of planning for health. The III Special Meeting of Ministers of Health analyzed the present situation in this area and fixed continental goals for the period 1971-80. It also recommended to the countries measures that would facilitate reaching these goals.

The health planning program has as its purposes (1) at the national level, to cooperate with institutions in the health sector in the development of their planning processes through consultant services, training of personnel, research, and information services; (2) at the regional level, to prepare the necessary documents, guides, and working models to facil-

itate the evaluation and readjustment of the Ten-year Health Plan; and (3) at PAHO level, to complete and improve the system of quadrennial projections as the basic instrument for planning the cooperation of PAHO with the Member Governments in order to obtain the best use of PAHO resources in meeting the requirements of the countries.

In the period 1973-75 it is planned to cooperate with all the countries of the Region in the incorporation of the goals of the continental health plan for the 1970's into national health policies, plus the formulation or readjustment of strategies for reaching these goals. Other objectives for this period are (1) to promote and cooperate in the development of national health planning processes; (2) to cooperate in the development and installation of a control-decision information system in four states of Brazil, Costa Rica, Ecuador and Colombia, and in others on request; (3) to train 600 health professionals in basic planning courses to be carried out at the national level in schools of public health and in special courses; (4) to train 250 professionals in seminars on national information systems and in seminars on administration planning and information; (5) to provide in-service training in programming within PAHO; (6) to design the model for determining the cost of the health sector and to apply it in five countries; (7) to develop and test in two geographic areas, models of investments in health and human resources directed toward definition of policies in these fields; (8) to cooperate in the development of methods for evaluating health planning processes and for studying the internal restrictions in the health sector; and (9) to provide information on planning to all countries of the Region.

## B. SPECIFIC PROGRAMS

# 4100 - MATERNAL AND CHILD HEALTH

Women in the fertile age group and children under 15 constitute nearly two-thirds of the population of most of the countries of the Region. The health status of these groups, in spite of notable improvements in the past decade, remains unsatisfactory. In Latin America, the rates of maternal mortality are five to seven times higher than in Northern America. Deaths in children under five constitute 41.1% of all registered deaths in Middle America and 34.7% of all deaths in South America, in comparison with 4.7% in Northern America.

Programs in nutrition, health education, control of communicable diseases, and environmental sanitation are contributing to improvements in the health status of mothers and children. However, greater emphasis is needed for the expansion of coverage and the enhancement of the quality of the specific preventive, curative, and rehabilitative actions required for the improvement of the health of these vulnerable population groups.

#### 4200 - NUTRITION

There is a general consensus among the governments of Latin America and the Caribbean that malnutrition and some specific deficiency diseases are major obstacles to social and economic development. They are very often associated with inadequate physical growth and mental retardation in children, reduced economic productivity of labor workers, and high morbidity and mortality rates in children under five years of age. Available information supports the assertion that food supply is insufficient, food intake is neither adequate nor balanced, and biological utilization of food is impaired, mainly due to microbial and parasitic infections which interfere with normal utilization of food.

Health and nutrition surveys carried out during the last few years throughout the Region clearly indicate that there are serious nutrition problems in most of the countries. Protein-calorie malnutrition; nutritional anemias due to lack of iron, folic acid, and vitamin  $B_{12}$ ; endemic goiter and cretinism; and hypovitaminosis A constitute health problems of great magnitude and significance in the Region. Moreover, some countries or specific population groups within a country are facing a rapid increase in nutrition-related conditions such as cardiovascular diseases, diabetes, and obesity.

PAHO cooperates with the governments in developing broad national nutrition programs with the basic aim of reducing the prevalence of nutrition diseases and the achievement of an optimum nutrition status for the entire population, as stated in the Ten-year Health Plan for the Americas. For the attainment of this objective, the following goals have been set up for the decade by the III Special Meeting of Ministers of Health of the Americas: (1) to reduce the current prevalence of second degree protein-calorie malnutrition by 10 to 50% (30% regional average) and of third degree malnutrition by 75 to 95% (85% regional average) among children under five; (2) to reduce the current prevalence of nutritional anemias by 30% among pregnant women; (3) to reduce the prevalence of endemic goiter to below 10% and eliminate endemic cretinism; (4) to reduce the current prevalence of hypovitaminosis A by 10 to 50% (30% regional average) among vulnerable groups; and (5) to reduce the current rate of increase in prevalence of diseases associated with obesity, such as cardiovascular diseases and diabetes.

More specifically, PAHO is assisting the governments in carrying out the following activities to achieve these goals: (1) formulation of biologically-oriented national food and nutrition policies and execution of coordinated intersectoral programs; (2) strengthening or creation of technical nutrition units in the health structures at central, intermediate, and local levels; (3) training of specialized personnel for nutrition services (medical nutritionists and nutritionistdietitians); (4) appointment of full-time nutrition specialists at schools of medicine, nutrition and dietetics, nursing, and public health; (5) establishment of an adequate system for diagnosis and epidemiological surveillance of the nutritional situation; (6) incorporation of nutrition activities into general community health services, particularly maternal and child health programs; (7) coordination and achievement of effective supplementary feeding programs for the most vulnerable groups of the population; (8) development of nutrition education programs through mass media communication and organized community participation; (9) establishment of effective food enrichment and fortification programs; (10) development and production of conventional and new low-cost, highly nutritious foods, especially for weaning children; (11) improvement of administration and operation of hospital and institutional food services; and (12) strengthening of research in the fields of food and nutrition, with emphasis on simple techniques, procedures, and methods for the nutrition assessment of the population, growth and development of children, cost-benefit analyses of supplementary feeding and nutrition education programs, prevention of endemic goiter and hypovitaminosis A, and relationships of nutrition deficiencies and infectious diseases.

In order to carry out its program of technical cooperation with the governments, PAHO provides nutrition advisory services through a group of medical and non-medical nutritionists at the central, zone, and country offices in the Region. It also utilizes, as specialized technical resources, the Institute of Nutrition of Central America and Panama (INCAP) and the Caribbean Food and Nutrition Institute (CFNI), particularly for training and research activities.

FAO, WFP, UNICEF, and private foundations cooperate in these programs.

#### 4300 - MENTAL HEALTH

Resources available in the Region are poorly distributed and insufficient to confront the growing problems in mental health. Care of psychotic patients is inappropriate, incomplete, and restricted to hospitalization which is insufficient to meet the demand. There are 13 countries with fewer than 0.5 psychiatric hospital beds per 1,000 population.

Psychosis, disabling neurosis, suidice, alcoholism, mental retardation, and epilepsy are among the more important mental health problems, and services are inadequate. Scarcity of specialized personnel - psychiatrists, psychiatric nurses, and rehabilitation experts - makes the expansion of services difficult. This situation emphasizes the need to create specialized training centers and to offer postbasic instruction in mental health to physicians, nurses, and social workers. PAHO is currently cooperating in a program of continued education in psychiatry for general practitioners. Thirteen countries have a national office on mental health, and eight of these have formulated policies.

PAHO cooperates in activities leading toward the inclusion of mental health services in the general health plans; in the modernization of psychiatric hospitals and expansion of their services to the community; in the training of personnel; and in carrying out research, particularly in the area of the epidemiology of mental illness. It will also cooperate with the governments in meeting the demand for community mental health services, in combating alcoholism and dependence on drugs, and in creating psychiatric services for children, as well as in improving services for seriously disturbed patients.

4400 - DENTAL HEALTH

In 1955 a survey revealed a great shortage of public health dentists in Latin America, and none of the better known schools of public health offered any kind of specialized formal training for dentists. At the present time, four schools of public health provide training in dental public health. This program has cooperated in national surveys of dental diseases, human resources, dental education, and institutions providing dental services in Argentina, Chile, Colombia, Ecuador, Montserrat, and Venezuela. Studies have been initiated in Colombia, Mexico, Peru, and Venezuela on the use of new dental materials which could, if successful, provide improved methods for treatment of large population groups; and investigations have been initiated in Colombia related to prevalence of dental caries in two communities.

Other activities developed with the support of PAHO include the establishment of an international laboratory for standardization, quality control, teaching, training, and research in the field of dental biomaterials in Venezuela; the establishment of a school for dental nurses in Jamaica; and technical assistance for the development of dental health programs in the Caribbean area and in Ecuador and Panema. Models of basic dental equipment have been developed. Through the water fluoridation program some 640 engineers have been trained, and in the past five years the population in Latin America benefitting from this measure has risen from 10 to 20 million. Studies have been conducted into alternatives to the use of fluorides, such as the fluoridation of salt.

The goals for the project recommended in the Ten-year Health Plan, drawn up at the III Special Meeting of Ministers of Health of the Americas, are to reduce dental morbidity and modify components of the morbidity index; increase dental care coverage in both urban and rural areas, giving priority care to children; achieve water fluoridation in cities of 50,000 or more population; promote and stimulate the training of intermediate-level personnel; and establish various models of dental practice ranging from individual practice to integrated teamwork.

#### 4500 - RADIATION AND ISOTOPES

This program deals with the health aspects of radiation and is composed of two principal parts: (1) assistance regarding the use of radiation in medicine, including the training of personnel and technical assistance in diagnostic radiology, radiation therapy, and nuclear medicine; and (2) assistance regarding protection against excessive or unnecessary exposure to radiation of workers and the public, including patients.

With regard to diagnostic radiology, little is actually known about utilization or cost-benefit relationships in the Region. However, it has been estimated that no fewer than 30,000 diagnostic x-ray units are in existence in Latin America and the Caribbean. Further estimates are that one-third to one-half of crucial medical decisions are dependent on x-ray diagnosis and that about two-thirds of all x-ray examinations in any radiodiagnostic department are of a basic nature. In the more developed countries the use of diagnostic x ray is expected to increase by about 1 to 4% per year in the decade 1971-80, which will accentuate the need for efficient use of personnel and equipment.

The practice of radiotherapy has spread considerably since its first use about 75 years ago, and a WHO expert committee has estimated that at least one-half of all cancer patients require this type of therapy during the course of their illness. From data available it has been estimated that there are approximately 500 radiotherapists, with varying degrees of qualification, and 1,000 therapy machines, about 100 of which are high-energy units, in Latin America and the Caribbean. However, the proper utilization of the costly investment which has already been made is questionable because of the lack of necessary supporting personnel. In the case of nuclear medicine, which is a relatively new field, most specialists have been trained concurrently with its development, and an estimated 700 specialists in Latin America and the Caribbean countries are working with radioisotopes or tagged molecules.

To date, the major effort in the radiation and health program has been expended in the radiation protection area. PAHO has entered into agreements with 10 countries (Argentina, Bolivia, Chile, Colombia, Costa Rica, Ecuador, Jamaica, Panama, Peru, and Venezuela) to assist with the development of radiation protection services. These projects usually consist of (1) technical assistance through PAHO staff and short-term consultants; (2) training through fellowships and short courses; and (3) supplies and equipment necessary for the detection and measurement of radiation. In addition, since 1962 PAHO has coordinated a program for the sampling of the environment for radioactive pollutants. Samples which are collected in various countries are sent to the U.S. Environmental Protection Agency Laboratory in Montgomery, Alabama, for analysis, with the results being reported directly to the countries and published monthly in "Radiation Data and Reports." Air samples are collected in 10 countries (Argentina, Bolivia, Chile, Colombia, Ecuador, Guyana, Jamaica, Peru, Trinidad and Tobago, and Venezuela), and milk samples are collected in five (Chile, Colombia, Ecuador, Jamaica, and Venezuela).

As the countries of the Region establish their goals for the decade, PAHO expects to be of service (1) to assist the various governments in studying and resolving the problem of the optimum use of radiation in medicine; (2) to assist in the training of needed professional and technical personnel; (3) to help improve the quality of existing services; (4) to help establish radiation protection services in countries where they do not exist; (5) to help establish environmental radioactivity sampling programs; (6) to help establish centers of excellence for training in radiotherapy, nuclear medicine, radiobiology, and radiation protection; and (7) to help achieve effective cooperation between the national and international institutions which have an interest in radiation and health.

#### 4600 - OCCUPATIONAL HEALTH

At the beginning of this decade the labor force in Latin America was about 94 million persons, and it is probable that by the end of the decade it will be 150 million. Industrial laborers, frequently due to lack of experience in their rural backgrounds, handle dangerous substances without any idea of the risks involved to themselves. Application of modern techniques, in efforts to short-circuit stages more highly developed countries have passed through, represent additional risks. This is demonstrated by the high incidence of industrial accidents and occupational diseases that exceed by 6, 10, or more times the rates experienced by more developed countries. For example, silicosis, which can be prevented, is present in several countries and in one of them affects 23% of the miners. Likewise, there exist high rates of other pneumoconioses such as those caused by asbestos, coal, and cotton, and there are frequent intoxications among workers using such substances as lead, organic solvents, manganese, mercury, and arsenic.

Studies during the past decade show that losses due to accidents and occupational illnesses are sometimes as high as 15% of the national income. To these losses, others must be added - the shorter work day in certain occupations, the prolonged vacations given persons whose health is exposed to risk, and the decrease in the number of years required to reach retirement. These latter measures, which do not contribute to the solution of the problem, do affect the cost of production.

The obectives for this decade, set by the III Special Meeting of Ministers of Health, are for countries without active programs in industrial hygiene to establish them as soon as possible so that by 1975 at least 25% of the working population exposed to risk will be covered by services, as will 50% by 1980, as a minimum. In those countries already having programs it is recommended that they be expanded to cover 40% of the workers by 1975 and 70% by 1980. PAHO will cooperate in the establishment and expansion of these programs and in the training of personnel.

#### 4700 - FOOD AND DRUG

It has long been recognized that governments must take the necessary steps to assure that their people receive safe and wholesome foods, and safe and effective drugs. This governmental responsibility has become more difficult in recent years because continuing innovation in food and drug manufacturing processes have greatly increased the problems confronting the government food and drug control officials.

PAHO's program in the food and drug field consists of (1) development of guidelines for food and drug control laws and organization and operation of national control agencies; (2) providing expert consultants, upon request, to study the situation in a country and to make recommendations based upon the circumstances encountered in that particular country; and (3) providing training opportunities for analysts, inspectors, and law administrators from the national food and drug control agencies.

During 1973, PAHO arranged for extended training at the U.S. Food and Drug Administration and the Canadian Food and Drug Directorate for a total of seven drug analysts, four microbiologists, and five drug establishment inspectors from the various national food and drug control agencies. Active steps are being taken to establish a drug quality institute in Brazil to provide advanced training in their native language for personnel from the national drug control agencies.

As in previous years, PAHO is responding to requests for special studies of the food and drug control needs of the countries. An example of a special study of this kind is the current program of the Caribbean countries for establishing, with PAHO's assistance, a Caribbean regional drug testing laboratory. In the field of food control, PAHO is providing training and research through the Food Hygiene Training Center in Venezuela, PAHO's Food Reference Laboratory at INCAP in Gustemala, and the food microbiology program carried out at the Pan American Zoonoses Center in Argentina, and by financing courses in the analysis of foods at the University of Panama.

#### 4800 - MEDICAL CARE

The health care delivery program of PAHO aims at the adoption by Member Governments of a health care system with broad coverage of the whole population and improved utilization and productivity of available resources. The program also involves training the necessary personnel for health systems administration.

To achieve this main purpose, projects are carried out in the following fields: (1) coordination among institutions of the health sector; (2) organization of regional comprehensive services for the delivery of health care to the population in a network of hospitals, outpatient clinics or health centers, and domiciliary services; (3) hospital design, administration, and maintenance to improve utilization and productivity of hospital facilities; (4) introduction of progressive patient care as a means of raising the quality of care; and (5) training of health professionals and technicians in medical care and hospital administration to enhance their full participation in the multidisciplinary health team within an institutional organization.

The unbalanced situation between increasing demand for services and the scarcity of resources available to meet this demand was discussed at the Meeting of Ministers of Health in Santiago, and the Ten-year Health Plan contains recommendations that national health services plan and coordinate the available resources within a health system adapted to the characteristics of each country. In this connection, PAHO has launched, and is trying to reinforce, a program of cooperation with social security institutions in an effort to attract their participation in the process of planning, execution, and evaluation of health care delivery to the whole population. The emphasis should be on comprehensive ambulatory services provided through a network of community health centers coordinated and technically supported by regional general hospitals.

The development of human resources is an indispensable element in establishing the health care program. Activities are therefore in progress to introduce elements of health care and hospital administration into the curriculum of medical schools, as well as to carry out in-service refresher courses for personnel actually in charge of hospitals. The training of professors and researchers is an objective to be implemented soon within the scope of the Pan American Health University, in order to enable different countries of Latin America to develop the nucleus for further improvement of services and teaching. Assistance is also available in the fields of architectural design and maintenance engineering to expand and maintain the physical structures needed to properly locate the services.

#### 4900 - HEALTH AND POPULATION DYNAMICS

The rapid growth of population (from 2.2 to 3.4% annually) in many of the countries of the Region has an effect on health and health services. The health and population dynamics program promotes research in population dynamics, demography, and reproductive biology; emphasizes the health aspects of family planning; fosters the integration of family planning activities within the health service structure, with particular emphasis on maternal and child health; and provides assistance in the formulation of population policies consistent with national goals.

The program provides technical and material assistance for the planning and implementation of projects in this field, with particular emphasis on the provision of the necessary human resources. In addition to regional activities, 21 country projects are operating in 19 countries. The program works closely with other international, national, and voluntary agencies interested in the field of population.

# 5000 - REHABILITATION

PAHO is planning to provide adequate rehabilitation coverage in two main ways. The first is to encourage health authorities throughout the Region to automatically include rehabilitation services in their medical care plans for public health programs, as approved by the Meeting of Ministers of Health in Santiago. The second is to determine, in individual countries, the estimated number of rehabilitation personnel (physiatrists, physical therapists, occupational therapists, prosthetist/orthotists, nurses, and communications personnel) required for efficient national coverage and to provide for appropriate preparation of such personnel during the next decade.

5100 - CANCER AND OTHER CHRONIC DISEASES

Among the factors contributing to the rising trend of chronic diseases that is being observed in many countries of the Region, the following are the most influential: increase in life expectancy, gains in communicable disease control, and adverse cultural and environmental changes. The Final Report of the III Special Meeting of Ministers of Health of the Americas underlined that "in the first half of the past decade, two-thirds of the deaths in the age group 15-74 years in 10 of the large urban centers of Latin America were attributed to chronic diseases." Cardiovascular conditions, metabolic and functional impairments of long duration, chronic bronchitis, neurological diseases, malignant neoplasms, and post-traumatic sequelae are thus becoming major health problems.

In many of these diseases primary prevention is seriously handicapped by the relative unavailability of effective methods. Furthermore, the chronic patient often requires continuing, prolonged, and costly care either in the hospital, in outpatient departments, or at home. In such care it is of paramount importance to harmonize the operation of medical, nursing, dental, nutrition, rehabilitation, and social services, among others. But the prevalent administrative confusion and lack of coordination of efforts have compounded the problem, since the inadequacy of resources is further increased by their far from optimal utilization.

PAHO is therefore assisting the countries in establishing a chronic disease control program, giving special attention to the development of comprehensive, progressive, and community-based health care services, anti-smoking activities, detection and timely treatment of cervical cancer and its precursors, rheumatic heart disease projects, improvement of radiation therapy facilities and practices, epidemiological research, and training of the much needed professional, technical, and auxiliary personnel.

#### III. DEVELOPMENT OF EDUCATIONAL INSTITUTIONS

#### 6100 - PUBLIC HEALTH

The implementation of the Ten-year Health Plan for the Americas will demand a great effort in the training of health personnel at all levels. This is being met by schools of public health of the Region, various training programs of the ministries of health, and recently by postgraduate courses. In addition to these resources, international and national centers which PAHO is supporting and training activities being carried out in the Region are helping to meet these needs.

PAHO is supporting these activities through advisory services, short-term consultants, fellowships, and limited direct financial assistance. Plans for the continuity of these efforts and the improvement of professionals in the Region are under preparation. These plans give special emphasis to those countries which do not have schools of public health and those with a greater demand for professionals. PAHO will give special attention to the development of in-service education programs for staff with public health responsibilities and without formal training in this specialty. Provision is made for special attention to be given to such critical areas as epidemiology, administration, social sciences, statistics, environmental sciences, and maternal and child health.

Programs for advanced training of public health personnel at the university level are being planned through the Pan American Health University.

6200 - MEDICINE

The training of health workers, mainly professional health workers, and the institutions in which that training is given, are subject to constant evaluation and review in the light of new methodological approaches and the increased responsibilities of those institutions.

Among the priority problems for which PAHO assistance is needed are the growing demand for medical and paramedical studies, the shortage of trained faculty members, the lack of material resources and funds, advances in science and in medical and educational technology, and the importance of coordinating the activities of educational institutions and of health services. The trend towards integration of educational agencies interested in conducting multidisciplinary programs is of special interest.

Among the basic problems hindering the preparation of a sufficient number of health personnel of the required caliber, the shortage of material resources and manpower is of special importance. It is therefore necessary to devise ways of making the best possible use of resources. The establishment of health science faculties or centers, which bring together scattered resources and whose functions include the training of health workers in various areas and of different levels, is a promising solution. In addition to unifying resources, the centers have the advantage of educating and training students to work as members of a team with a multidisciplinary approach to health problems.

PAHO is dealing with the problems by planning manpower requirements in accordance with educational possibilities to meet those needs and strengthening education institutions in order to develop sufficient manpower of the required caliber. Specific activities include the conduct of special studies in cooperation with interested institutions or countries, the provision of advisory services to improve administration and teaching patterns and methods, the award of fellowships for faculty members, the holding of meetings of working groups and of seminars on medical pedagogy and organization, and the improvement of exchange of information between various international agencies interested in medical and paramedical education in Latin America, with a view to increasing collaboration. A quarterly journal on medical education is published in Spanish and distributed to medical educators in the Region. A program to provide project textbooks for medical students is under way. Initial steps are being taken to launch a broad program of educational technology applied to medical education.

Short-term consultants, fellowships, and a limited amount of supplies and equipment are being provided, as are advisory services by Headquarters and Zone staff.

#### 6300 - NURSING EDUCATION

In order to arrive at a regional average of 14.5 nursing auxiliaries and 4.5 nurses per 10,000 population, in accordance with the Ten-year Health Plan for the Americas, it will be necessary to prepare in the present decade 360,000 auxiliaries and 125,000 nurses. This would require a considerable increase in the present rate of training personnel. The student capacity of the present known 279 nursing schools and 420 training programs for auxiliaries is generally very low. The average graduating class from 103 nursing schools in Latin America and 23 in the Caribbean area for the period 1968-70 was 17.1 and 25.9, respectively. The average for nursing auxiliaries in this same period in 88 courses in Latin America was 32 per course. The low productivity from the training programs is due principally to scarce human resources, facilities, and finances, and to the lack of coordination between the educational systems and the health sectors.

The lack of coordination between education and services is responsible for not having long-term plans for the increase in installed capacity for training or for the expansion of registration in teaching institutions during a time when growing health services are providing conditions for the absorption of the graduates. Scarce financial resources and the lack of teaching personnel are impeding the utilization of numerous new educational techniques, affecting greatly the efficiency and efficacy of present programs.

PAHO cooperates with Member Governments in (1) the definition and implementation of a system for nursing education capable of producing personnel in the numbers and at the level required for the health services; (2) the strengthening of teaching institutions with a view to the integration of teaching and nursing practice; (3) the study of problems affecting the teaching and production of personnel; (4) the training and better utilization of teaching personnel; (5) the creation of an information system that would permit evaluative judgments on the quality of teaching for its continuing improvement; (6) the production of textbooks of high educational quality and at costs that can be met by the students; and (7) holding seminars on the training of personnel and the structure of curricula for various levels of teaching. A plan for the establishment of a program in educational technology applied to nursing education is being formulated.

#### 6400 - ENVIRONMENTAL SCIENCES

In the last decade, programs in environmental health in general, and in water supply in particular, have been greatly expanded by the governments. It is estimated that 1,000 engineers are currently working in public health institutions. About 4,000 engineers, mostly civil, work in water supply, sewerage, and other services. About 3,000 sanitary inspectors are working in environmental sanitation programs in Latin America and in the Caribbean area. Improvement of the capabilities of personnel engaged in activities related to environmental control is decisive for the success of the countries' environmental programs. One of the fundamental policies of PAHO is to cooperate in education and training activities in the field of public health, including environmental engineering.

The Meeting of Ministers of Health of the Americas in Santiago, Chile, in October 1972 recommended goals for water supply, sewerage, enfironmental pollution control, occupational health, food hygiene, and other present and emerging responsibilities of environmental health officials. These goals, coupled with the increased use of new technologies, point to the need for sharply increasing the production of professional, technical, and auxiliary personnel. One special recommendation of the Meeting was to train 320 students annually in graduate sanitary engineering programs; organize short courses for 3,000 professional and technical personnel every year; and, in the decade of the seventies, increase to 2,000 the number of sanitary engineers in water supply, sewerage, and other environmental services; and to 4,000 the number of sanitary inspectors in public health.

A combination of aggressive training activities is to be undertaken on an institutional and academic basis to reach these goals. Strengthening of teaching institutions is one of the most important objectives of the program. Continuing education, on the basis of short, intensive courses on specific subjects, has proved to be extremely successful. The demand for technical assistance for this type of activity has grown immensely, due to its exceptional adaptability to national needs and to its multiplying effects.

In the last five-year period, PAHO has given technical assistance to all countries in the Region, through an operational network of 41 universities, to organize and carry on 351 short courses and 48 seminars and symposia. These activities were attended by 13,959 participants, and 2,847 national professors delivered lectures. PAHO collaborated with the services of 797 short-term consultants and staff members.

The objectives for the next five years are to increase of the tempo of this program, incorporate all the schools of public health into the operational network, and include subjects on environmental engineering in the programs of all schools of civil engineering. It is expected that in 1974 approximately 85 short intensive courses will be organized to benefit the 3,000 professional and technical personnel, as recommended by the Ministers of Health.

6500 - VETERINARY MEDICINE

The improvement in agribusiness, specifically in livestock development, will depend principally upon the ability of countries to produce an adequate number of veterinarians. Although 53% of the population of Latin America reside in rural areas, only 3% of the university student population study in the field of agricultural science. A minimum effort is made in the university centers toward training of the veterinarian. Demands for a greater number of veterinarians are increasing steadily, resulting from the development of national campaigns to control diseases of human and animal health significance. Although the schools are operating on a maximum capacity basis, the graduates represent only 17% of the total number of entering students. PAHO is attempting to remedy this trend by providing assistance to the schools of veterinary medicine through promoting and conducting seminars, providing fellowships for postgraduate training of professors, and supplying instructional resource material. Short-term consultants are assisting in those areas where deficiencies exist.

	6600 - D	ENTI	STRY			

In 1968 PAHO, in cooperation with 24 Latin American countries, conducted two studies on the utilization and education of dental auxiliary personnel. The first study collected specific information on functions and utilization of different categories of dental auxiliary personnel; the second was dedicated exclusively to their education. These studies revealed minimal utilization and inadequate numbers of dental auxiliaries, complicated by limited dental professional manpower; by maldistribution of dentists, who concentrate heavily in the upper income and urban areas; by the rapidly increasing population; and by widespread dental disease. There is a lack of trained dental auxiliaries and of adequate legislation covering their practice; there is no clear definition of the functions performed by dental auxiliaries; there is inconsistency in national requirements for registration of auxiliaries; there is inadequacy of physical facilities and insufficiency of teaching personnel in this field; the content and duration of courses vary considerably, even within the same categories; and the dental profession does not recognize the importance of dental auxiliaries in the practice of dentistry. In the five countries with 74% of Latin American dentists, only a small proportion actually employ dental assistants or auxiliaries with expanded functions. In the Latin American area there are fewer than 30 regular courses to train auxiliary personnel. The dentist-auxiliary ratio is 3:1.

The dental manpower situation illustrates a great shortage in most countries of the Region, especially due to the growth of population and the demand for dental care by larger groups of population. In more than 12 countries there is not yet one dentist per 10,000 population.

In the first stage of this program, emphasis was placed on the development of preventive and social dentistry teaching programs and design of new curricula for dental schools. These aspects have been successfully completed. At present, emphasis is being concentrated on assisting in the development and functional interrelationship between factors affecting the delivery of dental care (personnel, equipment, materials, and the socioeconomic system); developing personnel in certain specialized fields in dentistry as a nucleus for a scientific and training network in these fields in Latin America; simplifying and facilitating the availability of basic dental equipment; improving the design and function of dental training institutions and clinics; assisting the dental schools in Latin America in reviewing curricula, administration, and physical facilities; assisting and encouraging the development of educational planning units in dental schools; establishing a mechanism to interrelate dental schools in Latin America in the field of dental education; relating the teaching of preventive dentistry to the programming and provision of dental health services; improving the administration of dental libraries; and training dental librarians.

In the field of dental auxiliaries and utilization, plans are under way to establish regional centers for the training of dental auxiliary educators; to train auxiliary educators from each country who will subsequently establish national dental auxiliary training programs in their own countries; to assist dental auxiliary educators to establish national training programs for public and private dental care services; and to create new patterns of dental care delivery to provide expanded preventive and curative dental services to greater numbers of people despite social, economic, and cultural barriers.

The goal in this area of the Ten-year Health Plan for the Americas, recommended by the III Special Meeting of Ministers of Health of the Americas (Santiago, Chile, 2-9 October 1972) is to "increase by 20 per cent the present ratio of dentists per 10,000 population whenever that ratio in any country is lower than the present average for the area of 1.9 or lower than the average of the classification group."

#### 6700 - BIOSTATISTICS

The capability for making improvements in health statistics systems and in the utilization of statistical data and methodology is dependent on the expansion and strengthening of training programs related to health statistics throughout the Region. Academic courses must be provided to educate statisticians, medical records administrators, and computer scientists at both the professional and intermediate levels. In addition, sufficient statistical personnel at the auxiliary level must be trained to staff the many thousands of health care institutions. Physicians and many other categories of health personnel need an introduction to statistical methodology, procedures, definitions, and classifications to better fulfill their functions as producers and users of health data.

Minimum goals established for the decade are to train 300 professional-level statisticians, 100 medical records administrators, 4,000 medical records technicians, and 250 health statisticians at the intermediate level, and 40,000 statistical auxiliaries. At least 50 computer scientists and 250 computer programs in health should be prepared. These are only minimum goals, and many more specialists in each of these groups could be used in the Region.

To reach these goals additional training centers must be developed. Only one course exists for biostatisticians at the professional level (Chile), and three more are needed. The first advanced course in medical records science has recently been initiated (Argentina) and another three must be developed. In five countries intermediate-level courses are provided for medical records personnel. At least six more will be required to attain the goal for training in the decade.

Other training activities in health statistics should include strengthening of the teaching of biostatistics in the curriculum of medical schools and public health schools, including instruction on research methodology, computer science, medical statistical classifications, statistical systems for the health services, and interpretation and use of data. The public health schools of the Region and the health services should collaborate with civil registry and national statistical offices in the training of civil registrars. Orientation of personnel from other health disciplines on the value of maintaining records and statistics and their utilization is essential to improvement of the quality of health data.

#### IV. PROGRAM SERVICES

Administrative support services are not easily distributed by programs served. To facilitate review and administration, these activities have been grouped in a single category. They are the costs related to evaluation and reporting on projects; placement and follow-up of fellowship awards; production of visual aids; editorial services; liaison and public information; and library and computer services.

#### U. ADMINISTRATIVE DIRECTION

#### 8100 - EXECUTIVE AND TECHNICAL DIRECTION

Executive and technical direction is heavily weighted on the side of the technical content of the programs of the Member Governments rather than on day-to-day administration in this complex international organization. To reflect this, a separate category has been established to show the costs of the Director's Office and the Office of the Chief of Administration, as distinct from general administrative costs.

Project: Headquarters

#### 8200 - ADMINISTRATIVE SERVICES

Administrative services are organized so as to free the field staff for technical services by relieving them of as much administrative detail as possible. Personnel and accounting activities are centralized, and allotments, other than those for supplies and equipment, are issued to Country Representatives in terms of the elements needed to carry out the program rather than in dollars. These actions have facilitated the operation of Zone Offices with minimum administrative staff. This grouping includes the offices for budget, finance, personnel, supply, property services, and records and communications, as well as the administrative portions of each of the Zone Offices.

# VI. GOVERNING BODIES

The Pan American Health Organization is governed by the Pan American Sanitary Conference, which meets every four years. The Directing Council acts for the Conference in the intervening years. In addition, the Executive Committee of the Directing Council holds two regular meetings every year. By agreement with the World Health Organization, the Pan American Health Organization also serves as the Regional Committee of the World Health Organization. The category "Governing Bodies" covers the cost of scheduled meetings and supporting staff. The staff also supports other seminars and conferences as time allows.

## LETTER OF TRANSMITTAL

The Director of the Pan American Sanitary Bureau, Regional Office of the World Health Organization has the honor to present the following proposed program and budget estimates for consideration:

- 1. The proposed program and budget estimates of the Pan American Health Organization for the financial year 1974.
- 2. The proposed program and budget estimates of the World Health Organization for the Region of the Americas for the financial year 1975.
- 3. The provisional draft of the proposed program and budget estimates of the Pan American Health Organization for the financial year 1975.

Abraham Horwitz Director

#### INTRODUCTION

This program and budget has been developed in consultation with national health authorities primarily to provide technical information, advice, and services to Member Governments, within approved policies and long-range programs of PAHO. Special attention has been given to the fundamental importance of health to social and economic development and to the formulation of health plans as an integral part of the national plans for development. Health goals for the decade 1971-80 were established at the Special Meeting of Ministers of Health in 1972. These goals are reflected in many of the proposed projects. As in the past, flexibility is maintained to meet changing requirements of governments arising from redefinition of program objectives as national plans are developed.

Although not always reflected in this document, a significant amount of the time and energy of PAHO is devoted to cooperation with other international agencies, governments, and foundations in planning health programs to be financed by them, especially loans for water supply systems and housing, grants for research, education and training, and special programs in nutrition, in control and eradication of specific diseases, and in community development. Basic to future planning is the recognition of the rural character of the economy of Latin America where 50% of the population is engaged in agriculture. PAHO is cooperating with multilateral and bilateral lending agencies with a view to stimulating financial support to governments for greatly expanded programs of rural water supply.

The program is presented covering the latest actual year 1972, the present year 1973, and projections for 1974 and 1975. These are planned as a balanced whole, regardless of source of funds. Information for 1973 includes the latest data available at the time of preparation of the document. The 1974 program, presented as an advance draft in the previous budget document (Official Document No. 114), has been revised to reflect current priorities and latest known desires and requirements of governments. The 1975 program presents the advance plans for that year.

In accordance with Resolution VII of the XVIII Meeting of the Directing Council concerning the Tax Equalization Fund, provision is made for the sum of \$3,329,725 in 1974. This amount represents the difference between the estimated 1974 gross and net salary costs. While this amount is included in the proposed appropriation resolution, it is not included in the body of the budget presentation, since it does not affect the total program proposed. The PAHO Regular Program in this document is based only upon the effective working budget of \$21,522,310, which includes \$250,000 in miscellaneous income.

Sources of funds are identified throughout the document. They include:

- 1. The Regular Budget of the Pan American Health Organization.
- 2. Other funds expected to be available to PAHO for specified purposes. They include (a) special funds supported by voluntary contributions of governments; (b) special grants made to PAHO for specific activities; and (c) the Institute of Nutrition of Central America and Panama, supported by regular quota payments by its Member Countries and by grants from various sources. In addition, funds of the Pan American Health and Education Foundation and the United Nations Fund for Population Activities are shown.
- The portion of the Regular Budget of the World Health Organization allocated to the Region of the Americas.
   The amounts for 1973 and 1974 represent funds already appropriated by the World Health Assembly.
- 4. Funds of the United Nations administered by WHO for projects in the Region of the Americas. The amounts for 1974 and 1975 represent the program levels as anticipated for this biennium, including contingency allocations approved and anticipated. In addition, other funds available to the Americas through WHO are shown, as well as funds from the United Nations Fund for Population Activities.

The PAHO Regular Program and Budget for 1974 was presented as a provisional draft to the XXI Meeting of the Directing Council. Thereafter, it was again reviewed and revised in consultation with each Government. Consequently, the program presented reflects the latest known desires of the governments. Projects desired by governments which could not be fitted within the budget are shown in Annex 4.

The Program and Budget is submitted to the Executive Committee for examination and such recommendations thereon as it deems appropriate, and to the Directing Council for consideration and decision. The specific items on which action should be taken are the following: (1) review of the PAHO Regular Budget for 1974, and action on the proposed appropriation and assessment resolution; and (2) review of the Program and Budget for 1975 with a view to: (a) making observations and comments on its overall content and balance; (b) making recommendations to the Director-General on the proposed WHO Regional Program and Budget; (c) commenting on the provisional draft of the PAHO Regular Program and Budget to guide the Director in the preparation of his proposed program and budget to be resubmitted in 1974 for appropriation action; and (d) endorsing regional projects to be implemented in 1974-75 with funds of the United Nations Development Programme.

THE DIRECTING COUNCIL,

Total

#### RESOLVES:

1. To appropriate for the financial year 1974 an amount of \$24,852,035 as follows:

PART I ORGANIZATIONAL MEETINGS	\$ 387,705
PART II HEADQUARTERS	4,814,736
PART III FIELD AND OTHER PROGRAMS	13,748,785
PART IV SPECIAL FUND FOR HEALTH PROMOTION	250,000
PART V INCREASE TO ASSETS	450,000
Subtotal - Parts I-V	\$ 19,651,226
PART VI FOOT-AND-MOUTH DISEASE	1,871,084
Effective Working Budget (Parts I-VI)	\$ 21,522,310
PART VII STAFF ASSESSMENT (Transfer to Tax Equalization Fund)	3,329,725
Total - All Parts	\$ 24,852,035
2. That the appropriation shall be financed from:	
a. Assessments in respect to:	
Member Governments and Participating Governments assessed under the scale adopted by the Council of the Organization of American States in accordance with Article 60 of the Pan American Sanitary	
Code or in accordance with the Directing Council resolutions	\$ 24,602,035
b. Miscellaneous Income	250,000

In establishing the contributions of Member Governments and Participating Governments, their assessments shall be reduced further by the amount standing to their credit in the Tax Equalization Fund, except that credits of those governments who levy taxes on the emoluments received from the Pan American Health Organization by their nationals and residents shall be reduced by the amounts of such tax reimbursements by PAHO.

\$ 24,852,035

- 3. That, in accordance with the Financial Regulations of PAHO, amounts not exceeding the appropriations noted under Paragraph 1 shall be available for the payment of obligations incurred during the period 1 January to 31 December 1974, inclusive. Notwithstanding the provision of this paragraph, obligations during the financial year 1974 shall be limited to the effective working budget, i.e., Parts I-VI.
- 4. That the Director shall be authorized to transfer credits between parts of the effective working budget, provided that such transfers of credits between parts as are made do not exceed 10% of the part from which the credit is transferred. Transfers of credits between parts of the budget in excess of 10% of the part from which the credit is transferred may be made with the concurrence of the Executive Committee. All transfers of budget credits shall be reported to the Directing Council and/or the Conference.

(6)

# ASSESSMENTS OF THE MEMBER GOVERNMENTS AND PARTICIPATING GOVERNMENTS OF THE PAN AMERICAN HEALTH ORGANIZATION

Whereas, Member Governments appearing in the scale adopted by the Council of the Organization of American States are assessed according to the percentages shown in that scale, in compliance with Article 60 of the Pan American Sanitary Code; and

Whereas, other Member Covernments and Participating Governments are assessed on the basis of percentages which would be assigned to such countries if they were subject to the OAS scale; now, therefore,

THE DIRECTING COUNCIL.

#### RESOLVES:

(4)

To establish the assessments of the Member Governments and Participating Governments of the Pan American Health Organization for 1974 in accordance with the scale of quotas shown below and in the corresponding amounts.

<sup>(2)</sup> This column includes the OAS percentages adding to 100% and the equivalent percentages applicable to other Member Governments and Participating Governments. The OAS scale minimum assessment is 0.32% or per capita contribution equal to that of the largest contributor, whichever is smaller.

<sup>(5)</sup> This column includes estimated amounts to be received by the respective Member Governments in 1974 in respect of taxes levied by them on staff members' emoluments received from PAHO, adjusted for any difference between estimate

#### PROGRAM ANALYSIS

In the recent past, a continuum of highly significant events in public policy toward health in the Americas has been occurring. The Act of Bogotá recognized the fundamental importance of health to economic and social progress; the Charter of Punta del Este described it in more detail and made recommendations on broad goals for health programs; and in the spring of 1963 the Task Force on Health, established by the Charter, analyzed the problems, resources, priorities, and action programs necessary to meet these goals, and, in addition, recommended the development of a special program for rural welfare, which was strongly endorsed by the XIV Meeting of the Directing Council. In 1967, the Chiefs of State reemphasized the role of health in social and economic development and called upon the Pan American Health Organization to cooperate with governments in the preparation of specific programs. Accordingly, special meetings of Ministers of Health of the Americas were convened in Buenos Aires in 1968 and in Santiago in 1972. At the last meeting, goals for the Americas were updated to cover the period 1971-80.

Within the context of these recent events, and through delineation of problems and programs by technicians, and bearing in mind the long-range program previously established, the program and budget for PAHO has been developed. It is designed to meet the needs and requirements of Member Governments as these governments now recognize them, since the basic objective of the Pan American Health Organization is cooperation with Member Governments in attaining the objectives which they have established. For this reason, the program and budget should be considered as being in a continuous state of development for, as governments develop their plans for health services and establish standards and objectives, there will be a corresponding reflection in the program and budget of PAHO.

Table 1 represents the sources of funds which comprise the budget. Only the funds administered by PAHO/WHO are included. The program is closely planned with those of other international organizations, governmental agencies active in technical assistance and research, and private foundations interested in health. Most of the funds of these organizations are administered by them and not reflected in this document.

It will be noted that the total PAHO budget decreases by 0.2% in 1974, due primarily to decreases in the Community Water Supply Fund, grants, and other contributions to PAHO and WHO, and the Pan American Health and Education Foundation. The total budget of PAHO increases by 3.5% in 1975. The total figures in dollars would be \$44,985,718 for 1974 and \$46,575,252 for 1975.

For PAHO Regular Funds, the increase of 9.9% in 1974 and 9.9% in 1975 is intended to meet increased costs due to inflation, and devaluation of the dollar, and to permit a small annual expansion in programs.

The percentage change varies considerably among PAHO Other Funds. The decrease in the Community Water Supply Fund reflects only those voluntary contributions made by governments in relation to specific program services requested by them, since voluntary contributions are not received on a regular basis. Projects financed from grants are rarely planned two years in advance and often have not reached a stage one year ahead to warrant their inclusion in the budget.

The WHO Regular Budget shows a projected increase of 8.2% in 1974 and 8.1% in 1975. The funds shown for the United Nations Development Programme reflect estimates of expected requests for 1974-75.

Seven major program classifications have been established, with further subdivisions into subgroups and specific programs in order to facilitate program analysis. The first four of the major program classifications, Protection of Health, Promotion of Health, Development of Educational Institutions, and Program Services, provide direct assistance to programs. They represent 88.8% of the total in 1973; 88.0% in 1974; and 86.8% in 1975. The remaining three major program classifications, Administrative Direction, Governing Bodies, and Increase to Assets, could logically be attributed to each program. However, they have been kept apart since a separate analysis and review is generally made of them.

An attempt has been to classify proposed investments according to their major purposes. Additionally, the distribution of costs has been made without regard to the organizational structure of the Bureau, with the exception of costs common to all programs, such as those related to the Governing Bodies, which have been kept together for easier examination. It is necessary to bear this limitation in mind in the examination of the proposed program and budget, as well as the fact that the categories are complementary rather than mutually exclusive. A full appreciation of any category requires an examination of all related portions of the budget. A further limitation must be explained in relation to Table 4, where posts are shown according to one program classification only. Each post is shown under the subject which reflects the basic assignment of the staff member.

Table 3 presents a classification according to the types of activities PAHO expects to carry out. Advisory Services refers to all activities devoted to cooperation with governments in planning and executing health programs, including demonstration supplies and equipment. This applies not only to direct health programs but also to educational institutions. For example, the funds for consultants advising educational institutions, together with teaching supplies and equipment, are shown under Advisory Services, since this is the activity being carried out. Thus, the planned use of the funds is for 62.6%, 61.4%, and 60.0%, respectively, in the three years 1973-75, to be available for technical assistance in the planning and execution of programs, including the expertise provided as well as the supplies and equipment made available to assist national programs.

Development of human resources essentially comprises fellowships and seminar related activities. Although consultants providing advisory services often devote a substantial portion of their effort to in-service training, this time is not shown separately; rather the entire time is shown under advisory services. It will be realized, therefore, that the total training effort is greater than reflected in these tables. Following this definition, the development of human resources through fellowships and participation in seminars and other technical meetings will require 15.3% of the budget in 1973, 15.3% in 1974, and 15.6% in 1975.

The third heading on the horizontal axis is Research, which includes the research activities carried out by PAHO. These activities will account for 8.0% in 1973, 8.1% in 1974, and 7.8% in 1975. The remaining heading is Indirect Program Costs, which includes those costs not directly attributable to specific activities in the first three classifications. These indirect program costs will be 14.1% in 1973, 15.2% in 1974, and 16.6% in 1975.

With regard to the means required to perform these activities, as shown in Table 4, it will be noted that the number of full-time positions varies from 1,692 in 1973, 1,736 in 1974, to 1,721 in 1975. Short-term consultants vary from 1,703 months in 1973 to 1,579 months in 1975. Additionally, the development of professional personnel is expected to increase from 1,320 fellowships in 1973 to 1,487 in 1975.

Following the tables, there is presented a narrative for each subject explaining the program in the Americas. This includes a summary of the problem and its magnitude, the policy and method or approach followed by PAHO, and the activities being carried out and planned for future years. Following each narrative appears a summary of the cost and the number of posts, consultants, and fellowships.

Details of Headquarters, Zone Offices, and projects are described in the narrative explanations and the detailed schedules.

#### I. PROTECTION OF HEALTH

#### A. COMMUNICABLE DISEASES

#### 0100 - GENERAL

The mortality rate for infectious diseases in Latin America decreased by 48% between the years 1956-66 in the group under five years of age. The diseases of the gastrointestinal tract - mostly due to gastroenteritis - dropped by 44% and the diseases of the respiratory tract for the same period of time and mainly due to pneumonia and influenza, by 26%. In spite of the significant reduction observed, infectious diseases are still an important public health problem.

In 13 countries the percentage of deaths from infectious and parasitic diseases in relation to the total deaths from well-defined causes is more than 30, and in another two countries this percentage is between 20 and 29. The diseases susceptible to prevention through the use of vaccines represent more than 8% of the mortality from all well-defined causes in eight countries, and in six more it is between 4 and 7%.

These statistics indicate the seriousness of communicable diseases as public health problems and give rise to the goal of control of communicable diseases as one of the principal objectives of PAHO. Priority activities are (1) eradication of the diseases for which practical measures of elimination exist and for which the Governing Bodies have adopted resolutions on eradication (malaria, smallpox, yaws) and the eradication of Aedes aegypti, vector of urban yellow fever and dengue; (2) control of diseases susceptible to prevention through vaccines; (3) programs which are both technically and economically feasible for combating such diseases as tuberculosis, leprosy, and venereal diseases; (4) control of diseases posing serious problems in certain areas of the Americas, such as plague, epidemic typhus, Chagas' disease, filariasis, schistosomiasis, hydatidosis, onchocerciasis, cutaneous leishmaniasis, and other parasitic diseases; (5) research and epidemiological surveillance of diseases produced by viruses and rickettsias; (6) development or improvement of health infrastructures and complementary services which support research, control, or eradication of communicable diseases; and (7) development or improvement of an epidemiological surveillance system as a standard component of programs for control of eradication.

The Ministers of Health of the countries of the Region of the Americas, in their special meeting held in Chile in 1972, established goals to be reached in the decade of the seventies. For those diseases preventable by vaccination, the goals are to reduce the mortality rate for measles, whooping cough, and tetanus to 1.0, 1.0, and 0.5 per 100,000 inhabitants, respectively, and to reduce the morbidity for diphtheria and poliomyelitis to 1.0 and 0.1 per 100,000 inhabitants, respectively, at the same time maintaining the smallpox morbidity rate at zero level. These goals will be pursued by the countries of the Region in the coming years.

0200 - MALARIA

The Ministers of Health of the Americas, in their meeting in Santiago, Chile, in October 1972, set a goal for malaria eradication in the Hemisphere. It was concluded that, with sufficient resources, it will be possible to eradicate malaria by the end of the decade in areas with 168.2 million inhabitants (90.7% of the population of the originally malarious area). Final solution of the problem in the remaining areas (9.3% of the population) depends upon the application of more efficient methods against the vector and the parasite, or the protection of susceptible persons, using a flexible strategy adapted to epidemiological conditions in each area.

As of 31 December 1972, malaria eradication had been achieved in areas with 86.1 million inhabitants (45.3% of those living in the originally malarious areas); 42.0 million (22.1%) were in areas in consolidation phase; and 61.8 million (32.6%) were in attack phase. In terms of political units, 12 have eradicated the disease and in three (Argentina, the Canal Zone, and Guyana), consolidation phase has been reached in their entire territory. The remaining 19 units are applying attack measures in the areas where malaria transmission still exists, although the majority of these units have parts of their territories in maintenance or consolidation phases. In five political units (British Honduras, Costa Rica, the Dominican Republic, Panama, and Paraguay) steady progress has been made towards malaria eradication in the last two years, and the prospect is good for achieving malaria eradication within a determined period.

In five programs (Bolívia, Ecuador, Mexico, Surinam, and Venezuela), malaria incidence was reduced and notable progress observed in 1972. In another five programs (Brazil, Colombia, French Guiana, Haiti, and Peru), the situation of malaria remained about the same as in 1971. Finally, in the four countries in Central America (El Salvador, Guatemala, Honduras, and Nicaragua), where serious technical problems had interfered with normal progress, considerable improvement was observed in 1972 through the use of propoxur in areas where the vector is resistant to DDT. Further progress is expected to be achieved by continuing the application of propoxur.

PAHO research on malaria continues to be directed towards finding solutions for the problems that hamper the progress of eradication programs. Investigation of vector response to propoxur continues; in addition, studies of alternate attack measures and new insecticides which could be applied economically and effectively, such as landrin (OMS-597), will be carried out in 1973. A research project continued in El Salvador, in coordination with the Government, aimed at finding effective and economic means to interrupt malaria transmission in areas where the vector is resistant to DDT. Serological studies, experiments in chemotheraphy, and studies on the resistance of malaria parasites to chloroquine continued in Brazil in 1972; in 1973 such studies will be extended to Colombia, Costa Rica, and other countries.

PAHO continued to collaborate with the International Training Course on Malariology and Environmental Sanitation in Venezuela through the provision of fellowships for malaria eradication professional personnel. It also continued to supply antimalaria drugs for presumptive and radical-cure treatments, essential materials, and equipment for the countries to undertake research activities and field experiments and, within the availability of funds, certain laboratory supplies.

Technical assistance by PAHO was continued through medical officers, engineers, entomologists, advisers in administrative methods, parasitologists, laboratory advisers, and technical officers. In two countries, PAHO medical officers were assigned as co-directors of the National Malaria Eradication Services, sharing executive responsibilities of the respective programs. Grants were provided to a university to continue investigations in the development of an active immunization technique; PAHO will continue the grant in 1973.

0300 - SMALLPOX

The smallpox eradication campaign was begun in the Americas in 1967 when the disease was prevalent in five countries, During the 1967-71 period a total of 18,136 cases were reported, 99.7% of which were from Brazil. Since April 1971 no new cases have been reported, in spite of an intensive search made by special teams in areas where the last cases were found in 1970-71, and in regions considered to be of high risk because of poor maintenance of the vaccination programs. This investigation was particularly exhaustive in Brazil during the three-month period when the peak of smallpox cases used to occur. As a result of the policy adopted by the United States of America by which smallpox vaccination was discontinued, most countries are not pressing hard enough for good coverage in the maintenance programs.

In 1972, smallpox vaccinations carried out in the countries having agreements with PAHO were Argentina, 950,000; Bolivia, 211,313; Brazil, 14,077,397; Chile, 675,616; Colombia, 986,553; Costa Rica, 30,797; Cuba, 17,964; Ecuador, 353,209; Guatemala, 140,822; Panama, 29,410; Paraguay, 272,046; Peru, 1,134,824; Uruguay, 166,171; and Venezuela, 939,944. In Brazil, 92% of the estimated population was vaccinated between 1968 and 1972. Seven of the countries produce lyophilized smallpox vaccine of excellent quality. Annual production was 59 million doses in 1966, 135.7 million in 1970, 69 million in 1971, and 57.4 million in 1972. Since the attack phase is over, the production of vaccine has been decreased. In 1972 about five million doses of smallpox vaccine were donated from this Region to the WHO supply.

To assure the detection and control of any suspicious case, PAHO is promoting the enforcement of epidemiological surveillance activities. Special epidemiological surveillance courses for public health officers were conducted in the United States of America (Center for Disease Control of the Public Health Service) and Venezuela, sponsored by PAHO and the Governments of both countries. PAHO also cooperated with the governments through advisory and reference services on the quality of the vaccine.

#### 0400 - TUBERCULOSIS

Tuberculosis continues as a major public health problem in the Region. In 1971, there were 39,160 new cases of the disease in the United States of America and Canada and about 155,000 in Latin America and the Caribbean area. Even though not all cases were confirmed bacteriologically, the numbers demonstrate the importance of this disease from an operational point of view, giving as they do an indication of the numbers of new cases needing medical attention and treatment.

Transmission of the tuberculosis bacilli is the principal factor determining the present and future epidemiological problem. From among the various methods that can be elected to diminish the incidence of tuberculosis, vaccination with BCG has priority as the most efficient in relation to resources invested. From the point of view of social benefit, bacteriological examination of patients with respiratory symptoms and the chemotherapeutical treatment of ambulatory cases discovered would be the methods of choice. The general policy of the program, because of coverage and cost, must be based on the integration of control programs with the general health services.

The objectives of the tuberculosis control program for the present decade, approved by the III Special Meeting of Ministers of Health of the Americas, are vaccination with BCG of 80% of the population under 15 years of age; bacilloscopic examination of 60 to 75% of persons with respiratory symptoms; and treatment of all cases discovered, principally utilizing techniques and activities of ambulatory medical care services. These objectives were reaffirmed by the II Regional Seminar on Tuberculosis in November 1972.

#### 0500 - LEPROSY

There are about 10,000 new cases of leprosy reported annually from 29 countries and territories of the Americas. In order to more effectively control this disease, it is proposed to increase the promotion of control programs to include 14 countries and to provide technical assistance to design, implement, or evaluate leprosy control programs and epidemiological surveillance in six countries. To increase the accuracy of clinical diagnosis and classification of the disease, the Third International Seminar on the Histopathology of Leprosy for pathologists will be held. This should provide better data for epidemiological studies and the determination of disease patterns and trends.

The Advisory Committee on Leprosy, meeting in July 1971, observed that "the leprosy problem of the Americas is not yet fully and precisely defined," that "it is becoming obvious that our past approaches to (1) data collection and analysis and (2) leprosy control are not functioning uniformly well, and that, therefore, there is a real need for developing and evaluating new methodologies." The Committee recommended that "a coordinated Hemisphere-wide effort in leprosy control, training, and research through the development of a PAHO International Center for Training and Research in Leprosy and Related Diseases be established." It is proposed to establish at least two collaborating centers for field studies in leprosy control and rehabilitation.

New discoveries in immunology, treatment, and the use of the armadillo as an animal model to study leprosy, while promising an improvement in diagnosis, treatment, and control of the disease, nonetheless indicate the need to assure the implementation of the most effective control measures, properly administered, if control is to be realized. To be effective, control programs must make greater and greater use of ambulatory (domiciliary) services for leprosy patients. At present too many countries continue to expend large sums of money for unnecessary institutional care which detracts from, rather than contributes to, effective control. Reallocation of these funds will be necessary in order to plan and implement effective control programs and reduce incidence.

# 0600 - VENEREAL DISEASES

Venereal diseases continue to be the most frequently and increasingly reported infectious disease in the Americas, with a few exceptions. Where reporting is reliable, gonorrhea in particular has continued to rise precipitously.

Before the incidence of these diseases can be reduced, it will be necessary to stop the continued rise in new infections. Programs in the countries of this Hemisphere vary from very good to the bare provision of clinical services at the convenience of the provider. It is proposed, therefore, to promote the planning for or the implementation of programs for venereal disease control in 12 countries and to assist the governments in four countries to design, implement, or evaluate venereal disease programs and epidemiological surveillance. The training of personnel and the promotion of epidemiological and administrative research are to be included.

The IV International Course on the Epidemiology and Control of the Venereal Diseases is to be held in Chile in 1973. Fellowships are provided by PAHO for venereal disease control personnel from the countries, who then return to put on a similar course for other national venereal disease control personnel.

0700 - ZOONOSES

Those diseases which are transmitted from animals to man, the zoonoses, are found in every country of the Americas. The zoonoses representing hazards of the greatest significance to human and animal health are rabies, brucellosis, bovine tuberculosis, hydatidosis, and the arbovirus zoonoses. Control of these diseases is an integral part of livestock development. They cause direct losses to human health and to animal populations, and indicate losses of essential animal protein for adults and children already suffering from protein deficiency in most of the countries.

The ministries of agriculture and health of the Americas are developing joint programs to bring about control of these diseases. External financing from international lending agencies has provided the capital for achieving the reality of national control programs. Veterinary public health and animal health units responsible for zoonoses control are administering these programs. The Pan American Zoonoses Center has expanded its program of technical assistance, research, and training on a regional basis, in order to meet the increasing requests from the ministries and governments operating control programs. The Center serves as the biological and reference center for zoonoses investigations in the Americas.

### 0800 - FOOT-AND-MOUTH DISEASE

Foot-and-mouth disease is the most important infectious animal disease in the countries of South America and is the most serious threat to animal health in the countries of the Hemisphere that are free of the disease. This threat results principally from its highly contagious nature and the rapidity with which it spreads among livestock, and the severe economic losses of animals, animal products, and animal protein, with the additional handicaps of being prohibited from participating in the world market. The governments of the affected countries, in recognizing its significance on the import and export of livestock, have developed national programs to combat the disease and have joined together in a multinational effort with the objective to be free of the disease. External financing from international lending agencies has provided the means to achieve the reality of these programs and to place hope of eradication in the philosophy of these governments.

The Pan American Foot-and-Mouth Disease Center in Brazil is collaborating with these countries by providing technical assistance, training, and research. It also provides technical assistance to the countries free of the disease in their programs to prevent re-entry. The activities of the Center are coordinated with the programs of activities to control FMD in the various countries. The Center collaborates with these countries by providing assistance which is based upon the status of the disease in each country, the progress of the national campaign, and the capacity of the country to achieve its objectives.

0900 - OTHER COMMUNICABLE DISEASES

Some vector-borne diseases with intermediate hosts require special attention in the Americas. Plague in particular is enzootic in Argentina, Bolivia, Brazil, Ecuador, Peru, the United States of America, and Venezuela and represents a constant threat in the seaports of these countries. From 1963 to 1972, 4,698 cases of human plague were reported; 298 of these occurred in 1972.

Epidemics of Junin hemorrhagic fever have been recurrent in Argentina since 1943, with epidemics reaching a peak morbidity of 60 per 100,000 and a case fatality of 6%. In Bolivia, Machupo virus, having a rodent reservoir, has been the source of several outbreaks, totalling 1,434 cases with high fatality rates, between 1959 and 1972.

Among the arboviruses, dengue fever and Venezuelan equine encephalitis (VEE) present the most serious problems. The frequency of dengue outbreaks in the Caribbean area has been steadily increasing in the past ten years, and the latest epidemic in Colombia affected at least 416,000 people. Besides Colombia, three countries and eight territories in the Caribbean reported 86,948 cases of dengue between 1963 and 1972. VEE, primarily a disease fatal to horses, has steadily moved northward, from Ecuador to the United States of America, since 1969. Over 16,800 human cases and 17,500 equine deaths were reported in Mexico in 1971 and at least 2,845 human cases in 1972. In Venezuela, 29,102 cases of VEE in human beings have been reported since 1962. The cost of controlling the disease after it moved into the United States of America was estimated at \$10-15 million.

Louse-borne typhus remains an important endemic disease in the highlands of Bolivia, Ecuador, and Peru. Over the period 1962-72, nine countries reported 3,551 cases.

With the objective of acquiring more knowledge to permit more effective control of these diseases, PAHO collaborates with the governments in the investigation of the ecological factors which lead to the creation of enzootic foci and epizootic spread of the diseases and their persistence. PAHO provides fellowships and consultant services to stimulate, orient, and coordinate research and investigation and collaborates with the countries in the improvement of the surveillance services and control of these diseases.

#### 1000 - PARASITIC DISEASES

Of the parasitic diseases in the Americas, Chagas' disease and schistosomiasis are the most important. About 10,000,000 persons have the former and about 7,000,000 the latter. The social and economic losses caused by these two diseases are very great. In Brazil alone, a conservative estimate indicates that the annual economic loss due to schistosomiasis is many millions of dollars. In the case of Chagas' disease, many persons die each year in the acute phase of the disease, and, by conservative estimate, at least 1,000,000 persons have chronic cardiopathy due to the infection.

Onchocerciasis affects thousands of persons in Guatemala, Mexico, and Venezuela. Cutaneous leishmaniasis causes severe disfigurement and disability among rural populations in many areas. The other parasitic infections, including amebiasis, cysticercosis, ancylostomiasis, and fascioliasis, also take their toll of lives, reduce vitality, and interfere with economic development.

Only six out of ten countries with a high prevalence of Chagas' disease (Argentina, Brazil, Chile, Peru, Uruguay, and Venezuela) have either control programs under way or plans to start these activities. The other four (Bolivia, Guatemala, Mexico, and Paraguay) have no plans or activities. None of seven countries with a low prevalence of Chagas' disease are providing any control activities. Concerning schistosomiasis, in spite of the fact that control is feasible using available measures, only Puerto Rico and Venezuela have adequate activities. Another four countries carry on poor control activities, and three countries and territories have no control project at all.

The program seeks to assist governments in the development and improvement of national control and evaluation programs and to stimulate research and training activities. The program aims to incorporate parasitic disease control into regional economic development programs, such as agriculture and river basins and dams, to avoid the risk of increasing the problems, particularly of schistosomiasis, Chagas' disease, and leishmaniasis, as a result of ecological changes produced by such conditions. Standard serum for diagnosis of Chagas' disease is at the disposal of the countries, as a result of the recommendation made by an expert group on Chagas' disease which met in Costa Rica.

# B. ENVIRONMENTAL SCIENCES

#### 2100 - GENERAL

In the countries in the Americas not only is the population increasing at a rate without precedent, but so are the exploitation of resources and technological development. Even though half the population of Latin America still lives in rural conditions, some of the largest urban complexes in the world may be developing on the Continent. The magnitude of this growth of the principal cities, both in density of population and in industrial development, poses problems in environmental degradation and in alteration of ecological equilibrium similar to those experienced by highly industrialized countries. The ecological problems can become critical, up to the point of affecting the survival of man.

In 1961 the Governments of Latin America and the Caribbean area agreed to provide water and sewerage services to 70% of the urban and 50% of the rural population by 1971. During the III Meeting of Ministers of Health in 1972, these goals were reviewed and concrete measures added in respect to collection and disposal of solid wastes, environmental pollution, occupational health and hygiene, and health aspects of regional development. The results achieved in the urban and rural water supply programs during the decade 1961-71 have in turn stimulated the strengthening of national infrastructures in their efforts to improve the quality of water, air, soil, and food and to prevent dangers occasioned by products and byproducts derived from modern technology.

PAHO cooperates with Member Governments in planning, carrying out, and evaluating programs destined to reverse and prevent deficient environmental and ecological conditions. Programs are carried out within parameters and points of reference that can serve to define alternative courses of action, as well as to provide bases for cost estimates. Engineers are assigned to various projects to work in this area, as are the specialists assigned to the Pan American Sanitary Engineering Center in Peru.

This Center began operations in 1969 and in essence provides consultant services, produces and disseminates technical information, supports training of high level personnel, and promotes and assists applied research in problems that affect the urban and rural environment.

#### 2200 - WATER SUPPLIES

It was estimated in 1972 that about 56% of the total population of Latin America and the Caribbean area were served by water supply systems, but only 24% of the same population had adequate sewerage services. The rural and urban population served with water supply systems by either house connections or public hydrants was 79% and 27%, respectively. The great effort on the part of the countries to reach these figures of service has meant, during the period 1961-72, an investment of over \$3 billion in construction of new works or expansion and remodeling of existing systems. About one-third of this amount was provided by international or bilateral lending agencies, while two-thirds was funded by the countries themselves.

The III Special Meeting of Ministers of Health established the following goals for the decade of the 1970's: (1) to provide water through house commections to 80% of the urban population or, as a minimum, to supply half the population now without services; (2) to provide water supplies to 50% of the rural population or, as a minimum, to supply 30% of the population now without service; (3) to install sewerage systems to serve 70% of the urban population or, as a minimum, to reduce by 30% the proportion of the population now without such service; (4) to install sewerage systems or other means of sanitary disposal of excreta for 50% of the rural population or, as a minimum, to reduce by 30% the proportion of the population now without such services. It is estimated that to meet these goals the countries must invest \$10 billion in the next 10 years to serve an additional population of 130 million with water and of 100 million with sewerage service. To do this, it will be necessary to train some 10,000 technicians at the intermediate level and 20,000 administrators and managers of water and sewerage services.

PAHO will continue to cooperate in the planning, design, construction, operation, and maintenance of water and sewerage systems; in the planning, execution, and evaluation of national programs in rural and urban areas; in the improvement of agencies responsible for these programs; in training personnel; in applied research in cost reduction and simplification of systems; and in negotiations with international agencies for financing the projects.

#### 2300 - AEDES AEGYPTI ERADICATION

In the Americas in 1972 there were 53 cases of jungle yellow fever reported in six countries, 22 of them in an epidemic outbreak that affected the southwestern region of Venezuela. The total number of cases of the disease reported in the last 20 years years (1953-72) in the Region was 1,509, all sylvatic except for four urban cases in Trinidad in 1954.

Dengue in the last 12 years has been the cause of epidemics in the countries of northern South America and the Caribbean, more than 600,000 cases being registered. Identification of dengue virus type I and type II in the Americas in recent years has increased the concern over the possibility of a sudden epidemic in the hemorrhagic form with the shock syndrome.

At the end of 1972 the area free of Aedes aegypti in the Americas encompassed 8.6 million km² (73% of the area initially infested). i.e., Argentina, Bermuda, Bolivia, British Honduras, Canal Zone of Panama, Cayman Islands, Chile, Ecuador, Nicaragua, Paraguay, Peru, and Uruguay. Brazil has eliminated the reinfestation from its Northern Region. Guatemala and Panama, even though considered free of the vector, each has a focus of reinfestation. Mexico has an extensive area free of the vector, but a part of its territory is reinfested. The area in the Americas still infested with Aedes aegypti is 3.2 million km² (27% of the area initially infested), which includes 31 countries and territories in the Caribbean, part of northern South America, the United States of America, and regions of Mexico and Central America.

At the beginning of 1973, the following countries and territories had active eradication programs: Anguilla, Antigua, Barbados, Brazil, Colombia, Costa Rica, Cuba, Dominica, French Guiana, Grenada, Guatemala, Guadaloupe, Martinique, Mexico, Montserrat, Netherlands Antilles, Panama, St. Lucia, St. Vincent, and Trinidad. Limited campaigns are under way in the Bahamas, El Salvador, Guyana, Jamaica, Surinam, and Venezuela. Campaigns are being planned in the British Virgin Islands, St. Kitts, and Nevis. Honduras began the reorganization of its campaign with a budget approved for 1973. Infested countries without activities are the Dominican Republic, Haiti, Puerto Rico, Turks and Caicos Islands, the United States of America, and the U. S. Virgin Islands.

#### 2400 - HOUSING

Housing, as a part of the human environment, influences both the health and the welfare of human beings. Thus, the problem of housing must be related not only to its material aspects but also to its sociocultural aspects, since there is a necessity for adequate space to avoid the effects of overcrowding, with basic sanitary services, in a community and a neighborhood that permits a compatible social life. The problem is aggravated by urban sprawl and migrations from rural areas to the cities.

Latin America, with its annual population growth of 3% and its deficit of 25 million houses, must find new solutions to its housing problems. The basic difficulty is the low income of the population for acquiring housing, even at low cost. At the same time, many of the governments are not in position to finance the large-scale programs needed, thereby allowing little hope that focusing on traditional construction would give the desired results. The present need is to find a means of helping the low income groups construct housing, with minimum elements and services, at about 5% to 10% of conventional prices.

The improvement of housing conditions can only be achieved on a significant scale if present patterns of construction are changed to patterns of mutual or self-help through new efforts integrated with present socioeconomic developments, new materials, or actions that commit the population to the process of development. In Latin America, where the population is primarily agricultural, the economic stabilization of the rural area is an indispensable condition for urban-industrial development. Programs of low-cost housing, urbanization, colonization, and settlements in areas where agrarian reform programs are being carried out must take into account the general plan of development and the process of physical planning by regions.

In the last few years PAHO, through CEPIS, together with other interested international agencies, has collaborated with Member Governments in the physical planning for housing in urban and rural areas, principally with respect to health and welfare. The Center's efforts are directed towards (1) formulation of urban and regional planning projects; (2) establishing or improving institutions responsible for programs of housing and regional development; (3) adoption of interdisciplinary solutions to problems in housing and developmental programs; and (4) studies oriented toward eliminating or controlling certain vectors of disease.

# 2500 - AIR POLLUTION

Air pollution created by emissions of particles and gases from domestic and industrial activities and motor transport is on the rise throughout the world and has begun to seriously affect developing countries. High rates of population growth and rapid increase in size of cities in almost all the Region are aggravating the problem. Since 1965 PAHO has been coperating in programs for the control of air pollution. In June 1972 the United Nations Conference on the Human Environment recommended that a worldwide network be established to monitor the environment, including carbon dioxide, sulfur dioxide, oxidants, nitrogen oxides, heat, and particulates. The III Meeting of Ministers of Health of the Americas in 1972 set as a goal for the decade 1971-80 the formulation of programs for the control of atmospheric pollution in urban areas of more than 500,000 inhabitants and in other cities where industrialization or other considerations justify them. This is a formidable task, requiring tenacious efforts on the part of the countries.

Excluding Canada and the United States of America, there are some 45 urban areas that already have or will have over 500,000 population by 1980, including 15 with over a million population and four with over 5 million. There are at least 29 other cities with a growing rate of industrialization. The problem areas are distributed through 22 countries, and it will be necessary to develop an infrastructure adequate to handle the magnitude and seriousness of the air pollution problem. During the past decade, three cities have initiated programs and five or six more are in the advanced planning stage.

Following the mandate of the 1966 Directing Council, a network of 62 air sampling stations has been established to determine the magnitude of the air pollution problem, and 35 stations are being installed.

Through CEPIS and various country projects, PAHO cooperates in the evaluation of problems and in the formulation of programs of air pollution surveillance and control. It also provides short-term consultant services in specific cases and collaboration in training personnel and in preparation of legislation and regulations. These and related activities are to continue, having as the ultimate objective reaching the goals set by the Ministers' Meeting.

#### II. PROMOTION OF HEALTH

#### A. GENERAL SERVICES

#### 3100 - GENERAL PUBLIC HEALTH

The Ministers of Health of the Americas, at the III Special Meeting held in Santiago, Chile, in October 1972, drew up a Ten-year Health Plan for the Americas. Specific targets were established for the development and strengthening of the general health services of the countries of the Region by 1980. These targets were based on the main goals of extending the coverage, including minimum comprehensive services, to all the population living in accessible communities of less than 2,000 inhabitants and of providing basic and specialized services to the rest of the population through a regionalized health system. The actual population living in communities of less than 2,000 inhabitants was estimated to be 45% of the total population of Latin America and the Caribbean area, to become 40% by 1980. The estimation of the present coverage by at least minimum health services was considered to be approximately 63% of the total population of those same areas. The definition in each individual country of a health policy in the light of its economic and social development, clearly specifying the objectives and structural changes necessary to achieve them, was considered to be a basic requirement for achieving the goals.

To assure the achievement of the proposals under the Plan, the following objectives were thought to be essential: to establish and develop health systems through research and planning; to improve the operational capacity of the system; and to develop human, technological, physical, and financial resources, supported by adequate legislation, in line with the institutional development expected. The assistance to be given to Member Governments by the projects for health services throughout the period will be guided by and consistent with these restatements of objectives, and by the available means for expansion and strengthening of a system of general health services for each country, as the supporting infrastructure to carry on the specific health programs.

Such projects are already in operation in 25 countries and 14 territories and form the core of the advisory services to the governments. The long-range nature of the processes of building up an efficient system of health services in developing countries make these projects long-term in character, so their emphasis will vary from one problem to another and tifferent times. It is expected that during the decade two-thirds of the countries of the Region will have taken action through these projects toward the achievement of the goals of the Ten-year Health Plan.

3200 - NURSING

Lack of the quantity and quality of nursing care required constitutes a major problem for the delivery of health care and its extension to rural populations. The Ministers of Health, recognizing the seriousness of the situation, established goals which would contribute to the diminution of this deficiency. The goals to be attained by the end of the decade are (1) the establishment in 60% of the countries of the Region of a system of nursing in which the role of nursing personnel in the delivery of health care, as related to the achievement of health program objectives, is clearly defined, indicating the number and type of personnel, the educational programs for their preparation, and the administration, organization, and information required for adequate functioning; (2) the insurance of the provision of the minimal level of safe nursing care in at least 60% of hospitals of over 100 beds and in community health centers; (3) increasing the active work forces to 19 nursing personnel per 10,000 population (4.5 nurses and 14.5 nursing auxiliaries), which represents an increment in Latin America of 184% for nurses and 134% for total nursing personnel; and (4) the adjustment, improvement, and development of the subsystem of nursing education to provide the nursing manpower required.

The policy of PAHO is to assist the countries in the achievement of the goals, specifically through (1) definition and development of the system of nursing; (2) programming to provide the nursing care needs of the different services; (3) improvement of nursing care in general, as well as in the various clinical specialties, through definition and application of standards of care and the development of the administration and organization practices and structure required; and (4) development of the nursing manpower required through basic, postbasic, continuing education, and in-service training programs.

#### 3300 - LABORATORY

In the majority of the countries of Latin America and the Caribbean area, there is a great need to modernize the services of health laboratories, to increase their coverage, and to improve efficiency and productivity. It is estimated that only about 10% of the health services for ambulatory patients have some type of clinical laboratory, whereas this percentage rises to a range of 70 to 95 for hospital services. A lack of personnel of all types, as well as a lack of adequate physical facilities, equipment, and technical standards, is apparent.

PAHO cooperates with the Member Governments in programming and developing national laboratory systems, in training personnel, in strengthening both routine and reference diagnostic services, and in reinforcing laboratories for the control of water, food, biological products, and drugs. It also promotes operational and epidemiological research, as well as the training of professional, technical, and auxiliary personnel.

The principal objective of these activities for the present decade is the development of basic services by health laboratories in 24 countries in the Region.

#### 3400 - HEALTH EDUCATION

The Ten-year Health Plan for the Americas calls for the organization of health education as part of the process of active and informed participation of communities in all activities for the prevention and cure of disease.

Health education services are available in all except three of the countries in the Region. However, the operational levels of health education programs are limited, and these shortcomings interfere in the continuity and effectiveness of community education activities. There are also weaknesses in the planning of the educational component of health programs due to a shortage of human, financial, and material resources assigned to health education services. At present, three Latin American public health schools train an average of 65 specialists annually among them. Only six countries have systematically included instruction in health education in their general education curricula.

PAHO cooperates with the governments in the reorganization and consolidation of health education units in order to enable them to channel the educational process so that it contributes to increased participation of the community in health actions. This also includes the health education training of specialists and other personnel of health and related agencies.

#### 3500 - STATISTICS

The broad objective of the health statistics program is to have available essential data of good quality and coverage to plan, administer, and evaluate local, national, and international health programs. Analysis of health statistics systems reveals that in most countries coverage, completeness, quality, and utilization of data are deficient. This assessment applies to statistics on births and deaths, to morbidity data, and to information on health resources and services rendered. Personnel resources for these systems are inadequate, as are their training and remuneration. Advisory services, supervision, and evaluation are sporadic.

With advances in health systems and medical technology and the extension of medical care services to larger proportions of the population, more and more statistical information is required to plan and evaluate programs. Computer technology will make it possible to process and analyze data in greater depth than previously, but this should not take precedence over improvement of the quality and coverage. Research is needed on methods for improving statistical systems and data production, for developing indicators of health status and changes taking place, and for supplementing data available from routine statistical systems. Although improvement of statistical systems is the long-term endeavor, efforts must also be directed to more immediate ways to obtain and interpret data.

The goal in each country is to establish a health statistics system or to strengthen the existing system to assure the flow of information from local sources (civil registration offices, hospitals, health units) to regional and national units for processing, analysis, and distribution to users. Standard forms and manuals for guidance at all levels, effective supervision of activities of collection and transmission, and coordination of agencies with related responsibilities in order to integrate data from all sources, will contribute to improving the systems. Emphasis should be directed to the improvement of the quality, coverage, and completeness of the vital and health statistics.

Through 12 statistical consultants assigned to zone and country projects, advisory services are provided to the countries in establishing or improving health statistical systems. Six posts are available for medical records administrators who render advisory services on the organization of medical record departments in hospitals, as well as on the development of courses for personnel in this specialty. The Computer Science Section and the Computer Center in Argentina are the source of consultant services in this technical field — on the feasibility of acquiring computer resources, on systems analysis, and on computer programming.

The health statistics program of PAHO also has responsibility for regional activities in collecting and disseminating information at the international level. Jointly with WHO, weekly data on communicable diseases are collected and annual data on mortality, morbidity, and health resources and services are obtained and analyzed. The reports published by WHO include the World Health Statistics Report, the World Health Statistics Annual, and the Weekly Epidemiological Record. PAHO publishes the Weekly Epidemiological Report, the annual series Reported Cases of Notifiable Diseases in the Americas, and periodically Health Conditions in the Americas and Facts on Health Progress.

Activities on the <u>International Classification of Diseases</u> (ICD) are also part of the regional program in health statistics. Staff of the Department of Health Statistics, together with the Latin American Center for Classification of Diseases and the ministries of health of the Region, plan for the preparation of volumes in Spanish and Portuguese, including supplementary volumes for use in hospital indexing, surgery, and dentistry. Courses on the use of the <u>Classification</u> are given each year and training materials are developed.

Research is an indispensable part of the program in health statistics. Plans to establish health demography laboratories are currently being made. Data from the Inter-American Investigation of Mortality in Childhood, as well as from the related probability sample of households, will continue to be analyzed. The final report of the study was published in April 1973.

#### 3600 - ADMINISTRATIVE METHODS

During the past decade, the countries of the Americas have made progress in improving public administration. Nevertheless, the results do not meet the expectations, particularly in the health sector, where management problems continue to be the most important single factor affecting the returns on investments, despite major contributions toward streamlining present organizational structures and administrative machinery. PAHO continues to promote and assist governments and health sector institutions in updating administrative processes, streamlining infrastructure, and training the personnel required by the health services in order to achieve their goals.

The institutional development of health services constitutes the overall objective of this program. Attainment of this goal requires the definition of policies and programs, adequate infrastructure, modern administrative methods and procedures, determination of resources required, and development of a system of positive control. The services provided under this project are closely coordinated with those under the health planning programs.

### 3700 - HEALTH PLANNING

During the last decade the Governments of the Americas began to emphasize the processes of planning for health. The III Special Meeting of Ministers of Health analyzed the present situation in this area and fixed continental goals for the period 1971-80. It also recommended to the countries measures that would facilitate reaching these goals.

The health planning program has as its purposes (1) at the national level, to cooperate with institutions in the health sector in the development of their planning processes through consultant services, training of personnel, research, and information services; (2) at the regional level, to prepare the necessary documents, guides, and working models to facil-

itate the evaluation and readjustment of the Ten-year Health Plan; and (3) at PAHO level, to complete and improve the system of quadrennial projections as the basic instrument for planning the cooperation of PAHO with the Member Governments in order to obtain the best use of PAHO resources in meeting the requirements of the countries.

In the period 1973-75 it is planned to cooperate with all the countries of the Region in the incorporation of the goals of the continental health plan for the 1970's into national health policies, plus the formulation or readjustment of strategies for reaching these goals. Other objectives for this period are (1) to promote and cooperate in the development of national health planning processes; (2) to cooperate in the development and installation of a control-decision information system in four states of Brazil, Costa Rica, Ecuador and Colombia, and in others on request; (3) to train 600 health professionals in basic planning courses to be carried out at the national level in schools of public health and in special courses; (4) to train 250 professionals in seminars on national information systems and in seminars on administration planning and information; (5) to provide in-service training in programming within PAHO; (6) to design the model for determining the cost of the health sector and to apply it in five countries; (7) to develop and test in two geographic areas, models of investments in health and human resources directed toward definition of policies in these fields; (8) to cooperate in the development of methods for evaluating health planning processes and for studying the internal restrictions in the health sector; and (9) to provide information on planning to all countries of the Region.

### B. SPECIFIC PROGRAMS

# 4100 - MATERNAL AND CHILD HEALTH

Women in the fertile age group and children under 15 constitute nearly two-thirds of the population of most of the countries of the Region. The health status of these groups, in spite of notable improvements in the past decade, remains unsatisfactory. In Latin America, the rates of maternal mortality are five to seven times higher than in Northern America. Deaths in children under five constitute 41.1% of all registered deaths in Middle America and 34.7% of all deaths in South America, in comparison with 4.7% in Northern America.

Programs in nutrition, health education, control of communicable diseases, and environmental sanitation are contributing to improvements in the health status of mothers and children. However, greater emphasis is needed for the expansion of coverage and the enhancement of the quality of the specific preventive, curative, and rehabilitative actions required for the improvement of the health of these vulnerable population groups.

### 4200 - NUTRITION

There is a general consensus among the governments of Latin America and the Caribbean that malnutrition and some specific deficiency diseases are major obstacles to social and economic development. They are very often associated with inadequate physical growth and mental retardation in children, reduced economic productivity of labor workers, and high morbidity and mortality rates in children under five years of age. Available information supports the assertion that food supply is insufficient, food intake is neither adequate nor balanced, and biological utilization of food is impaired, mainly due to microbial and parasitic infections which interfere with normal utilization of food.

Health and nutrition surveys carried out during the last few years throughout the Region clearly indicate that there are serious nutrition problems in most of the countries. Protein-calorie malnutrition; nutritional anemias due to lack of iron, folic acid, and vitamin  $B_{12}$ ; endemic goiter and cretinism; and hypovitaminosis A constitute health problems of great magnitude and significance in the Region. Moreover, some countries or specific population groups within a country are facing a rapid increase in nutrition-related conditions such as cardiovascular diseases, diabetes, and obesity.

PAHO cooperates with the governments in developing broad national nutrition programs with the basic aim of reducing the prevalence of nutrition diseases and the achievement of an optimum nutrition status for the entire population, as stated in the Ten-year Health Plan for the Americas. For the attainment of this objective, the following goals have been set up for the decade by the III Special Meeting of Ministers of Health of the Americas: (1) to reduce the current prevalence of second degree protein-caloric malnutrition by 10 to 50% (30% regional average) and of third degree malnutrition by 75 to 95% (85% regional average) among children under five; (2) to reduce the current prevalence of nutritional anemias by 30% among pregnant women; (3) to reduce the prevalence of endemic goiter to below 10% and eliminate endemic cretinism; (4) to reduce the current prevalence of hypovitaminosis A by 10 to 50% (30% regional average) among vulnerable groups; and (5) to reduce the current rate of increase in prevalence of diseases associated with obesity, such as cardiovascular diseases and diabetes.

More specifically, PAHO is assisting the governments in carrying out the following activities to achieve these goals:
(1) formulation of biologically-oriented national food and nutrition policies and execution of coordinated intersectoral programs; (2) strengthening or creation of technical nutrition units in the health structures at central, intermediate, and local levels; (3) training of specialized personnel for nutrition services (medical nutritionists and nutritionist-dietitians); (4) appointment of full-time nutrition specialists at schools of medicine, nutrition and dietetics, nursing, and public health; (5) establishment of an adequate system for diagnosis and epidemiological surveillance of the nutritional situation; (6) incorporation of nutrition activities into general community health services, particularly maternal and child health programs; (7) coordination and achievement of effective supplementary feeding programs for the most vulnerable groups of the population; (8) development of nutrition education programs through mass media communication and organized community participation; (9) establishment of effective food enrichment and fortification programs; (10) development and production of conventional and new low-cost, highly nutritious foods, especially for weaning children; (11) improvement of administration and operation of hospital and institutional food services; and (12) strengthening of research in the fields of food and nutrition, with emphasis on simple techniques, procedures, and methods for the nutrition assessment of the population, growth and development of children, cost-benefit analyses of supplementary feeding and nutrition education programs, prevention of endemic goiter and hypovitaminosis A, and relationships of nutrition deficiencies and infectious diseases.

In order to carry out its program of technical cooperation with the governments, PAHO provides nutrition advisory services through a group of medical and non-medical nutritionists at the central, zone, and country offices in the Region. It also utilizes, as specialized technical resources, the Institute of Nutrition of Central America and Panama (INCAP) and the Caribbean Food and Nutrition Institute (CFNI), particularly for training and research activities.

FAO, WFP, UNICEF, and private foundations cooperate in these programs.

#### 4300 - MENTAL HEALTH

Resources available in the Region are poorly distributed and insufficient to confront the growing problems in mental health. Care of psychotic patients is inappropriate, incomplete, and restricted to hospitalization which is insufficient to meet the demand. There are 13 countries with fewer than 0.5 psychiatric hospital beds per 1,000 population.

Psychosis, disabling neurosis, suidice, alcoholism, mental retardation, and epilepsy are among the more important mental health problems, and services are inadequate. Scarcity of specialized personnel - psychiatrists, psychiatric nurses, and rehabilitation experts - makes the expansion of services difficult. This situation emphasizes the need to create specialized training centers and to offer postbasic instruction in mental health to physicians, nurses, and social workers. PAHO is currently cooperating in a program of continued education in psychiatry for general practitioners. Thirteen countries have a national office on mental health, and eight of these have formulated policies.

PAHO cooperates in activities leading toward the inclusion of mental health services in the general health plans; in the modernization of psychiatric hospitals and expansion of their services to the community; in the training of personnel; and in carrying out research, particularly in the area of the epidemiology of mental illness. It will also cooperate with the governments in meeting the demand for community mental health services, in combating alcoholism and dependence on drugs, and in creating psychiatric services for children, as well as in improving services for seriously disturbed patients.

4400 - DENTAL HEALTH

In 1955 a survey revealed a great shortage of public health dentists in Latin America, and none of the better known schools of public health offered any kind of specialized formal training for dentists. At the present time, four schools of public health provide training in dental public health. This program has cooperated in national surveys of dental diseases, human resources, dental education, and institutions providing dental sérvices in Argentina, Chile, Colombia, Ecuador, Montserrat, and Venezuela. Studies have been initiated in Colombia, Mexico, Peru, and Venezuela on the use of new dental materials which could, if successful, provide improved methods for treatment of large population groups; and investigations have been initiated in Colombia related to prevalence of dental caries in two communities.

Other activities developed with the support of PAHO include the establishment of an international laboratory for standardization, quality control, teaching, training, and research in the field of dental biomaterials in Venezuela; the establishment of a school for dental nurses in Jamaica; and technical assistance for the development of dental health programs in the Caribbean area and in Ecuador and Panama. Models of basic dental equipment have been developed. Through the water fluoridation program some 640 engineers have been trained, and in the past five years the population in Latin America benefitting from this measure has risen from 10 to 20 million. Studies have been conducted into alternatives to the use of fluorides, such as the fluoridation of salt.

The goals for the project recommended in the Ten-year Health Plan, drawn up at the III Special Meeting of Ministers of Health of the Americas, are to reduce dental morbidity and modify components of the morbidity index; increase dental care coverage in both urban and rural areas, giving priority care to children; achieve water fluoridation in cities of 50,000 or more population; promote and stimulate the training of intermediate-level personnel; and establish various models of dental practice ranging from individual practice to integrated teamwork.

#### 4500 - RADIATION AND ISOTOPES

This program deals with the health aspects of radiation and is composed of two principal parts: (1) assistance regarding the use of radiation in medicine, including the training of personnel and technical assistance in diagnostic radiology, radiation therapy, and nuclear medicine; and (2) assistance regarding protection against excessive or unnecessary exposure to radiation of workers and the public, including patients.

With regard to diagnostic radiology, little is actually known about utilization or cost-benefit relationships in the Region. However, it has been estimated that no fewer than 30,000 diagnostic x-ray units are in existence in Latin America and the Caribbean. Further estimates are that one-third to one-half of crucial medical decisions are dependent on x-ray diagnosis and that about two-thirds of all x-ray examinations in any radiodiagnostic department are of a basic nature. In the more developed countries the use of diagnostic x ray is expected to increase by about 1 to 4% per year in the decade 1971-80, which will accentuate the need for efficient use of personnel and equipment.

The practice of radiotherapy has spread considerably since its first use about 75 years ago, and a WHO expert committee has estimated that at least one-half of all cancer patients require this type of therapy during the course of their illness. From data available it has been estimated that there are approximately 500 radiotherapists, with varying degrees of qualification, and 1,000 therapy machines, about 100 of which are high-energy units, in Latin America and the Caribbean. However, the proper utilization of the costly investment which has already been made is questionable because of the lack of necessary supporting personnel. In the case of nuclear medicine, which is a relatively new field, most specialists have been trained concurrently with its development, and an estimated 700 specialists in Latin America and the Caribbean countries are working with radioisotopes or tagged molecules.

To date, the major effort in the radiation and health program has been expended in the radiation protection area. PAHO has entered into agreements with 10 countries (Argentina, Bolivia, Chile, Colombia, Costa Rica, Ecuador, Jamaica, Panama, Peru, and Venezuela) to assist with the development of radiation protection services. These projects usually consist of (1) technical assistance through PAHO staff and short-term consultants; (2) training through fellowships and short courses; and (3) supplies and equipment necessary for the detection and measurement of radiation. In addition, since 1962 PAHO has coordinated a program for the sampling of the environment for radioactive pollutants. Samples which are collected in various countries are sent to the U.S. Environmental Protection Agency Laboratory in Montgomery, Alabama, for analysis, with the results being reported directly to the countries and published monthly in "Radiation Data and Reports." Air samples are collected in 10 countries (Argentina, Bolivia, Chile, Colombia, Ecuador, Guyana, Jamaica, Peru, Trinidad and Tobago, and Venezuela), and milk samples are collected in five (Chile, Colombia, Ecuador, Jamaica, and Venezuela).

As the countries of the Region establish their goals for the decade, PAHO expects to be of service (1) to assist the various governments in studying and resolving the problem of the optimum use of radiation in medicine; (2) to assist in the training of needed professional and technical personnel; (3) to help improve the quality of existing services; (4) to help establish radiation protection services in countries where they do not exist; (5) to help establish environmental radioactivity sampling programs; (6) to help establish centers of excellence for training in radiotherapy, nuclear medicine, radiobiology, and radiation protection; and (7) to help achieve effective cooperation between the national and international institutions which have an interest in radiation and health.

#### 4600 - OCCUPATIONAL HEALTH

At the beginning of this decade the labor force in Latin America was about 94 million persons, and it is probable that by the end of the decade it will be 150 million. Industrial laborers, frequently due to lack of experience in their rural backgrounds, handle dangerous substances without any idea of the risks involved to themselves. Application of modern techniques, in efforts to short-circuit stages more highly developed countries have passed through, represent additional risks. This is demonstrated by the high incidence of industrial accidents and occupational diseases that exceed by 6, 10, or more times the rates experienced by more developed countries. For example, silicosis, which can be prevented, is present in several countries and in one of them affects 23% of the miners. Likewise, there exist high rates of other pneumoconioses such as those caused by asbestos, coal, and cotton, and there are frequent intoxications among workers using such substances as lead, organic solvents, manganese, mercury, and arsenic.

Studies during the past decade show that losses due to accidents and occupational illnesses are sometimes as high as 15% of the national income. To these losses, others must be added - the shorter work day in certain occupations, the prolonged vacations given persons whose health is exposed to risk, and the decrease in the number of years required to reach retirement. These latter measures, which do not contribute to the solution of the problem, do affect the cost of production.

The obectives for this decade, set by the III Special Meeting of Ministers of Health, are for countries without active programs in industrial hygiene to establish them as soon as possible so that by 1975 at least 25% of the working population exposed to risk will be covered by services, as will 50% by 1980, as a minimum. In those countries already having programs it is recommended that they be expanded to cover 40% of the workers by 1975 and 70% by 1980. PAHO will cooperate in the establishment and expansion of these programs and in the training of personnel.

#### 4700 - FOOD AND DRUG

It has long been recognized that governments must take the necessary steps to assure that their people receive safe and wholesome foods, and safe and effective drugs. This governmental responsibility has become more difficult in recent years because continuing innovation in food and drug manufacturing processes have greatly increased the problems confronting the government food and drug control officials.

PAHO's program in the food and drug field consists of (1) development of guidelines for food and drug control laws and organization and operation of national control agencies; (2) providing expert consultants, upon request, to study the situation in a country and to make recommendations based upon the circumstances encountered in that particular country; and (3) providing training opportunities for analysts, inspectors, and law administrators from the national food and drug control agencies.

During 1973, PAHO arranged for extended training at the U.S. Food and Drug Administration and the Canadian Food and Drug Directorate for a total of seven drug analysts, four microbiologists, and five drug establishment inspectors from the various national food and drug control agencies. Active steps are being taken to establish a drug quality institute in Brazil to provide advanced training in their native language for personnel from the national drug control agencies.

As in previous years, PAHO is responding to requests for special studies of the food and drug control needs of the countries. An example of a special study of this kind is the current program of the Caribbean countries for establishing, with PAHO's assistance, a Caribbean regional drug testing laboratory. In the field of food control, PAHO is providing training and research through the Food Hygiene Training Center in Venezuela, PAHO's Food Reference Laboratory at INCAP in Guatemala, and the food microbiology program carried out at the Pan American Zoonoses Center in Argentina, and by financing courses in the analysis of foods at the University of Panama.

## 4800 - MEDICAL CARE

The health care delivery program of PAHO aims at the adoption by Member Governments of a health care system with broad coverage of the whole population and improved utilization and productivity of available resources. The program also involves training the necessary personnel for health systems administration.

To achieve this main purpose, projects are carried out in the following fields: (1) coordination among institutions of the health sector; (2) organization of regional comprehensive services for the delivery of health care to the population in a network of hospitals, outpatient clinics or health centers, and domiciliary services; (3) hospital design, administration, and maintenance to improve utilization and productivity of hospital facilities; (4) introduction of progressive patient care as a means of raising the quality of care; and (5) training of health professionals and technicians in medical care and hospital administration to enhance their full participation in the multidisciplinary health team within an institutional organization.

The unbalanced situation between increasing demand for services and the scarcity of resources available to meet this demand was discussed at the Meeting of Ministers of Health in Santiago, and the Ten-year Health Plan contains recommendations that national health services plan and coordinate the available resources within a health system adapted to the characteristics of each country. In this connection, PAHO has launched, and is trying to reinforce, a program of cooperation with social security institutions in an effort to attract their participation in the process of planning, execution, and evaluation of health care delivery to the whole population. The emphasis should be on comprehensive ambulatory services provided through a network of community health centers coordinated and technically supported by regional general hospitals.

The development of human resources is an indispensable element in establishing the health care program. Activities are therefore in progress to introduce elements of health care and hospital administration into the curriculum of medical schools, as well as to carry out in-service refresher courses for personnel actually in charge of hospitals. The training of professors and researchers is an objective to be implemented soon within the scope of the Pan American Health University, in order to enable different countries of Latin America to develop the nucleus for further improvement of services and teaching. Assistance is also available in the fields of architectural design and maintenance engineering to expand and maintain the physical structures needed to properly locate the services.

#### 4900 - HEALTH AND POPULATION DYNAMICS

The rapid growth of population (from 2.2 to 3.4% annually) in many of the countries of the Region has an effect on health and health services. The health and population dynamics program promotes research in population dynamics, demography, and reproductive biology; emphasizes the health aspects of family planning; fosters the integration of family planning activities within the health service structure, with particular emphasis on maternal and child health; and provides assistance in the formulation of population policies consistent with national goals.

The program provides technical and material assistance for the planning and implementation of projects in this field, with particular emphasis on the provision of the necessary human resources. In addition to regional activities, 21 country projects are operating in 19 countries. The program works closely with other international, national, and voluntary agencies interested in the field of population.

## 5000 - REHABILITATION

PAHO is planning to provide adequate rehabilitation coverage in two main ways. The first is to encourage health authorities throughout the Region to automatically include rehabilitation services in their medical care plans for public health programs, as approved by the Meeting of Ministers of Health in Santiago. The second is to determine, in individual countries, the estimated number of rehabilitation personnel (physiatrists, physical therapists, occupational therapists, prosthetist/orthotists, nurses, and communications personnel) required for efficient national coverage and to provide for appropriate preparation of such personnel during the next decade.

5100 - CANCER AND OTHER CHRONIC DISEASES

Among the factors contributing to the rising trend of chronic diseases that is being observed in many countries of the Region, the following are the most influential: increase in life expectancy, gains in communicable disease control, and adverse cultural and environmental changes. The Final Report of the III Special Meeting of Ministers of Health of the Americas underlined that "in the first half of the past decade, two-thirds of the deaths in the age group 15-74 years in 10 of the large urban centers of Latin America were attributed to chronic diseases." Cardiovascular conditions, metabolic and functional impairments of long duration, chronic bronchitis, neurological diseases, malignant neoplasms, and post-traumatic sequelae are thus becoming major health problems.

In many of these diseases primary prevention is seriously handicapped by the relative unavailability of effective methods. Furthermore, the chronic patient often requires continuing, prolonged, and costly care either in the hospital, in outpatient departments, or at home. In such care it is of paramount importance to harmonize the operation of medical, nursing, dental, nutrition, rehabilitation, and social services, among others. But the prevalent administrative confusion and lack of coordination of efforts have compounded the problem, since the inadequacy of resources is further increased by their far from optimal utilization.

PAHO is therefore assisting the countries in establishing a chronic disease control program, giving special attention to the development of comprehensive, progressive, and community-based health care services, anti-smoking activities, detection and timely treatment of cervical cancer and its precursors, rheumatic heart disease projects, improvement of radiation therapy facilities and practices, epidemiological research, and training of the much needed professional, technical, and auxiliary personnel.

### III. DEVELOPMENT OF EDUCATIONAL INSTITUTIONS

### 6100 - PUBLIC HEALTH

The implementation of the Ten-year Health Plan for the Americas will demand a great effort in the training of health personnel at all levels. This is being met by schools of public health of the Region, various training programs of the ministries of health, and recently by postgraduate courses. In addition to these resources, international and national centers which PAHO is supporting and training activities being carried out in the Region are helping to meet these needs.

PAHO is supporting these activities through advisory services, short-term consultants, fellowships, and limited direct financial assistance. Plans for the continuity of these efforts and the improvement of professionals in the Region are under preparation. These plans give special emphasis to those countries which do not have schools of public health and those with a greater demand for professionals. PAHO will give special attention to the development of in-service education programs for staff with public health responsibilities and without formal training in this specialty. Provision is made for special attention to be given to such critical areas as epidemiology, administration, social sciences, statistics, environmental sciences, and maternal and child health.

Programs for advanced training of public health personnel at the university level are being planned through the Pan American Health University.

6200 - MEDICINE

The training of health workers, mainly professional health workers, and the institutions in which that training is given, are subject to constant evaluation and review in the light of new methodological approaches and the increased responsibilities of those institutions.

Among the priority problems for which PAHO assistance is needed are the growing demand for medical and paramedical studies, the shortage of trained faculty members, the lack of material resources and funds, advances in science and in medical and educational technology, and the importance of coordinating the activities of educational institutions and of health services. The trend towards integration of educational agencies interested in conducting multidisciplinary programs is of special interest.

Among the basic problems hindering the preparation of a sufficient number of health personnel of the required caliber, the shortage of material resources and manpower is of special importance. It is therefore necessary to devise ways of making the best possible use of resources. The establishment of health science faculties or centers, which bring together scattered resources and whose functions include the training of health workers in various areas and of different levels, is a promising solution. In addition to unifying resources, the centers have the advantage of educating and training students to work as members of a team with a multidisciplinary approach to health problems.

PAHO is dealing with the problems by planning manpower requirements in accordance with educational possibilities to meet those needs and strengthening education institutions in order to develop sufficient manpower of the required caliber. Specific activities include the conduct of special studies in cooperation with interested institutions or countries, the provision of advisory services to improve administration and teaching patterns and methods, the award of fellowships for faculty members, the holding of meetings of working groups and of seminars on medical pedagogy and organization, and the improvement of exchange of information between various international agencies interested in medical and paramedical education in Latin America, with a view to increasing collaboration. A querterly journal on medical education is published in Spanish and distributed to medical educators in the Region. A program to provide project textbooks for medical students is under way. Initial steps are being taken to launch a broad program of educational technology applied to medical education.

Short-term consultants, fellowships, and a limited amount of supplies and equipment are being provided, as are advisory services by Headquarters and Zone staff.

### 6300 - NURSING EDUCATION

In order to arrive at a regional average of 14.5 nursing auxiliaries and 4.5 nurses per 10,000 population, in accordance with the Ten-year Health Plan for the Americas, it will be necessary to prepare in the present decade 360,000 auxiliaries and 125,000 nurses. This would require a considerable increase in the present rate of training personnel. The student capacity of the present known 279 nursing schools and 420 training programs for auxiliaries is generally very low. The average graduating class from 103 nursing schools in Latin America and 23 in the Caribbean area for the period 1968-70 was 17.1 and 25.9, respectively. The average for nursing auxiliaries in this same period in 88 courses in Latin America was 32 per course. The low productivity from the training programs is due principally to scarce human resources, facilities, and finances, and to the lack of coordination between the educational systems and the health sectors.

The lack of coordination between education and services is responsible for not having long-term plans for the increase in installed capacity for training or for the expansion of registration in teaching institutions during a time when growing health services are providing conditions for the absorption of the graduates. Scarce financial resources and the lack of teaching personnel are impeding the utilization of numerous new educational techniques, affecting greatly the efficiency and efficacy of present programs.

PAHO cooperates with Member Governments in (1) the definition and implementation of a system for nursing education capable of producing personnel in the numbers and at the level required for the health services; (2) the strengthening of teaching institutions with a view to the integration of teaching and nursing practice; (3) the study of problems affecting the teaching and production of personnel; (4) the training and better utilization of teaching personnel; (5) the creation of an information system that would permit evaluative judgments on the quality of teaching for its continuing improvement; (6) the production of textbooks of high educational quality and at costs that can be met by the students; and (7) holding seminars on the training of personnel and the structure of curricula for various levels of teaching. A plan for the establishment of a program in educational technology applied to nursing education is being formulated.

#### 6400 - ENVIRONMENTAL SCIENCES

In the last decade, programs in environmental health in general, and in water supply in particular, have been greatly expanded by the governments. It is estimated that 1,000 engineers are currently working in public health institutions. About 4,000 engineers, mostly civil, work in water supply, sewerage, and other services. About 3,000 sanitary inspectors are working in environmental sanitation programs in Latin America and in the Caribbean area. Improvement of the capabilities of personnel engaged in activities related to environmental control is decisive for the success of the countries' environmental programs. One of the fundamental policies of PAHO is to cooperate in education and training activities in the field of public health, including environmental engineering.

The Meeting of Ministers of Health of the Americas in Santiago, Chile, in October 1972 recommended goals for water supply, sewerage, enfironmental pollution control, occupational health, food hygiene, and other present and emerging responsibilities of environmental health officials. These goals, coupled with the increased use of new technologies, point to the need for sharply increasing the production of professional, technical, and auxiliary personnel. One special recommendation of the Meeting was to train 320 students annually in graduate sanitary engineering programs; organize short courses for 3,000 professional and technical personnel every year; and, in the decade of the seventies, increase to 2,000 the number of sanitary engineers in public health programs; to 5,000 the number of engineers in water supply, sewerage, and other environmental services; and to 4,000 the number of sanitary inspectors in public health.

A combination of aggressive training activities is to be undertaken on an institutional and academic basis to reach these goals. Strengthening of teaching institutions is one of the most important objectives of the program. Continuing education, on the basis of short, intensive courses on specific subjects, has proved to be extremely successful. The demand for technical assistance for this type of activity has grown immensely, due to its exceptional adaptability to national needs and to its multiplying effects.

In the last five-year period, PAHO has given technical assistance to all countries in the Region, through an operational network of 41 universities, to organize and carry on 351 short courses and 48 seminars and symposia. These activities were attended by 13,959 participants, and 2,847 national professors delivered lectures. PAHO collaborated with the services of 797 short-term consultants and staff members.

The objectives for the next five years are to increase of the tempo of this program, incorporate all the schools of public health into the operational network, and include subjects on environmental engineering in the programs of all schools of civil engineering. It is expected that in 1974 approximately 85 short intensive courses will be organized to benefit the 3,000 professional and technical personnel, as recommended by the Ministers of Health.

6500 - VETERINARY MEDICINE

Mexico-6400

AMRO-6401

AMRO-6414

Costa Rica-6400

Cuba-6400

The improvement in agribusiness, specifically in livestock development, will depend principally upon the ability of countries to produce an adequate number of veterinarians. Although 53% of the population of Latin America reside in rural areas, only 3% of the university student population study in the field of agricultural science. A minimum effort is made in the university centers toward training of the veterinarian. Demands for a greater number of veterinarians are increasing steadily, resulting from the development of national campaigns to control diseases of human and animal health significance. Although the schools are operating on a maximum capacity basis, the graduates represent only 17% of the total number of entering students. PAHO is attempting to remedy this trend by providing assistance to the schools of veterinary medicine through promoting and conducting seminars, providing fellowships for postgraduate training of professors, and supplying instructional resource material. Short-term consultants are assisting in those areas where deficiencies exist.

6600 - DENTISTRY

In 1968 PAHO, in cooperation with 24 Latin American countries, conducted two studies on the utilization and education of dental auxiliary personnel. The first study collected specific information on functions and utilization of different categories of dental auxiliary personnel; the second was dedicated exclusively to their education. These studies revealed minimal utilization and inadequate numbers of dental auxiliaries, complicated by limited dental professional manpower; by maldistribution of dentists, who concentrate heavily in the upper income and urban areas; by the rapidly increasing population; and by widespread dental disease. There is a lack of trained dental auxiliaries and of adequate legislation covering their practice; there is no clear definition of the functions performed by dental auxiliaries; there is inconsistency in national requirements for registration of auxiliaries; there is inadequacy of physical facilities and insufficiency of teaching personnel in this field; the content and duration of courses vary considerably, even within the same categories; and the dental profession does not recognize the importance of dental auxiliaries in the practice of dentistry. In the five countries with 74% of Latin American dentists, only a small proportion actually employ dental assistants or auxiliaries with expanded functions. In the Latin American area there are fewer than 30 regular courses to train auxiliary personnel. The dentist-auxiliary ratio is 3:1.

The dental manpower situation illustrates a great shortage in most countries of the Region, especially due to the growth of population and the demand for dental care by larger groups of population. In more than 12 countries there is not yet one dentist per 10,000 population.

In the first stage of this program, emphasis was placed on the development of preventive and social dentistry teaching programs and design of new curricula for dental schools. These aspects have been successfully completed. At present, emphasis is being concentrated on assisting in the development and functional interrelationship between factors affecting the delivery of dental care (personnel, equipment, materials, and the socioeconomic system); developing personnel in certain specialized fields in dentistry as a nucleus for a scientific and training network in these fields in Latin America; simplifying and facilitating the availability of basic dental equipment; improving the design and function of dental training institutions and clinics; assisting the dental schools in Latin America in reviewing curricula, administration, and physical facilities; assisting and encouraging the development of educational planning units in dental schools; establishing a mechanism to interrelate dental schools in Latin America in the field of dental education; relating the teaching of preventive dentistry to the programming and provision of dental health services; improving the administration of dental libraries; and training dental librarians.

In the field of dental auxiliaries and utilization, plans are under way to establish regional centers for the training of dental auxiliary educators; to train auxiliary educators from each country who will subsequently establish national dental auxiliary training programs in their own countries; to assist dental auxiliary educators to establish national training programs for public and private dental care services; and to create new patterns of dental care delivery to provide expanded preventive and curative dental services to greater numbers of people despite social, economic, and cultural barriers.

The goal in this area of the Ten-year Health Plan for the Americas, recommended by the III Special Meeting of Ministers of Health of the Americas (Santiago, Chile, 2-9 October 1972) is to "increase by 20 per cent the present ratio of dentists per 10,000 population whenever that ratio in any country is lower than the present average for the area of 1.9 or lower than the average of the classification group."

#### 6700 - BIOSTATISTICS

The capability for making improvements in health statistics systems and in the utilization of statistical data and methodology is dependent on the expansion and strengthening of training programs related to health statistics throughout the Region. Academic courses must be provided to educate statisticians, medical records administrators, and computer scientists at both the professional and intermediate levels. In addition, sufficient statistical personnel at the auxiliary level must be trained to staff the many thousands of health care institutions. Physicians and many other categories of health personnel need an introduction to statistical methodology, procedures, definitions, and classifications to better fulfill their functions as producers and users of health data.

Minimum goals established for the decade are to train 300 professional-level statisticians, 100 medical records administrators, 4,000 medical records technicians, and 250 health statisticians at the intermediate level, and 40,000 statistical auxiliaries. At least 50 computer scientists and 250 computer programs in health should be prepared. These are only minimum goals, and many more specialists in each of these groups could be used in the Region.

To reach these goals additional training centers must be developed. Only one course exists for biostatisticians at the professional level (Chile), and three more are needed. The first advanced course in medical records science has recently been initiated (Argentina) and another three must be developed. In five countries intermediate—level courses are provided for medical records personnel. At least six more will be required to attain the goal for training in the decade.

Other training activities in health statistics should include strengthening of the teaching of biostatistics in the curriculum of medical schools and public health schools, including instruction on research methodology, computer science, medical statistical classifications, statistical systems for the health services, and interpretation and use of data. The public health schools of the Region and the health services should collaborate with civil registry and national statistical offices in the training of civil registrars. Orientation of personnel from other health disciplines on the value of maintaining records and statistics and their utilization is essential to improvement of the quality of health data.

## IV. PROGRAM SERVICES

Administrative support services are not easily distributed by programs served. To facilitate review and administration, these activities have been grouped in a single category. They are the costs related to evaluation and reporting on projects; placement and follow-up of fellowship awards; production of visual aids; editorial services; liaison and public information; and library and computer services.

#### V. ADMINISTRATIVE DIRECTION

#### 8100 - EXECUTIVE AND TECHNICAL DIRECTION

Executive and technical direction is heavily weighted on the side of the technical content of the programs of the Member Governments rather than on day-to-day administration in this complex international organization. To reflect this, a separate category has been established to show the costs of the Director's Office and the Office of the Chief of Administration, as distinct from general administrative costs.

		1972	 1973	 L974	 1975

Project: Headquarters

#### 8200 - ADMINISTRATIVE SERVICES

Administrative services are organized so as to free the field staff for technical services by relieving them of as much administrative detail as possible. Personnel and accounting activities are centralized, and allotments, other than those for supplies and equipment, are issued to Country Representatives in terms of the elements needed to carry out the program rather than in dollars. These actions have facilitated the operation of Zone Offices with minimum administrative staff. This grouping includes the offices for budget, finance, personnel, supply, property services, and records and communications, as well as the administrative portions of each of the Zone Offices.

### VI. GOVERNING BODIES

The Pan American Health Organization is governed by the Pan American Sanitary Conference, which meets every four years. The Directing Council acts for the Conference in the intervening years. In addition, the Executive Committee of the Directing Council holds two regular meetings every year. By agreement with the World Health Organization, the Pan American Health Organization also serves as the Regional Committee of the World Health Organization. The category "Governing Bodies" covers the cost of scheduled meetings and supporting staff. The staff also supports other seminars and conferences as time allows.

## Ch. 2. Department of Engineering and Environmental Sciences

This Department is responsible for health-related programs in engineering and environmental sciences. These responsibilities include both basic sanitation in rural and urban areas and broader problems of air and water pollution, industrial

hygiene, housing, solid waste disposal, and related activities resulting from industrialization and urbanization. Functions of the Department include development of broad regional objectives, establishment of priorities, and assistance in setting standards, guides, and approaches for the planning, design, operation, management, and financing of necessary sanitary works. The Department encourages, stimulates, and assists with programs to strengthen education, to carry out training courses, and to promote applied research activities. Another function is to assist Member Governments in the development and presentation of soundly conceived projects for submission to international funding agencies, such as banking institutions, the United Nations, and private foundations.

### Ch. 5. Department of Health Statistics

This Department is responsible for the collection, processing, analysis, and publication of vital and health statistics for the Region. In order for statistical data to become available for local, national, and international use, consultant services are rendered for the development or improvement of statistical programs in the countries. Also, to improve the quality of statistical data and systems of vital statistics, hospital statistics, notifiable diseases, and statistics of health manpower and facilities, the Department promotes the development of education and training programs in vital and health statistics at professional, intermediate, and auxiliary levels. The Department is responsible for large-scale coordinated research programs and promotes research projects involving the application of statistical and epidemiological methods. Statistical services for the collection and analysis of data are rendered to all departments of PAHO. Through the Computer Science Section, data processing services are also available to all departments, and consultant services on the use of computers in the health field are provided to the countries.

#### Ch. 7. Department of Human Resources Development

This Department is responsible for developing broad regional objectives, plans, and program priorities in the field of health manpower requirements, with special emphasis on the training of physicians and related health personnel. It develops standards, guides, and procedures for the planning and operation of educational programs and evaluation of their progress. It promotes the training of faculty for medical schools and schools of public health, with emphasis on improvement in pedagogical skills, on strengthening preventive and social concepts in the curricula, and on administration of the schools. It promotes activities directed toward comprehensive manpower studies and evaluation of teaching programs and institutions. It has responsibility for coordination of all education and training activities of PAHO.

The Department is responsible for the publication in Spanish of a quarterly journal on medical education, with summaries in English, French, and Portuguese. It also serves as the secretariat of the Health Sciences Education Information Center. In addition, this Department administers the fellowship program of PAHO and maintains a close working relationship and coordination with national and international agencies engaged in similar activities.

### Ch. 8. Department of Malaria Eradication

This Department is responsible for planning and directing PAHO's assistance to Member Governments in the Region in the eradication of malaria. It provides advisory services and develops technical, operational, and administrative guidelines for national malaria eradication programs; maintains liaison with national and international agencies; coordinates cooperative efforts to eradicate malaria from the Americas; and plans and participates in evaluating progress of country programs. The Department is also responsible for the overall programming and analysis of PAHO's research activities on malaria. Continuing contact is kept with research institutions, and information on new techniques or improved methodology resulting from research is distributed.

## Ch. 12. Department of Special Technical Services

This Department recommends policy to the Director on new and developmental activities in health planning, health economics, health legislation, health and social welfare, nursing services, laboratory services, and food and drug control. It has the responsibility for the development of objectives, plans, policies, and methods of operation of PAHO in assisting governments to carry out the national health planning process, including economic and financial studies; in training the necessary personnel; and in conducting research in these fields. It guides and supervises the operations of the Pan American Program for Health Planning. It is also responsible for the promotion of coordination of PAHO's internal long-term planning, reporting, and evaluation process. The Department recommends regional objectives in nursing services and education, as well as policies and priorities regarding norms for the provision of services in all phases of nursing. It is responsible for the development of the technical policies of PAHO in the control of drugs. It provides the necessary norms for advisory services in the development of national health laboratories for diagnosis and production in the control of biologicals. The Department is also responsible for advisory services in health legislation and in the health aspects of social welfare.

# Sec. 4. Temporary Personnel

The estimate for this section represents the continuation of the need for temporary personnel to replace staff on extended sick or maternity leave and to meet short-term workload requirements for which it would be uneconomical to maintain full-time staff.

## Sec. 5. Common Services - Headquarters

The estimates for the various common services for the Washington Office are shown by major expense items in the schedules. Costs are apportioned on a pro rata basis between funds budgeted under PAHO and WHO, except for office equipment, which is charged directly to the appropriate source of funds.

### BARBADOS - DETAIL

### BARBADOS-0700, VETERINARY PUBLIC HEALTH

The purpose of this project is to cooperate with the Government of Barbados in a leptospirosis control program. The objectives of the program are the determination of the extent of leptospirosis, the prevalent serotypes, and the sources of infection. The plan of action includes ecological studies of the vectors and the human population at risk, training of technical personnel, and upgrading of a laboratory unit to provide uniform diagnostic methods.

### BARBADOS-0702, ANIMAL AND HUMAN HEALTH

Barbados, a tropical island in the Caribbean, supports a population of about 250,000. The number of species of wild vertebrate animals in Barbados is small. Domestic animals include cattle, hogs, sheep, goats, donkeys, fowl, dogs, and cats. Of all the vertebrates, humans, cattle, horses, hogs, sheep, goats, dogs, mongooses, Norway rats, black rats, and mice are known to be infected with leptospirosis. Brucellosis has been found in tested herds of dairy cattle. The Government is encouraging the development of a local livestock industry to reduce capital outflow for imported animal protein. Brucellosis, leptospirosis, and other animal diseases are positive checks on livestock populations.

The present veterinary medical and veterinary public health services are not capable of controlling or preventing zoonoses or other animal diseases. The objective of this project is to develop an organization with capability to control, prevent, and eventually eliminate zoonotic and animal diseases of public health and economic concern to Barbados.

## BARBADOS-2100, ENVIRONMENTAL SANITATION

Barbados is experiencing a rise of living standards and a rapid growth of new environmental health hazards. Water resources are increasingly taxed for production and quality; solid wastes management is a major problem in both health and financial aspects; protection of workers is minimal in view of the rapid diversification of services and industry; sewage disposal is of major concern; and other traditional problems are likewise being exacerbated. Programs are now under way to create a sewerage system for Bridgetown, redesign solid waste management practices, and improve water supply management. Occupational health and public health inspectorate administration programs, started in 1972, will continue into 1974. The Public Health Engineering Unit of the Ministry of Health will be increasingly in charge of the study and planning aspects of environmental health. The main objective of this project is to strengthen the water, solid waste, and public health engineering agencies with the purpose of creating national capability to eliminate existing health hazards and prevent new ones.

### BARBADOS-2201, WATERWORKS ADMINISTRATION

The Barbados Water Works Department is concerned with a development plan covering the period up to the year 1980. Costs are being met by the Government and by international loans. The present population of about 250,000 is almost entirely supplied with water, 45% having house connections. The consumer population is projected at 480,000 in 1996, and development investment will be \$11,000,000 by 1980. Recent trends indicate that utilization of known resources is taking place more rapidly than originally estimated. Thus, additional exploration, design, and funding may be needed earlier than previously anticipated. Furthermore, a major sewerage system will be designed in 1972-73 with construction to start in 1973. The purpose of this project is to improve the administration and management of the Water Works Department to permit efficient operation, lead to financial self-support, and provide flexibility and strength to absorb sewerage and other expanded activities.

### BARBADOS-3100, HEALTH SERVICES

Barbados is a tropical country of about 250,000 population with a low annual growth rate. The national development plan is geared toward the interrelated goals of diversification of the present economic structure and reduction of the current rate of unemployment. There has been heavy emphasis on human resources development in general and development of the infraestructure for public services. About 26% of expenditures from UNDP and government sources has been allocated to human resources development, mostly in the health sector.

Within the health sector, emphasis is being placed on institutional development concomitant with the administrative reform programs in the public service. Priority will be given to environmental health programs and to the development of child care and geriatric services as part of the national health plan. The purpose of this project is to cooperate in the development of the plan and the priority areas of activities.

## BARBADOS-3200, DISTRICT NURSING SERVICES

Barbados has an estimated population of 250,000, over 80,000 of whom are from 5-19 years old, the school-age group. District health care services are inadequate to meet the growing needs of the community and, for the most part, health personnel are not well trained to carry out care programs, or programs designed to meet these needs. The purpose of this project is to cooperate with the Government in developing an integrated public health nursing service which will include a school health program and a nursing service to provide care to the patient at home.

### BARBADOS-4600, OCCUPATIONAL HEALTH

The Government of Barbados is fully aware that one of the fundamentals for increasing productivity is satisfactory environmental conditions under which related activities are carried out. With the steady expansion of industry and the proposed agricultural diversification program, the Government considers it essential to give greater attention to the implementation of occupational health legislation. The Ministry of Health has the main responsibility for this undertaking and in cooperation with the Ministries of Labor and Agriculture is embarking on a program to reduce or eliminate occupational health hazards. The purpose of this project is to provide consultant services in this area.

### BARBADOS-4801, HOSPITAL ADMINISTRATION

The purpose of this project is to improve the operational efficiency and standard of patient care of Barbados hospitals. The immediate objectives are to reorganize five district hospitals currently utilized as homes for the destitute, geriatric patients, and retarded children; to relate the use of their facilities to the clinical needs of the country; and to coordinate their activities plus those of the mental hospital by means of a single administrative structure centered at the Queen Elizabeth Hospital.

## BARBADOS-6600, DENTAL EDUCATION

The purpose of this project is to cooperate with the Government of Barbados in the development of a dental program, with emphasis on treatment for schoolchildren, through the training of dental auxiliaries. Special attention is being given to the use of modern and readily installed equipment in health clinics.

### FRENCH ANTILLES AND GUIANA - DETAIL

FRENCH ANTILLES AND GUIANA-0200, MALARIA ERADICATION

The French Antilles are free of malaria transmission, but not so French Guiana, where the disease continues to be registered, especially in the interior. The population of French Guiana (50,000 inhabitants) is distributed as follows: 50% in areas in the maintenance phase, 38% in the consolidation phase, and 12% in the attack phase. In 1972 some isolated foci were registered in areas in the maintenance phase, related to cases imported from areas in the attack phase or from other countries. In that same year, 7,597 blood samples examined turned up 223 positive cases, which represented a slight increase over 1971 when 116 positive cases were discovered in 7,176 blood samples examined.

FRENCH ANTILLES AND GUIANA-1000, SCHISTOSOMIASIS CONTROL

The purpose of this project is to control schistosomiasis on the island of Guadeloupe, principally through eradication of the vector snail. Survey activities are under way to determine baseline data on the prevalence of the disease and the vector, and the Government is planning control activities in pilot areas. PAHO provides consultants and fellowships for training in the technical aspects of the campaign.

FRENCH ANTILLES AND GUIANA-3300, LABORATORY SERVICES

Since 1968 the Pasteur Institute in French Guiana has been carrying out a research project consisting of a systematic collection of data aimed at a better understanding of the transmission, reservoirs, and epidemiology of viral diseases in the rain forest. Jungle insects and mammals are trapped and taxonomic lists made. The insects are pooled by species and viruses are isolated. Immunologic tests have been carried out on sera of persons from the three French Departments suspected of having viral diseases.

The purpose of this project is to isolate viruses, with emphasis on Group B viruses, from the insect pools, and to determine the immunity status of humans and other mammals to these viruses for the better understanding of the epidemiology of viral diseases.

GUYANA - DETAIL

#### GUYANA-0200, MALARIA ERADICATION

The entire country of Guyana, with some 757,000 inhabitants, is considered to be originally malarious. Since 1971 the population has been divided, 93.9% in the maintenance phase of the malaria program and 6.1% in the consolidation phase. Problems have been encountered in reducing the disease to limited foci in the southeast part of the country, bordering Brazil. In this area, application of preventive measures is being continued in localities with a recent history of transmission, or which are especially vulnerable. Susceptible people are treated with chloroquine salt. The program maintains coordination with neighboring countries. In 1972 there were 266 cases identified through 59,931 blood sample examinations, a considerable increase over 1971 when there were only 27 cases registered from 65,967 blood examinations.

### GUYANA-0700, VETERINARY PUBLIC HEALTH

No human cases of zoonoses were reported in Guyana during 1970-72. Many animal diseases, including bovine rabies, bovine brucellosis, canine leptospirosis, and equine trypanosomiasis, are known to be present. There also exists a potential risk of a foot-and-mouth disease outbreak. Reporting of diseases is deficient and diagnostic facilities are practically non-existent. There is a shortage of trained veterinarians and laboratory technicians in animal health.

The overall purpose of this project is to reduce disease and death in the animal population, thus protecting the human population from zoonotic diseases, through the improvement of veterinary services and the means of control of food consumed by humans. Specific objectives include establishment of a veterinary public health unit in the Ministry of Health, organization of an adequate veterinary public health laboratory service, improvement of the reporting and surveillance system, improvement of the food hygiene program, and development of human resources for these services.

## GUYANA-2100, ENVIRONMENTAL SANITATION

This project provided assistance to the Government of Guyana in developing a suitable organization for the management of water and sewerage services; in developing comprehensive plans for water and sewerage systems; in improving the functions of the Sanitary Engineering Division of the Ministry of Health; and in developing adequate human resources to plan and execute environmental health programs. In the latter area, preparation of a manual of operations for the public health inspectors provided a valuable means of standardization of operational procedures and also of evaluation.

### GUYANA-2201, WATER AND SEWERAGE CORPORATION

Ninety-five per cent of the total population of 715,000 in Guyana live along a narrow coastal strip which is below sea level, which gives rise to special problems of drainage and sewage disposal. The population of the three main urban centers - Greater Georgetown, New Amsterdam, and Linden - is 200,000, 25,000, and 35,000, respectively. Since 1968, the

FUND	1972 1973	1974	1975	FUND	1972	1973	1974	1975
							_	

Government of Guyana has been following a long-term plan for the improvement of water supplies in the coastal area. Only the central part of Georgetown is served by a sewerage system, which dates back to 1929. The remaining area is served by pit latrines or septic tanks discharging into an inadequate storm drainage system. There is a high incidence and prevalence of water-borne diseases.

The objectives of the project are to assist the Government in the preparation of technical-economic feasibility studies for sanitary sewerage and storm drainage systems for Georgetown, New Amsterdam, and Linden and for additional potable water supplies for Greater Georgetown, and to provide the administrative assistance and training needed in the establishment of a national water and sewerage authority.

## GUYANA-2300, AEDES AEGYPTI ERADICATION

Guyana is moderately infested with Aedes aegypti, the vector of urban yellow fever, dengue and hemorrhagic fever. A program to eradicate Aedes aegypti began in 1970. The attack phase in Area I, comprising Greater Georgetown and parts of East Coast Demerara, East Bank Demerara, and West Bank Demerara, began in January 1970. The overall index is now 1.4% as compared to an initial index of 57.8%. Administrative and organizational problems have continued to affect the campaign.

The overall purpose of the project is to eradicate <u>Aedes aegypti</u> from the country and thereby protect the population from yellow fever, dengue, and hemorrhagic fever. Immediate objectives are to improve the administrative machinery of the campaign; to provide an adequate number of trained personnel; and to expand the present campaign into a full-scale, country-wide eradication program.

### GUYANA-3100, HEALTH SERVICES

Two major categories of health problems are identified in Guyana - those pertaining to the health status of the population and those pertaining to the status of the health services in the country. Although the overall mortality rates are low, there is a relatively high incidence of some communicable diseases preventable either through immunization or through the institution of control or eradication measures. Problems relating to the infrastructure of health services are more prominent. The present dichotomy in the preventive and curative services, as well as a highly centralized administrative organization, affects the quality and utilization of health services. Planning of health programs is lacking, and financial resources are inadequate. There is a shortage of trained health personnel.

The purpose of the project is to assist the Government of Guyana in the development, implementation, and evaluation of systematically planned health services. Specific objectives include the reorganization of the basic structure of health services, promoting integration of preventive and curative services; improvement of administration and management of health services; improvement of health facilities; expansion of diagnostic services and promotion of their adequate utilization; strengthening of rural health services; development of human resources; qualitative and quantitative improvement of nursing services; development of health statistics; and assistance in the revision of health legislation.

GUYANA-3200, NURSING SERVICES

In 1971, there were 781 graduate nurses (11.1 per 10,000 population) in Guyana. There is a shortage of nursing auxiliaries, the ratio presently being 0.5 per 10,000 population. There is a shortage of trained teaching staff in the schools of nursing and of trained administrative nursing staff in the health services.

The purpose of the project is to improve the quality of nursing services through improvement of nursing education programs. Specific objectives are to provide graduate nurses with continuing educational opportunities to develop their teaching, supervisory, and administrative skills; to prepare a corps of nurses who would be responsible for continuing in-service nursing education; to provide an annual institute program on new aspects of nursing for graduate nursing staff; and to develop a knowledge of teaching skills in middle-level graduate nursing personnel.

GUYANA-4200, NUTRITION

Nutritional deficiency is considered to be fairly prevalent in young children in Guyana. The infant mortality rate in 1969 was 33.6 per 1,000 live births. Forty per cent of the deaths of children under five years were from Group A diseases. A national nutrition survey conducted during 1971 showed a high overall prevalence of malnutrition in children under five (18.2% with moderate and severe protein-calorie malnutrition. A large percentage of the population appears to suffer from deficiencies in diet, and the intake of animal protein is generally low. Food and dietary services of the hospitals are poor, and there is a shortage of trained personnel in nutrition and dietetics.

The purpose of this project is to reduce malnutrition substantially and to collaborate in the attainment of maintenance of the normal nutrition status necessary for optimum health. Specific objectives are to assist the Government in establishing a national food and nutrition policy; to promote nutrition education through the collaborative efforts of relevant governmental agencies; to strengthen the medical care services for malnourished children and for their rehabilitation; to improve food and dietary services in the hospitals; and to train health sector personnel in nutrition.

GUYANA-4400, DENTAL HEALTH

The dental health status of the population of Guyana is not known, but is considered to be very poor, particularly among school children. Dental treatment provided by government health services is almost exclusively confined to extraction, and very little restorative and prophylactic care is given. Service coverage is inadequate. There is a severe shortage of dentists, only 0.3 per 10,000 population. There are no trained dental auxiliary staff.

# FUND 1972 1973 1974 1975 FUND 1972 1973 1974 1975

The purpose of the project is to assist the Ministry of Health in the improvement and extension of its dental health services. Specific objectives include provision of adequately trained professional and subprofessional dental personnel, and promotion of dental health through education and preventive measures.

### GUYANA-4900, MATERNAL AND CHILD HEALTH AND POPULATION DYNAMICS

Forty-five per cent of the total population of Guyana are under 15 years of age: 17.3% are 0-4 years and 27.7% are 5-14 years of age. Approximately 20% of the population is made up of females 15-44 years of age. The infant mortality rate in 1969 was 33.6 per 1,000 live births. Forty per cent of the total deaths of children under five years of age were due to infectious and parasitic diseases, and 7.6% were perinatal. The maternal mortality rate in 1969 was 0.69 per 1,000 live births. Illegal abortions are said to be high. It is estimated that 60-70% of pregnant women attend prenatal clinics, less than one-third of children under five attend child health clinics, and approximately 20% of the deliveries are conducted by untrained personnel. Immunization levels are low.

The purpose of this project is to assist the Ministry of Health in the development of a comprehensive maternal and child health program, integrating family health, school health, nutrition, and cancer control programs. The specific objectives are to reduce infant mortality by 25% by 1980; to increase prenatal services to 80% of pregnant women, and immunization to 80% of children under five; to provide high quality medical care service for high risk mothers and infants; to develop family planning and postnatal services; and to train human resources.

### JAMAICA - DETAIL

### JAMAICA-0700, VETERINARY PUBLIC HEALTH

The prevalent zoonoses in Jamaica are brucellosis, leptospirosis, and bovine tuberculosis. The objectives of this project include the development of a program to make Jamaica self-sufficient in meat and milk production and to eliminate the public health hazards of the zoonoses through improved diagnosis, development of animal health programs, and strengthening of veterinary medical services.

### JAMAICA-0701, ANIMAL HEALTH PROJECT (UNDP)

The purpose of this project is to develop a national animal health and veterinary public health program with a permanent infrastructure, designed to reduce the incidence of the zoonoses and other animal diseases; avoid loss of animal proteins caused by animal diseases; and provide an effective food hygiene program. Assistance will be provided to the Government in preparing that part of the agricultural sector study related to animal health programs; determining the immediate requirements of the joint livestock development project with respect to animal health needs; preparing a long-range national animal health and veterinary public health program; planning and establishing a training program for animal health and veterinary public health assistants; and detailing objectives and a work plan for a two-year project for which this project is the preparatory phase.

### JAMAICA-2100, WATER SUPPLIES AND ENVIRONMENTAL SANITATION

In Jamaica, 96% of the urban population is served through house connections with adequate water services, while only 81% of the rural population is provided with water, 20% by house connections and the remainder by public fountains. Only 27% of the urban population is connected to public sewer systems, and in the rural areas there is a great need to improve means of excreta disposal. A large number of the rural water supplies are not chlorinated.

The objectives of this project are to improve the present Sanitary Engineering Department of the Ministry of Health; to increase the number of properly chlorinated rural water supply systems; to develop a national water supply program to provide potable water to 60% of the rural population in the next five years; to provide adequate sewage disposal to the urban and rural population and protection against pollution of the water resources; to protect the health of workers in industry; to reduce pollution in the atmosphere; and to prepare qualified professional and nonprofessional personnel for the Sanitary Engineering Department.

### JAMAICA-2202, WATER RESOURCES SURVEY

The objectives of this project are to assist the Government of Jamaica in the establishment of a water quality monitoring network; identification of the quality standards for the network and the data to be collected, including the development of analytical procedures and the training of staff; in-depth studies on project basins or other specified areas where problems of water quality deterioration become apparent; and water quality considerations necessary for both the planning and management programs in the project basins.

### JAMAICA-2204, WATER AND SEWER ADMINISTRATION IN JAMAICA

The National Water Authority of Jamaica has requested PAHO to carry out an in-depth diagnosis of its administrative and financial problems, including assistance in organizing a supply section at an earliest possible date. The objective of this project is to improve the organizational structure and the internal administrative and financial procedures of the National Water Authority so that it may overcome its present problems and become eligible to receive financial assistance from international banks.

### JAMAICA-3100, HEALTH SERVICES

The Government of Jamaica, in trying to achieve its goal that every citizen regardless of means or location is entitled to receive proper health care, is handicapped by the uneven distribution of resources between rural and urban areas, e.g., there is one doctor per 1,024 people in urban areas and only one per 7,692 in rural areas. Superimposed on this is an acute shortage of nursing personnel with a heavy loss of graduate nurses through emigration (2,735 between 1953 and 1971).

The objectives of this project are (1) to analyze the organization and management of the headquarters of the Health Ministry and to develop a new organizational structure and system of management in keeping with the new policies for delivery of health care; (2) to undertake studies on the use of auxiliaries to ensure the most economic method of providing comprehensive medical care to urban and rural areas and to train selected nursing personnel to undertake some duties now only performed by doctors; and (3) to develop an information system for the management and programming of the health services.

### JAMAICA-4300, MENTAL HEALTH

Almost half of Jamaica's 7,000 hospital beds are in the large Bellevue Mental Hospital. Psychiatric services are largely concentrated in this hospital, which serves the whole island but isolates the majority of the patients from their family and community and promotes chronicity. As of 1964, two-thirds of the patients in Bellevue Hospital had been hospitalized for five years or longer. There is a critical shortage of nurses and psychiatrists at Bellevue. Of 327 staff nurse positions, only 100 are filled. There are only one full-time and one part-time psychiatrist in the hospital. Many of the medical and nursing personnel throughout the country have had little exposure to psychiatry, although this is changing rapidly. Public and professional attitudes toward the mental hospital, and mental illness in general, are predominantly negative.

The purpose of this project is to improve the level of psychiatric care and thereby reduce the number of mentally-ill patients becoming chronically institutionalized. The objectives are (1) to decentralize psychiatric care through increased use of general hospitals and the development of regional psychiatric services based on health centers; (2) to reduce the tendency to create the chronically institutionalized person by utilizing therapeutic techniques and rehabilitation programs; and (3) to strengthen the follow-up of psychiatric patients.

### JAMAICA-4500, RADIATION PROTECTION

The purpose of this project is to develop a radiation protection service in Jamaica on a national scale in order to control exposure to radiation of workers in this field, as well as the general public.

## JAMAICA-4800, MEDICAL CARE AND HOSPITAL ADMINISTRATION

To improve delivery of health services in Jamaica it is necessary to decentralize the day-to-day operational management of the 26 government hospitals by means of a central control at the Ministry of Health. The main objectives are management improvement of personnel and supplies, establishment of a self sufficient system of hospital maintenance, and inservice training for various levels of administrative staff.

### JAMAICA-5000, REHABILITATION

It is not at present possible to provide adequate physical therapy services in the English-speaking Caribbean; some islands are able to provide about one-third of the estimated requirements, others none at all. In Jamaica, where some 40,000 patients a year need these services, there is already a shortage of physical therapists and the problem will be-

FUND 1972 1973 1974 1975 FUND 1972 1973 1974 1975

come more acute when services are expanded, as planned, to smaller urban and rural districts and to the increasing geriatric population. No training facilities are at present available for the preparation of physical therapists in the Caribbean area.

The purpose of this project is to assist in (1) the establishment of a school of physiotherapy for the training of physical therapists at the Mona Rehabilitation Centre in Kingston, Jamaica, to provide adequate services of physical therapy for the English-speaking Caribbean; and (2) the training of approximately 50 physical therapists over a five-year period, and such replacements as may be needed thereafter, to give adequate coverage within the economic possibilities of the

### JAMAICA-6400, SANITARY ENGINEERING EDUCATION

Few of the personnel working in sanitary engineering and environmental health programs in Jamaica have received special training in these subjects. Most of them have gained knowledge of their work only by practical experience. The purpose of this project is to improve the training of professional, technical, and auxiliary personnel working in these fields. Intensive short courses on special topics related to sanitary and environmental health engineering will be organized at the College of Arts, Science and Technology in Kingston. This project will also seek the improvement of laboratory and library facilities.

### JAMAICA-6600, DENTAL EDUCATION

This project provided assistance to the Government of Jamaica in the development of a dental auxiliary training school and a program for provision of dental care to schoolchildren.

### NETHERLANDS ANTILLES - DETAIL

### NETHERLANDS ANTILLES-2300, AEDES AEGYPTI ERADICATION

Of the six islands which comprise the Netherlands Antilles group, three (Curacao, St. Maarten, and St. Eustatius) are infested, the first heavily, with Aedes aegypti, vector of yellow fever, dengue, and hemorrhagic dengue. There is a grave risk of hemorrhagic dengue in these islands following the recent isolation of dengue Types II and III viruses in the Caribbean. Disturbances in hemovascular mechanisms were observed in cases of dengue in the Dutch Windward Islands during the 1964 and 1968 epidemics. The lack of pipe-borne water supply systems in the Windward Islands makes it necessary to store water in cisterns, tanks, drums, and barrels, all ideal breeding places for Aedes aegypti. Due to unfore-seeable increases in personnel and operating costs, funds originally budgeted for campaigns in all six islands are now inadequate, and this has delayed the start of the attack phase in Curacao.

The purpose of this project is to eradicate the vector from all six islands of the group (Curacao, Aruba, Bonaire, St. Maarten, Saba, and St. Eustatius) and thereafter to set up vigilance services to prevent reinfestation. Targets for the budget period are to move into the consolidation phase in Aruba, Bonaire, and Saba in early 1973; to complete the attack phase in St. Maarten and St. Eustatius by the end of 1973; to obtain additional funds from Holland for the campaign in Curacao; and, if possible, to begin the attack phase in that island by mid-1973.

### SURINAM - DETAIL

SURINAM-0200, MALARIA ERADICATION

Surinam has a population of 400,000. Since the inception of the malaria program in 1958, the city of Paramaribo, with 35% of the population of the country, has been non-malarious. At the end of 1970, the coastal belt with 46% of the population entered the maintenance phase, and the adjacent Savannah Zone and the Corantijn River area bordering Guyana, with 10% of the population, passed into consolidation phase in 1968. The remainder of the country, with 9% of the population, is still in attack phase, including the two malarious areas of the Upper Surinam River, and the Upper Marowijne, the Tapanahony, and the Lawa Rivers. From 1967 to 1970 the overall smear positivity rate was reduced from 7 to 2%. In 1972, 59,600 blood smears were examined with 800 found to be positive, which compares favorably with the situation in 1971 when 52,306 smears were examined with 1,546 positive.

The ultimate goal of the project is to eradicate malaria from the whole country and to maintain a malaria-free status after eradication. Specific objectives include establishment of an adequate malaria vigilance scheme integrated with the general health services in the areas in maintenance phase, and improvement of the functional structure of the eradication service and its administrative management of attack and surveillance operations.

UNICEF cooperates in this project.

SURINAM-0700, VETERINARY PUBLIC HEALTH

There is a lack of appropriate veterinary medical services in Surinam. There are only six veterinarians in the country and one of them works full-time in animal husbandry. Efforts are being made to improve knowledge on the animal health situation by improving the diagnostic capacity of the local veterinarians. In this field, a veterinary diagnostic laboratory has been established and equipped, but it is now in need of trained technicians, which are very scarce in this country.

Surinam is free of foot-and-mouth disease and is taking measures to prevent the introduction of the virus. The large population of bats and stray dogs in Surinam, together with the known presence of the rabies virus, causes rabies to be a permanent threat to the human and animal populations.

The purposes of this project are to improve knowledge on the prevalence of the zoonoses through better diagnosis and surveillance of specific diseases; to maintain the country free of foot-and-mouth disease through protective measures; to protect the animal population from rabies through the adoption of preventive measures, including legislation; and to improve food protection by defining more clearly the responsibilities in this field.

SURINAM-1000, SCHISTOSOMIASIS

Some surveys have shown schistosomiasis prevalence in Surinam as high as 75% for the age group 10-19 years, and in at least one area the rate is higher in males than in females and higher in the rice-growing families. Two species of snails were identified as vectors, <u>B. glabrata</u> and <u>B. stramines</u>, but only the former was found to be naturally infected. The health authorities in Surinam have approved a pilot control project, which is now in the process of being funded. The purpose of this project is to ascertain, by means of the pilot project, the feasibility of schistosomiasis eradication in Surinam.

## SURINAM-2100, ENVIRONMENTAL SANITATION

Existing problems in the field of environmental sanitation in Surinam, such as water supplies in the urban and rural areas, air and water pollution, industrial and food hygiene, housing and urbanization, require technical assistance.

This project will assist in the creation of an environmental sanitation unit in the Ministry of Health, including definition of responsibilities; the construction of rural water supplies with assistance from UNICEF; a review of the water pollution situation; improvement of sanitary inspection by training of inspectors and a better definition of their responsibilities; training of technicians to permit the construction of rural water supplies; and fluoridation of urban and rural water supplies.

### SURINAM-2200, WATER SUPPLIES

During 1967, 7% of all causes of death in Surinam were attributed to water-borne diseases, and gastroenteritis and schistosomiasis were the second and fourth most frequent causes of death among the infectious diseases. During 1968, 41 cases of typhoid and paratyphoid fever were reported to PAHO/WHO. In 1969, 31.7% of the population had either house connections or easy access to safe water. In 1972, 73% of the population had house connections and an additional 17% had easy access to water systems. Thirty-five per cent of the rural population were served through house connections or easy access. There are no separate municipal sanitary sewer systems in Surinam, and domestic and industrial sewage in major population centers receives rudimentary primary treatment in septic tanks before being discharged into surface or storm drains.

The purpose of this project is to carry out the research, planning, and design of water supply, sewerage, and surface drainage systems. This will enable the Government to improve sanitary conditions at urban locations, since flooding occurs several times a year. The project will also coordinate funding and construction of sewerage and drainage improvements.

## SURINAM-2300, AEDES AEGYPTI ERADICATION

The entire coastal area of Surinam is infested with <u>Aedes</u> <u>aegypti</u>, the vector of yellow fever, dengue, and hemorrhagic dengue. The overall <u>Aedes aegypti</u> house index is between 3 and 4%, but the highest infestation of about 7% is in Paramaribo. The yellow fever virus is known to be present in the interior of the country and in the northern reaches of the

			4			

Amazon basin near the Surinam-Brazil border. With the steadily increasing traffic by air, road, and river between the coastal area and the interior, there is danger of endemic jungle yellow fever becoming epidemic in the thickly populated urban and suburban districts where most of the people are not immunized against this disease.

### SURINAM-3100, HEALTH SERVICES

With a life expectancy at birth of 68.9 years, a death rate of 6.8 per 1,000 population, and an infant mortality of 39.6 per 1,000 live births, Surinam's health situation would seem to be above expectations, considering that the gross domestic product per capita in 1968 was only \$628. Since approximately half of the population live in rural areas and communications are very difficult because of geographic reasons, it is possible that inadequate reporting is one cause of these figures.

There are both positive and negative factors in the health situation in Surinam. Support from the Kingdom of the Netherlands has set a high standard for health, but this support is now being decreased and the Government of Surinam is taking over. The population concentration in a small urbanized area permits relatively easy access to health services. Communications in these areas are satisfactory. In some of the inaccessible rural areas there are well-equipped hospitals to serve the population. Specialized services are supplied in Paramaribo for patients referred from all over the country. Trained nurses are stationed in the most remote areas to supply routine care, and physicians and dentists are flown in periodically.

One of the most critical factors influencing the Surinam health picture is the lack of trained personnel. Doctors and nurses are trained in Surinam, but they frequently continue their training in the Netherlands and many of them stay there. The Government has given high priority to the preparation of health professionals and to the review of their training in the light of the needs of the country. Another area that needs attention is the field of health statistics, which until recently was staffed by a partially-trained statistician. This office has now been restructured and reports directly to the Ministry of Health. A recently established medical records department in the University of Paramaribo Hospital now provides, for the first time, statistical data on this hospital. This information has brought to light serious problems such as the lack of a full-time director, the lack of trained administrative personnel, and the absence of a clear policy regarding private practice by government physicians. The planning process in the health sector is in the preliminary stage, and the part that this sector plays in the overall development planning is minimal.

The purpose and objectives of this project are the improvement of the health services available to the people of Surinam through the delivery of integrated services by teams of adequately trained health personnel and better equipped facilities; the improvement of the infrastructure and supportive services with special emphasis on administrative methods, human resources, and health statistics; the allocation of resources as a result of a rational planning process; the training of needed health workers; and the recognition and definition of fields in which multilateral assistance is needed and the provision of channels for requesting this assistance.

### SURINAM-6200, MEDICAL EDUCATION

The Medical School of Paramaribo, Surinam, has been in existence since the beginning of this century, but it suffers from many deficiencies. First of all, it has not had enough prestige and its graduates have been considered second-class when compared with those from schools in Holland. This problem has been partially resolved through an agreement with Leyden University, which will train local lecturers in Holland and will send visiting professors from Holland. Other problems are that the School currently has no physical quarters, no full-time faculty or administration, no published curriculum, and no administrative plan. Laboratory and library facilities are very poor. There are no provisions for continuing education of local physicians, nor do they have much opportunity to attend medical conferences or refresher courses.

The purposes of this project are to improve undergraduate teaching at the Paramaribo Medical School, to adjust it to the needs and problems of Surinam, and to develop a teaching and administrative staff able to carry out the task according to the realities of the country.

### SURINAM-6300, NURSING EDUCATION

In 1972 the Government of Surinam took a census of nursing personnel in the whole country. The total number (including midwives) was 960, or a ratio of 5.4 nursing personnel per physician. Of these, 437 were graduate nurses or midwives, a ratio of 1:1.2 graduate nurses (or midwives) per auxiliary. The ratio of nursing personnel per hospital bed is 0.5, and the number of graduate nurses (and midwives) per hospital bed is 0.2. The distribution of the nursing personnel is skewed towards the city of Paramaribo, where 384 out of 437 (87.9%) graduate nurses and/or midwives can be found. Only 56 out of 437 graduate nurses (12.8%) work in other than hospitals, i.e., private practice (of midwifery), preventive services, or clinics.

There are three schools for graduate nurses in Surinam: one at the main government hospital, one at the psychiatric hospital, and one jointly at the two large private hospitals of Paramaribo. The midwifery course is given at the a'Lands Hospital, as is the course for practical nurses. No structured postgraduate courses for nurses are given in Surinam at this time; nurses must go to Holland for postgraduate education. There are very few trained nurse-tutors, and no nursing school has more than two full-time instructors. Teaching is done in great part by physicians, and the curriculum has been copied from the one of the nursing schools in Holland. There is little coordination between nursing service needs and the nursing education programs. There is no agency or department in the Ministry to plan and coordinate the training of nursing personnel. A large number of nursing personnel emigrate to other countries (mainly Holland).

The purposes of this project are the strengthening of the organization and administration of nursing schools at the auxiliary, professional, and postbasic levels; adaptation of the curricula to the needs of the health sector and to the socio-cultural situation of the country; the preparation of nurse-tutors; and the provision of postgraduate education for nurses in fields relevant to the needs and the capabilities of the country.

TRINIDAD AND TOBAGO - DETAIL

### TRINIDAD AND TOBAGO-0100, EPIDEMIOLOGY

There is inadequate information available in Trinidad and Tobago on the behavior of communicable diseases and their conditioning factors, resulting in a restricted capability to anticipate scientifically and sufficiently in advance changes in the evolution and possible effects of infectious diseases. Interdisciplinary coordination and collaboration is insufficient to provide the country with a sound epidemiological surveillance system. The recent polio outbreak (December 1971 to January 1972) demonstrates the need for such a system.

The purpose of this project is to assist the Ministry of Health in organizing, developing, and strengthening epidemiological surveillance systems which will enable them to anticipate new situations, foresee changes in the evolution of communicable diseases, recommend and evaluate control measures, and provide the needed basis for health planning and programming. The objective is a sound epidemiological surveillance program providing the bases for health planning and programming through up-to-date information on the current situation of the diseases in question, on their epidemiological trends, and on the factors that affect them.

## TRINIDAD AND TOBAGO-0700, VETERINARY PUBLIC HEALTH

Some of the animal diseases in Trinidad and Tobago are major problems not only for livestock development but also for human health and the national economy in general. The zoonoses are a significant factor in maintaining diminished livestock productivity, which persists at a level too low to satisfy the needs of the expanding population. Limited interdepartmental collaboration and coordination reduce the effectiveness of programs for the prevention, control, and eradication of animal diseases transmissible to man. Compounding the efforts to combat immediate and long-range veterinary public health problems is a shortage of trained personnel to provide veterinary medical services, plus insufficient veterinary medical education opportunities and inadequate laboratory facilities.

The purpose of this project is to stimulate the development of a veterinary public health unit within the Ministry of Health and to assist in establishing effective programs for (1) the prevention, control and eradication of animal disases, with emphasis on those transmissible to man; (2) food protection; and (3) veterinary medical education. The objective is a sound veterinary public health unit staffed with trained personnel for the planning, management and operation of veterinary medical services, with emphasis on contributing to improvement of animal health, reduction of human zoonoses cases, increased livestock development, and subsequent greater availability of protein of animal origin.

TRINIDAD AND TOBAGO-0900, POLIOMYELITIS CONTROL

The purpose of this project is to provide oral trivalent poliomyelitis vaccine (type 7 Sabin) to the Government of Trinidad and Tobago. This project is administered by the Pan American Health and Education Foundation and is financed by the Tesoro Petroleum Corporation.

## TRINIDAD AND TOBAGO-2100, ENVIRONMENTAL SANITATION

Problems in environmental health in Trinidad and Tobago fall into the following broad categories: education and training; organization and administration; legislation; planning; surveys and surveillance; and implementation. There exists among public health personnel and the general public a lack of awareness and understanding of environmental health problems, with a resulting indifference to such problems. A serious imbalance exists between the needs to be met and the adequacy of the administrative machinery to carry them out.

Existing legislation as it relates to environmental health problems is, in most cases, out-dated and insufficiently enforced. There seems to be a lack of awareness of the advantages of systematic program and project planning and a tendency to operate on "snap" decisions. Finally, present surveys and surveillance programs are insufficient in quantity and scope and are uncoordinated.

The purposes of this project are to help improve the health and socioeconomic conditions of the country by organizing, developing, and strengthening public health engineering services within the Ministry of Health, in the framework of the national development and health plans; to assess problems; to plan a comprehensive program in the various disciplines of public health engineering; and to establish standards and control practices that will meet the needs and aspirations of the people.

## TRINIDAD AND TOBAGO-2200, WATER SUPPLIES

This project provided assistance to the Government of Trinidad and Tobago in undertaking surveys of water sources and of existing water supply and sewerage facilities; in planning and designing new water supply and sewerage systems; in preparing economic and feasibility reports on these systems; and in making application to international lending agencies for financial assistance. Through its close contact with the water and sewage authority, the project also assists in the administrative aspects of the water and sewage facilities in the islands, including design, management, operation, and maintenance.

## TRINIDAD AND TOBAGO-3100, HEALTH SERVICES

The human and material resources in the health sector in Trinidad and Tobago fall short of what would be needed to provide ideal coverage. Utilization of present manpower resources is suboptimal. Inadequate coordination exists between institutions and departments, and there is a lack of clear sectoral policies. The delivery of health services to the population is low in efficiency, pointing out the need for management and administrative reforms in order to increase effectiveness and to improve productivity. Lack of preventive maintenance of facilities and equipment and absence of a maintenance and repair policy cause health care support to suffer and result in high operating costs.

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975
		~				

The purpose of this project is to advise the Government in planning and evaluating the health services in the context of socioeconomic, political, and administrative realities, in order to achieve optimum health in the community. The objective is the fullest possible coverage of the population provided by an efficient organization of integrated national health services systems adapted to the circumstances, conditions, and requirements of the country.

Up to the present, integrated medical services have been properly established in the Point Fortin pilot area and also in the Sangre Grande area. Integrated maternal and child health and family planning is progressing in several areas, notably in the Arima and Bond Accord (Tobago) pilot areas. Training activities for cytologists, public health nurses, sanitary inspectors, laboratory staff members, and administrative officers have been strengthened. For 1973-75 the project will continue to support the programmed extension of services to other areas, the training of the needed personnel, and the institutional development of the health sector.

TRINIDAD AND TOBAGO-3500, HEALTH STATISTICS

The health statistics situation in Trinidad and Tobago improved substantially during 1972 with the commitment by the Ministry of Health to the development of a health statistics information system. A health statistics service is being established, consisting of a ministry-level unit supported by trained statistical clerks at selected peripheral institutions and health facilities. A graded career structure for health statistics personnel is being established. The Data Processing Unit of the Ministry of Health, using mechanical IBM equipment, is being expanded by the addition of three new posts to accommodate health services data. In spite of these improvements, problems of quality and coverage of statistical information on the health services persist.

The registration of vital events and the corresponding data are unduly delayed and the cause of death inadequately recorded. Medical records departments of the large hospitals are critically overburdened with records for which there is neither space nor adequate filing facilities. A policy for limiting the period of record retention is imperative. Most of the small hospitals lack means of handling medical records efficiently. New forms have been designed and introduced, although maldistribution throughout the country is a problem. Records for district health services have recently been revised, but reporting procedures also need to be revised and the channels of reporting and feedback require review. The reporting of communicable diseases is incomplete and delayed, but procedures for reporting immunizations have been revised and improved.

The purpose of the project is to provide relevant, reliable, and timely information for the administration, management, and planning of health services and for research and related activities. The objectives are to stimulate the interest of senior medical officers and administrators in the utilization of statistical information about health conditions and health services; and to assist with planning and development of a health statistics information system and with the training of health statistics personnel.

## TRINIDAD AND TOBAGO-4800, HOSPITAL ADMINISTRATION AND MEDICAL RECORDS

This project provided assistance to the Government of Trinidad and Tobago in improving medical care services, in improving the organizational structure at the national, regional, and local levels, and in achieving integration of curative and preventive medical care services through adoption of a general policy at the national level.

## TRINIDAD AND TOBAGO-4900, HEALTH AND POPULATION DYNAMICS

This project provided assistance to the Government of Trinidad and Tobago in reinforcing and complementing services in family planning and maternal and child health activities and in assuring their integration into the National Health Program. Assistance was provided through advisory services and funds for contraceptives.

## TRINIDAD AND TOBAGO-4902, TRAINING CENTER IN CERVICAL CYTOLOGY

This project provided assistance to the Government of Trinidad and Tobago in establishing a center in cervical cytology and in training technicians, in improving and expanding two special diagnostic clinics and a central laboratory, and in organizing a coordination office. Fellowships were awarded to candidates from various countries in the Eastern Caribbean to study at the center.

#### VENEZUELA - DETAIL

VENEZUELA-0300, SMALLPOX ERADICATION

Assistance was provided to support a regional course on epidemiological surveillance held in Venezuela.

VENEZUELA-0700, VETERINARY PUBLIC HEALTH

In Venezuela the investigation and control of the zoonoses is of great importance. The effects of these diseases on the economy and on public health are particularly damaging because they seriously impair livestock production, and their transmission to the human population has serious health considerations. The most important zoonoses in Venezuela are rabies, brucellosis, equine encephalomyelitis, tuberculosis, leptospirosis, and hydatidosis. In addition to combating these diseases, food and meat inspection has to be revised and reorganized.

There is only one veterinary diagnostic laboratory in the country, and its staff is operating at full capacity with vaccine productions and investigations. National control programs for these diseases are at a minimum in some areas of the country and nonexistent in others. There is an acute shortage of veterinary medical manpower, including veterinary auxiliaries. The country has at present 642 veterinarians, and 6,000 are needed. Continuing education of the present veterinarians is minimal, and the distribution of the veterinary medical services is not compatible with the geographical occurrences of the zoonoses, which are causing severe animal losses resulting in serious protein losses and endangering human health.

The purpose of this project are to promote the development of national programs within the ministries of health and agriculture to bring about control and prevention of these diseases; to provide assistance to the veterinary medical services of the ministries in the design, formulation, preparation, and conduct of these national programs; and to promote and assist in the conduct of instructional programs for the continuing education of professionals.

VENEZUELA-0701, VENEZUELAN EQUINE ENCEPHALITIS

Venezuelan equine encephalitis (VEE) was first identified in 1936. Subsequent evidence indicates that it is endemic in Venezuela, Colombia, and Central America. An outbreak in 1967-68 resulted in the deaths of between 50 and 100 thousand horses and about a quarter of a million human infections in Colombia. Other separate outbreaks have resulted in 60,000 known human cases with 500 deaths in Ecuador, Colombia, and Venezuela over a period of several years. Twelve countries, from Peru to the United States of America, have experienced outbreaks. The virus of VEE has its reservoir in forest animals, is transmitted by mosquitoes, and travels in epizootic fashion through the equine population, infecting humans secondarily. Prevention of equine epizootics prevents human epidemics. Local authorities are reluctant to import existing live virus vaccine, and the efficacy of locally produced, inactivated vaccine is questionable.

The purpose of this project is to prevent equine deaths and human infections through training of personnel in laboratory and field research techniques; attempting to develop safe and effective live and/or inactivated vaccines; studying "wild" virus strains for their pathogenicity for humans and equines; and analyzing domestic and wild equine populations in respect to VEE susceptibility and population dynamics.

### VENEZUELA-2100, ENVIRONMENTAL SANITATION

Venezuela is one of the rapidly developing Latin American countries which has not yet solved its basic sanitation problems and which now must face additional burdens related to development, such as pollution. Surrounding the large cities are growing areas which need basic services such as water supply, sewerage, city cleaning services, and housing. In urban areas, 80% of the population have water supplies and 49% have sewerage services. In rural areas, 65% have water supplies and only 2% have sewerage services. Collection and disposal of solid wastes is inadequate, causing pollution of soil, water, and air. The use of pesticides in agriculture also causes pollution of soil, water and food supplies. Various cities have increasing numbers of industries and motor vehicles, and the related air pollution is aggravated by lack of adequate legislation.

The purposes of this project are to incorporate environmental sanitation activities into the integrated development programs of the country; to plan, develop, and evaluate sanitation programs; and to assist in the training of professional and auxiliary personnel.

## VENEZUELA-2200, WATER SUPPLIES

The purpose of this project is to cooperate with the National Institute of Waterworks (INOS) in the implementation of the institutional development program, which includes the strengthening of its structure, management, technical operations, and administrative practices and procedures. The objectives are to study, analyze, and evaluate the existing situation for the purpose of recommending and establishing institutional policies, criteria, standards, and practices for country-wide application and for the control of operations in order to obtain the best use of available resources, the most economical operation, and the best service possible to all sectors of the population of Venezuela. Parallel to the technical assistance program, a training program is also being developed to familiarize officials with the new techniques and systems being implemented. In 1973 INOS signed a two-year extension and has expanded the project to cover the water and sewer system for the metropolitan area of Caracas. INOS will make a contribution amounting to \$565,000 to finance this technical assistance program.

## VENEZUELA-2300, AEDES AEGYPTI ERADICATION

In the forest areas of Venezuela there are sizeable numbers of animal species which constitute a natural reservoir for yellow fever, and the presence of the vector in this and other regions is well known. This represents a potentially grave risk. In 1972 there were yellow fever cases in persons who entered these regions without being vaccinated, and vaccination of marginally exposed people has now been intensified. No cases of urban yellow fever have been notified. A large part of the country is infested with Aedes aegypti, which is resistant to chloride insecticides. In 1969 cases of dengue were reported in Caracas and other urban centers. In addition to the participation of this vector in the transmission of yellow fever and dengue, its participation in encephalitis transmission is possible.

It is necessary to reinforce epidemiological surveillance of the vector, both as to its geographic mobility and its cyclical manifestations. The program should begin with a study of the ecological behavior of the reservoir species and their major characteristics. In addition, constant observation should be maintained on fluctuations, and methods for the control and eventual eradication of <a href="Acdes aegypti">Acdes aegypti</a> should be established. In reality, the activities of this program have been limited to measures of control in the western area of the country, in the zones bordering Colombia. PAHO has undertaken a study of the situation at the regional level and held a meeting of the technical personnel involved. In view of the existing information, the group recommended that this vector be eradicated.

### VENEZUELA-2500, AIR POLLUTION

The cities of Caracas, Maracaibo, Valencia, and Maracay in Venezuela have a total of 304,000 automotive vehicles and 7,000 industries, all of which contribute to air pollution. It is estimated that the number of cars increases at an annual rate of 6,3% and that of industries at a rate of 12%. The amount of industrial waste is increasing, and the burning of trash in the open air causes increased air pollution. There are insufficient statistical data in Venezuela to properly estimate the extent of the problem. An agreement was signed in 1967 which provided that Venezuela would form part of the Latin American Air Pollution Sampling Network. There are now five air sampling stations in Caracas. It is planned to expand the Network to add 25 more stations in the urban areas of Venezuela.

The purposes of this project are to continue the collection of data in order to learn more about the characteristics, magnitude, and future potential of the contamination problem through the operation of sampling stations; to adopt, on the basis of this data, the necessary corrective measures to preserve and control the quality of the air; and to train personnel, both technical and professional, in the disciplines related to this field.

## VENEZUELA-3100, CONSULTANT SERVICES IN HEALTH

Venezuela has succeeded in raising life expectancy and in lowering both general and specific mortality rates. However, diseases that could be eradicated or reduced still contribute to both morbidity and mortality. A useful level of protection against diseases preventable by vaccination has not been reached. The health sector infrastructure has several deficiencies, among which are the following: (1) a wide dispersion of the sector, represented in 84 agencies and set forth in innumerable laws, decrees, and other legal documents; (2) lack of consistency in the population benefited and the treatment provided by various agencies; (4) primary emphasis on curative, rather than preventive, medicine; (5) a lack of plans and programs for most of the agencies of the sector and continued dependence on a traditional form of budget; (6) a lack of defined standards for the delivery of health services; and (7) inconsistencies among the various institutions in the quality of their statistical data, which are incomplete and which are not always related to the needs of the planning process. In addition, there has never been a clear and complete plan for the participation of the health sector in the economic and social development of the country.

The purpose of this project is to provide PAHO support for improvement of the level of health through the reduction of morbidity and mortality caused by certain diseases, particularly communicable ones; strengthening of the organization and resources of the sector through increased productivity and efficiency, thereby providing integrated, continuous, and opportune health care for the people; and integration of the health sector into the general development plan of the country.

### VENEZUELA-3200, NURSING SERVICES

The Ministry of Health in Venezuela is in the process of bringing about administrative reform through the development of a national health plan based on regional services through hospitals providing progressive health care. In light of these changes, the Division of Nursing would like to revise its present structure, which consists of three sections — curative, preventive, and teaching. These sections work through regional services to establish standards of care and to provide assistance to nurses throughout the country. The supervisors are all stationed in Caracas, which involves considerable travel in order to provide proper supervision.

It is estimated that there are 20,125 nursing personnel in Venezuela, 6,770 of whom are nurses. The Ministry employs 13,455 nursing auxiliaries, 7,765 of whom are trained. There has been considerable progress in the preparation of nursing personnel in the country, but there are no realistic plans for the general development of nursing in relation to the actual needs of the population, or for reorganizing the nursing structure in accordance with the plans for reorganizing the health services in general.

The purpose of this project is, in the context of the health policy and the socioeconomic development of the country, to prepare and carry out a long-term plan for the delivery of nursing care, including the preparation of the necessary human resources.

## VENEZUELA-3300, LABORATORY SERVICES

The current situation of the health laboratories in Venezuela makes it necessary to improve the structure and coverage of the services, to provide incentives to retain personnel, and to improve and increase the physical space and equipment. There are at present 156 laboratories in the country, employing approximately 500 technical personnel. Only 2% of 3 million laboratory analyses are for bacteriological and epidemiological research purposes.

The objectives of this project are to improve the national network of laboratory services, increasing their efficiency and support to the epidemiology program of the country, especially in the field of bacteriology; to strengthen the central level of the network and increase its operating capacity; to train personnel at all levels; and to standardize laboratory techniques and procedures.

### VENEZUELA-3301, NATIONAL INSTITUTE OF HYGIENE

The main functions of the National Institute of Hygiene of Venezuela are the production of biologicals for the immunization programs of the Ministry of Health and Welfare; control of drugs, foods, cosmetics, and reagents; diagnosis and research activities oriented to the field of health; and training of personnel. The purpose of this project is to cooperate in the improvement of the organization and administration of the Institute in order to successfully carry out its specific functions.

VENEZUELA-3600, ADMINISTRATIVE METHODS AND PRACTICES IN PUBLIC HEALTH

The health sector in Venezuela is comprised of some 84 official and semi-official agencies and more than 150 private institutions. Due to this fact there is a wide dispersion in legal, institutional, and financial aspects, which is detrimental to program execution because of duplication of services and increasing costs. Studies recently performed on the administrative system indicate the existence of serious functional problems in the institutions of the public subsector, such as inadequate vertical and horizontal communications; lack of intrasectoral and intersectoral coordination; deficiencies in mechanism control; absence of an expanding process of integrated planning to provide for long-, medium-, and short-range goals; the existence of various statistical systems, none of which have precisely defined the information needed at the various decision-making levels, resulting in deficiencies of varying degrees in the coverage, precision, suitability, and utilization of data; very limited application of a united program budget and weakness in its formulation and control; and deficiencies in the systems of personnel administration, accounting, maintenance, and administration of supplies.

The purpose of this project is to cooperate with the Ministry of Health and the institutions responsible for preparing and improving medical and paramedical personnel, in accordance with the general outlines set up by the government agency responsible for administrative reform at the national level, in the following areas: (1) study of administrative organization with the goal of recommending needed improvements and the procedure for establishing the structures and systems to permit improved efficiency and effectiveness in the development of health action and in the preparation and improvement of personnel; and (2) improvement of administrative systems to provide adequate support at all health levels.

VENEZUELA-4200, NUTRITION

Nutrition surveys in Venezuela have shown that protein-calorie deficiency in children under five years of age is a real public health problem, since 55.8% of this age group has some degree of malnutrition. This condition, alone or associated with digestive or respiratory diseases, accounts for the high mortality and morbidity rates in childhood. Endemic goiter, despite the iodized salt program, persists in some areas of the country, with a prevalence of 14% in school children. In rural areas, anemia is the leading cause of morbidity, mainly due to iron deficiency. Protein availability and consumption is low, especially in some age groups.

Coordination among health, agriculture, and education services is inadequate, and the National Institute of Nutrition, hampered by organizational problems, has had difficulty in assisting in the formulation and implementation of a food and nutrition policy. The objectives of this project are the establishment of a biologically oriented policy in food and nutrition and the strengthening of programs for improving nutritional status. Methods to be used include operations research, training, and action, through general health services, schools, and agricultural extension services.

## VENEZUELA-4301, OCCUPATIONAL THERAPY AND MENTAL HEALTH

In Venezuela, psychiatric care and related preventive services are limited to those provided by the psychiatric hospitals, two general hospitals, and the mental health units of health centers. Hospitals are overcrowded; there are only 5,295 psychiatric beds, of which 3,000 are occupied by chronic patients, for a population of approximately 10 million people. Community mental health services, including preventive services, are limited to a pilot center and several mental health units at the health centers. Technical personnel is scarce, especially in the fields of nursing and rehabilitation. Rehabilitation programs are limited to some occupational therapy shops, most of which are under-staffed. There is only one service with personnel graduated in occupational therapy.

The purposes of this project are to support the implementation of a national program of mental health, to train personnel in sufficient numbers, and to modernize the existing services. As a first step in the development of these goals, training in psychiatric occupational therapy will be started, new sections of occupational therapy in psychiatric services will be organized, and existing ones will be improved. In addition, it is planned to analyze existing resources and needs in the field of psychiatric occupational therapy, and to make recommendations for putting into effect a progressive program for integrating occupational therapy into psychiatric services.

## VENEZUELA-4401, CENTER ON DENTAL MATERIALS

In Venezuela, as in other Latin American countries, the principal problem in relation to dental materials lies in the absence of a system of quality control; the lack of standardization; the high costs; the limited study of production, distribution, and utilization; and the need to improve training in this field. In Venezuela there is no precise information on the quality of the dental materials that are used, nor is there sufficient data on costs, utilization, or evaluation of results.

The purpose of this project is to establish a center on dental materials which will control the quality and standardization of dental materials, promote research in these areas, and improve training related to their use at all levels.

### VENEZUELA-4500, RADIATION PROTECTION

There are in Venezuela more than 1,200 radiodiagnostic units, 38 x-ray therapy units, and 14 cobalt-60 teletherapy units. The risk of exposure to radiation, both for personnel operating the equipment, for the patients who receive the services, and for the people indirectly exposed, has not been definitively quantified; however, it is estimated that approximately 4,000 people work in this field and that the number of patients exposed could be as high as a million.

The purpose of this project is to assist in the development of a radiation protection program on a national scale. This includes protection of technical and auxiliary personnel who work with radiation sources as well as the general population and involves studies of the use of radiation, preparation of legislation and regulations, implementation of protective techniques, provision of radiation measuring equipment, and training of personnel.

### VENEZUELA-4800, MEDICAL CARE SERVICES

Medical care resources in Venezuela are not adequately utilized, due principally to a lack of coordination between the different units and services of the health sector, which decreases their productivity. There are a total of 32,632 hospital beds in the country, or three per 1,000 population, and there is a hospital bed occupancy rate of approximately 86%.

The purpose of this project is to plan and set up a system which will provide for organizational and functional integration between hospitals, health centers, and related service units, for the purpose of improved distribution and increased efficiency of the available resources.

VENEZUELA-4804, NATIONAL SYSTEM OF MAINTENANCE AND ENGINEERING OF HEALTH CARE FACILITIES

There is an accumulated deficit of current investment in maintenance of health care facilities in Venezuela, presently over 100 million bolivares, and a growing demand for maintenance related to the increase of capital investment, 10% annually in the complex system of hospital care in the country. At present, the accelerated rate of deterioration of the buildings, installations, and equipment is estimated as being over 30% loss in relation to normal life use, and there is an increase of deferred capital requirements resulting from lack of adequate maintenance. During the useful life of the hospital, and under normal conditions, a reinvestment of 129% of the initial capital is necessary to guarantee the level of service. There is a potential cost reduction identified through the project of over Bs 1,500,000 a year.

The objective of this program is to develop a national system for maintenance and engineering of hospital and health care facilities, as required by the National Plan 1970-74, in order to reduce the present rapid rate of deterioration and high loss of capital investments; to increase the effectiveness and productivity of both the capital investments and the operational investments; and to reduce operational costs. These three factors will combine to produce a better level of health care for the population of Venezuela.

## VENEZUELA-5000, REHABILITATION

There are many incapacitated patients in Venezuela who need rehabilitation treatment to provide for their physical, mental, and social readaptation. Exact statistics on the number and type of such patients are lacking; there are only indirect indicators, such as the number of hospital discharges for illnesses or accidents which require rehabilitation, the number of patients with controlled leprosy (8,869 in 1971), and the number of patients treated. The new Rehabilitation Service of the Ministry of Health treated a total of 7,254 patients during 1970. There are insufficient human and material resources in the Rehabilitation Service to take care of the physically incapacitated population. The total personnel of the Ministry of Health in its central and regional services are one director of the national rehabilitation program, nine medical physiatry chiefs of service, 19 physiotherapists, one occupational therapist, four orthetic and prosthetic technicians, one psychologist, and two social workers. In addition, there is the Cardiopulmonary Rehabilitation Service in Caracas with two medical physiatrists and two physiotherapists. Other public and private agencies administer four rehabilitation services in Caracas, which utilize physiotherapy and occupational therapy personnel and provide teaching capability for the courses in the School of Public Health. The first laboratory for orthesis and prosthesis, in Barquisimeto, was equipped through the use of private funds.

The purpose of this project is to strengthen the development of the Rehabilitation Service in Venézuela through the creation of the technical sections necessary for the integrated readaptation of patients, and the training of the required medical and technical personnel.

VENEZUELA-6100, SCHOOL OF PUBLIC HEALTH

The number of professionals in Venezuela specialized in the field of public health administration, particularly doctors, nurses, and health inspectors, is insufficient to meet the needs that confront the health sector agencies. The School of Public Health of the Central University of Venezuela has the responsibility of training these professionals. Currently, the School offers three basic training courses: public health administration, a clinical postgraduate course, and courses for paramedical personnel. These courses have brought about an administrative, operational, and teaching complexity which exceeds the capability of the School.

The purpose of this project is to assist the Government of Venezuela in the preparation of the qualified personnel needed for the efficient management of the health programs of the country through strengthening of the School of Public Health, improving its facilities, providing new teaching equipment, and collaborating in a revision of the curriculum. It will also cooperate with the School in the preparation of public health personnel – medical, paramedical, and auxiliary – in fields of public health administration, and will provide assistance in the preparation of research programs in the area of public health, especially in epidemiology and medical care.

VENEZUELA-6200, MEDICAL EDUCATION

There has been a great increase in the demand for medical studies in Venezuela. This can be demonstrated by the fact that the number of applicants in 1969 was seven times the number in 1960 (6,204 vs. 884). Although each school of medicine and each professor has been supplied with explicit educational objectives, and programs have been set up which are in accord with the medical problems and needs of the Venezuelan people, there are still curricula with extensive traditional content. There is a large deficit of teaching and research personnel in the majority of medical schools. There is also a high rate of student failures and drop-outs. Equipment and textbooks for the training program are insufficient, and there is no national plan for continued medical education.

The purpose of this project is to collaborate with the Government of Venezuela in the improvement of the quality of national medical education through revision of the curricula and teaching methods of the schools of medicine, strengthening of the departments of preventive medicine, and improvement of the administrative structures of the medical schools. It is planned to collaborate in the organization of national seminars to discuss general aspects of medical education, human relations, and medical pedagogy; to give technical assistance in the introduction of teaching of behavioral and social sciences into the medical curriculum; and to cooperate in the establishment and organization of offices of medical education charged with the planning, evaluation, and revision of teaching systems.

VENEZUELA-6300, NURSING EDUCATION

Nursing preparation in Venezuela has been heterogeneous; the number of instructors with special preparation in education is not sufficient to meet the needs, and the plans of study are traditional ones. In 1970 the Ministry of Education initiated a program of nursing in conjunction with secondary education. The duration of this program is three years, and at completion students received a nursing diploma and a secondary education certificate. To date, several in-service programs to prepare instructors have been developed, outlines for the courses have been completed, and the teaching material established for the first two years. The system of nursing education in Venezuela includes 13 schools carrying out the program in conjunction with secondary education, 11 one-year courses for the preparation of nursing auxiliaries, and two schools of nursing at the university level, with one more to initiate its program in 1973. There are also several postbasic courses in different clinical areas. There is no evidence that studies have been made of the needs and the available human resources for these programs.

FUND 1972 1973 1974 1975	FUND	1972	1973	1974	1975
		é			

The purpose of this project is to develop a system of nursing education adapted to the educational and socioeconomic needs of the country. The objectives are (1) to prepare a sufficient number of nursing professors to teach at the university, intermediate, and auxiliary levels; (2) to revise and restructure the different nursing programs with special emphasis on the new program at the secondary level; (3) to adjust the content of the various postbasic courses in nursing to meet the requirements of the health services; and (4) to update teaching methods.

VENEZUELA-6401, SANITARY ENGINEERING RESEARCH CENTER

The environment in Venezuela is subjected to two diametrically opposed types of actions: those intended for the improvement and preservation of the environment and those which cause its deterioration. The latter is a consequence of rapid population growth and industrialization. The country has not yet solved the basic problems of waste disposal and, in addition, it is facing daily the growing problems inherent in industrial development. The problems are aggravated by lack of appropriate legislation to deal with pollution of the air, water, and soil.

The purpose of this project is to cooperate in the establishment of an integrated program of investigations to protect and improve the environment, as well as in the coordination and development of the human and material resources applicable to these endeavors.

## VENEZUELA-6500, VETERINARY MEDICINE EDUCATION

Of the three schools of veterinary medicine in Venezuela, two were recently established and are experiencing difficulties due to lack of professors in the basic and clinical sciences. The teaching staff has received only limited teacher training. Development of research has not reached the level needed to support the teaching program. More emphasis needs to be given to continuing education and public service. A scarcity of veterinarians and auxiliary personnel persists in Venezuela, which has 642 professionals instead of the 1,300 required to carry out the current and proposed programs for human and animal health.

The purpose of this project is to improve training through the use of qualified teaching personnel; to increase the number of professionals; to restructure the programs of study; and to define the priorities of the teaching program. This will be done through various national seminars on veterinary medical education; through assistance to the programs of study in the schools of veterinary medicine; through individualized teaching instruction; and through the organization of programs of continuing education and public relations.

### VENEZUELA-6707, LATIN AMERICAN CENTER FOR CLASSIFICATION OF DISEASES

The Latin American Center for Classification of Diseases was established in 1955, in collaboration with the Government of Venezuela, to study problems of medical certification of causes of death and to assist in improving medical certification in Latin America. The Center provides instruction and teaching materials for coding diseases and causes of death and serves as a clearing center for problems arising in the application of the Spanish edition of the Manual of the International Classification of Diseases, Injuries and Causes of Death. The staff of the Center participates in the periodic revision of the Classification, and the preparation of the Classification in Spanish and Portuguese.

This project is a subdivision of AMRO-6707 and reflects the relationship of the Center to the programs in Venezuela.

#### WEST INDIES - DETAIL

\_\_\_\_\_

#### WEST INDIES-0700, VETERINARY PUBLIC HEALTH

In the countries of the West Indies, where more than half of the population live in rural areas in contact with domestic and wild animals and are thus exposed to the zoonoses, the study and control of these diseases is of great importance. The effects of these diseases on the economy and on public health are evident because they seriously impair livestock production, and their transmission to man has serious repercussions on human health.

The purposes of this project are to promote and aid in the development of national programs within the ministries of health and agriculture for the control and prevention of these diseases; to provide assistance to the veterinary medical services of the ministries in the design, formulation, preparation, and execution of these national programs; and to promote and assist in conducting training programs for the continuing education of professionals.

WEST INDIES-2101, ENVIRONMENTAL SANITATION (MONTSERRAT)

The purpose of this project is to provide training for public health inspectors from Montserrat at the School of Public Health in Jamaica, in order to maintain and improve the sanitation status on the island.

WEST INDIES-2102, ENVIRONMENTAL SANITATION (GRENADA)

The hotel industry is fast becoming the mainstay of the economy in Grenada. The problem of waste disposal, however, is creating serious health problems in the localities where the hotels are situated. Expert assistance is needed in developing a feasibility study and in designing a sewage collection and disposal system, not exclusively for the hotels but also for the residential districts located in the same area, which is approximately two square miles and contains eight large hotels and about 50 private dwellings.

WEST INDIES-2103, ENVIRONMENTAL SANITATION (ST. LUCIA)

The Government of St. Lucia is attempting to diversify the economy away from being basically agriculture-oriented. Tourism and small-scale industries are growing in prominence. However, there are increasing problems of disposal of agricultural and domestic solid wastes. In addition, housing developments have been established with no effective means for waste disposal. The purpose of this project is to cooperate with the Government in the planning and development of effective methods for the collection and disposal of solid wastes.

WEST INDIES-2104, LIQUID AND SOLID WASTE MANAGEMENT

With the rapid housing, commercial, and industrial development of the islands of Antigua, Dominica, St. Lucia, and St. Vincent, the problem of water and soil pollution by human and industrial waste is rapidly growing, causing a deterioration of the environment that can have very adverse effects on the health and economy of these islands. In order to cope with the problem, efforts will be concentrated on this aspect of environmental sanitation in order to develop the required infrastructure, and the technical and managerial capabilities to establish adequate systems for the collection and disposal of wastes. Urban, rural, and industrial land development should be carried out in a way that insures that proper systems are designed and built to control the wastes and that those systems are competently operated and maintained. All this requires good planning, supported by adequate legislation and financing. A well-trained staff and a high degree of informed citizen participation are the ultimate keys to a successful waste management program. The purpose of this project is to cooperate in these activities.

WEST INDIES-2200, WATER SUPPLIES

Although each water utility is at a slightly different stage of development in the six islands of the Eastern Caribbean, they all face similar problems in the areas of organization and administration, planning, education and training, construction, and operation and maintenance of water and sewer systems. The purpose of this project is to help improve the health and socioeconomic conditions of the countries through the provision of adequate quantities of piped, safe water, readily accessible to the user from facilities operated and maintained by an organization with competency in planning, design, management, and sanitary surveillance of community water supplies, giving due consideration to other essential uses of water resources.

WEST INDIES-2300, AEDES AEGYPTI ERADICATION

Grenada, St. Vincent, St. Lucia, Dominica, Antigua, Montserrat, St. Kitts/Nevis, the British Virgin Islands, and Anguilla, are all infested, some heavily, with Aedes aegypti, vector of yellow fever, dengue, and hemorrhagic dengue. In some of these islands the Aedes aegypti house index is over 70%. Any outbreaks of the above-mentioned diseases could seriously and collectively harm the tourism-dependent economies of these islands. Budgetary limitations have hindered the start of eradication campaigns in St. Kitts/Nevis and the British Virgin Islands. Heavy traffic by sea and air between these islands provides the potential for easy reinfestation of those areas from which the vector has been eradicated.

The purpose of this project is to eradicate Aedes aegypti from these islands and, on achieving eradication, to maintain them free of the vector until regional eradication has been achieved. Targets for the budget period are to complete the attack phase of campaigns in Grenada, Montserrat, Antigua, St. Vincent, and Dominica by 1973; to move into the consolidation phase in St. Lucia; to begin spraying operations in Anguilla and the British Virgin Islands; and to obtain funds for a campaign in St. Kitts/Nevis in 1973.

WEST INDIES-3100, HEALTH SERVICES

The purpose of this project is to cooperate with the various governments in the West Indies in improving the efficiency of the administrative system; providing better patient care through improvement, where necessary, of the quality and quantity of the nurses; promoting organized health planning; creating new types of health workers where necessary to solve specific problems; and increasing the number of trained personnel. Activities for the budget period include training for nurses, physicians, administrators, and other health personnel; systematic programming of maternal and child health services as a preliminary to overall health planning; and improvement of immunization programs.

WEST INDIES-3101, HEALTH SERVICES (LEEWARD ISLANDS)

Health conditions of Anguilla, Antigua, the British Virgin Islands, Montserrat, and St. Kitts-Nevis constitute an important problem in the overall development process of these countries, as indicated by a crude death rate of about 8.1; an infant mortality rate of 55.3; 29% of all deaths occur in children under five years of age; and nearly 25% of deaths at all ages are caused by infectious and parasitic diseases. The governments are aware of this situation and of the need for improving the development of health service resources.

The purpose of this project is to assist in training needed personnel, in improving administrative practices, and in modifying the basic structure of health services where necessary, thus ensuring maximum health benefits for the population.

FUND 1972 1973 1974 1975 FUND 1972 1973 1974 1975

WEST INDIES-3108, HEALTH SERVICES (GRENADA)

The population of Grenada in 1970 was 94,826. In the intercensal period from 1960 to 1970 it is estimated there was a net emigration of 17,500. The population increase over the decade was 0.6% per annum. There has been a steady decline in fertility and birth rates. Total births were 4,016 in 1960 and 2,757 in 1969. The crude birth rate dropped from 30.6 to 26.5 per 1,000 between 1965 and 1969. Infant mortality, which was 78 per 1,000 in 1960, had dropped to 40 per 1,000 in 1969. The maternal mortality was 0.7 per 1,000.

Malnutrition and gastroenteritis are still common causes of death; 1,263 gastroenteritis cases and 80 cases of malnutrition were reported in 1970. Although mortality is low from communicable diseases, morbidity is significant. There is no nationwide immunization program in operation. Health services are within easy reach of all the population - no one lives more than three miles from a medical station - but ancillary services (e.g., laboratory and radiography) are not sufficient to cover the population. Social diseases included 222 cases of syphilis and 1,518 of gonorrhea in 1970. There were 35 cases of leprosy and 14 of tuberculosis notified in 1970.

Environmental sanitation in the fields of pollution of water sources, including the coastline, and inefficient disposal of solid waste is causing some concern. Laboratory services are limited by cramped quarters at the St. George Hospital, insufficient equipment, and overloading of the service with requests from the peripheral institutions where laboratory facilities are lacking. Development of the community psychiatric program is now dependent on a specialist medical officer recently returned from overseas, and the cooperation of CIDA specialists and a ward sister recruited from Trinidad and Tobago for one year. Dental services, particularly in schools and at maternal clinics, are confined to extractions; two government dentists are conducting the program. Fluoridation of the Annandale Water Supply, to take place within the next year, will require the upgrading of dental services to obtain full benefits, and the Ministry of Health is considering the possibility of utilizing dental hygienists in their program.

The purpose of this project is the improvement of the health conditions of the community by strengthening health and sanitation services, including continuous planning, programming, and evaluation; and by training of the staff needed to serve the programs, thereby ensuring maximum health benefits for all the population.

WEST INDIES-3110, HEALTH SERVICES (BAHAMAS)

The population of the Bahamas was 168,812 in 1970, and there were approximately 1.3 million tourists. The country consists of 3,000 islands, cays, and rocks, of which 13 have settlements. The ad hoc development of health services to meet this scattered need has resulted in a concentration of resources in New Providence and the Grand Bahamas, with the remaining area receiving only basic curative services. There has been organizational separation of the curative from the public health services, and hospitals from outpatient activities. There are inadequate resources to control the environment.

The purposes of the project are to reorganize the health services so that there is economic and adequate coverage and to ensure that the environment is safeguarded throughout the Bahamas. The objectives of the project are to assist in the development of two health complexes, one serving the northern group of islands and the other the central and southern groups; to assist in the development of adequate controls for safeguarding the environment; to promote the development of an agency responsible for water services and liquid and solid waste management; and to develop an information system for management and programming.

WEST INDIES-3300, LABORATORY SERVICES

The immediate objectives of this project are to provide specialized pathological services from Dominica to Montserrat, Antigua, and St. Kitts, and to ensure the provision of sufficient staff in the laboratories of all of the seven Eastern Caribbean countries. The ultimate objectives will be to assist the four Governments mentioned above in the organization and financing of shared laboratory services; to ensure the maximum utilization of laboratory technicians; and to encourage the employment of standard laboratory methods by all Covernments.

WEST INDIES-3302, MEDICAL LABORATORY TECHNOLOGY (GRENADA)

In view of the increasing diagnosis of carcinoma of the cervix in Grenada and the lack of trained personnel for early detection through Pap smears, it is essential from a preventive point of view that laboratory training in this field be provided for appropriate staff of the General Hospital. This would provide for screening of smears with access to a central laboratory where necessary. Professional personnel to provide final diagnoses are available.

WEST INDIES-3500, HEALTH STATISTICS

In several countries of the Eastern Caribbean, health and vital statistics are inadequate to meet the needs of the planning and evaluation process, epidemiological surveillance, or research. Often basic data are unreliable and statistics are produced with considerable delay. The system for recording, reporting, and producing statistics is either nonexistent or inefficient. The corps of trained personnel needed for the records and statistical system has been dwindling, due primarily to a lack of career or promotional opportunities. In some countries, not a single person trained in health statistics or medical records remains in the health ministry. The demand for health statistics is also at a low level. Officers in the health ministries rarely call for statistics for purposes other than the preparation of annual reports.

The purpose of this project is to cooperate with the governments of the English-speaking countries of the Eastern Caribbean in the development of statistical services to ensure a continuous flow of reliable and up-to-date health and vital statistics needed for planning, administration, and evaluation of health services.

WEST INDIES-4200, NUTRITION

The area covered by this project includes St. Vincent, St. Lucia, and Dominica; the population is approximately 265,000. The major nutritional problem is protein-calorie malnutrition of early childhood, very often associated with acute infectious diseases such as gastroenteritis. Other nutritional problems are iron deficiency anemia and some riboflavin deficiency. There is no biologically oriented food and nutrition policy in the countries. Availability of protective foods is inadequate, and actual food production is difficult to determine.

Ignorance, lack of awareness of good nutrition and its relation to health, high cost of food, poor sanitation, and insufficient water supplies appear to be important factors in the high prevalence of malnutrition found. There is a lack of trained nutrition personnel, especially qualified nutritionists/dietitians, which helps to prevent progress in combatting these problems. Public nutrition education and information, particularly for high risk groups, is a great need. Food services in institutional facilities are inadequate in most respects, from management and organization to nutrition and sanitation. Supplementary feeding programs in the area do not follow any definite plan: administration is poorly organized, criteria for selection of recipients is lacking, and little or no nutrition education is given in accompaniment.

The objectives of this project are to improve the nutritional status of the population, with emphasis on vulnerable groups, through the services of well-trained personnel, integration of nutrition into educational institutions and health services, and increasing the awareness of nutrition in relation to health and productivity at all levels; to encourage the establishment of at least one nutritionist-dietitian post in each country; and to develop adequate food services in institutions concerned with the health and care of individuals.

UNICEF cooperates in this project.

WEST INDIES-4300, MENTAL HEALTH

To serve a population of 660,000 in the eight countries of the Eastern Caribbean there are three qualified psychiatrists and 1,298 mental hospital beds. There are serious weaknesses in diagnosis, an almost complete absence of facilities for rehabilitation and after-care of patients and, with the exception of Barbados, a general lack of trained psychiatric nurses. There is an urgent need for in-service training of medical practitioners in psychiatry and the adoption of a standardized classification of psychiatric diagnoses to facilitate regional studies and assistance.

The immediate objectives of this project are to assist the Government of St. Vincent in the development of community mental health services, utilizing local human resources, especially public health inspectors, for field work; and to utilize the St. Vincent program as a model in assisting Dominica and the other Covernments in the development of community mental health services.

WEST INDIES-4800, MEDICAL CARE AND HOSPITAL ADMINISTRATION

The project serves seven of the Eastern Caribbean countries (St. Vincent, St. Lucia, Dominica, Antigua, Montserrat, St. Kitts-Nevis-Anguilla, and the British Virgin Islands). Most of the hospitals of these countries are administered by the respective ministries of health, with a system of limited delegation of administrative authority down to the hospital level. Fiscal policy is controlled by the ministry of finance and personnel policies are retained by a civil service comission and a department of establishment, thus limiting the administrative authority vested in the ministries of health.

FUND 1972 1973 1974 1975	FUND	1972	1973	1974	1975
				~	

Governments have recently recognized the need to decentralize in order to introduce the element of accountability into the administrative process at the functional level. Unfortunately, such innovations may require difficult and time-consuming constitutional changes. Several governments have expressed interest in utilizing PAHO/WHO assistance in revising hospital legislation in order to provide a sounder legal framework for administrative and organizational structures.

The purpose of this project is to cooperate in the development of modern and efficient organizational structures and administrative procedures for each hospital or hospital group within the countries of the Eastern Caribbean.

WEST INDIES-4811, HOSPITAL ADMINISTRATION IN GRENADA

In Grenada there is the General Hospital with 250 beds, plus other public health institutions with another 430 beds. Technical and medical staff are available, but there is difficulty in obtaining a person with the necessary administrative experience to serve as hospital administrator. Assistance is required in supervising the hospitals and assisting in in-service training while a national is sent abroad for training in hospital administration.

WEST INDIES-4812, HOSPITAL ADMINISTRATION IN ANTIGUA

The only hospital in Antigua is the 210-bed Holberton Hospital, which does not have a full-time qualified administrator. The Government, realizing that this situation was unsatisfactory, approved the new post of superintendent in 1970. However, there is no one locally available with the necessary qualifications to fill this post. Assistance is needed in providing a lay administrator for the hospital and in providing advice and training in hospital management to accelerate reorganization of the hospital and establishment of proper procedures.

WEST INDIES-4900, HEALTH AND POPULATION DYNAMICS

Due to the expanding programs of comprehensive maternal and child health and family planning in the West Indies, a need has arisen for the expansion of advisory services in nursing-midwifery. The purpose of this project is to promote the most efficient use of nursing personnel in maternal and child health and family planning programs. Technical advisory services will be available to the countries of the region, and training programs will be sponsored.

WEST INDIES-6302, TRAINING OF NURSING AUXILIARIES IN THE CAYMAN ISLANDS

For the total population of 10,200 in the Cayman Islands, there are 46 hospital beds and one clinic; all five positions for doctors are filled. Of the available 24 nursing positions, 48% are filled with untrained nursing personnel. Until 1972 no nursing personnel were produced locally. The first course for training nursing assistants was completed in June when 11 participants graduated. Two fellowships were awarded to prepare nurses for teaching and administrative positions.

The purpose of the project is to improve the nursing services and to develop a comprehensive system of nursing. The objective is the development of a local training program to prepare 30 nursing assistants (10-month course) by June 1974 and to train seven professional nurses abroad by 1976.

CUBA - DETAIL

CUBA-0100, COMMUNICABLE DISEASE CONTROL

The purpose of this project in Cuba is to cooperate in the reduction of morbidity and mortality from tetanus, diphtheria, whooping cough, measles, tuberculosis, and infectious hepatitis, through an organized program of immunizations. Since the beginning of the program in 1965 there has been a clear diminution in the incidence of tetanus, diphtheria, and tuberculosis. In 1971 the following cases were registered: 11,276, measles; 1,543, tuberculosis; 361, whooping cough; 174, tetanus; and 0, diphtheria. The objective of the program for 1973 is to cover the population under 15 years of age with immunizations as follows: under 6 years, 80% with DPT and BCG; ages 7-9, BCG 70% and DT 80%; and ages 10-14, BCG 70% and DT 70%.

UNICEF cooperates in this project.

CUBA-0700, ZOONOSES CONTROL

The purpose of this project is to cooperate with the Government of Cuba in the reduction of sources of rabies, brucellosis, tuberculosis, and toxoplasmosis for man, through the control of the incidence and prevalence of these zoonoses in animals. There have been an average of 15 human cases of brucellosis annually and in 1971 there were four human cases of rabies in the country.

#### CUBA-2100, ENVIRONMENTAL SANITATION

In Cuba various problems in samitation exist because of inadequate disposal of solid wastes, lack of control of vectors capable of transmitting diseases, and contamination of the soil, water, and food from extensive use of pesticides. The purposes of this project are to cooperate in (1) the study of specific problems in solid and industrial waste disposal in order to find more adequate methods; (2) laboratory studies to determine the sensitivity/resistance of certain vectors to various insecticides and to provide adequate techniques in the use of such pesticides; (3) a study of standards and regulations for the use of pesticides and laboratory methods for control; and (4) training of personnel.

#### CUBA-2200, WATER SUPPLIES

According to the 1970 census, there are 160 localities in Cuba with water service (76% of the urban population) and 227 localities without such service. Sixteen localities have sewerage systems for service to 41% of the urban population and 371 communities lack such service. The water supply systems of 28 cities of appreciable size, including the capital, need improvements in their installations since they have surpassed design capacity.

The purpose of this project is to cooperate in the adequate maintenance of existing water supply systems in order to avoid progressive deterioration; in the expansion of both water supply and sewerage services to meet requirements of an increasing population; in the adoption of efficient and economical methods for treatment of liquid wastes from cities and industries; in the improvement of laboratory facilities for the control of water quality; and in the training of personnel.

#### CUBA-2300, AEDES AEGYPTI ERADICATION

The purpose of this project is to cooperate in the eradication of <u>Aedes aegypti</u> and in the integration of the eradication campaign into the general health services in Cuba. Voluntary labor is used efficiently to apply insecticides. Up to mid-year in 1972, 500,000 houses of the principal urban centers were treated with insecticides (Abate). It is estimated that 890,000 houses will be treated during 1973-74.

#### CUBA-3100, HEALTH SERVICES

The purpose of this project in Cuba is to cooperate in the improvement of general health services, in the administrative structure of hospital institutions at all levels, and in the development of specialized services with priority at the national level. The following statistics indicate the health situation in the country in 1970: general mortality, 6.2 per 1,000 population; births, 28 per 1,000 population; infant mortality, 38.4 per 1,000 live-births. The short-term objectives are to develop activities in the fields of administration and organization of hospitals, in rehabilitation, in nursing and statistics, in production and distribution of pharmaceutical products, in mental health, in training of human resources, and in evaluation of health services.

### CUBA-3300, LABORATORY SERVICES

The purpose of this project is to cooperate with the Government of Cuba in the improvement of the National Institute of Hygiene, Epidemiology, and Microbiology, which has responsibility for setting standards, for teaching, and for controlling 77 laboratories distributed throughout the country. The objectives of the 1970-79 decade include training of 198 microbiologists, 65 chemists, and 185 technicians; the creation of 154 diagnostic laboratories; the organization of services for taking care of laboratory animals; the revision of laboratory techniques and methods presently in use; and the investigation of epidemiological and microbiological problems as they arise.

# CUBA-3301, MODERNIZATION OF LABORATORY SERVICES

National production of biological products in Cuba does not completely satisfy the needs of national programs of immunization and control of communicable diseases. The purpose of this project is to collaborate in increasing the production capacity of biological products in order to satisfy the demand for them. The objectives are to produce annually 56,000 doses of smallpox vaccine, 2 million doses of BCG vaccine, 2 million doses of typhoid vaccine, 8.1 million doses of tetanus toxoid, 4.1 million doses of diphtheria toxoid, 2.6 million doses of pertussis vaccine, 6 million units of rabies antiserum, 2.5 million units of tetanus antitoxin, 70 million units of diphtheria antitoxin, 25,000 ampoules of gangrene antitoxin, 56 kg of gamma globulin, and various other sera, culture media, and reagents.

#### CUBA-4100, MATERNAL AND CHILD HEALTH

In a total population of about 8.5 million in Cuba, some 232,000 births were registered in 1970. Infant mortality in the same year was 38.6 per 1,000 live births, and more than 90% of the births took place in health institutions. The maternal mortality rate was 0.7 per 1,000 live births. Rapid expansion of pediatric and obstetrical services has created a necessity for increasing the number of persons available with specialization in maternal and child health.

The purpose of this project is to cooperate in achieving a reduction of 50% in the infant mortality rate within 10 years. Project activities include programming maternal and child health services at the national level; programming care for pregnant women at birth and immediately after, as well as for newborn and premature babies in a selected number of maternity centers; and establishing a network of centers for care of mothers and infants, as well as infant recuperation centers and premature clinics.

UNICEF cooperates in this project.

### CUBA-4200, NUTRITION

In 1970 it was estimated that in Cuba the average daily diet had 2,250 calories, with 45 grams of protein, half of which was of animal origin. Serious cases of malnutrition, those if Grade III, are rare (0.5% in those under seven years of age); some 25% of these same children had Grade I malnutrition and 5% Grade II. In some zones the prevalence of goiter in the school population reaches 10%. The prevalence of diabetes in the general population is about 5.5%. A survey has shown inadequate percentages of calcium and vitamin A in the foods being consumed.

The purpose of this project is to cooperate in the formulation and implementation of a national food and nutrition policy hrough periodic surveys to determine the nutritional status of the population and its food habits; creation of a mechanism for coordinating the activities of the various entities with responsibilities in the food supply process; structuring technical groups charged with conducting nutrition programs at all levels; creation of a school of nutrition and dietetics at the university level; and strengthening of training programs for physicians and nutritionists.

#### CUBA-4300, MENTAL HEALTH

Psychiatric services in Cuba are concentrated in Havana, and there is a plan to decentralize activities to two new centers, Camaguey and Holguín. A system of community mental health services is being developed to provide care through clinics and dispensaries that are subsidiaries of hospital psychiatric services. The purpose of this project is to cooperate in the training of professional personnel.

### CUBA-4600, INDUSTRIAL HYCIENE

The purpose of this project is to cooperate with the Government of Cuba in the strengthening of national industrial hygiene programs. Its principal objectives are quantification of occupational health problems in the principal industrial centers of Cuba; identification of atmospheric contaminants in urban localities; and training of personnel.

#### CUBA-4700, FOOD AND DRUG CONTROL

In Cuba various basic drugs and medicaments are manufactured and industries are being developed to provide food for local consumption as well as for exportation in some cases. The purpose of this project is to cooperate with the Government in the establishment of a national authority for the control of the quality of foods and drugs.

### CUBA-6200, DEVELOPMENT OF HUMAN RESOURCES

The purpose of this project is to cooperate with the Government of Cuba in formulating and carrying out a plan for the development of human resources in health, within the general health plan. The plan will encompass a determination of the quantity of human resources presently available in the various health professions and categories and the identification of requirements, as well as utilization of human resources both available and necessary according to present needs and conditions in the country. The plan will include an increase in the number of teaching institutions and their supplies and equipment; modernization of systems of organization and administration of teaching institutions; revision of plans of study and modernization of pedagogical techniques; better access to textbooks and bibliographic materials; and expansion of the services to be employed in the training of teachers and research personnel.

### CUBA-6400, SANITARY ENGINEERING EDUCATION

Cuba needs to increase the number of adequately trained sanitary engineers and auxiliary personnel to promote, organize, and carry out the environmental health programs of the country. The purpose of this project is to cooperate in the training of teaching personnel responsible for the sanitary engineering program in the University of Havana and other institutions; in the review of curricula of sanitary engineering teaching; in the organization and development of short courses in specialized topics; in the improvement of laboratory, reference, and teaching facilities; and in the promotion of applied research in this field.

#### DOMINICAN REPUBLIC - DETAIL

\_\_\_\_\_\_

#### DOMINICAN REPUBLIC-0200, MALARIA ERADICATION

In 1966, the National Malaria Eradication Service in the Dominican Republic was reorganized. It received adequate financial support, and a plan of operations was begun. Transmission was interrupted in all of the national territory except in the area bordering the Pedernales, where the incidence is declining. By the end of 1972, 79% of the country (with 90.4% of the population) was in the maintenance phase; 13.4% (with 7.1%) was in the consolidation phase; 6.3% (with 2.5%) in the area bordering Raiti was in the attack phase; and in 1.8% (with 0.7% of the people) there was no malaria. In 1972, a study of 392,394 blood samples turned up 261 cases, 66 of which were autochthonous.

In 1973, spraying will continue in two frontier counties (Pedernales and Elias Piña), where 5,000 houses will be sprayed in 155 localities and epidemiological surveillance will be maintained. Five of the seven counties in the attack phase will pass to consolidation, and eight of the nine counties in consolidation will pass to maintenance. Joint activities with the general health services will continue in Samitary Regions I and II and will begin in Regions III, IV, and V. In 1974, depending on epidemiological conditions, spraying will be carried out in areas of foci and will terminate with the transfer of surveillance activities to general health services.

#### DOMINICAN REPUBLIC-0400, TUBERCULOSIS CONTROL

In the Dominican Republic in 1970 tuberculosis was certified as the cause of 1.0% of all deaths and 5.0% of deaths due to communicable diseases, with a mortality rate of 6 per 100,000 and a morbidity rate of 41.8 per 100,000. The purpose of this project is to diminish morbidity and mortality from tuberculosis by a control program through which the following objectives can be reached: collection of basic information, design of statistical forms and records, revision and updating of standards, and organization of several antituberculosis dispensaries. In 1972 the program was implemented in rural areas in the province of San Cristóbal. BCG vaccinations have been given to 173,210 children under 15 years of age. Sixty-four local medical service directors and epidemiologists, as well as 12 nursing service directors, have received basic training. In 1974-1975, the organization of the program will be consolidated at the central and local levels and will be gradually extended to the rural areas.

DOMINICAN REPUBLIC-2100, ENVIRONMENTAL SANITATION

In the Dominican Republic the population is predominantly rural (60.2%), and it is estimated that only 5% have access to a sanitary waste disposal system. The purpose of this project is to collaborate with the Government in the development of a plan of rural sanitation, installing 30,000 latrines in four years in selected areas of the country, with preference for the areas included in the National Plan for Rural Water Supplies. In the period 1971-72 a total of 13,200 latrines were built, and a revolving fund was established to finance a long-term plan. In 1973, 8,400 latrines will be installed in the provinces of San Cristobal and Peravia, and in 1974, 8,400 will be built in the provinces of San Juan de la Maguana, Barahona, and Bahoruco.

### DOMINICAN REPUBLIC-2200, WATER SUPPLIES

In the Dominican Republic 55% of the urban population have house connections to water supply systems and 16% have connections to sewerage systems. In the rural population only 15% have water services. The objectives of this project for the years 1974 and 1975 are to provide water services to 62% of the urban population through the National Plan for Urban Water Supplies, and to provide sewerage services to 17% of that population; to provide water supplies to 25% of the rural population, carrying out the second stage of the National Plan for Rural Water Supplies through the construction of 180 systems in 1973-74, beginning in 1975 on the third stage which calls for the construction of 220 aqueducts; to improve the structure of the National Institute for Water Supplies and Sewerage Services through organization at the zone and local levels; to promote a policy of economic self-sufficiency through adequate water rates; and to continue the training of professional and auxiliary personnel.

### DOMINICAN REPUBLIC-3100, HEALTH SERVICES

In the Dominican Republic, where 80% of the population receive services of the Secretariat of Health, the health structure is not completely developed. Communicable and parasitic diseases continue to produce high mortality rates, and diseases preventable by vaccination cause 8.3% of all deaths. The country has a high rate of growth, 2.9% in 1971. There is a maternal mortality rate of 1.2 per 1,000 live births and an infant mortality rate of 63.9 per 1,000 live births. In order to increase the present institutional capacity, the Secretariat of Health has under way a program of constructing or remodeling six hospitals, 11 health centers, and 29 rural clinics. The administrative units are in the process of organization, and the training of personnel has increased through in-service education programs and postbasic courses.

The purpose of this project is to improve health services through regionalization of the country and through extension of health services to rural areas, utilizing personnel from general health services and from the malaria eradication program. In 1973 regionalization will be started, planning and developing Health Region II and simultaneously developing regional epidemiological services, with special attention to epidemiological surveillance, strengthening of diagnostic laboratories, and vaccination of the population against preventable diseases. In 1974 the regionalization will continue, setting up Health Region II, and in 1975 Health Region III will be established.

UNICEF cooperates in this project.

#### DOMINICAN REPUBLIC-4200, NUTRITION

In the Dominican Republic protein-calorie malnutrition contributes to high morbidity and mortality rates in children under five years of age. About 75.4% of this group suffer from some degree of malnutrition, 26.6% from moderate to severe malnutrition. The availability of food on a national scale demonstrates deficiencies in calories, protein, vitamin A, and riboflavin. The objectives of this project are to improve the nutritional status of the population through integrated action of health, agriculture, and education sectors by means of a food and nutrition council, which will be governing agency for national policy in this field; to organize nutrition services; to promote, develop, and produce foods of high protein value and low cost; to carry out nutrition education and publicity activities; and to train the required nutrition personnel.

### DOMINICAN REPUBLIC-6201, DEVELOPMENT OF HUMAN RESOURCES

The number of professionals in the various categories of the health sector in the Dominican Republic is insufficient to meet the demand. To provide human resources at the university level there are two schools of medical science which provide all the courses related to the health sciences. Nursing education is provided by two schools, one of them a university, and there are three teaching centers, branches of the Secretariat of Health, for the training of auxiliary nursing personnel.

The Universidad Autónoma de Santo Domingo set up a new plan of university organization which divided the existing schools, incorporating the School for Medical Sciences into the health sciences sector. It also designed a project for the organization and development of the Office of Education and Planning for the sector, which started operating in 1972. The process of adaptation of the health sciences sector will continue in 1974. The academic curriculum for nursing studies in the country will be revised and reestablished in order to prepare personnel at different levels in three- or four-year programs.

### DOMINICAN REPUBLIC-6400, SANITARY ENGINEERING EDUCATION

The Dominican Republic does not have enough professional sanitary engineering personnel to carry out its environmental sanitation programs (five sanitary engineers per 100,000 people). The purposes of this project are to improve the civil engineering courses at the university level, including in them sanitary engineering subjects; to train professional personnel now in service through intensive short courses; and to promote applied research activities. In the civil engineering school of the Universidad Autónoma de Santo Domingo there has been an evaluation and amplification of these fields of study. In 1974-75 two short courses will be given each year in a program of continuing education. The laboratories will be provided with additional equipment, and the process of improving the plan of studies will continue.

DOMINICAN REPUBLIC-6600, DENTAL EDUCATION

This project provided assistance to the Government of the Dominican Republic in the development of curricula for the training of professional and auxiliary personnel in the two dental schools of the country.

HAITI - DETAIL

HAITI-0100, COMMUNICABLE DISEASE CONTROL

The prevalence of syphilis and yaws in Haiti was estimated to be more than 51% of the general population in 1950. Following an eradication campaign based on penicillin injections, this disease is now in the pre-eradication phase. There still persist a low but undetermined number of cases, with some degree of focalization. Apart from the yaws, malaria, and small-pox programs, communicable diseases in Haiti have not received specialized epidemiological attention, in spite of their importance, especially tuberculosis, leprosy, and umbilical tetanus.

The main purpose of this project is to eradicate yaws by 1975. Specific objectives include elimination of each focus of known transmission; extension of evaluation coverage in order to determine the location of each active focus; modernization and reorientation of concepts and practices in the fight against communicable diseases, particularly tuberculosis, tetanus, smallpox, and leprosy; protection, principally through vaccinations, of the most vulnerable groups of people; reform, extension, and improvement of the activities of vaccination teams, providing them with equipment and sufficient funds; utilization of available human resources to improve the diagnosis and understanding of leprosy in rural areas; and reorientation of the organizational structure to integrate more effectively the central epidemiological levels and the operational activities in the field of communicable diseases.

## HAITI-0200, MALARIA ERADICATION

Haiti has a territory of 27,750 km<sup>2</sup>, with a malarious area of 19,100 km<sup>2</sup> and a population of 3.7 million. Protection measures include the application of DDT to 800,000 houses twice a year. In some areas, additional measures, such as an extra cycle of spraying, drainage, larviciding, and distribution of antimalarial drugs, are also carried out. During 1972 six cycles of aerosol spraying of malathion ULV were applied in the Miragoane Lake area for experimental purposes. Despite these efforts, disease transmission continued during the major part of the year, with intensified outbreaks as a result of heavy rains and hurricanes, such as the one that struck the Southern Peninsula and produced an epidemic of 8,943 cases.

Of the total of 560 rural sections into which the country is divided, only 52, with 10% of the total population of the malarious area, have a high transmission potential. A total of 25,961 cases of malaria were registered in 1972, based on 313,368 blood examinations, and 17,853 of them (68.7%) were from these high-potential sections. In 1971 there were a total of 11,316 cases based on 270,288 examinations.

UNICEF cooperates in this project.

## HATTI-0700, VETERINARY PUBLIC HEALTH

The prevalence of zoonoses problems in Haiti is unknown because of the lack of veterinarians in the country. Rabies is endemic, particularly in Port-au-Prince, but it apparently does not constitute a problem since there have been only 29 human cases reported in 15 years. According to available data, the most common zoonoses in 1970 were anthrax (23 cases) and leptospirosis (16 cases). There is no zoonoses control program, with the exception of some vaccination against anthrax in areas of high prevalence in the country. On the other hand, there is adequate inspection of the slaughterhouse at Hampco. There is as yet no department of zoonoses in the Ministry of Public Health; the only active program is that for rabies control in Port-au-Prince.

The purpose of this project is to cooperate in the creation of a veterinary section which can, in coordination with the Ministry of Health, determine the extent of the existing zoonoses problems in Haiti and develop control procedures.

## HAITI-2100, ENVIRONMENTAL SANITATION

The health of the people is greatly affected by poor environmental sanitation conditions. In Haiti there has been very little progress in providing water supply and sewerage services. Other excreta disposal systems are very scarce, and the collection and removal of liquid and solid wastes is limited. As a result, gastrointestinal and diarrheal diseases rank high in the causes of death in children, and the high incidence of intestinal parasites constitutes a grave health problem.

The purpose of this project is to extend urban and rural sanitation services. The immediate objective is to construct 10,000 latrines in Mirebalais before 1975.

## HAITI-2200, WATER SUPPLIES

By the end of 1972 only 16% of the urban population was served by house connections or with adequate water supply systems. In the rural areas there was not a substantial number of people adequately served with water supply. Only a small part of the capital city is provided with sewerage, and sanitary facilities for excreta disposal in rural areas are almost nonexistent.

The purposes of this project are (1) to proceed immediately with rezoning and with the installation of pipes for secondary distribution of water supply in the metropolitan area; (2) to begin in 1973 the construction of the second phase of expanding and improving the urban water supply, to be financed with an IBD loan; (3) to improve the distribution systems in the cities of the interior; and (4) to prepare a broad program for supplying water to semiurban and rural communities.

#### HAITI-3100, HEALTH SERVICES

A great number of statistical indicators demonstrate that there is a very poor state of health in Haiti. Among these are the following: life expectancy was estimated to be 47.5 in 1970 and it is anticipated that it will be 50.0 in 1975 and 52.5 in 1980. The general mortality rate is 16.9 per 1,000 inhabitants. The infant mortality rate is 146 per 1,000 in the births. The proportion of deaths from unknown or ill-defined causes is large. In the area of morbidity, estimated on the basis of hospital admissions, communicable diseases cause over 30% of admissions, with the leading causes enteritis and other diarrheal diseases, pneumonia, typhoid fever, tuberculosis, and infectious hepatitis. Twenty-three per cent of hospital admissions were children under five years of age, and 28.7% were related to pregnancy and childbirth.

In addition, it is estimated that 70% of children under five are malnourished, 10% severely so. Professional personnel in the field of health are extremely scarce: for each 10,000 inhabitants there are 0.8 doctors (only 10 physicians have had a course in public health) and 0.85 graduate nurses. In the country there are only three samitary engineers, three veterinarians, four professional nutritionists and one intermediate-level health statistician. Physical and technical resources are also insufficient. There is practically no health structure. The severity of the lack of resources is increased by inadequate utilization of those that are available.

The purposes of this project are (1) to promote a better state of health of the people, primarily through the improvement of the use of existing resources and through an increase in resources as soon as possible; (2) to establish technical standards and procedures to be applied on a national scale in all health units, with emphasis on the four priority areas of malnutrition, diarrhea, pulmonary tuberculosis, and tetanus of the newborn, and on preventive medicine measures; (3) to improve technical and administrative efficiency through training and motivation of personnel, adequate decentralization, and strengthening of the health structure by developing regional demonstration projects of integrated health care; and (4) to establish adequate management procedures and practices and better statistical information systems, all in agreement with the national health policies and plans.

UNICEF cooperates in this project.

# HAITI-3105, PUBLIC HEALTH SERVICES

The purpose of this project is to strengthen and develop the health services in the region of Les Cayes in cooperation with national and international agencies. The main objectives are to control communicable diseases, to improve environmental sanitation (provision of drinking water, construction of 10,000 latrines); to improve the population's nutritional

FUND 1972 1973 1974 1975	FUND	1972	1973	1974	1975

status (70% of children under four years of age suffer from malnutrition); to accelerate the training of medical and paramedical personnel, especially auxiliaries; to expand the medical care coverage of the region; to equip and organize the Hospital des Cayes so that it may serve as a reference center for the health centers of the region and complement their activities; to improve health and hospital statistics; and to develop a statistical system suitable for use throughout the country. Health education for the public will be an important part of all activities. This project will serve as a demonstration and training area.

#### HAITI-4200, NUTRITION

The average diet in Haiti provides only 1,700 calories and 41 grams of protein (7.1 of animal origin) per capita/day. The problem is very serious in preschool children, with a prevalence of kwashiorkor of about 7%. In addition, the situation is aggravated because of a high prevailing rate of infectious and parasitic diseases and a high fertility trend. The situation is more serious in the rural zones, while in Port-au-Prince there is more medical assistance and better availability of foods.

The purpose of this project is to improve the nutritional status of the most vulnerable groups of the population through better utilization of available resources. The objectives are to educate and inform the population on sound food practices in order to increase the consumption of better foods; to evaluate the most effective means of carrying out nutrition education activities; to study the epidemiological aspects of nutritional deficiencies and possible solutions; to expand supplementary feeding programs for mothers and children of all ages; and to participate with other sectors in developing an integrated food and nutrition program in selected rural areas of the country.

UNICEF cooperates in this project.

# HAITI-4900, HEALTH AND POPULATION DYNAMICS

Due to high infant and maternal mortality, a high population growth rate, and limited resources, the Government of Haiti recognizes the need for the development of a comprehensive maternal and child health and family planning program. The purpose of this project is to assist in the development of such a program and to provide technical and material assistance. Maternal and child health and family planning services will be included in selected hospitals and health centers in Portau-Prince and later extended to rural areas.

#### HAITI-6200, MEDICAL EDUCATION

The medical school in Haiti is unable to meet the needs of the country because of problems in the areas of facilities, educational program, and examinations. The facilities include antiquated laboratories with so little equipment as to be of almost no use, and a library that is as yet not functioning adequately, in spite of the fact that the number of students has increased from 48 in 1960 to almost 200 in 1970. In addition, lack of concrete educational objectives and of periodic examinations of the results of the program of studies have held back improvements. There is also a grave problems of emigration from the country of many of its medical school graduates.

The purpose of this project is to improve (1) the work facilities for the medical education program; (2) the system of examinations in the medical school; and (3) the medical training, in order to meet the needs of Haiti and to follow modern trends in this field.

## HAITI-6400, SANITARY ENGINEERING EDUCATION

Sanitary engineering education in Haiti is included in one section of the School of Sciences of the National University, but in practice it is only a part of the second-year course of studies in civil engineering. Only two hours of sanitary engineering are offered per week, and there are no suitable laboratories except for two portable units for physical and bacteriological examination of water. However, the Central Metropolitan Water Authority (CAMEP) permits the use of its laboratory. The purposes of this project are to expand and improve sanitary engineering education in the School of Sciences, and to develop short intensive courses for professionals and technicians.

MEXICO - DETAIL

MEXICO-0200, MALARIA ERADICATION

Mexico has a population of some 51 million inhabitants, approximately half of whom live in areas where there is risk of contracting malaria. In 1972 a revision of program strategy in the malaria campaign was accepted by a group of national officials and international advisers, based on WHO recommendations. The population in the areas of risk are divided into 46.4% in the consolidation phase and 53.6% in the attack phase. In the application of control measures, priority has been given to the Gulf of Mexico and the Yucatan Peninsula. The chief antimalarial measure has been the use of DDT in twice-yearly sprayings, although in limited areas sprayings have been applied four times a year. The epidemiological situation has responded well to these measures, except in one area where the program was interrupted by the campaign against an outbreak of equine encephalitis.

In the suburbs of Acapulco, application of insecticides is complemented with antilarval treatment of mosquito breeding places. The vectors are susceptible to insecticides except in the Rio Balsas valley, where 20% of the localities studied since 1963 have had vectors (A. pseudopunctipennis) which are resistant to DDT, and 53% have shown intermediate susceptibility to the same insecticide. However, vectors in these areas are susceptible to malathion and propoxur. The number of blood sample examinations in the whole country was 1,889,877 in 1970; 2,859,256 in 1971; and 2,329,667 in 1972. The number of registered cases showed a considerable decrease in these three years, from 61,158 in 1970 to 42,978 in 1971 and 26,216 in 1972.

MEXICO-0710, RABIES CONTROL: MEXICO-UNITED STATES BORDER

Rabies has been a serious problem along the United States-Mexico border for a number of years. To intensity the attack against the disease, the Government of Mexico and PAHO signed an agreement in 1966 for carrying out a control program. Having completed the attack phase, the program is now in the surveillance and maintenance phases and is expected to continue for another five years, with the ultimate goal being elimination of canine rabies in the border area. New methods of program evaluation are being developed, which are being coordinated with the effort to integrate the program into the local health services of the Mexican border cities.

In addition to rabies, other zoonoses problems such as the arbovirus group (VEE), parasitic zoonoses (cysticercosis), and brucellosis, exist in the border area, which will require increased surveillance and control. There is also a need for improvement in veterinary medical education and public health training for veterinarians in the border area. Since this is an intercountry project, the cooperating agencies include the health and agriculture authorities of both Mexico and the United States of America, as well as the United States-Mexico Border Public Health Association.

This project was formerly designated AMRO-0710.

## MEXICO-2100, CONTROL OF ENVIRONMENTAL POLLUTION

There are two emerging sanitation problems in Mexico: the contamination of water as a consequence of the discharge of municipal and industrial waste water, and the contamination of the air by industry and automobiles. In addition, the soil is subject to pollution from inadequate disposal of solid wastes and from the increased use of pesticides in agriculture.

In order to resolve these problems, the Government in 1970 passed a federal law to prevent and control environmental contamination; in September 1971 it approved regulations for the prevention and control of environmental contamination originating in smoke and dust; and in January 1972 the Subsecretaria del Mejoramiento del Ambiente was added to the Secretaria de Salubridad y Asistencia. PAHO will cooperate with the various federal, state and municipal agencies in the control of contamination of water, air, and soil, as well as in the preparation of the professional and auxiliary personnel needed for this activity.

## MEXICO-2102, IMPROVEMENT OF THE ENVIRONMENT

The purposes of this project are to assist the Government of Mexico in coordinating programs of prevention and control of contamination, and improvement of the environment. It provides for preparation of the specialized technical personnel needed in the country; basic research; analysis of current conditions and definition of problems; training of technical and administrative personnel; studies on the effects of contaminants on health; and dissemination of technical information.

MEXICO-2200, WATER SUPPLIES

Mexico had an annual rate of increase of urban population of 4.77% during the past decade. The present urban population is estimated to be 32,300,000. By December 1972, 68% of the urban population had water supplied by house connections and 48% had sewerage service. The authorities hope to reach a coverage of 80% in the area of water supplies, while the goals for sewerage services are being revised.

The main objectives of this project are to attain a better coverage of water and sewerage services, on both a short- and a long-term basis; to revise the standards for design, construction, operation, and maintenance of the systems; to make provisions for these systems to become self-financing; and to train the required professional and auxiliary personnel.

MEXICO-3100, HEALTH SERVICES

The long-term objectives of this project are to reinforce the general health services in Mexico through provision of specialized consulting services and the training of technical and auxiliary personnel; to extend the benefits of public health to rural and suburban populations; to develop the health planning process; and to assure the integrated functioning of the entire health infrastructure in the country.

The short-term objectives are to train 500 people each year in different specialized fields, and 15 people each year outside the country; to plan, execute, and evaluate health programs for rural and suburban populations; to provide two courses each year in health planning; and to establish departments of planning in each of the state headquarters for coordinated health services.

MEXICO-3107, HEALTH SERVICES IN CHIAPAS

An agreement to provide a program of socioeconomic development in Altos de Chiapas, Mexico, was signed in September 1971 by the Covernment of Mexico, FAO, UNESCO, UNDESA, UNICEF, and PAHO/WHO. The general purposes of the program are to aid in the solution of the socioeconomic problems which affect the family, the children, and the youth and to incorporate these programs into the general development plans for the country, and to promote integrated community development through programs which take into account the actual situation in the region and which have the technical quality, continuity, and flexibility for extension in the future.

In the area of health, the long-term objectives are to improve the level of health and nutrition of the people, especially of the most vulnerable groups, through a health plan which will give particular emphasis to maternal and child health, communicable diseases, environmental sanitation, and health nutrition education at the family level. For the short term, the objectives are the planning of a complete health system in Altos de Chiapas; coordination with state agencies working in this area; and implementation of the objectives set forth in the plan of operations of the general agreement.

UNICEF cooperates in this project.

MEXICO-3108, FIELD OFFICE: UNITED STATES-MEXICO BORDER

The programs of the Field Office in El Paso concern health problems along the frontier of the United States of America and Mexico. The objectives are (1) to stimulate and promote joint study and planning of health activities of the frontier localities in order to assist in strengthening the local services on both sides of the border and to permit the development of coordinated programs to deal with health problems of geographic areas; (2) to assist in the interchange of epidemiological and related information between frontier health authorities; and (3) to serve as the secretariat for the United States-Mexico Border Public Health Association.

This is a joint project with United States of America-3108, and the posts are listed under that project. The two projects were formerly designated AMRO-3108.

MEXICO-3301, TRAINING CENTER IN IMMUNOLOGY

The Mexican Research and Training Center in Immunology was established in 1969. Its principal objectives are research, training of personnel, publication of scientific documents, and coordination of activities from the various laboratories which participate in the country's immunology program. The Research Unit's department of immunology and the blood bank, both agencies of the National Medical Center of the Mexican Social Security Institute, have been included in the educational program. Through its association with the graduate school of the Instituto Politécnico Nacional, the Center can grant master's and doctor's degrees in immunology.

#### MEXICO-3302, VACCINE PRODUCTION

The purpose of this project is to provide assistance to the Government of Mexico in establishing the capability of producing live oral poliomyelitis vaccine. The domestic requirements for Mexico are in excess of 12 million doses per year. The ultimate goal is to have a production capacity that will provide all of this and in addition will allow for extra production for other countries in the Region, should they need it. To date production has been limited to the Type I polio strain. Six batches have been produced and are now undergoing control testing. Production of Types II and III strains is expected later this year.

During the course of this project, the development of a continuous flow perfusion tissue culture apparatus is being undertaken. This apparatus, when completed, could enhance considerably the efficiency of providing this vaccine and possibly others as well. The goal is to produce, within a two-year period, an apparatus capable of large-scale production.

#### MEXICO-3303, NATIONAL HEALTH LABORATORIES

The purpose of this five-year project is to assist the Government of Mexico in modernizing the eight national health laboratories responsible for production of vaccines and sera, sanitary control of food and drugs, diagnosis for control of infectious diseases, training of personnel, and research into public health problems. Specific objectives include improving the existing organization and facilities of the national health laboratories; increasing the quantity of biologicals produced by the Government and providing adequate vaccines, sera, antigens, and reagents for the control of infectious diseases; incorporating new techniques to improve the potency of biologicals, increase their shelf life, and upgrade their quality to the level demanded by international standards; expanding and modernizing facilities for laboratory diagnosis and for testing and control of biologicals, food, beverages, and drugs; expanding the training and specialization facilities for the professional and technical staff of the national health laboratories; facilitating basic and applied research; and improving laboratory services and their centralization.

# MEXICO-4800, MEDICAL CARE AND HOSPITAL ADMINISTRATION

The purposes of this project are to put into effect an integrated medical care plan to cover a large part of the population of Mexico; to develop new models of individual and group medical care, experimenting with various combinations of health teams; to provide for the development of related services, especially statistics and accounting systems; to set priorities for programs of physical expansion of medical services; to coordinate the activities of various agencies; and to obtain community participation in carrying out these activities. This project will cover medical, teaching, and related fields.

#### MEXICO-4900, HEALTH AND POPULATION DYNAMICS

Mexico is concerned with changing urban-rural patterns and migration of its population. The city of Huixquilucan has been chosen for an intensive sociodemographic study as a pilot-model designed to develop measures and approaches to the understanding of population dynamics. The purpose of this project is to obtain sociodemographic data over an extended period to determine patterns of population change, including measures of mortality, morbidity, fertility, and migration. The University of Wisconsin has been collecting data for the past five years and expects to continue its cooperation in the project.

## MEXICO-5000, REHABILITATION

FELLOWSHIPS-SHORT TERM

The Government of Mexico initiated in 1971 an extensive six-year program of rehabilitation, utilizing the principal rehabilitation institutes, all of which are divisions of the Secretariat of Public Health and Assistance. It is estimated that in Mexico there are 250,000 people who are victims of some form of paralysis, 75,000 with amputations, 50,000 blind, and 500,000 with defective hearing.

The Government will develop a training program to provide the medical and paramedical personnel needed for rehabilitation services, as well as for services to blind children and to people with locomotor disabilities, impaired communication, non-locomotor medical problems (cardiac, pulmonary, and others), and for social and vocational rehabilitation. It is anticipated that other interested agencies will collaborate with PAHO in this effort.

MEXICO-6100, DEVELOPMENT OF HUMAN RESOURCES

The purpose of this project is to collaborate with the Government of Mexico in the planning, organization, and development of courses for the training of health personnel at various levels. It will include health manpower studies and the strengthening of basic professional education, with special emphasis on the preventive and social aspects of the practice of medicine, as well as the improvement of postgraduate education. It will stress the need for a greater integration of the different professions in the field of health and also of the schools and health services, with the goal of providing greater harmony between medical training and the needs and resources of the population to be assisted.

## MEXICO-6233, LATIN AMERICAN CENTER OF EDUCATIONAL TECHNOLOGY FOR HEALTH

This project aims to increase the efficiency of the educational process in the field of health, through research and development of new educational methods and models; to adapt the characteristics of the learning process to distinct situations in the countries; and subsequently to prepare instructional materials adequate to the needs. It will deal primarily with Mexico and will gradually include other countries of the Region, providing technical assistance for the improvement of educational methodology, acquisition of equipment, and organization of offices or departments of health sciences education

This project was reported as Mexico-6200 in the Financial Report of the Director.

## MEXICO-6300, NURSING EDUCATION

Training in nursing in Mexico is provided at three levels: nurse, nursing technician, and auxiliary. Five per cent of the nursing schools require secondary education as a prerequisite (11 to 12 years), 89% require nine years of schooling; and 6% require only a primary education (six years). The student population includes about 11,000 in schools of nursing and 1,000 in technician training; no data are available on training of auxiliaries. Seventy-two per cent of the schools are headed by physicians and 36% do not have nurses in the teaching staff. There are postbasic courses in teaching and in clinical specialties, and a complementary course for the bachelor degree in nursing.

The objectives of this project are (1) to increase the number of students and to improve the quality of preparation for work in the three levels of the nursing program; (2) to increase the number of teachers prepared in the various areas of nursing; (3) to strengthen existing postbasic programs and to create new ones in accordance with established priorities; and (4) to reformulate plans of study and introduce new educational technology for the different levels of teaching.

#### MEXICO-6400, SANITARY ENGINEERING EDUCATION

The accelerated population and industrial growth in Mexico has caused a strong demand for water and sewerage services, and an increase in pollution has resulted. The Government has specific plans for the extension of the water and sewerage systems to a large proportion of urban and rural inhabitants, as well as for stricter controls for protecting the environment. All of these plans will require training of additional personnel, as well as further training for those already working at the different levels. The purpose of this project is to cooperate with five Mexican universities in strengthening training in sanitary engineering through short courses, fellowships, grants, provision of materials for laboratories and libraries, and applied research.

## MEXICO-6500, VETERINARY MEDICINE EDUCATION

The Government of Mexico estimates that 6,000 veterinarians are needed to meet its present requirements and that only 2,500 now practice in the country. There are at present eight schools of veterinary medicine with 3,000 students, but these must rely on low budgets, and they have a high rate of student dropouts, averaging about 25%. In addition, only four of the eight schools offer training in preventive medicine and public health, while 70% of the veterinarians work for state agencies which require professionals to be trained in these fields. For these reasons, the purpose of this project is to provide assistance to the Government of Mexico to improve and develop training in preventive medicine and public health in the schools of veterinary medicine, and at the same time to train the professors who will be responsible for these courses.

BELIZE - DETAIL

BELIZE-0200, MALARIA ERADICATION

All of Belize, with 128,000 inhabitants, was originally considered malarious. Forty-one per cent of the population live in the District of Belice, and this area is in the consolidation phase, while the other five districts, with 59% of the population, are in the attack phase. Transmission was almost completely interrupted in the years 1969, 1970, and 1971, when only 28, 33, and 33 cases, respectively, were reported. In 1972 the number of cases rose to 86 in the whole country, due to an outbreak in a new locality that was not included in the surveillance activities of the program. There were 48 cases in August alone, when the outbreak was discovered. Due to the reestablishment of transmission in this area and to the vulnerability and receptivity of some zones, preventive measures must be maintained.

UNICEF cooperates in this project.

#### BELIZE-2100, ENVIRONMENTAL SANITATION

Belize, underpopulated for its size, has 64% of its land under heavy forest, while the north and coastal plains are flat and low-lying. This causes serious problems for environmental sanitation because the terrain makes it very difficult and costly to provide adequate and safe water, sewerage, and solid waste disposal systems. In 1972, 45% of the total population benefited from water supplies, only 28% by house connections. Only 35% of the total population have suitable arrangements for the sanitary disposal of sewage: 4% of the urban population are served by public sewers, and there are a number of septic tanks for individual establishments; 66% of the rural population are served by latrines.

The purpose of the project is to improve the standard of environmental sanitation throughout the country. The objectives include revision and preparation of plans for the individual areas of sanitary engineering activities; integration of these plans with the national socioeconomic development plans; training of personnel of all categories working in the field of environmental sanitation; promotion of community participation in environmental sanitation programs; cooperation with the national water authority in economic feasibility studies and design of water and/or sewerage projects; and execution and evaluation of programs as they are formulated by the respective authorities.

## BELIZE-2300, AEDES AEGYPTI ERADICATION

The Aedes aegypti mosquito was declared eradicated from Belize in 1956, and there have been no cases of yellow fever in man in Central America since 1954. However, because of the presence of this mosquito in El Salvador, Costa Rica, and Honduras since 1965, an active surveillance program is necessary in Belize, which is in direct communication with some of these countries by aircraft and sailing vessels. The purpose of the project is to prevent a reinfestation of Aedes aegypti and to be geared for immediate eradication activities should reinfestation occur.

BELIZE-3100, HEALTH SERVICES

Belize has a number of inherent problems which do not contribute to the development of adequate health services. It has a relatively small population for its size and this results in a scarcity of human resources. Those that are trained cannot be adequately sustained by the low level of economic activity and tend to emigrate.

About 64% of the land is under rain, savannah, and mangrove forest, and a large portion of the coastal area of the north and east are flat and low-lying. This leads to difficulties in providing adequate and safe water supply systems and sewage and solid waste disposal. As a result, there is a high incidence of dysentery, enteritis, and other diarrheal diseases, leading to a high demand for hospital and outpatient treatment for these causes.

The country has a good nucleus of health facilities to meet its demands, with a hospital and a basic health center located in each district and a number of rural health centers at strategic points throughout the country. The shortage of trained professional, administrative, and paramedical personnel, together with the extreme scarcity of financial resources, prevents full utilization of those facilities and retards development of the health services.

The purposes of the project are to prepare a national health plan which relates to the available resources and is integrated with the national socioeconomic plan; to combat infectious diseases by organizing adequate immunization programs; to support the program for maternal and child health care, including family education on responsible parenthood; to institute a formal program for medical attention, laboratory support, and adequate statistical services; and to train professional and paramedical personnel at all levels, including administration.

UNICEF cooperates in this project.

BELIZE-4100, MATERNAL AND CHILD HEALTH

Demographic information reveals that the birth rate in British Honduras is 40 per 1,000, and there are 22,000 children under five years of age. Infant mortality was 46 per 1,000 live births in 1969. Twenty-nine per cent of the deaths were children under one year of age. There are only 16 nursery schools for children of preschool age, and no national authority assumes full responsibility for the training and care of these children, many of whose mothers are at work during the day.

The purpose of this project is to improve the welfare of the preschool child in the areas of health, home, and institutional care and education. The objectives, all related to the preschool child, include setting up an integrated program for planning, coordination, and execution of the activities necessary for adequate care; formulating national policies on the provision of services; establishing schools and improving existing ones for proper overall care; organizing education programs to provide better understanding of care and protection, as well as the importance of such care to healthy development; organizing adequate health care and immunization in both urban and rural areas; and coordinating and executing activities of the official food and nutrition policy.

UNICEF cooperates in this project.

BELIZE-6400, SANITARY ENGINEERING EDUCATION

The small population and the paucity of financial resources in Belize make it impracticable to have a university or special center for the formal training of professional and paramedical personnel, except in nursing. This has resulted in a shortage of fully trained personnel in the field of sanitary engineering and environmental sanitation. The purpose of the project is to assist the country in creating conditions leading to the strengthening of the education of personnel working in the environmental sciences, in establishing a program of continuing education for these personnel, and in applying new methods of training of persons employed in this subsector.

### COSTA RICA - DETAIL

#### COSTA RICA-0200, MALARIA ERADICATION

In January 1971 Costa Rica initiated a new five-year plan for the eradication of malaria. The plan includes the application of two grams of DDT per square meter twice a year, and spraying with OMS-33 in localities with vectors resistant to DDT in areas in the attack phase; surveillance activities in areas in the consolidation phase; investigation and radical cure of all registered cases; and mass distribution of antimalaria drugs in selected areas.

In 1971 the population of the original malarious area was 567,713, of which 31.3% resided in areas in the consolidation phase and 68.7% in areas in the attack phase. In 1972, 92,600 dwellings in the area in the attack phase were sprayed semiannually and 4,900 dwellings quarterly.

In 62 localities in the Pacific area, 8,100 dwellings were sprayed in three cycles with propoxur. In addition to the spraying activities in the areas in the attack phase, it was necessary to apply DDT in 5,471 dwellings in a consolidation area because of cases discovered there. The number of cases of malaria has decreased considerably, from 4,443 in 1967 to 350 in 1970, 257 in 1971, and 159 in 1972. Recent epidemiological investigations indicate that 39% of the notified cases were imported from outside the country.

UNICEF cooperates in this project.

COSTA RICA-0400, TUBERCULOSIS CONTROL

In 1971 mortality from tuberculosis in Costa Rica was 6.2 per 100,000 inhabitants and morbidity 22.7 per 100,000. Of the cases diagnosed, 93.5% were treated and 76.3% of these were hospitalized. It is estimated that 82% of the population under 15 years of age have been vaccinated with BCG. In 1972, 78.9% of newborn children were vaccinated.

The objectives of this project are to increase tuberculosis control coverage, incorporating the activities into the general health services; to train health services personnel in this program; and to reduce the costs of hospitalization by increasing ambulatory treatment. The goals of this project are to reduce the index of tuberculosis mortality by 80% in the group of children under 15 years of age; to vaccinate with BCG 80% of those susceptible to the infection; to diagnose 50% of the estimated incidence; and to treat 90% of the newly discovered cases.

### COSTA RICA-2100, ENVIRONMENTAL SANITATION

The purpose of this project is to cooperate with the Government of Costa Rica through the Ministry of Public Health and the Instituto de Fomento y Asesoría Municipal in the improvement of sanitary conditions through the formulation and execution of plans and programs in the field of environmental sanitation. Specific activities will be carried out during the next three years in defining the national policies and in executing programs for resolving the problems of solid waste in the urban areas of the country. In the next four years 100,000 latrines will be installed through a program financed by the municipalities of the country. Other activities are being planned in the fields of occupational health, industrial hygiene, and food control.

### COSTA RICA-2200, WATER SUPPLIES

In spite of the fact that Costa Rica is one of the countries having a very high percentage of the population served with water, the systems are deteriorating due to age and are becoming insufficient to meet the needs of a growing population. In order to resolve this situation, the Servicio Nacional de Acueductos y Alcantarillado (SNAA) is carrying out water and sewerage projects in the five principal cities of the country at a cost of \$10 million. External financing is to be arranged so that in the next five years expansion and improvement in the water systems of 14 other cities can be carried out, and sewerage systems in another five cities can be constructed at an approximate cost of \$21 million.

The objective of this project is to continue advisory services to SNAA on the programming, execution and operation of water and sewerage programs.

### COSTA RICA-2300, AEDES AEGYPTI ERADICATION

The purpose of this project is to cooperate with the Government of Costa Rica in the reorganization of the Aedes aegypti eradication program in the area of Puntarenas on the Pacific coast, where the mosquito has been discovered; in inspections of areas ecologically favorable for  $\underline{\Lambda}$ , aegypti; in perifocal treatment of houses as well as wastelands; and in establishing surveillance activities.

### COSTA RICA-2500, AIR POLLUTION

In 1971 the first air sampling station in Costa Rica was installed in the Ministry of Public Health in San José. The results obtained indicate that the presence of these contaminants in the atmosphere is within permissible limits.

The objective of this project is to advise the Ministry of Public Health on air pollution control programs. During 1973 attention will be given to the supply and operation of equipment to measure emissions from automotive vehicles and to the installation of a second air sampling station.

COSTA RICA-3100, HEALTH SERVICES

In Costa Rica, estimated life expectancy is 67.8 years. In 1972 the crude birth rate was 31.5 per 1,000 persons; the general mortality rate is 5.9 per 1,000; and the infant mortality rate is 56.5 per 1,000 live births. Thirty-eight per cent of deaths occur in children under five years of age and 43% in the population 50 years and over. Infectious and parasitic diseases cause 19.7 of deaths. The group of communicable diseases controllable by vaccination represents 4.2 of the total deaths. The investment by the Government in health programs is 5.34% of the gross national product.

The objectives of this project are (1) to increase life expectancy from 67.8 years in 1971 to 71 years in 1980; (2) to reduce general mortality 5.5 per 1,000 by 1980, the infant mortality rate to 41.8 per 1,000 live births, and mortality of children under five years from 46% to 35.4% of the total deaths; (3) to reduce the index of mortality from poliomyelitis by 100% in children under 14 years of age; from diphtheria, whooping cough and tetanus by 80% in all ages; from tuberculosis by 80% in children under 15 years of age; to eradicate measles, malaria, and the vector of urban yellow fever; and to raise the immunization level of the population against diseases controllable by vaccination through (a) implementation of the National Health Plan; (b) enforcement of the General Health Law once it is approved; (c) improvement of the overall infrastructure of the health sector with emphasis on the rural areas; (d) improvement of the administration of health services; and (e) integration of health services at the local level.

UNICEF cooperates in this project.

COSTA RICA-3104, RURAL HEALTH

In Costa Rica 65.6% of the population live in rural areas; 51.1% live in localities with less than 2,000 inhabitants; 48% of the population are under 15 years of age; 17.6% of deaths are due to infectious and parasitic diseases; 57.4% of the population under five years of age suffer from some degree of malnutrition; and 45.8% of deaths occur without medical care. Wide areas lack permanent health services, and 15% of the population have no access to these services.

The purposes of this project are to extend the coverage of basic health services to the rural areas of the country through the development of an adequate infrastructure for health services, utilizing simple techniques and procedures that are easily applied by auxiliary personnel with a short period of training and some supervision; to obtain community participation in the activities of this program; to increase the level of immunization to 80% of the susceptible population for communicable diseases preventable through vaccination; to provide latrines for 100% of rural houses in areas where this program is being developed; to improve environmental sanitation; to provide basic assistance to these people; and to train auxiliary personnel for this program.

COSTA RICA-3300, LABORATORY SERVICES

Costa Rica has 138 health laboratories, 85 of which are under the Ministry of Public Health. In this last group, one is the central laboratory and acts as a reference laboratory for the whole system. The objectives of this project are expansion and improvement of the structure and organization of the Department of Laboratories; improved utilization of available resources; increased efficiency of laboratory services, both in quantity and quality; and establishment of a network of health laboratories at different operational levels in order to expand the coverage of laboratory services.

COSTA RICA-3700, HEALTH PLANNING

The purpose of this project is to strengthen and reorganize the Office of Health Planning in Costa Rica in order to meet the conditions of the National Health Plan, and to advise the sanitary districts and health organizations in the programming and application of the National Health Plan. Some of the objectives are to establish norms and techniques; execute and coordinate the activities of the National Health Plan; advise the Ministry of Public Health on the establishment of a national health policy; maintain an adequate information system, including statistics; and establish a process of evaluation on a national scale.

The latest studies on the nutrition problem in Costa Rica indicate that 57.4% of the population under five years of age suffer from various degrees of malnutrition. There is a prevalence of hypovitaminosis A, endemic goiter, and iron deficiency anemias in pregnant women.

The purpose of this project is to improve the nutrition conditions of the population through activities of prevention and recuperation directed toward high-risk persons, and also to promote greater participation of the family in nutrition matters. The activities being developed include nutrition education, supplementary feeding, school and family gardens, and local training meetings for personnel in this field.

COSTA RICA-4500, HEALTH ASPECTS OF RADIATION

Radiation exposure in Costa Rica arises out of the utilization of 286 diagnostic x-ray machines, 4 orthovoltage x-ray therapy machines, 2 megavoltage cobalt-60 teletherapy units, 1 x-ray and 2 cobalt-60 units used for research, 305 milligrams of radium, and an approximate annual radioisotope consumption for diagnosis, treatment, and research purposes of 5 curies. As a direct result of their professional activities, 909 persons are exposed to radiation and an additional 2,680 persons are exposed due to their employment in the vicinity of radiation sources.

The objectives of this project are to study the risks to those persons who are occupationally exposed and to the public; to adopt necessary protective measures; to revise and improve existing legislation; to initiate a personnel radiation dosimetry service; and to train the staff needed to operate an effective radiation protection program.

COSTA RICA-4800, MEDICAL CARE SERVICES

In 1970 the rate of hospital discharges in Costa Rica was 11.1 per 100 persons. The principal causes of hospitalization were childbirth, enteritis, accidents, and pneumonia and bronchitis. The rate of medical consultations in 1970 was 2.1 per person.

The objectives of this project are to promote technical integration among the health and social medical assistance organizations; to promote intrasectoral coordination; to improve the organization of statistical and administrative systems of hospital services; to improve hospital engineering and maintenance; to establish a national system of cost accounting; and to promote the training of personnel to build up the hospital directing team.

COSTA RICA-4900, HEALTH AND POPULATION DYNAMICS

The population growth in Costa Rica was estimated to be 2.8% in 1971. High rates of morbidity and mortality occur: maternal mortality of 1 per 1,000 live births, infant mortality of 56.5, and perinatal mortality of 30.9 per 1,000 live births. In 1971, 78.9% of deliveries were in hospitals, which facilitated the development of a program which, beginning with maternity, covers a potentially high risk population with services of maternal and infant protection and family planning.

The objectives of this project are (1) the development of activities of education and motivation in family planning in postpartum, abortion, and gynecological wards; (2) increase in the coverage of prenatal services, including information on family planning; (3) assistance to national programs of family planning through intrahospital activities; (4) increase in the users of family planning among women in the childbearing ages, particularly the younger ones; and (5) development of a statistical system.

COSTA RICA-6200, MEDICAL EDUCATION

The majority of health science professionals in Costa Rica are concentrated in the capital. For every 10,000 persons there are 5.5 physicians, 1.4 dentists, 2.7 pharmacists, 0.9 microbiologists, and 6.3 nurses. The objectives of this project are to strengthen the basic professional education of doctors, dentists, microbiologists, pharmacists, and nurses, with emphasis on public health aspects, and to contribute to the integration of the teaching of health sciences in the different schools of the University of Costa Rica.

COSTA RICA-6300, ADVANCED NURSING EDUCATION

The purpose of this project is to strengthen the educational programs in nursing and nursing midwifery in Costa Rica, to adapt them to the requirements of the National Health Plan, and to incorporate these programs in the systems of higher education of the country. An evaluation of the School of Nursing was made, and its incorporation into the University was recommended, including the following programs: (a) bachelor in nursing; (b) nursing technician; and (c) specialization in clinical nursing.

The goals for 1973-1975 are to reorganize the existing educational programs in order to raise them to the University academic level; to design curricula for new programs; to organize a nursing unit in the University; to strengthen the preparation of administrative and teaching personnel; and to expand and improve the nursing facilities and resources in order to meet the targets of the Ten-year Health Plan for the Americas as they relate to nursing manpower.

COSTA RICA-6400, SANITARY ENGINEERING EDUCATION

The national institutions responsible for environmental sanitation programs in Costa Rica are experiencing difficulties in obtaining the required professional personnel for the execution of their programs. The School of Engineering of the University of Costa Rica is making modifications in its teaching programs, adapting them to the needs of private enterprise and official organizations. The purpose of this project is to assist the School of Engineering in training, investigation and coordination between the University and the organizations responsible for sanitary engineering programs.

### COSTA RICA-6700, BIOSTATISTICS EDUCATION

Since 1966 an annual course on medical records and statistics has been given, originally in the Ministry of Health, and beginning in 1971 in the School of Medicine of the University of Costa Rica. Twenty students attended the five-month course in 1972, 10 from Costa Rica and 10 from other countries (Bolivia, El Salvador, Guatemala, Honduras, Mexico, Panama, and Paraguay). The purpose of this project is to train specialized personnel at the intermediate level in medical records and hospital statistics in order to improve records and hospital statistics not only in Costa Rica but also in the other countries of the Region that send students to the course.

#### EL SALVADOR - DETAIL

### EL SALVADOR-0100, EPIDEMIOLOGY

Communicable diseases in El Salvador produce 40.9% of registered deaths from known causes, 22.9% of hospitalizations, and 34.0% of outpatient visits to health services. There is a shortage of epidemiological personnel and auxiliary testing facilities to support diagnosis, and epidemiological notification is inadequate. The objective of this project is to assist in reducing the problem through improved organization and strengthening of the Division of Epidemiology and its branches, training of personnel, and program planning in the areas of execution and evaluation of the activities of control and notification of communicable diseases.

### EL SALVADOR-0200, MALARIA ERADICATION

El Salvador covers a total area of 21,149 km², 18,656 (88%) of which are considered to be originally malarious; this area has a population of 3.2 million people. All of the originally malarious area is in the attack phase of the malaria program, although only 53% of its territory and 59% of its population benefit from specific antimalarial measures. In areas where the vector is susceptible to DDT this insecticide is applied as a measure of protection for 436,000 inhabitants, with the result that the current status there has been maintained without serious deterioration. In Rio Lempa and Golfo de Fonseca, where the vector is resistant to chlorinated insecticides, spraying houses with propoxur every three months is utilized for the protection of 335,000 inhabitants. Between Rio Lempa and the Guatemalan border partial spraying with propoxur is carried out every 35 days.

In 1972 there was an appreciable decrease in the number of cases in the Departments of Usulutan, San Miguel, and La Unión. However, the problem of resistance to DDT on the part of A. albimanus still exists in the central part of the coastal strip (Departments of Usulutan, San Vicente, La Paz, and La Libertad), where the same vector is resistant to propoxur. In 1972, 38,355 cases were discovered in 394,935 blood samples throughout the country; in 1971 there were 46,858 cases in 414,331 examinations.

UNICEF cooperates in this project.

### EL SALVADOR-0216, RESEARCH ON THE EPIDEMIOLOGY OF MALARIA IN PROBLEM AREAS

The objective of this project is to develop improved methodology for the interruption of malaria transmission in problem areas. For the past several years standardized attack measures with chlorinated hydrocarbon insecticides have been ineffectual in preventing malaria in areas of Central America because of physiological resistance and the vector's avoidance of contact with insecticides. Similar problems are encountered to a lesser extent in other countries of the Region. An operational field trial in El Salvador with the carbamate insecticide propoxur in the late 1960's demonstrated its potential for preventing transmission by total house spraying. Because of the high cost of the insecticide, field trials were initiated in 1970 to determine if similar results could be achieved more economically by only partial spraying of houses. Preliminary results are most promising, and protocols for its use in national programs are being developed.

Future activities will consist of evaluating the effectiveness of other candidate insecticides, including OMS-597, which has successfully passed the preliminary criteria of the WHO Program for Evaluation of New Insecticides, and alternative attack measures. The project is being conducted in cooperation with the Government of El Salvador. Seminars will be conducted in 1973 and 1974 on advanced epidemiology and improved methodology of antimosquito measures.

### EL SALVADOR-2100, ENVIRONMENTAL SANITATION

There are numerous environmental sanitation problems in El Salvador that require attention from the Government and assistance from PAHO. Water supply and sewerage services are still needed in many of the urban areas and for most of the rural population. Water, air, and soil pollution are becoming increasingly important in view of the size of the country and the rapid industrialization and urbanization processes. Food sanitation remains a serious problem despite efforts made in past years. Training of personnel, both professional and auxiliary, is a continuing activity of this project.

The purposes of this project are to strengthen the national program of environmental sanitation, especially in the rural and urban water supplies area; to increase the coverage of waste disposal systems, particularly in the rural sector; to create or expand the controls intended to eliminate or diminish contamination of the atmosphere; to improve the control of food and food-producing establishments; to train personnel; and to supervise and evaluate the programs in progress.

### EL SALVADOR-2200, WATER SUPPLIES

It is estimated that at present 73% of the urban population of El Salvador have water supplies through house connections or public fountains and that in the rural sector, which comprises 60% of the population, about 35% benefit from these services. It is imperative that water supply coverage be increased through (1) revision of the water-rate structures to provide for self-financing of services provided; (2) international loans (i.e., form the Inter-American Development Bank) and a larger share in the national budget for water systems; (3) community participation in the construction and maintenance of rural water supply systems; and (4) improvement of water quality control activities.

All of this implies improved organization and an expansion of the operating capacity of the Division of Environmental Sanitation of the Ministry of Health, which is charged with the construction of rural water systems with IADB financial assistance. Training of personnel and revision of standards and procedures are also required.

### EL SALVADOR-2500, AIR POLLUTION

Since 1970 an air-sampling station has been operating in El Salvador as part of the Pan American Air Pollution Surveillance Network. The reason for its installation was the rapid growth of the city of San Salvador and the possibility of

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975

a resulting increase in air pollution. The information supplied by the station backs up this supposition, and it is now necessary to take appropriate preventive measures.

The purposes of this project are to continue the operation of the station and to obtain the necessary information to determine what preventive measures are required.

### EL SALVADOR-3100, HEALTH SERVICES

The level of health in El Salvador, evaluated in 1970 by various indicators, is unsatisfactory: general mortality was 9.9 per 1,000 people and infant mortality 66.6 per 1,000 live births; 43.8% of all deaths were children under five years of age. Intestinal and other diarrheal diseases, together with bacillar dysentery and dysentery and amebiasis, totaled more than one-fifth of all deaths. Malnutrition and avitaminosis were among the 10 main causes of death, an indication of the nutrition problems in the country.

A measure of morbidity by outpatient consultations indicates that the country provided only 0.52 of these services per person per year, one-third of which were given by Social Security. The largest number of consultations (40%) were for infectious respiratory diseases, digestive disorders, and parasitic infestations; prenatal and postnatal examinations accounted for another 6%. These statistics indicate that there is inadequate health coverage and that preventive programs are very limited and deficient.

The purpose of the project is to cooperate with the Government of El Salvador in implementing the National Health Plan in order to modify this situation through (1) an increase in efficiency; (2) a broadened coverage of health services; (3) improvement in their organization; (4) training of personnel; (5) standardization; and (6) program planning, with the corresponding supervision and on-going evaluation.

UNICEF cooperates in this project.

### EL SALVADOR-3200, NURSING SERVICES

El Salvador has 2.2 nurses and 4.6 auxiliaries per 10,000 inhabitants. Each year about 3% (or 26 nurses) are lost to the service when they leave the country. Approximately 65 nurses are graduated each year from the two existing schools of nursing. The distribution of nursing personnel is uneven: 67% are in the large hospitals and only 33% in preventive services. Moreover, there is a high concentration (62%) in the three large cities, especially in the capital. The utilization of personnel, especially of auxiliaries and aides, is unsatisfactory. Because of the absence or scarcity of resources in areas related to nursing, other types of functions, such as administration, reception, laboratory work, and hospital dietetic services, have been incorporated into the nursing activity. This contributes to a decrease in nursing resources.

The purposes of the project are to improve the organization and distribution of resources, to standardize utilization and thus increase efficiency, to define functions at each level, and to improve the training of personnel and increase their number, establishing as a goal 3.0 nurses and 7.4 auxiliaries per 10,000 inhabitants in the next five years.

#### EL SALVADOR-3300, LABORATORY SERVICES

Laboratory services coverage in El Salvador is insufficient, equipment is scarce, and it is necessary to improve the training of personnel. In addition, various laboratory levels (central, regional, local) should be established in order to provide standards at each level. The system of controls in the production of biologicals and in reference laboratories should be improved. The establishment of goals and the process of evaluation should be reviewed for the purpose of upgrading them. The purpose of this project is to provide PAHO support for the solution of these problems, for setting standards, and for training personnel, as well as for program planning and evaluation.

# EL SALVADOR-3600, ADMINISTRATIVE METHODS AND PRACTICES IN PUBLIC HEALTH

The Government of El Salvador has initiated a major administrative reform of its public service structures. The Ministry of Public Health, following this general guidance, is presently engaged in a revision of its structures, organizational patterns, and administrative methods and procedures. Serious functional problems in communications, coordination, decision-making, and control have been detected. Through this project PAHO cooperates in carrying out the necessary improvements to permit efficiency and effectiveness of health activities.

### EL SALVADOR-4800, MEDICAL CARE SERVICES

The 14 large hospitals in El Salvador, although their budgets are part of the Ministry of Health, enjoy a great deal of autonomy and are not part of the regional health system. Both the organization and the functioning of the hospitals demonstrate serious faults in utilization and maintenance. Hospital beds are scarce (1.6 per 1,000 inhabitants), and their distribution is uneven, with a large concentration (40%) in the capital. The percentage of bed occupancy (85) is good, with a patient mobility which permits a turnover rate of 30 patients per bed per year. The number of outpatient visits is low (0.6 per person per year as a national average), and the major portion of these consultations (80%) was for the urban population.

It is necessary to organize the hospitals into a regional system, to promote outpatient visits as a means of reducing unnecessary hospitalization, and to stress that the hospitals incorporate preventive procedures not currently in practice. For these purposes, this project proposes to assist in the organization and streamlining of hospital management and to increase the coverage, both of hospitalizations and of outpatient consultations, with the goal of providing an opportunity to have at least 0.7 medical visits per person per year and hospital discharges at a level of 10 per 100 population.

### EL SALVADOR-6200, MEDICAL EDUCATION

The School of Medicine of El Salvador is in the process of reorganization and needs assistance in the areas of administrative structure, curriculum revision, coordination of teaching units, training of personnel and, above all, incorporation or extension of administrative and public health aspects into the medical system. In addition, there are postgraduate courses which are required in order to improve the public health and preventive medicine programs in the country. The purposes of this project are to assist in improving administration and coordination of the teaching units; to update curricula, with emphasis on preventive and administrative medicine; and to provide more opportunities for training and improving teaching personnel.

### EL SALVADOR-6400, SANITARY ENGINEERING EDUCATION

El Salvador has one sanitary engineer for each 165,000 inhabitants. The Faculty of Engineering does not train sanitary engineers, although it does include some subjects of sanitary engineering in its civil engineering curriculum. The content of this curriculum should be expanded in order to improve the education of professionals in these subjects and to broaden the field of practice.

The purposes of this project are to study and improve the curriculum areas, giving emphasis to the practical aspects; to improve the quality of professional teaching, especially in sanitary engineering as it relates to health; and to update teaching materials, particularly literature and bibliography. It also has the purpose of carrying out continuing education activities, mainly through intensive short courses, and to promote applied research in environmental problems.

#### GUATEMALA - DETAIL

GUATEMALA-0100, COMMUNICABLE DISEASE CONTROL

Communicable diseases are the cause of 66% of the total deaths in Guatemala. Specific preventive measures are available for many of the diseases, yet vaccination coverage is very low in the country due to lack of trained personnel, shortage of equipment, and the high cost of some vaccines. The purpose of this project is to improve the surveillance and control of communicable diseases. Special emphasis is being placed on programs of vaccination against poliomyelitis and measles. PAHO will assist in training personnel and in the organization and development of local demonstration programs.

### GUATEMALA-0200, MALARIA ERADICATION

In 1972 the limits of the malarious area in Guatemala were redetermined to include a population of 2,087,000 or 37.2% of the total population of the country. All of the malarious area is in the attack phase. Since 1971 a new plan of operations has been developed, based on domiciliary spraying of DDT in the areas susceptible to the vector and the use of propoxur where the vector is resistant to chlorinated insecticides. DDT is applied in twice-yearly cycles in areas including 145,000 houses and in quarterly cycles in other areas with 16,500 houses. Propoxur is applied every three months to 72,000 houses and every 45 days to another 3,000. As a complementary measure, antimalarial drugs are distributed.

In the last three years there has been a slight decrease in the number of known cases, from 11,044 in 1970 among 447,706 blood samples studied, to 7,750 in 1972 in 345,156 samples. One factor that indicates the favorable effect of the program is the disappearance of infections due to P. falciparum: in 1967 there were 1,284 known cases caused by this parasite, and in 1972 there were only four.

UNICEF cooperates in this project.

### GUATEMALA-2100, ENVIRONMENTAL SANITATION

The purpose of this project is to extend water supply and sewerage services in urban and rural areas of Guatemala, to study and control pollution of water services, and to improve solid waste disposal services. The targets for the period 1973-75 are to serve 46% of the urban population by house connections, to provide 18% of the rural population with reasonable access to safe water, and to provide sewerage services to 45% of the urban population. It is planned to organize solid waste disposal services in five of the main cities of the interior, to develop a program of water pollution control, and to train 50% of the sanitary inspectors. It is hoped that the various agencies concerned with the planning, construction, and operation of water and sewerage systems will be integrated within the next year.

AID and LADB cooperate in this project.

### GUATEMALA-3100, HEALTH SERVICES

The predominant health problems in Guatemala are those that affect a young, mostly rural population, with a high birth rate, low educational level, and low income. Even though available data are deficient, it is clear that in the structure of mortality reducible diseases predominate, especially in the population under five years of age. Other factors affecting the level of health are nutritional and environmental deficiencies, and a low level of immunity of the population. Basic resources in the public health sector are insufficient and not well distributed.

The purpose of this project is to cooperate in the organization and development of the technico-administrative health structure at the various levels of government and in the formulation and execution of a national health plan.

UNICEF cooperates in this project.

### GUATEMALA-3200, NURSING SERVICES

Nursing services in Guatemala are insufficient in quality and quantity to support the health activities. There is poor utilization of nursing personnel, and there is no nursing policy which clearly defines its role and prepares the personnel to carry it out. The purposes of this project are to improve nursing services in the country by defining the role of nursing in accordance with the requirements of the health programs and policy of the country, and to establish new ones which promote the development of nursing; to train nursing personnel at all levels through the organization of postbasic, continuing, and in-service programs as needed; to prepare new nursing personnel at those levels required for the health programs of the country and which can be accommodated in the socioeconomic structure; and to develop techniques and audiovisual training materials in conformity with the needs of the educational programs.

### GUATEMALA-3500, HEALTH STATISTICS

The purpose of this project is to cooperate in the administrative organization of the health statistics unit of the Ministry of Health, integrating the statistical offices of the various agencies of the health sector in order to avoid duplication of effort. The use of the International Certificate of Death will be promoted and a substitute will be recommended to be used by civil registrars when there is no medical certification. In addition, PAHO cooperates in the training of personnel and the organization of statistical services in the health regions.

#### GUATEMALA-4500, RADIATION PROTECTION

The health authorities of Guatemala are beginning to study the magnitude of radiation exposure in the country. They have available to them the Institute of Nuclear Energy, whose basic law gives it the responsibility of registry of existing equipment and of dosimetric control of persons who work with radiation. The purposes of this project are to propose legislation and standards related to radiation exposure; to learn of the number, use, and condition of the equipment; to establish a personnel dosimetry service; to train personnel for supervision of the equipment; and to diminish the risks inherent in the use of radiation sources to acceptable levels.

### GUATEMALA-4701, UNIFIED FOOD CONTROL LABORATORY

The objectives of this project are to strengthen food control activities with a view to the better protection of the health of the population, to contribute to the improvement of food technology in industry, to protect the consumer economically, to facilitate and enhance intrazonal trade, and to expand export of foodstuffs to foreign markets. It is intended to realize these aims by creating a unified food control laboratory by the fusion of the Food Control and Analysis Division of the Institute of Nutrition of Central America and Panama (INCAP) in Guatemala City and the Bromatological Laboratory of the Ministry of Public Health and Social Assistance, coordinated with strengthening of the food inspection services vested in the Food Control Department. Specialized laboratory staffs will also be offered to other Central American countries, and analytical methodology research to standardize the methods used in the area will be an additional vital task of the laboratory, as well as the coordination of periodic revisions of the Sanitary Food Standards.

GUATEMALA-4900, MATERNAL AND CHILD HEALTH

The Government of Guatemala has expressed concern over the low coverage of follow-up health care services for pregnant women and for children under five years of age, and of family orientation services for women in the fertile age group in Quetzaltenango and other areas. The lack of adequately trained personnel is a particular problem for the expansion of these services.

The purposes of this project are to establish a methodology of work which will increase follow-up health care services to 40% of pregnant women and 40% of children under five years of age; and to provide 20% of the women of the fertile age group with family education services, especially in the area of Quetzaltenango, but also to include Solola and San Marcos. PAHO will provide assistance primarily in the area of training for nursing and paramedical personnel.

GUATEMALA-6200, MEDICAL EDUCATION

The School of Medicine in Guatemala placed in operation a new plan of studies in 1969, simultaneously with the establishment of free entry of students. These events have aggravated the disproportion between teaching resources and the demands for training and research. A marked predominance of undergraduate training programs persists to the detriment of diversification in the training of both professional and technical personnel. The purpose of this project is to cooperate in the training of health personnel to meet the needs of the health sector of the country.

## GUATEMALA-6600, DENTAL EDUCATION

There are serious problems in dental health in Guatemala. Dental caries has a prevalence of 93 to 100%. Periodontal diseases also have a high incidence, with more than 50% of the rural population of school age estimated to have some type of gingival disease. Human resources for provision of services are markedly insufficient (0.6 dentists per 10,000 inhabitants) and are poorly distributed (81% of the dentists are in Guatemala City). The purpose of this project is to cooperate with the Faculty of Dentistry in development of its training programs, its organization, and its orientation toward public dental health problems.

#### HONDURAS - DETAIL

### HONDURAS-0200, MALARIA ERADICATION

The originally malarious area of Honduras includes a population of 2.3 million inhabitants, 19.5% of whom are in areas of consolidation and 80.5% in areas of the attack phase of the malaria program. In spite of the efforts made to date, it has not been possible to stop transmission, due mainly to technical problems caused by the resistance of the vector to DDT in some areas of the country. In addition to the technical problems, there have been budgetary limitations which have not permitted application of attack measures to the whole area of transmission.

The plan of operations provides for spraying with propoxur four times a year in the areas where the vector is resistant to chlorinated insecticides and the use of twice-yearly cycles of DDT where this insecticide is effective. The number of cases registered in 1971 was 48,586, based on 255,773 blood samples examined, and in 1972 there were 18,651 cases based on 226,579 samples. The greatest decrease occurred in areas sprayed with propoxur.

UNICEF cooperates in this project.

HONDURAS-2100, SANITARY AND URBAN DEVELOPMENT (PUERTO CORTES)

The purpose of this project is to improve environmental conditions in Honduras through plans and programs, in both urban and rural areas, of basic sanitation, water supply, and waste disposal. In addition, programs will be implemented to improve administrative procedures and to prepare personnel.

From 1973 to 1975 it is planned to improve and significantly extend the water and sewerage systems in the metropolitan area as well as in other cities in the country. Seventy-five rural water systems will be constructed with local funds, and if funds from outside sources are obtained, the request for which are in preparation, these will be extended to 150 other localities. The program of latrine building will be intensified, with a goal by the end of 1974 of adding 5,000 latrines annually instead of the current 2,000. It is hoped to extend the coverage of urban sanitation systems in all localities having more than 20,000 inhabitants.

### HONDURAS-2300, AEDES AEGYPTI ERADICATION

Eradication of Aedes aegypti was completed in Honduras in 1959, and a surveillance service was established for periodic inspections of the areas most exposed to reinfestation. In 1968 San Pedro Sula, Puerto Cortés, and later 38 other cities were found to be reinfested. For budgetary reasons, eradication activities during 1969-71 were limited to the city of San Pedro Sula and a few neighboring localities. In 1972 all activities were suspended. However, preliminary studies are being made on reinstituting the activities on a national scale.

The purpose of this project is to eradicate Aedes aegypti from all the reinfested zones.

### HONDURAS-3100, HEALTH SERVICES

The purposes of this project are to develop the health services of Honduras in accordance with the National Health Plan and the National Plan for Social and Economic Development, during the period 1972-77, including integration of curative and preventive medical services as well as extension of these services throughout the country. It is planned during 1973-75 to establish the Dirección General de Salud; to carry out a complete administrative reorganization, including services related to personnel management, budgeting, and transportation; and to improve the statistical systems which provide the information necessary for planning, administration, and evaluation of health programs. It is also planned to complete the integration of the existing hospitals and health centers; to expand the coverage of services through the establishment of new health posts and health stations; and to train needed personnel.

### HONDURAS-3104, BORDERING ZONES REHABILITATION PROGRAM

The purpose of this project is to build the health structure in the frontier zones of Honduras in three phases. The first and second phases were completed at the end of 1971, and the third, that of expansion and consolidation, will be carried out in the period 1972-74 as part of the National Health Plan.

UNICEF cooperates in this project.

### HONDURAS-3105, COMMUNITY HEALTH SERVICES

The purpose of this project is to stimulate the development of rural communities in Honduras through the improvement of environmental sanitation conditions and family health care. Water supply systems will be built, latrines will be installed, and services will be developed with the participation of the communities.

#### HONDURAS-3300, LABORATORY SERVICES

The purpose of this project is cooperate with the Government of Honduras in the improvement and expansion of its public health laboratory services. It is planned to adapt the Division de Laboratorios to their specific functions and to the National Health Plan; to improve the central laboratory; to expand and improve the laboratories of the health centers; and to train personnel. A working group on laboratories was created by executive decree, with the purpose of evaluating, planning, coordinating, and promoting the development of the laboratory services of the Ministry throughout the country.

#### HONDURAS-4800, MEDICAL CARE SERVICES

The purpose of this project is to cooperate with the Government of Honduras in the reorganization of medical and hospital care services; in completing the integration of hospitals and health centers; and in training personnel in medical care and hospital administration. For the period 1973-75 it is planned to continue the technical-administrative restructuring of the Dirección General de Asistencia Médica and of the national hospital system, as well as to begin the construction of the Hospital Escuela in Tegucigalpa. It is also planned to increase the capacity for meeting the demand for medical care through improvement in the use of resources available and the creation of new physical and human resources, re-equipping of the hospitals, and training of personnel.

## HONDURAS-6400, SANITARY ENGINEERING EDUCATION

The purpose of this project is to improve the teaching of sanitary engineering in the Facultad de Ingeniería Civil of the University of Honduras and to organize intensive short courses for professional, technical, and auxiliary personnel who work in national and local environmental sanitation programs. These courses are designed to meet the needs of the Ministry of Public Health and of the National Autonomous Service of Water Supply and Sewerage.

#### NICARAGUA - DETAIL

#### NICARAGUA-0200, MALARIA ERADICATION

Nicaragua has a total of 118,358 km² in the malarious area, with a population of 1,965,000 inhabitants. The vector is A. albimanus and the predominant parasite is P. vivax, although P. falciparum exists in a lesser proportion. An antimalaria campaign was started in 1957 using as an attack measure domiciliary sprayings; during the first year dieldrin was used, followed later with seven twice-yearly cycles of DDT in the entire malarious area. In 1962 it was decided that the persistence of transmission in an area of 17,344 km² was due to resistance of A. albimanus to DDT; this area has now broadened to include 27,365 km² and 1,314,921 people. In the rest of the malarious area the vector continues to be susceptible to DDT.

Malaria incidence has decreased considerably in the last year, especially in the area where the vector is resistant to DDT and where quarterly sprayings with propoxur have been applied. In 1972 there were only 8,964 cases registered on the basis of 174,763 blood samples examined, which contrasted favorably with 1971 when 25,303 cases based on 223,098 samples were registered.

UNICEF cooperates in this project.

## NICARAGUA-2200, WATER SUPPLIES

In 1971, 91% of the urban population of Nicaragua and 18% of the rural had water supply services; only 40% of the urban and none of the rural inhabitants had sewerage systems. Most of the water systems in the country are under the charge of the National Department of Water Supply and Sewerage (DENACAL), a branch of the Ministry of Public Health. There are a few small systems in the hands of municipal agencies, known as "aguadoras." The water system for the city of Managua is operated by the Empresa Aguadora de Managua. Both DENACAL and the Empresa are in a state of consolidation and as a result they need help in several areas. Furthermore, it is important to assist DENACAL in supplying water to most of the rural communities with more than 500 inhabitants, since the dispersed rural population is completely unprotected in this area.

The Government has set as an overall objective for the 1971-80 decade provision of water supplies to 80% of the urban population and sewerage service to 50% of this same group, both systems to be financially self-sufficient. At the same time it is planned to provide water to 50% of the dispersed rural population through community services.

#### NICARAGUA-2201, NATIONAL WATER SUPPLY PROGRAM

The purpose of this project is to provide consultant services to the Departamento Nacional de Acueductos y Alcantarillados. The project will introduce improvements and reforms in the administrative methods and practices through provision of manuals, standards, and data collection that will allow greater operating flexibility and control. Personnel will be trained; application of the new methods will be evaluated; and adjustments will be made as necessary.

NICARAGUA-2202, WATER SUPPLIES IN MANAGUA

The purpose of this project is to provide consultant services for the Empresa Aguadora de Managua in the administrative aspects of the water supply system. A diagnosis of administrative procedures has been made, and manuals on standards and regulations are being developed with emphasis on data processing, accounting, budgeting, auditing, organization and methods, and personnel administration. Personnel are being trained; application of the new procedures is being evaluated; and adjustments will be made as necessary.

NICARAGUA-3100, HEALTH SERVICES

Available information indicates that there is a poor level of health in Nicaragua. This situation is conditioned by such adverse factors as the vulnerability of a predominantly young population, with a large rural sector, low incomes, and high illiteracy and malnutrition rates; by human, material, and financial resources which are scarce and poorly distributed, with a high concentration in the capital and other important urban areas; and by poor overall coverage of the population. There are many public and semipublic agencies, as well as some private organizations, with responsibility in the health field but without integration into a sectoral structure.

The budget for health is not enough to assure the improvement and protective measures required for a population with a rate of increase of 2.9% annually. This results in a lack of coverage of health services, i.e., 24% of the municipalities lack health centers and the localities outside these towns have even less coverage. Where there are doctors in health centers, they work for two hours a day, and much of the medical care in the country, especially in the field of child health, relies totally on nursing personnel. The national health plan put into effect almost 10 years ago has not had sufficient strength to properly influence the functioning of the health sector. All this is reflected in health statistics that show high morbidity and mortality rates due to preventable disease, especially in children under five years of age, and even higher for children under one year of age. Many deaths could be avoided through improved sanitation conditions, broader vaccination programs, and adequate nutrition.

The purpose of this project is to keep in force the goal of providing adequate legislation, structure, and operations of the Ministry of Health at all levels - national, regional, and local. Objectives include putting into effect better planning, administration, and efficiency of programs, particularly in the area of providing better coverage through basic integrated health programs, training of professional and auxiliary personnel, and coordination of activities with the national agencies responsible for the improvement of health conditions.

UNICEF cooperates in this project.

### NICARAGUA-3102, EMERGENCY RELIEF AND REHABILITATION SERVICES

Nicaragua suffered an earthquake in December 1972. The authorities estimate that between 5,000 and 10,000 persons were killed and approximately 20,000 injured. Approximately 27 km<sup>2</sup> of the city of Managua were damaged, 50% of which was completely destroyed. This involved the loss of homes of approximately half of Managua's population of 400,000 persons. The purpose of this project is to provide emergency supplies for Nicaragua.

THTAL	S C	-	40,000	-	-
SUPPLIES AND FOUTPMENT		_	40.000	_	-

### NICARAGUA-3300, LABORATORY SERVICES

A long-standing problem in Nicaragua has been the inadequacy of the laboratory system. In 1969 there were 63 health laboratories at the peripheral level; by the end of 1972 there were 96, or one for each health center in operation. There is a notable lack of certain low-cost supplies and equipment required by the central laboratory for which no financial provision is made, such as glassware and library books. Some of the major problems which need to be faced in order to improve the health laboratories are (1) to complete the regionalization of the laboratories; (2) to centralize the technical and administrative supervision of the laboratories of the Ministry of Health; (3) to increase the budget for health laboratories; (4) to increase the number of medical posts and to fill the vacancies with university graduates; (5) to coordinate the health laboratories with other public agencies in the health sector; (6) to produce manuals and instructions with technical and procedural standards; (7) to provide in-service training for personnel; (8) to improve productivity; and (9) to improve the financing of the central laboratory.

The purposes of the project are the reorganization of the technical-administrative structure in the entire Ministry of Health laboratory system; the improvement and expansion of the central laboratory; the establishment of the regional laboratories that are needed and the improvement of existing ones; the improvement and expansion of local laboratories; the training of personnel at subprofessional levels; and increased utilization of university-trained medical technologists.

### NICARAGUA-4200, NUTRITION

There is a serious nutrition problem in Nicaragua which especially affects children under five years of age and pregnant and lactating women in rural areas; it includes protein-calorie malnutrition, endemic goiter, and vitamin deficiency. On the other hand, there is no well-defined food and nutrition policy. Supplementary feeding programs are irregular and nutrition education activities very limited.

The purpose of this project is to assist in the nutrition training of health personnel and the strengthening of the nutrition component of regular health programs as a coordinated effort among agricultural, health, education, and other groups interested in the improvement of the food and nutrition status of the population.

UNICEF cooperates in this project.

## NICARAGUA-4800, MEDICAL CARE SERVICES

Prior to the earthquake the city of Managua had 2,125 hospital beds out of a total of 4,389 for the entire country. With this bed capacity the country was able to offer 4.4 discharges per 100 population. The earthquake destroyed 1,350 beds in the city of Managua so that the availability was reduced to 775 beds and thus the coverage to 1.6 discharges per 100 population. The health care system of Nicaragua prior to the earthquake was inadequate to provide comprehensive services to the whole population. The situation has become still worse since the earthquake. The problem of reconstruction is not only that of replacing the hospitals destroyed by the earthquake, but rather the essential element to be considered is the introduction of changes that may serve as a basis for improvement of the health care system of the city of Managua and of the country as a whole.

FUND	1972 1973 1974	1975	FUND	1972	1973	1974	1975
	<b></b>						
				4	_		

The main purpose of this project is to help the national authorities to plan, develop, and organize a health care system for the whole country, with special reference to the city of Managua. Emphasis should be placed on preventive medicine and ambulatory health care in a well-coordinated system in which the different levels of health care are properly designed so as to make primary health care available to the whole community near their places of residence, and specialized hospital services concentrated in a regional system whereby, through a regional mechanism, the specialists' services are available to anyone in need of special diagnosis or treatment. In addition to these technical reasons, when considering financial priorities under a stringent situation, it is more feasible to place the emphasis on comprehensive ambulatory health care services as the main method of improving the health level of the population.

#### NICARAGUA-4801, REGIONALIZATION OF MEDICAL SERVICES

The purpose of this project is to carry out an inventory of the physical and human resources for medical care services in Nicaragua and to formulate a plan for dividing the country into health zones for the location of regional hospitals and satellite establishments. In addition, a plan for the coordination of services is to be provided, as well as training in both hospital administration and hospital maintenance.

## NICARAGUA-4900, MATERNAL AND CHILD HEALTH AND FAMILY PLANNING

The purpose of this project was to cooperate with the Government of Nicaragua in an intra-hospital maternal and child health program in the General Hospital of Managua, for the improvement of care provided during pregnancy and birth, with special emphasis on the cases with high obstetrical risks, and with provision for family planning counseling in the post-partum period for those desiring such services.

## NICARAGUA-6200, MEDICAL EDUCATION

There is a low production rate of doctors by the only school of medicine in Nicaragua; the curriculum does not correspond with the medical care needed by the people of the country; and there is no orientation to lead the future professional to make himself the hub of a team which develops programs of action while keeping in mind the magnitude of the health problems of the country and the feasibility of their early control. Approximately 45 doctors have been graduated annually in recent years, although the country needs about 60 additional doctors each year. There are obvious budgetary limitations on the development of university training in general, and this is reflected in medical education. There are 18 full-time and 42 part-time professors in the medical school. The physical facilities are very poor, and the final years of undergraduate study lack facilities for proper demonstration and supervision.

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975
			4		<b>A</b>	

The purposes of this project are to collaborate with the School of Medicine in the preparation of doctors, in order to provide for carrying out more efficiently the programs of the health sector and the practice of the profession; and to collaborate in the training and improvement of professors on the medical faculty, in the promotion of scientific research, and in plans for developing and operating new facilities in the areas of curriculum, organization of training, and physical facilities.

#### NICARAGUA-6400, SANITARY ENGINEERING EDUCATION

There is a lack of professional, laboratory, and technical personnel to meet the sanitary engineering needs of Nicaragua. In 1970 there were 16 civil engineers in the country with postgraduate work in sanitary engineering and 45 civil engineers who had taken courses in that field. To provide a proper proportion in relation to the population of Nicaragua, there should be 40 engineers with postgraduate training in sanitary engineering, and if the increasing population is taken into account, 14 more would be needed by 1980; this means that a total of 38 engineers should be given special training in sanitary engineering in this decade. The problems of sanitary engineering and environmental sanitation, even with the high rates of disease that could be avoided through proper environmental action, have not been successful in developing the leadership required to secure the wide application of sanitary practices. It is necessary to broaden the scope of the courses in the field of sanitary engineering.

The purposes of this project include the improvement of technical preparation of professional personnel working in the field of sanitary engineering; the development of short intensive courses on sanitation and sanitary engineering which will be related to the actual stage of development of the country; and the development of research activities, focusing especially on the search for technico-economic criteria to lower the cost of the sanitation facilities needed by the country.

## NICARAGUA-6600, DENTAL EDUCATION

The Dental School of the Universidad Nacional Autónoma of Nicaragua has been in existence for 26 years, but it has constantly faced problems of financing, physical resources, and lack of teachers. About 55 students enter the School each year although its capacity for the first-year class is only 30; there are only six full-time professors, four part-time, and 13 on hourly contracts. There are no research personnel of any kind. As a result, only about 50% of the annual needs of the country are met. The curriculum is in urgent need of revision; this requires a better prepared teaching body with full-time dedication to the task and a more comprehensive understanding of the health and social needs of the country. There is no true program of dental health in any institution in the health sector; what actually exists are emergency services such as extractions, and there is practically no preventive care.

The purposes of this project are (1) to strengthen and develop more fully the Department of Social and Preventive Dentistry of the Dental School, in both its preclinical and clinical training; (2) to improve the technical preparation of dental students in social and public health areas, developing in them a positive preventive and scientific attitude, not only through the Department of Social and Preventive Dentistry but in all the departments of the School; and (3) to aid in studying and resolving the serious public health problem caused by the large and growing number of unmet dental needs throughout the country.

#### PANAMA - DETAIL

PANAMA-0100, EPIDEMIOLOGY

Panama does not have sufficient specialized personnel in the field of epidemiology. PAHO will provide a full-time epidemiologist to work in the Department of Epidemiology.

#### PANAMA-0200, MALARIA ERADICATION

The malarious area of Panama includes 69,840 km², all of which is in the attack phase of the antimalaria program; the population of this area is 1,466,000 or 96.3% of the total population of the country. As a result of attack measures applied during the execution of the Triennial Plan (1969-1972), the incidence of malaria has been considerably reduced in the country, and it is estimated that in 24% of the originally infected area transmission has been interrupted. Transmission persists in areas of the Districts of Colon, Portobelo, and Panama where the vector A. albimanus is resistant to DDT and the parasite P. falciparum is resistant to chloroquine. In these areas it has been necessary to apply additional measures, with good results. In addition to the areas with technical problems, there is an area in the Province of Bocas del Toro where progress is very slow because of operational problems.

In spite of the problems indicated, the general balance of the epidemiological situation is favorable, and it is expected that in 1973 a region with 500,000 inhabitants will be able to pass from the attack to the consolidation phase. In 1972 there were 819 cases registered on the basis of 269,098 blood samples, compared to 1,041 cases based on 301,930 samples in 1971.

### PANAMA-2100, ENVIRONMENTAL SANITATION

Environmental sanitation services in Panama, especially in the rural sector, do not provide sufficient coverage of the population. According to recent statistics, a large segment of the rural population lacks adequate water supply services, and a moderate portion of the urban population and a high percentage of the people living in rural areas are not provided with sewerage services or individual excreta disposal facilities. It is estimated that 71.3% of the urban population (in the cities of Panama and Colon) had solid waste disposal services, lacking in the rest of the urban centers. Data are insufficient or unavailable on such growing environmental problems as air and water pollution, radiation, industrial hygiene, and control of food products. Lastly, the number of trained personnel to develop sanitary engineering programs is insufficient.

To improve the situation it is necessary (1) to strengthen the administrative structure of the appropriate governmental agencies in order to provide for program planning and development and to determine priorities and procedures; (2) to devote attention to the provision of water supplies and to solid waste disposal, particularly in small communities; (3) to determine the degree of contamination of air, water, and soil; (4) to provide performance standards for programs of industrial and food hygiene, for collection and disposal of solid wastes, for markets and slaughterhouses, for insect and rodent control, and for urban planning; and (5) to expand programs of basic sanitation in rural areas.

#### PANAMA-2200, WATER SUPPLIES

At the end of 1971, 100% of the urban population in Panama had water service, 90.4% from house connections. Of the rural population, 49% had water supplies but only 7.9% had house connections. In the area of waste disposal, 67.9% of the urban and 0.6% of the rural population were served by sanitary systems, while an additional 24.9% urban and 67.5% rural had septic tanks or latrines. The purpose of this project is to continue programs for building and operating water and sewerage systems in order to provide broader coverage of the population served by house connections and to extend the rural coverage.

## PANAMA-3100, HEALTH SERVICES

Various indices related to the health situation in Panama show that the population of the country has a large proportion of young people and that there is great inequality in the services provided the rural population as compared with those provided urban residents.

The purposes of this project are to support and promote all aspects of the health sector in order to improve the level of health in the community, and to develop an expanded and more efficient health care delivery system. The specific objectives are (1) to collaborate in the development of resources; (2) to promote a program of training at the various health personnel levels; (3) to assist in the development of programs of continuing education; and (4) to help revise and improve administrative systems.

UNICEF cooperates in this project.

PANAMA-3102, ESTABLISHMENT OF A PROGRAM FOR REGIONAL AND MUNICIPAL DEVELOPMENT

The development process in Panama does not totally incorporate a system of community involvement; health services are delivered without sufficient planning or community preparation. The communities which lack organization are less receptive to health movements, do not identify their problems adequately, and do not use available resources properly. The urban sector is better organized and is in a stronger position to receive benefits from available health services than is the rural sector. Thus the rural areas receive insufficient attention, sometimes in sporadic form or in emergency situations only.

The purpose of this project is to assist the Ministry of Health, as part of the national health policy, in raising the level of health in the communities through their active participation and improved organization. The objectives are (1) organization of community health committees to make the people more conscious of health problems in general; (2) coordination of community action and health teams in order to share responsibility in the solution of health problems; (3) orientation in modern techniques related to diversified food production at the local level in order to meet the nutritional requirements of the communities; (4) development in the community of such basic health programs as environmental sanitation, maternal and child health, adult medical care, health education at the community level, and administration of health resources in the community; and (5) executive decentralization of basic programs in order to utilize health teams and medical equipment on a regional basis, to integrate the community into specified health areas, and to correlate the basic health needs with the available resources.

PANAMA-3300, LABORATORY SERVICES

Panama has not developed a satisfactory laboratory system. Present coverage is incomplete; laboratory services are not adequately utilized and productivity is limited; and material and human resources are inadequate. The purposes of this project are extension and improvement of laboratory services in the country; development of a plan to extend the coverage of these services, to increase productivity, and to improve utilization; and provision of more trained professional and auxiliary personnel, and additional health installations at the central, regional, and local levels.

## PANAMA-4100, MATERNAL AND CHILD HEALTH

The maternal mortality rate in Panama is 1.3 and the perinatal mortality rate is 24.5 per 1,000 live births. Professional attention at childbirth is provided for 39.5% of rural and 96.4% of urban mothers. Abortion causes 10% of maternal deaths and 10.8% of obstetrical hospitalizations. Eleven per cent of all hospitalizations are from obstetrical causes. Infant mortality is 40.6 per 1,000 live births and is principally due to diarrheal diseases, acute respiratory infection, malnutrition, accidents, and intestinal parasites. The birth rate is 37 per 1,000 population, and women of childbearing age constitute 22.5% of the total population.

The purposes of this project are reduction of the risks related to pregnancy, delivery, and postnatal complications; integrated health care for children; and assistance in the development of the idea of responsible parenthood. It is hoped that this can be achieved through broadening of professional care during pregnancy and delivery; promotion of family planning; improvement of preventive care for healthy children, of curative care for sick ones, and of early care for the newborn; and expansion of the immunization program.

#### PANAMA-4500, RADIATION PROTECTION

The damage to health caused by the various forms of radiation used in medicine, industry, training, research, and other fields is unknown. In Panama there is no health policy or legislation directed toward protection against the pathological effects of radiation. There is also a lack of professional personnel specialized in the field of radiation protection.

The purposes of this project are (1) to study the exposure risks to the population resulting from the increasing use of various forms of radiation; (2) to establish a health policy directed to the development of a program of protection against radiation; and (3) to integrate this program into the work of the Ministry of Health. This is to be achieved through quantification of the magnitude of radiation risk in the country; application of techniques to reduce exposure of the population to radiation in such areas as medicine and industry; broadening of the rules and regulations for radio-logical protection; and development of personnel specialized in this field.

## PANAMA-4800, MEDICAL CARE SERVICES

Medical care services in Panama are concentrated in the urban areas, particularly in the capital. Human and financial resources are inadequate, and distribution of those that are available is uneven. Administration of medical care facilities is inadequate, and there is need for a national program which will establish a work plan within a reasonable period of time.

The purpose of this program is to provide adequate, integrated medical care services, with emphasis on the rural and suburban areas. The specific objectives are (1) broadening medical care coverage, increasing and redistributing the present capacity; (2) redistribution and improvement of human resources; (3) continuation of the regionalization of medical care; (4) coordination with the University of Panama to improve the preparation of professionals, in accordance with the actual needs of the country; and (5) introduction of a national system of medical care services.

#### PANAMA-6200, MEDICAL EDUCATION

There are at present only six doctors per 1,000 inhabitants in Panama, and the School of Medicine of the University of Panama does not have the capacity to prepare the number of doctors that the country needs. Sixty per cent of the doctors were trained outside the country. It appears that there will be insufficient funds in the next few years to provide for any increase in the number of students.

The purpose of this program is to broaden and improve the technical and administrative level of the School of Medicine in order to raise the quantity and quality of the professionals trained there. This is to be accomplished through the introduction of structural changes to improve the utilization of the present capacity, adding to the School a division of health sciences.

### PANAMA-6300, NURSING EDUCATION

There are not enough professional nurses in Panama, and as a result it is impossible to meet the growing demands and the plans for progressive expansion of services, particularly in rural areas, in accordance with the policy of the Ministry of Health. Nursing personnel are concentrated in large cities, and the current capacity of the School of Nursing of the University of Panama is inadequate in face of population projections.

The purpose of this program is to provide professional nurses in accordance with the needs of the country and to improve the preparation of the existing nurses through improvement of basic and postgraduate training.

# PANAMA-6400, SANITARY ENGINEERING EDUCATION

There is a scarcity of technical personnel in Panama for the development of national programs of water supply, disposal of liquid wastes, collection and disposal of solid wastes, and other sanitary engineering fields. The purpose of this project is to provide training in the field of sanitary engineering for both professional and technical personnel. The objectives are to raise the level of professional and subprofessional personnel in the field of sanitary engineering, and to improve the training facilities of the School of Engineering of the National University of Panama through the organization of short intensive courses and the promotion of applied research activities.

## PANAMA-6600, DENTAL EDUCATION

There is a high incidence of oral diseases in Panama which cannot be treated adequately with the human and material resources available in the country. There also continues to be a scarcity of professional and dental services as a result of the teaching limitations of the recently established dental school.

The purpose of this project is to develop the technical teaching capacity of the school in order to increase the number of professionals and auxiliary personnel and their utilization in the country. The objectives are the revision and evaluation of plans of study in the faculty, the formulation of a plan of training for teaching personnel, and the development of improved systems for the delivery of dental care, including investigations in the field of dental prevention.

#### BOLIVIA - DETAIL

## BOLIVIA-0100, EPIDEMIOLOGY

Communicable diseases in Bolivia continue to be a major problem since they represent about 60% of the general morbidity and 40% of the mortality from all causes. The purpose of this project is to cooperate in the solution of problems retarding reduction in morbidity and mortality. In particular, these problems are the training of personnel for epidemiological and laboratory services and the need for intensified promotion of systematic vaccination campaigns against measles, diphtheria, whooping cough, tetanus, poliomyelitis, and yellow fever.

#### BOLIVIA-0200, MALARIA ERADICATION

There are some 1,677,000 people in Bolivia living in areas subject to risk of malaria; 59.6% in the consolidation phase and 40.4% in the attack phase. The National Malaria Eradication Service was reorganized early in 1972; an increase in the funds provided to it produced a wider coverage of the program and reduced the number of known cases from 8,080 in 1971 to 4,275 in 1972. The decrease in the incidence occurred in all of the country except in the area around Tarija, where it was necessary to intensify attack measures.

UNICEF cooperates in this project.

### BOLIVIA-0300, SMALLPOX ERADICATION

Smallpox was an endemic-epidemic disease in Bolivia until 1964, the year in which the most cases were notified, although the country was officially declared free of the disease in 1968. Eradication was accomplished through successive campaigns of mass vaccination which were carried out at the national level. The first campaign was conducted in the period 1957-59; the second, in 1963-68; and the third, in 1969-73.

The purpose of this project is to maintain eradication through national vaccination campaigns. This program forms part of the continental plan for eradication of smallpox.

## BOLIVIA-0400, TUBERCULOSIS CONTROL

Tuberculosis is one of the five leading causes of death in Bolivia, with an infection rate in the age group 5-15 years of 33.3% in rural areas, 23.4% in mining areas, and 44.2% in the Yungas zone of the Department of La Paz. Morbidity has been estimated to be 1.76% in the Altiplano (rural and mining area), 2.25% in the Yungas zone, and 0.64% in Montero, Santa Cruz. The main purposes of this project are to decrease morbidity and mortality from tuberculosis and reduce transmission.

## BOLIVIA-0701, ZOONOSES CONTROL

Rabies, brucellosis, and bovine tuberculosis are some of the principal prevalent zoonoses in Bolivia, with epizootic outbreaks causing economic and social problems. Vaccines for the control of some of the zoonoses are produced in the country in the laboratories of the National Institute of Animal Biology and in the National Institute of Health Laboratories, but the quantity is insufficient and the effectiveness is sometimes doubtful, making it necessary to import vaccines at a high cost. The purpose of this project is to collaborate with the Government through the Ministries of Health and of Agriculture in carrying out activities intended to effectively control the principal zoonoses in the country.

#### BOLIVIA-0901, TYPHUS

Exanthematic typhus persists endemically in Bolivia in an area of 258,000 km<sup>2</sup> with an approximate population of 2,700,000. More than 4,400 cases have been reported during the last 20 years, the majority of them in the age group 15-19 years. The purposes of this project are to study the prevalence of the disease through serological studies in representative areas; to experiment with strain E vaccine in pilot areas and to make the related evaluation; and to make susceptibility studies on the vector.

#### BOLIVIA-2100, ENVIRONMENTAL SANITATION

There are some 14 agencies in Bolivia which in some form or other carry on health activities. Coordination of these activities has been undertaken through a committee on environmental sanitation made up of representatives of some of the agencies. This project covers water, sewerage, and other aspects of the environmental problem. Only about 30% of the population in areas of 2,000 or more inhabitants have provision for disposition of solid wastes. Water pollution is uncontrolled and air pollution is widespread with no control measures. There are not enough technicians to cover all of the areas of the country; there is a scarcity of economic resources and a lack of coordination of efforts.

The purposes of this project are (1) to improve the sanitary conditions of the environment in both urban and rural areas; (2) to provide adequate environmental sanitation services through coordination of the existing human and material resources; (3) to increase the actual percentage of the population served with water, sewerage, solid waste disposal, and occupational health services; (4) to improve the sanitary production of food; (5) to regulate water quality through a nationwide sanitary code; and (6) to train environmental sanitation personnel through short courses and fellowships.

## BOLIVIA-2200, WATER SUPPLIES

This project covers the construction, operation, and administration of water and sewerage services in Bolivia. It is hoped to increase the percentages of the population who benefit from these services. At present 77% of the urban and 4% of the rural populations have water supplies, and 24% of the urban and 2% of the rural have sewerage systems. Another 4% of the population have sanitary waste disposal through latrines and septic tanks. The purpose of this project is to collaborate with the ministries of health and of urbanization and housing in the improvement and construction of water and sewerage systems.

BOLIVIA-2203, WATER AND SEWER ADMINISTRATION (POTOSI)

The Water and Sewer Agency of Potosí, Bolivia, is in the process of utilizing an international loan for improvement and extension of its water system, but its internal organization is deficient in the areas of financial accounting, supplies, rates, and collection systems. The objective of this project is to evaluate the present organizational and financial situation and to develop policies, systems, and procedures in the areas of accounting and budget, supplies, rates, billing and collecting, in conjunction with activities for attracting and training personnel and coordinated in an adequate management system for making decisions, with special emphasis on investment aspects.

#### BOLIVIA-3100, HEALTH SERVICES

In spite of the achievements already accomplished and the progress made by the Ministry of Health and other private and public agencies in the health sector in Bolivia, the level of health is still unsatisfactory, as a consequence of insufficient coverage of services and programs, especially in relation to environmental sanitation and the control of communicable diseases.

The objectives of this project are to cooperate with the Government in raising the level of health through (1) reducing the rates of morbidity and mortality from gastrointestinal and communicable diseases and other causes; (2) decreasing morbidity and mortality in mothers, nursing infants, and preschool children; (3) controlling communicable diseases by improving and broadening health services; (4) intensifying activities in the rural sector; (5) organizing the technical and administrative aspects of health services; (6) training of personnel; (7) improving the utilization of hospital beds; (8) training schoolteachers and others who work together in health programs through the schools; (9) preparing intersectoral programs of nutrition (agriculture and education); (10) improving vital statistics information; and (11) improving health education.

BOLIVIA-3104, HEALTH SERVICES (COCHABAMBA AND TARIJA)

The high rates of morbidity and mortality from communicable diseases in Cochabamba and Tarija (Bolivia) are the reflection of inadequate environmental sanitation conditions in combination with deficiencies in such areas as food supply, housing, and cultural level. In 1967 the lack of basic sanitary services was very serious, and this condition is only slightly improved. At that time only 0.6% of the rural population had water supplies, and by the end of 1971 this had increased to 1.5%. None of the rural population had adequate waste disposal systems in 1967; 0.9% were served by the end of 1971. The purpose of this project is to improve the sanitary conditions of the environment in both urban and rural populations in order to provide integrated health care, an important factor in the socioeconomic development of the country.

UNICEF cooperates in this project.

### BOLIVIA-3500, HEALTH STATISTICS

There is no national system of health statistics in Bolivia with the capability of providing all the data needed for the adequate analysis of the present health situation or for planning and evaluation of activities that are being carried out in the field of health. The existing statistical systems suffer from severe deficiencies in relation to coverage, quality of the information, and timeliness in presenting it. There are neither information nor statistical procedures for obtaining data for planning in important fields such as human resources, nor is there any information about autonomous and decentralized agencies that are not dependent on the Ministry of Health and Social Welfare. The purpose of this project is to develop a national system of health statistics which can provide the data necessary for the various users, especially for sectoral planning.

				4	<b>A</b>	4	

The Department of Biostatistics of the Ministry of Health and Social Welfare has been reorganized and its functions expanded. New forms for registration of vital events have been introduced and a multidisciplinary work group has been formed as the first step in establishing a national committee on vital and health statistics. A system of morbidity statistics has been defined and a standard medical record form has been designed, together with standards and procedures for its implementation.

#### BOLIVIA-4100, MATERNAL AND CHILD HEALTH

The actual size of the maternal and child health problem in Bolivia is not known but, utilizing official mortality statistics for the year 1966, infant mortality was 77.2 per 1,000 live births, a figure which may be underestimated by as much as 50%. Children under 15 years of age constitute about 42% of the population. Women of childbearing age (15-45 years) represent approximately 43% of the total female population. The annual birth rate was estimated to be 40 per 1,000 population in 1965. Deaths in children under five years of age constitute 47.9% of total deaths, and 65.5% of these are under one year. The major causes of death in children under five years are diseases of early infancy, respiratory infections, gastrointestinal problems, and communicable diseases.

The purpose of this project is to develop in the country programmed health activities for mothers and children and for family well-being. The objectives are, fundamentally, decreasing mortality in children under 15 years of age, principally in those under five years, and diminishing maternal mortality.

## BOLIVIA-4200, NUTRITION

Bolivia faces serious nutrition problems, such as a high prevalence of endemic goiter, protein-calorie malnutrition, and nutritional anemias, especially in certain areas, although the real extent and magnitude of each of these is not sufficiently known. Deficiencies in hospital food services and lack of trained personnel to carry out programs of nutrition education at regional and local levels are also problems which require special attention. The School of Nutrition and Dietetics in the University of San Andres requires technical assistance to develop a sound curriculum according to the professional needs of the country.

The purpose of this project is the improvement of the nutritional status of the population, with special attention to mothers and children, and solution of specific problems which affect the health of the community. Among the principal objectives are (1) participation in the study and formulation of a national food and nutrition policy; (2) broadening of the technical component of nutrition in health services at national, regional, and local levels; (3) organization of nutrition education activities jointly with programs of maternal and child care and supplementary feeding, as part of the regular activities of local health services; (4) technical organization of institutional food services; and (5) development of a good undergraduate nutrition and dietetics program leading to an academic degree.

BOLIVIA-4201, ENDEMIC GOITER CONTROL PROGRAM IN BOLIVIA

Four towns in Bolivia in the area of high endemicity of goiter are being studied to determine the incidence of goiter in a sample population, and to administer iodized oil orally in two towns and intramuscularly in the other two towns, as a demonstration of its efficacy and as an interim measure until iodized salt is readily available.

BOLIVIA-4202, EFFECTS OF IODINE DEFICIENCY AND ITS CORRECTION ON MENTAL PERFORMANCE OF CHILDREN

Iodine deficiency is a major health problem for large parts of Latin America, Asia, and Africa. Its most serious consequence is the gross mental retardation of endemic cretinism. Little is known about the effects of iodine deficiency on the "normal" noncretinous population. The purpose of this project is to assess these effects in a Bolivian village with severe iodine deficiency, by examining schoolchildren before and after iodine supplementation, administered in a double-blind fashion. Mental performance is evaluated by the intersensory integration test and by a modified Stanford-Binet method. Anthropometric measurements, nutrition status, and thyroid function are also assessed, to permit correlation with mental performance.

BOLIVIA-4600, OCCUPATIONAL HEALTH PROGRAM

The purpose of this project is to collaborate with the Government of Bolivia in protecting the mining population from the risk of contracting diseases such as silicosis which are rather widely disseminated in the mines, the principal industry of the country, and to establish programs for the protection of workers in all other industries.

BOLIVIA-4800, MEDICAL CARE SERVICES

Present medical care services in Bolivia primarily cover the urban populations, and are provided by approximately 20 different institutions. The Ministerio de Previsión Social y Salud Pública is responsible for the care of approximately 43% of the total population. In 1969, 46,263 consultations were provided by the Ministry and 20,194 by the National Social Security Institution. The Ministry has 103 short-stay hospitals, with an average occupation rate of 55%. The Social Security Institution has 30 such hospitals with an average occupancy of 70.4%. The Ministry has seven long-stay hospitals, with an occupation rate of 79.5%; the Social Security Institution has five, with an occupation rate of 82.2%. To cover ambulatory care there are 63 medical posts and hospital-health centers, 23 health centers and polyclinics, and 256 health posts. Medical care services lack personnel, particularly trained auxiliaries. Supplies and equipment are inadequate; there is no national emergency plan; and organization and medical records of hospitals are deficient.

The purposes of this project are to collaborate with the government agencies in the adequate organization of medical care services for both ambulatory and hospitalized patients; to coordinate these activities with other agencies; to encourage proper distribution of resources; and to train personnel, particularly for medical care administration.

## BOLIVIA-6200, MEDICAL EDUCATION

In 1971 the universities in Bolivia were closed, and the National Commission of University Reform was established for the purpose of making an intensive study of the situation and of preparing the plans for a new university whose activities in the preparation of professionals would be more in accord with the needs and the actual situation in the country. In the middle of 1972 the new Fundamental University Law of Bolivia was passed, which encompassed complete reform of the university structure; in it was included the School of Health Sciences to provide training for careers in medicine, dentistry, chemistry and pharmacy, nutrition, and nursing. Teaching activities were initiated in a limited form in October 1972, and the full program will be incorporated by the first semester of 1973.

The purpose of this project is to collaborate with the universities in restructuring the medical curriculum, in the reorientation of teaching personnel, and in the inclusion in the medical course of basic concepts of public health, social medicine, and preventive medicine.

### BOLIVIA-6400, SANITARY ENGINEERING EDUCATION

Water supply and environmental health programs in Bolivia do not have sufficient trained staff. Professional training through short local courses is needed to overcome these deficiencies. The purpose of this project is to broaden and improve the training of professional, intermediate, and auxiliary personnel in sanitary engineering. In addition, it is hoped that sanitary engineering as a major area of study will be added to the curricula of the Universidad Mayor de San Andrés in La Paz and the Universidad Técnica in Oruro.

## BOLIVIA-6500, VETERINARY MEDICINE EDUCATION

The total number of veterinarians teaching in the only school of veterinary medicine in Bolivia is completely inadequate in relation to the cattle production needs during this time of rapidly increasing growth. With the current university reform it will be necessary to restructure the training in accordance with the principles established by the new Fundamental University Law.

The purpose of this project is to cooperate with the Universidad Gabriel René Moreno in Santa Cruz in restructuring the veterinary medicine curriculum and in the organization of basic courses, with emphasis on veterinary public health.

## BOLIVIA-6600, DENTAL EDUCATION

The universities of Bolivia are being completely restructured, as indicated in Bolivia-6200, Medical Education, above. The purpose of this project is to collaborate in revising the dental curriculum, in the reorientation of teaching personnel, and in the inclusion in the dental training program of basic concepts of public health, social dentistry, and preventive dentistry.

#### COLOMBIA - DETAIL

#### COLOMBIA-0200, MALARIA ERADICATION

With the advance of the malaria program in Colombia, it has been possible to reduce the area in the attack phase. This provided for the spraying of 267,000 houses twice a year, 133,700 once a year, and 91,000 annual preventive sprayings, utilizing two grams of DDT per square meter. At the beginning of the program in 1958 there were 1.2 million sprayings twice a year. The population exposed to risk has increased from 7.7 million in 1957 to 13.2 million in 1972; 67.2% of the present population live in areas in the consolidation phase and the rest in areas of attack. The number of known cases has increased from 22,402 in 1971 to 30,997 in 1972. The largest increase occurred in areas of colonization which are in the attack phase.

The purpose of this project is to maintain the status in those areas where the epidemiological situation has been favorable, and to eliminate mortality and reduce morbidity in areas where transmission continues despite the application of antimalarial measures. Because there are areas with technical problems, this project includes research into methods of attack and alternative control procedures. The program also carries on other health activities for which additional funds are received.

UNICEF cooperates in this project.

### COLOMBIA-0300, SMALLPOX ERADICATION

The purpose of this project is to cooperate with the Government of Colombia in a campaign to eradicate smallpox through vaccination of 80% of the population and the production of lyophilized vaccine.

### COLOMBIA-0500, LEPROSY CONTROL

The purpose of this project has been to carry out a study in Colombia on the problems of concomitance of mycobacteria in the hamster; experimental bacteriology of human and murine leprosy, especially the presence of the factor x in the two; experimental transmission of human leprosy to animals; and the diminution of the virulence of M. tuberculosis when inoculated at the same time as M. leprae in the guinea pig.

### COLOMBIA-0700, VETERINARY PUBLIC HEALTH

The zoonoses in Colombia constitute a group of diseases which cause serious economic problems in the animal industry and also gravely affect public health. Among these diseases are rabies, foot-and-mouth disease, Venezuelan equine encephalitis, brucellosis, cysticercosis, anthrax, leptospirosis, salmonellosis, streptococcal diseases, and bovine paralytic rabies. These diseases cause obvious losses of food of animal origin, particularly meat and milk; reduce agricultural profits; and raise the cost of health services. The Government, with financial aid from IADB, is making a strong effort to establish an animal health section whose first goal will be to control foot-and-mouth disease and brucellosis, which most seriously affect livestock production and development. Cooperative action by the Ministries of Health and Agriculture is required to solve these problems.

The purposes of this project are to strengthen collaboration between the veterinary services of the two ministries and to promote the establishment of unified programs of zoonoses control, especially brucellosis and equine encephalitis.

#### COLOMBIA-0701, RABIES CONTROL

Rabies is one of the principal zoonoses of serious public health importance in Colombia. However, only about 41% of the animal cases and 49% of the human cases are laboratory confirmed. About 94% of human exposures are dog-associated. Vaccine production and vaccination campaigns have been intensified in recent years, as have programs for the capture and elimination of stray dogs, but rabies still remains a serious problem. In view of the magnitude of the problem and the various epidemiological, technical, administrative, and socioeconomic factors involved in rabies control, a pilot project was set up in the Cauca Valley to provide an area for study and for training of personnel. An extension of this program to the rest of the country is now under development.

The purpose of this project is total elimination of human rabies cases and a reduction of canine rabies in the shortest possible time.

### COLOMBIA-2100, ENVIRONMENTAL SANITATION

FELLOWSHIPS-SHORT TERM

Colombians, both urban and rural, are facing progressive deterioration of the environment as a consequence of a rapidly growing population, accelerated industrialization, intensive use of fertilizers and insecticides, and constant migratory movements. This project includes, among others, problems of water supply; liquid and solid waste disposal; sanitation of housing, public places and working facilities; food and vector control; water, air, and soil pollution control; and protection against radiation and risks at work. The purpose of the project is to collaborate with various federal and local agencies in Colombia to meet the growing demand for health services and to solve the problems of environmental sanitation.

### COLOMBIA-2102, WATER QUALITY STUDIES

Industrial development and population growth in the area of Colombia served by the Corporación Autónoma Regional, especially the city of Bogotá which discharges its untreated waste water into nearby streams, have produced a rapid increase in pollution of the Bogotá River and its tributaries, which are used for various purposes such as water supply, irrigation, electric power, and recreation.

The Corporación Autónoma Regional was created to promote and guide the socioeconomic development of the region, conserving, defending, coordinating, and administering natural resources to provide better technical utilization and effective development in order to improve the living standards of approximately three million people in the area. To reach these goals the Corporación has imposed on property within its jurisdiction a national tax equivalent to 0.02% of its taxable value. The Corporación, in collaboration with PAHO/WHO, is working on a program of planning, sanitary protection, development, and administration of water resources in the Bogotá River basin.

#### COLOMBIA-2201, WATER AND SEWER ADMINISTRATION IN PALMIRA

The purpose of this project is to cooperate with the Government of Colombia and the Empresas Públicas Municipales de Palmira in the study, analysis, and evaluation of the existing administration systems, policies, and practices for the provision of water and sewerage services. Recommendations on changes are being made in the areas of organization, accounting, budgeting, auditing, billing and collection, personnel administration, and supply.

### COLOMBIA-2202, WATER AND SEWER ADMINISTRATION IN COLOMBIA

Responsibility for programs of investment in water supply and sewerage systems in Colombia rests with three groups of agencies, but there is no integration or coordination among these agencies in relation to financial programming and budgeting. The administrative efficiency of these federal agencies and other public entities, with few exceptions, needs much improvement. The financial situation is critical, due to lack of planning, increasing costs and investments, and lack of a national water rates policy; the accounting systems are not operable and statistical information is irregular. In technical areas there are no standards for various levels of development. There is no preventive maintenance, and this causes under-utilization of the systems. Water quality is not controlled, and trained personnel are scarce.

The purpose of this project is to assist in strengthening and restructuring the organization, administration, financing, and technical programs of these agencies, on the basis of diagnosis, analysis, and evaluation of structures, plans, programs, and available resources, for the purpose of organizational improvement to better utilize an approved loan of some \$35 million from the World Bank.

COLOMBIA-2300, AEDES AEGYPTI ERADICATION

Sylvatic yellow fever is endemic in various parts of Colombia, and its virus represents a threat for localities infested with the urban vector of the disease. A program to eradicate <u>Aedes aegypti</u> has been in effect in Colombia. By 1961 the country was free of the mosquito, but there have been several reinfestations in the area bordering Venezuela and in Caribbean ports. A study was made in 1971-72 to determine the current extent of the problem and it showed that the infested area comprised some 94 localities with a total of about 450,000 houses. A program of training and retraining personnel is now under way, with the goal of initiating the attack against the vector in the infested area.

The purpose of this project is to eradicate Aedes aegypti from the entire country; this is to be done by (1) eradicating the mosquito in the infested areas; (2) continuing surveillance in areas vulnerable to reinfestation by the vector; (3) promoting additional activities, such as cleaning up residential properties, with the aid of the communities; (4) studying the remaining localities of the 367 originally positive, as well as other areas which because of their ecology and geographic situation are reinfestation risks; and (5) active vaccination in the area where the selvatic form of the disease persists.

### COLOMBIA-2500, AIR POLLUTION

Since 1967 an air pollution sampling station has been operating in Bogotá, Colombia, as part of the Pan American Network. The Ministry of Public Health, with the assistance of PAHO/WHO and some of the cities, wishes to considerably broaden the program of evaluation of air pollution in the country. Eighteen additional stations will be established in six of the largest cities, based on the criteria of general population and industrial production. This program of evaluation will complement one of control, with the purpose of solving existing problems and preventing the appearance of new ones.

### COLOMBIA-3100, HEALTH SERVICES

The main problem in the health field in Colombia is the insufficient coverage of services provided to the people, either individually or in groups, and results from very limited resources and uneven utilization, need for improvement in the integration of policies between agencies, excessive urban concentration, and low productivity. The purpose of this project is to cooperate with the country in increasing health resources and in correcting the inequalities, as a method of increasing coverage, through integration of policies and agencies and increasing productivity.

UNICEF cooperates in this project.

### COLOMBIA-3300, LABORATORY SERVICES

The purpose of this project is to cooperate with the Government of Colombia in improving and expanding the national laboratory services. At the central level various aspects of diagnosis, investigation, production of biologicals, and training of personnel need to be strengthened; and at lower levels a network of health laboratories will be installed.

# COLOMBIA-3301, NATIONAL INSTITUTE OF HEALTH (CARLOS FINLAY)

The National Institute of Health (Carlos Finlay) in Colombia needs legal authority to act as a central and reference laboratory for the network of health laboratories of the country. It would also be advisable to use its resources to support research on yellow fever and other arboviruses, and to stimulate the production of yellow fever vaccine and its distribution to the countries of the Continent.

The goals of this project include the improvement of the technical and administrative organization of the Institute; strengthening of its reference and research activities; improvement, broadening, and diversification of the production and control of biologicals; and training of personnel for the health laboratory services of the country.

# COLOMBIA-3501, REDESIGN OF HEALTH INFORMATION SYSTEMS

The reorganization of the health information sector and its speedy adjustment to rapidly changing public needs, the redirection of policies, technological innovations, and the national capacity require the readaptation of the present information system centering in the Ministry of Health. Despite all that has been attempted in the past five years, modernization has been fragmentary. At present the information available is incomplete, dispersed, irrelevant, and unreliable. It is excessively difficult to obtain and use, and is therefore never up to date.

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975
					A	

In order to devise a new system for Colombia, a descriptive diagnosis and evaluation of the present system is essential and would be achieved by an ad hoc study group responsible to the decision-making levels of the public sector. The new version would include experimental tests and the practical training of personnel. It is expected that the process will take several years and will require the automation of some parts of the system's component machinery. In the final year of the project the system would have to be evaluated with a view to making appropriate readjustments.

### COLOMBIA-3600, ADMINISTRATIVE DEVELOPMENT OF HEALTH SERVICES

At the present time the administrative system in the health sector in Colombia is of minimal efficiency compared to that required to manage resources equivalent to four thousand million Colombian pesos per year. This needs immediate reorganization in line with the Government's desire to redesign the system. Until now the health sector has been characterized by widespread institutional disintegration and a marked directive weakness at the central level, with consequent autonomy of the other levels and an underdeveloped administrative structure.

The purpose of this project is integrated administrative development in accordance with the policies of redesign of the general system. The objectives are analysis, diagnosis and delimitation of the sector; analysis and diagnosis of the different administrative areas (failure detection and critical fields); design of corrective models, their experimental application on a reduced scale, and later evaluation and readjustment; application of the adjusted models on a national scale, surveillance, and support; and organizational restructure.

#### COLOMBIA-4101. CLINICAL AND SOCIAL PEDIATRICS

There is insufficient awareness among pediatricians, obstetricians, and nurses of the socioeconomic factors which affect the health of mothers and children in Colombia. Moreover, many of these specialists have not had sufficient administrative preparation, and this lack diminishes their potential contribution to maternal and child health programs.

The purpose of this project is to provide knowledge regarding clinical, public health, and administrative aspects of maternal and child health to pediatricians, obstetricians, pediatric nurses, and other personnel working in institutions related to family welfare, in order to enable them to be efficient collaborators in maternal and child health and family welfare programs. Courses will be offered annually to physicians and nurses, preferably to those in teaching positions or those who are involved in the direction of programs in the maternal and child health field.

UNICEF cooperates in this project.

#### COLOMBIA-4700. FOOD HYGIENE

As carriers of communicable diseases, foods have a dangerous effect on public health, causing serious economic, psychological, social, and health problems. In Colombia relatively limited efforts have been made to determine the background and to improve the situation as it relates to obtaining, expanding, distributing, and selling various foods and to establish programs for their hygienic control. About 83% of the total population of the country do not have food control services. A program for the control of production, transportation, pasteurization, and selling of milk is needed, with provision for the simultaneous training of the related personnel and for the equipment to be used in decreasing those diseases transmitted by milk, which principally affect school-age children. Meat and its derivatives constitute a second problem of major importance which needs to be resolved through preparation of personnel and provision of equipment.

The purpose of this project is to reduce morbidity and mortality caused by infectious diseases carried by foods and to avoid the loss of food supplies because of lack of hygienic control of their production, distribution, management, and consumption.

### COLOMBIA-4801, HOSPITAL MAINTENANCE AND ENGINEERING

There are 749 different hospitals in Colombia at various levels, whose equipment and instrumentation are valued at some 1,400 million Colombian pesos but which do not receive any preventive maintenance, primarily because of lack of qualified personnel and of an organization capable of acting in this area. The private sector does not have the capacity to provide this maintenance, and as a result 95% of the hospitals do not have maintenance programs and many of them have non-operative services.

The purpose of this project is to organize and put into operation a national center for maintenance of hospital equipment, which will act in the double capacity of training and repairing, in order to provide training for personnel, to establish a program of preventive maintenance, and to repair the equipment in use.

# COLOMBIA-4900, HEALTH AND POPULATION DYNAMICS

The most recent statistics available (1968) show high levels of maternal and child morbidity and mortality in Colombia, with a death rate from maternal causes of 2.4 per 1,000 live births and a death rate for infants of 75.0 per 1,000 live births. More than 44% of all deaths occur before five years of age. Medical care for these groups needs improvement and resources are inadequately utilized. A national policy on population planning is being studied and the health sector has been assigned the functions of providing family planning information and services.

The purposes of this project are to reduce maternal and infant morbidity and mortality, increasing prenatal and postnatal coverage by 10% annually; to provide information and family planning services to those who request them; and to train doctors, nurses, nursing auxiliaries, and rural health workers in the promotion of maternal and child health.

### COLOMBIA-6300, NURSING EDUCATION

The purpose of this project is the establishment in Colombia of an education and research center in maternal and child nursing in which aspects of population dynamics and responsible parenthood are integrated into the curricula for the preparation of nurses in Latin America. Short courses, postbasic and postgraduate, are offered in this center. During 1971-72, 80 nurses from various countries were trained for teaching and service in the area of maternal and child care. Research has been started in relation to health teaching and procedures used in the field of maternal and child health.

#### COLOMBIA-6400, SANITARY ENGINEERING EDUCATION

According to studies by the Department of Human Resources of the Ministry of Health (1971), there were only 100 professionals specialized in sanitary engineering, a number completely inadequate to meet the needs of a population of some 22 million people. About 700 civil engineers work on environmental health projects.

The purpose of this project is to collaborate in the training of an adequate number of sanitary engineering professionals in order to staff environmental sanitation programs in the most efficient way, in accordance with the actual socioeconomic situation in the country. Objectives include improving teaching programs on subjects related to sanitary engineering in the universities; providing specialized sanitary engineering training to 100 professionals; training 400 engineers through short intensive courses (four courses each year); developing applied research programs (one each year); and establishing close collaboration between the universities and the government agencies responsible for environmental sanitation activities. The training and research activities will be oriented to the priorities established by the Government.

### COLOMBIA-6500, VETERINARY MEDICINE EDUCATION

A great demand exists in Colombia for veterinarians to direct, plan, and execute national programs for the prevention and control of the principal diseases of human and animal health significance. In addition, wider markets for the exportation of meat and meat byproducts have increased the need for veterinarians in the field of food inspection, in order to guarantee the quality of these products. Colombia has five schools of veterinary medicine and two centers for postgraduate study in this field. Despite efforts on the part of national authorities to produce specialists in fundamental fields, there are still not enough to meet the needs of the country. It will be necessary to revise the curricula of the schools of veterinary medicine in order to adjust them to the actual requirements and to incorporate modern techniques of learning.

The purpose of this project is to improve veterinary medical education in the schools of veterinary medicine; improving the teaching; incorporating into the profession research in human and animal health; and providing closer collaboration between members of the scientific community, including veterinarians and those agencies dedicated to socioeconomic development of rural areas, especially in the field of meat production.

### COLOMBIA-6600, DENTAL EDUCATION

There is a great lack of awareness on the part of dentists in Colombia of the importance of preventive oral medicine. The purposes of this project are to provide information to dental professionals on the need and growing importance of preventing dental disease, and to advise dental schools in the development of their programs, in order to provide training through undergraduate and postgraduate courses, and to undertake research in this field.

#### ECUADOR - DETAIL

ECUADOR-0100, COMMUNICABLE DISEASE CONTROL

Communicable diseases constitute the principal health problem in Ecuador. In 1969 48% of deaths were due to infectious and parasitic diseases, and 13% of them could be prevented through vaccination. Levels of protection through immunization are unsatisfactory. Activities of epidemiological surveillance are very scarce, so it is impossible to identify the problems.

The purpose of this project is to collaborate in the organization, execution, and evaluation of programs for control and eradication of communicable diseases, with the goal of decreasing to a significant extent the risk of morbidity and mortality from these diseases, and at the same time to establish related programs of epidemiological surveillance.

#### ECUADOR-0200, MALARIA ERADICATION

The area of Ecuador that is considered to be malarious is of great economic importance because the major export products are generated there: agricultural products in the western region and petroleum in the east. The malaria eradication campaign was begun in 1957, and the incidence was so reduced that by 1965 only 4,200 cases were registered. Due to financial difficulties, the campaign was almost totally suspended in the period 1966-68, and the incidence increased, with 50,297 cases registered in 1969. With the reapplication of attack measures, a decrease in the incidence was obtained, to 9,171 cases in 1971 and 6,709 in 1972.

The situation has improved greatly in almost every part of the country, except in the Provinces of Esmeraldas and Napo. In the latter, people attracted by the new petroleum industry constructed a large number of houses which exceeded the operating capacity of the campaign. A study is being made in a sample district of the Province of Esmeraldas to determine the factors that are impeding the campaign there. The population subject to risk in the country comprises 3.6 million inhabitants, 58.3% of whom live in areas in the attack phase and the rest in areas of consolidation.

UNICEF cooperates in this project.

### ECUADOR-0300, SMALLPOX ERADICATION

Smallpox was eradicated in Ecuador in 1964; since then no cases have been notified. An immunization program was set up to vaccinate children under five years of age. The purpose of this project was to maintain the country free of smallpox and in this way contribute to the continental plan of eradication through the application of adequate methods and techniques of vaccination; to supervise and evaluate the activities of the program; and to provide vaccines in sufficient quantities to meet the needs of the country.

ECUADOR-0500, LEPROSY CONTROL

The purpose of this project is to set up a control program to decrease the incidence of leprosy in Ecuador, maintain prevalence at the lowest possible limits, prevent invalidism, and correct handicaps. In 1971 there were 1,971 known cases of leprosy, 46% of which were active. It is estimated that there are at least 3,500 cases. The program of control of the disease was reorganized in accordance with the recommendations of the Seminar on Leprosy held in Cuernavaca, Mexico, in 1963. The objectives of the program are the location of 80% of presently unknown cases and the control of their contacts; treatment of 90% of known cases; and control of 90% of known contacts. These services are gradually being incorporated into the general health services.

#### ECUADOR-0600, TREPONEMATOSES

The incidence of venereal diseases has increased in Ecuador, especially in the large cities. In one city alone syphilis has reached a rate of 105.4 per 100,000 people, and gonorrhea a rate of 209.5 per 100,000. The purpose of this project is to reduce the incidence of venereal diseases in general and, in particular, to reduce the syphilis rate by 60% by 1973 through improvement of the technical-administrative structure, treatment and control of cases, location of contacts, hygiene education, and training of personnel. Antivenereal services are gradually being incorporated into the general health services, thereby increasing their coverage.

### ECUADOR-0701, NATIONAL VETERINARY LABORATORIES

The long-term objectives of this project in Ecuador are the reduction of losses from disease in the livestock industry; production and control of vaccines to combat these diseases; establishment of diagnostic laboratories; and support of diagnostic services in the field. Short-term objectives include, among others, the building of adequate laboratories in Guayaquil and Quito; provision of the necessary personnel and equipment; and the construction of small local laboratories of limited capacity.

ECUADOR-0900, PLAGUE CONTROL

Plague constitutes an endemic problem in Ecuador. The endemic zones have 1,640,248 inhabitants, 64.7% of whom live in rural areas; in the period 1963-72 there were 1,125 known cases of plague. The purpose of this project is to collaborate with the Government of Ecuador in the control of plague, with the goal of diminishing the risk of morbidity and mortality from this disease.

### ECUADOR-2100, ENVIRONMENTAL SANITATION

The goal of this project is to improve the environmental conditions in urban and rural zones of Ecuador. The activities include assistance to those agencies charged with providing water and sewerage systems, elimination of solid wastes, water pollution control, and ecological protection. The objectives of the program are to provide, by the end of 1975, water supplies through house connections to at least 75% of the urban and 22% of the rural populations and sewerage systems to 70% of the urban and 11% of the rural populations. At present, 60% of the urban population have water services through house connections, and 55% have sewerage systems. It is necessary to intensify the work in the rural area, where only 7% have water service through house connections and 1% have waste water elimination services. Assistance will also be provided in all other aspects of environmental sanitation, including collection and elimination of solid wastes, control of air pollution, housing and food hygiene, and industrial hygiene and safety.

# ECUADOR-2101, DEVELOPMENT OF THE GUAYAS RIVER BASIN

This project was initiated in Ecuador in 1963 and is one of the most ambitious development projects in the country. The Guayas River Basin has a population approaching two million people, including the city of Guayaquil. This is an integrated development project, utilizing all existing natural resources in order to obtain energy, irrigation, water supplies, flood control, pollution control, and navigation facilities.

This project seeks to identify the effects produced by the use of water, with special attention to its relationship with health, attempting to optimize the different uses of water. It also provides for cooperation in an effective urban-rural population distribution, in control of epidemiological risks, and in the broadening of medical care coverage.

### ECUADOR-2201, SEWER ADMINISTRATION IN GUAYAQUIL

The Sewer Administration in Guayaquil assumed responsibility for carrying out sewerage projects costing a total of \$11 million, partially financed by an IADB loan of \$7 million. The Administration has signed a two-year agreement with PAHO to carry out an analysis of standards, systems, and administrative procedures for the purpose of introducing ways and means to obtain optimum use of resources in areas of basic structure, accounting, budget, audit, public relations, rates, billing, taxes, and design of administrative systems related to loans.

#### ECUADOR-3100, HEALTH SERVICES

Near two-thirds of the population of Ecuador lack medical care services. Life expectancy is 57.7 years; the annual rate of population growth is 3.4%; and infant mortality in 1970 2as 76.6 per 1,000 live births. In general, mortality and morbidity are principally due to preventable and communicable diseases, with a growing influence of such factors as environmental conditions of low quality and low levels of nutrition. Health resources are mainly concentrated in urban zones of more than 20,000 inhabitants, and even there the level of health services is inadequate. Productivity is low, the quality is deficient, and there is lack of coordination between them.

The purpose of this project is to cooperate with the Government of Ecuador in the formulation and implementation of a policy of well-being, giving special attention to diminishing rates of mortality and morbidity from preventable diseases, especially in children under five years of age, and to the increased coverage of health services by improvement of the functional structure of the health sector. Activities directed to the organization of the Ministry of Health will be re-oriented, through processes of progressive integration and coordination, with adequate legislation, efficient administration, personnel training, programs of teaching and research, and development of epidemiological services for the control of preventable diseases, as well as nutrition, maternal and child health, medical care, and environmental sanitation.

UNICEF cooperates in this project.

### ECUADOR-3103, MODERNIZATION OF RURAL LIFE

A large part of the population of Ecuador lives in villages of less than 2,000 inhabitants, with a large dispersed population, which imposes serious limitations on the distribution and availability of services. The level of life in these communities is low; indexes and structure of morbidity and mortality are almost unknown, although it is thought, from available indicators, that these rural zones have rates of morbidity and mortality three times greater than those of urban zones.

The purpose of this project is to organize a program of integrated social and economic development in the rural zones. Health services in this program will include simplified medicine, promotion of maternal and child health, supplementary feeding, immunization, and environmental sanitation.

### ECUADOR-3105, CENSUS OF HEALTH RESOURCES

The purpose of this project was to collect and analyze data on physical and human resources in the health sector in Ecuador, to permit the Government to apply the pertinent findings to national health plans. The process was the first step in the development of an information system for evaluation, control, and decision-making.

ECUADOR-3106, STRENGTHENING OF THE HEALTH SECTOR

The purpose of this project is to promote the development of health services in Ecuador, extending them to rural areas and improving their quality through the building up, at the beginning, of the overall infrastructure of the Ministry of Health and then of the whole sector, with particular emphasis on planning and management of health services and the use of statistical and epidemiological information as part of an information system for the health sector.

ECUADOR-3301, NATIONAL INSTITUTE OF HEALTH

The purpose of this project is to collaborate with the Government of Ecuador in the improvement and expansion of the laboratory services provided by the National Institute of Health; in research on problems of public health importance; and in training of personnel. The general objectives of the project are to improve and increase the preparation of biologicals for human use; to control their quality; to give the necessary support to epidemiological surveillance; to extend diagnostic services through a regional organization; to carry out the analysis for the control of physical contamination of the environment; and to control medicaments, food, and beverages.

ECUADOR-3400, FAMILY LIFE EDUCATION COURSES

Knowledge and practice of health procedures are limited in Ecuador because of the socioeconomic level of the people, the low literacy rate, and the scarcity and poor training of Ministry of Health personnel. There is no national health education policy or work plan. This project will collaborate in the determination of a policy and plan of work; expand the infrastructure of services to all provinces with trained personnel, increasing the amount of equipment available; and obtain agreements with the Ministry of Education for the training of professors and teaching supervisors in order to expand basic knowledge of health problems to children, youth, and families.

ECUADOR-3500, HEALTH STATISTICS

Health statistics in Ecuador are deficient in coverage, quality, and timeliness and are underutilized. Vital statistics suffer from defects in the organization of the system. Information on hospital discharges is made known to the health sector two years later. Statistics on services do not cover the entire system. There is no control of the obligatory reporting of communicable diseases, nor is information on these diseases distributed at the local level.

The purpose of this project is to reduce deficiencies in all fields of health statistics; to improve the structure of statistical services; and to advocate the establishment of general standards, uniform procedures, and training of personnel.

#### ECUADOR-3600, ADMINISTRATIVE METHODS AND PRACTICES IN PUBLIC HEALTH

A review of the Quadrennial Projections during the last two years has verified the existence of deficiencies in the organization, execution, and evaluation of administrative activities at all health service levels in Ecuador. The purposes of this project are to provide assistance in determining the situation through legislative and organizational analysis; to recommend necessary changes; to promote administrative planning; to establish systems compatible with the statistical and planning needs; to establish standards and procedures; to train personnel; and to promote administrative research for improvement of training in order to satisfy the needs of the country.

#### ECUADOR-3700, HEALTH PLANNING

Health service resources in Ecuador are scarce and poorly distributed, and there are large areas in which they are not provided at all. Various agencies function in the health sector without coordination and without any specific order of priorities. The purpose of this project is to cooperate with the Government in developing a process of health planning as part of the economic and social development of the country. In the first phase, the planning activities will be concentrated on legal and functional aspects, the provision of facilities, and the development of human and administrative resources. In the second phase, health activities will be planned, beginning at the local level, with the intention of extending them later on to other levels.

### ECUADOR-4100, MATERNAL AND CHILD HEALTH

The maternal and child population of Ecuador constitutes a large, vulnerable group. Mortality rates for mothers and infants are 23 per 10,000 and 77 per 1,000 live births, respectively, although both of these are understated. Fifty-one per cent of the deaths are in the under five age group. There is a 36.9% prevalence of malnutrition in children under five years, according to a survey by the National Nutrition Department. Hospital deliveries account for less than 22% of the total. Facilities and resources to meet the actual need are scarce and inefficient.

The purpose of this project is to improve health care for mothers and children, diminishing risks for the susceptible population, reducing the present rates of maternal and infant morbidity and mortality, and adopting a policy of maternal, infant, and family protection.

### ECUADOR-4200, NUTRITION

According to available information, 36.9% of the population under five years of age in Ecuador suffer from various degrees of protein-calorie malnutrition. There is a high prevalence of endemic goiter, particularly in the highlands, as well as some vitamin deficiencies. In 1968, the average diet contained 1,920 calories and 56.8 grams of protein per capita/day.

FUND 1	972 1973 19	74 1975	FUND	1972	1973	1974	1975
				4		*	

The objectives of this project are (1) to train personnel to carry out nutrition activities within the general health services; (2) to organize and coordinate nutrition education and supplementary feeding programs; and (3) to promote activities related to nutrition, food production, and the preparation of specialized personnel in nutrition. At present, a multisectoral technical group is responsible for the formulation of a national food and nutrition policy and the implementation of an integrated nutrition and rural development program in the provinces of Cotopaxi, Bolivar, and Los Ríos.

#### ECUADOR-4202, GOITER PREVENTION

Preliminary results of a study carried out in 10 provinces of the Andean region and the coast of Ecuador indicate a prevalence of endemic goiter of 27.6 and 11.7%, respectively, among schoolchildren. In some areas of the Sierra this rate is even higher. Dispersed population and communication difficulties create complex problems in the distribution and sale of iodized salt. The purpose of this project is to study the feasibility of using iodized oil in rural areas and to evaluate its effectiveness in the prevention of endemic goiter. The most important results of this research are the prevention of goiter in children of mothers treated with iodized oil and a drastic reduction of the prevalency rate.

### ECUADOR-4203, NUTRITION (PORTOVIEJO)

Based on the high prevalence of protein-calorie malnutrition in childhood, a nutritional recuperation center was established. The project is presently assisting the National Institute of Nutrition in the completion of a nutrition survey that includes assessment of endemic goiter prevalence and trends.

TOTAL	PG	-	8+863	-	-
LOCAL COSTS		-	9,863	_	-

### ECUADOR-4500, HEALTH ASPECTS OF RADIATION

It is estimated that 1,000 persons in Ecuador are exposed to ionizing radiation as a result of their professional and technical activities in more than 200 centers which provide radiodiagnostic and radiotherapeutic services. Furthermore, about 500,000 patients may receive unnecessary exposure because the existing installations do not have recommended protective devices. In addition, fission products resulting from nuclear weapons testing constitute a source of environmental radiation exposure.

The purpose of this project is to assist with the development of a national radiation protection program for occupationally exposed persons as well as for patients and the general public, including the adoption of necessary legislation, provision of a personnel radiation dosimetry service, operation of a radiation protection laboratory, and training of professional and technical personnel.

#### ECUADOR-4800, MEDICAL CARE SERVICES

In Ecuador there are a great number of medical care institutions - public, private, and semiprivate - and their actions overlap in the fields of investment, constructing and equipping hospitals, and program execution. Although by 1972, 62% of the existing beds were integrated under the Ministry of Public Health, this procedure should be expanded to provide more rational use of resources.

This project seeks to collaborate in the restructuring process at all levels of medical care, through defining standards; coordinating all agencies in the areas of investment, project planning, construction, and remodeling, giving priority to teaching and provincial hospitals; setting up hospital-health centers at the canton level and subcenters at the parochial level and providing simplified services to dispersed populations, all in an integrated health system; utilizing the philosophy of progressive patient care; and providing care to all social classes. It also aims to raise the technical level of health personnel; introduce new simplified techniques which will provide broader coverage; and draw up and apply a maintenance policy for buildings and equipment.

#### ECUADOR-4900. MATERNITY CENTERED FAMILY PLANNING PROGRAM

In a study of the causes of mortality in Ecuador, it has been determined that one of the principal causes of infant deaths is perinatal disease. The rate of notified maternal mortality was 2.3 per 1,000 live births (1969), and perinatal deaths are estimated to be 45 per 1,000 live births. There is lack of proper care of mothers and newborn infants. The maternal population also has problems associated with multiparity and short spacing between pregnancies, such as unwanted pregnancies, abortions (approximately 12% of gynecological-obstetrical discharges), high maternal and fetal morbidity and mortality rates, and complications of pregnancy and delivery.

The basic purpose of this project is to improve the perinatal health situation through progressive development of operational efficiency of the hospital services available to mothers and the new born, and to extend the availability of family planning services to hospitalized maternity patients. In-service training, through fellowships and local seminars, and applied research on human reproduction are other important components of this project.

ECUADOR-4909, TEACHING AND INVESTIGATION IN MATERNAL AND CHILD HEALTH

Training in pediatrics and in gynecology and obstetrics constitutes an average of 10.2 and 12.7% respectively of the total clinical teaching hours in the undergraduate curricula of the schools of medicine in Ecuador. At the postgraduate level there are no regular residency courses in these specialties. Possibilities for applied research and teaching in these areas are limited.

The purpose of this project is to contribute to training and research in maternal and child health, revising and broadening the curricula of the schools of medicine, developing medical residency programs, supporting seminars and meetings of university teaching personnel, and stimulating the development of research in maternal and child health and in social and demographic topics as they relate to these groups.

ECUADOR-6200, MEDICAL EDUCATION

Medical training in Ecuador is provided by five medical schools, one of them private. The training is fundamentally limited to classrooms; it is costly; and it relates particularly to the improvement of health in urban zones. There is little provision for postgraduate courses and continuing education. The Association of Schools of Medicine was created with the purpose of formulating a teaching policy in this discipline for the entire country.

The objective of this project is to work with the Association in achieving this purpose. Collaboration will be provided in improvement of study curricula, internships, and specialized and rural residencies; in the preparation of professors and general doctors in conformity with present and future needs; in the establishment of courses for paramedical specialties; and in the development of programs for continuing education.

SUPPLIES AND EQUIPMENT		12.417	_	_	_

ECUADOR-6300, NURSING EDUCATION

There are five schools of nursing in Ecuador which graduate a total of about 40 nurses each year. The Quadrennial Projections indicate that it is necessary to prepare 1,200 nurses in 10 years in order to maintain a ratio of one nurse per 10,000 inhabitants, and to prepare 6,400 nursing auxiliaries during the same period.

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975
			_			

In accordance with the investment goals and extension of medical care coverage included in the Quinquennial Health Plan (1973-77), the demand for professional and auxiliary nursing personnel has increased. Currently there are only 0.9 nurses and 2.3 auxiliaries per 10,000 inhabitants. With the assistance of this project it is planned to increase the production of nursing personnel and to adapt the training programs to the needs of the country, with the goal of providing 2 nurses and 10 auxiliaries per 10,000 people by 1980.

### ECUADOR-6400, SANITARY ENGINEERING EDUCATION

The purpose of this project is the strengthening of sanitary engineering education in the universities of Ecuador. Civil engineers with specialization in sanitary engineering are being trained at the Universities of Quito and Cuenca, and a department of sanitary engineering is being organized in the University of Guayaquil. This project has the purpose of improving the teaching programs in the universities, including the provision of laboratories and libraries; strengthening research in environmental sanitation; training professionals in specific aspects of sanitary engineering through intensive short courses; and preparing technical and auxiliary personnel assigned to environmental sanitation programs.

### ECUADOR-6500, VETERINARY MEDICINE EDUCATION

Improvement of production of protein of animal origin is very important in Ecuador, both to meet the needs of the country and to promote exports to neighboring countries. Trained veterinarians are scarce and training programs are deficient. The purpose of this project is to increase the number of professionals and to improve their quality, providing improved correlation between veterinary medicine education and the socioeconomic programs of the country; to relate more adequately to professionals in animal health and zoonosis control through unification of the program of studies, both for educators and for specialists; and to provide continuing programs of education through courses, seminars, fellowships, and other means of continuing education.

### ECUADOR-6600, DENTAL EDUCATION

The number of dentists in Ecuador is not sufficient to meet the needs of the country and, in addition, their distribution is uneven. In their professional training, emphasis is placed on corrective aspects of dentistry, and very little attention is given to preventive care. There are no dental auxiliaries.

The purpose of this project is to review the national situation, including a study on the problem of dentistry, possible solutions, and provision of the resources necessary to adequately prepare dental personnel; and to revise and update current programs and teaching methods, giving special attention to public health dentistry, postgraduate training, and the preparation of dental auxiliaries to carry out a broader role.

#### PERU - DETAIL

#### PERU-0100, COMMUNICABLE DISEASES

In Peru, communicable diseases continue to be the cause of 49% of the general mortality and 69% of all deaths in children under five years of age. The purpose of this project is to control or eradicate these diseases through wise use of available human and technical resources. Special emphasis will be given to restructuring the services at all levels; better training for epidemiological personnel; improvement of the notification network; establishment of an effective system of epidemiological surveillance; and adoption of methods of control and disease eradication.

#### PERU-0200, MALARIA ERADICATION

The originally malarious area of Peru includes 5,034,761 inhabitants or 35% of the total population of the country. It was estimated that in June 1972 there were 1,380,000 people in areas which had already entered the maintenance phase, 2,427,000 in areas of consolidation, and 1,228,000 (24.4%) in areas of attack. The malaria service is responsible for those areas which are in the consolidation and attack phases, while epidemiological surveillance of the territory in the maintenance phase is the responsibility of the integrated health services.

Foci in Cañete and Chincha, in areas in the maintenance phase, have shown changes for the worse, while the situation in areas in the consolidation phase is critical. In addition to foci which have evolved earlier, new ones have appeared in the Andes valleys and in the Río Apurimac valley. In 1972 there were foci in nine regions of the area in consolidation: Zarumilla, Tumbes, Chira, Piura, Lambayeque, Jequetepeque, Marañón, Huarmey/Casma/Culebras, and Apurimac. In 1972, up to October, 282,399 blood samples had been examined, 7,614 of them positive, while in the same period in 1971 there had been 3,737 positive cases based on 286,461 samples. The major deterioration in the epidemiological situation occurred in areas in the consolidation phase, where the number of cases up to October 1972 was 4,548, triple the number registered in 1971 for the same period (1,538).

UNICEF cooperates in this project.

#### PERU-0300, SMALLPOX ERADICATION

Smallpox was endemic in Peru, with 21,480 cases reported in the 10-year period 1945-1954. From 1955 to 1962 no cases were reported, due to a systematic vaccination program. In 1963 the disease was imported from Brazil and there were 1,350 cases between then and 1966. Since 1968, the country has been utilizing a program of simultaneous smallpox and BCG vaccination, providing coverage to 35.4% of the population by 1971.

The purpose of this project is to maintain the country free of smallpox through a massive immunization program to be carried out during the six-year period 1969-1974.

PERU-0700, VETERINARY PUBLIC HEALTH

Human brucellosis is a serious zoonosis in Peru, particularly in the Departments of Ica and Lima and the Constitutional Province of Callao, where 96.9% of the total cases in the country are reported. The incidence of this disease is a consequence of the high infection rate in goats and of factors related to raising them, the repeated use of pastures, and the public consumption of fresh cheese without sanitary control or hygiene. A control program has been instituted, consisting of vaccination of goats with Rev. 1 vaccine provided by PAHO/WHO. A major difficulty in providing adequate levels of coverage is the nomadic type of the goat husbandry which permits grazing from the coast to the sierra, often in inaccessible ravines. Epidemiological surveillance, inspection, and control of the commercial distribution of the cheese and general education of the people are also difficult because of the mobile and inaccessible population.

The purpose of this project is to reduce the incidence of human brucellosis through control of the animal disease in the areas of highest prevalence. PAHO/WHO is collaborating in this program, through training of diagnostic laboratory personnel, increasing the vaccine supply, and providing field and laboratory equipment and consultative services.

PERU-0701. RABIES CONTROL

A pilot program of rabies control in Peru was begun in 1970 for the purpose of controlling rabies in Lima and Callao and at the same time to serve as a demonstration project to focus on the problem at the national level. Rabies is endemic in the principal cities, with cyclical epizoctics. Except for Lima and Callao, and Arequipa, which has also started a control program with broad coverage, the rest of the country has only sporadic control activity, limited mainly to the elimination of stray dogs without large-scale vaccination. The pilot program includes massive vaccination of dogs; epidemiological surveillance and control of foci; medical attention to exposed persons and clinical observation of biting dogs; laboratory confirmed diagnosis; education measures at all levels; and elimination of unvaccinated stray dogs. A program of maintenance and extension of vaccination to neighboring areas is also progressing.

As a result of this program canine rabies was reduced by 62% in 1971 and by 98% in 1972 compared to 1970. It appears that there may be complete control by 1973. There have been no cases of human rabies during the period of the program. The vaccines produced in the country for both human and canine use are of high quality and the production capacity is adequate to meet present and future national needs. The Ministry of Health suthorities have decided to broaden the pilot program to the entire country, with assistance from PAHO/WHO.

The purposes of this project are the decrease and eventual elimination of human rabies cases in the endemic areas; short-term control, with a view to eventual eradication, of canine rabies in the principal urban centers; regionalization of diagnostic laboratories, increasing the coverage of clinical observation of dogs; establishment of epidemiological surveillance units and control of foci; rational application of post-exposure human immunization and improvement of these vaccines, with the goal of increasing safety and effectivity and eliminating risks of post-vaccinal reactions; and improvement of general education on the subject of rabies and its prevention.

PERU-0702, HYDATIDOSIS CONTROL

Hydatidosis constitutes a serious health and economic problem in a large part of the mountainous zones of Peru, especially where sheep are raised. Factors associated with the prevalence include the ecological, socioeconomic, and cultural systems; inadequate supply, inspection, and waste disposal systems; a large number of stray dogs; a high level of illiteracy; and traditional customs that are difficult to change. Laws and methods used in countries which have controlled hydatidosis are not applicable to Peruvian conditions for many of the above reasons, and it is necessary to install methods appropriate to the epidemiological characteristics peculiar to the country.

The organization created by the agrarian reform and the living conditions in the rural communities of the Mantaro Valley are considered particularly suited for the establishment of a pilot control program in the Central Sierra. The purpose of this project is to utilize available resources in the country to establish such a pilot program.

PERU-0900, PLAGUE CONTROL

The area endemic for plague in Peru consists of some 320 foci distributed in 40 districts of 16 provinces in the northern region of the country. This ecological niche corresponds to a similar one in Ecuador. As a result of living conditions and the presence of rodents and their parasites, sylvatic plague continues to be present with endemic and epidemic characteristics. In spite of efforts to date, it has not been possible to reduce the risk from this disease.

The purpose of this project is to reduce the risk of disease or death from plague. Objectives include the development in problem areas of an infrastructure capable of early detection of the presence of the disease, with the goal of instituting immediate treatment; strengthening of the technical capacity of the health services to carry out research on the characteristics of transmission; and reduction in the number of rodents and related parasites through appropriate use of rodenticides and insecticides, in order to interrupt transmission.

PERU-1000, CHAGAS' DISEASE

Seventeen of the 23 departments in Peru have been found to be infested with the vector of Chagas' disease. It is estimated that some 2 million people run the risk of contracting this infection. Serological studies carried out in some valleys of the southern coast show an infection index of 10%, which infers that some 80,000 people could be infested. Cases of heart disease and enlarged esophagus and spleen are frequently diagnosed in the affected area. A vector control program was begun in 1965 using various types of insecticide.

The purpose of this program is to decrease or eliminate the risk of Chagas' infection in the population of the endemic area. Objectives include identification of the problem areas and of indices of human infection, vectors, and reservoirs, through serological, clinical, electrocardiographic, and entomological investigations; control of infestation by Triatoma, through application in houses of residual-action insecticides; health education oriented to the establishment of a network of voluntary collaboration to detect the presence of the vector in susceptible areas; and research to improve knowledge of the variables which affect the complex mechanism of transmission and prevalence of this disease.

### PERU-2100, ENVIRONMENTAL SANITATION

There are many problem areas in the field of environmental sanitation in Peru. Since water resources are limited, soil pollution results from the utilization of contaminated water to irrigate the extensive suburbs of the cities, creating health risks to the population. Except for Lima and Arequipa, only 18% of the cities of more than 2,000 inhabitants have garbage collection, and in the larger cities the system for final disposal is incineration. Major problems are the formation of trash heaps on idle land and the lack of sufficient personnel and equipment. Inadequate disposition of wastes from mines and industries is rapidly increasing water pollution. The rapid urbanization of the cities and the development of extensive suburbs without adequate sanitary conditions is producing a deterioration of living conditions in urban areas, while rural housing lends itself to the proliferation of vectors of various communicable diseases. There are many agencies which have responsibility for environmental sanitation, and their activities need to be coordinated. Finally, the requirements for personnel at all levels is increasing as a result of the constantly growing needs in this field.

The purpose of this program is to create a more adequate environment for the people of Peru, through proper coordination and planning among the various agencies involved, and utilizing an overall view of the situation. Basic services will be supplied, and effective control of environmental pollution will be promoted.

### PERU-2200, WATER SUPPLIES

In 1972 it was estimated that more than 45% of the urban population in Peru did not have water supplies through house connections, that 35% did not have connections to sewerage systems, and that in rural areas only 35% of the people concentrated in communities of 400 to 2,000 inhabitants had water services. On the other hand, the rapidly increasing population requires an increase in services of some 7% per year in Lima and other large cities just to take care of the population growth, of 4 to 7% in the urban areas of 2,000 or more inhabitants, and of 2% in the rural areas. This situation demands a continuous expansion of the systems for water supply, including treatment and distribution, and sewerage systems to meet the growing needs and to increase the coverage in order to overcome the present deficit in these areas; and the provision of adequate human, financial, physical, administrative, and other resources for these services.

The objectives of this project are to assist the Government in its effort to increase the coverage of urban and rural services, attempting to maintain benefits at a level of 80% of the population in communities of more than 2,000 inhabitants and 50% of those in communities of from 400 to 2,000 people; to improve the infrastructure; and to develop financing systems that will insure an adequate income.

# PERU-2202, WATER AND SEWER ADMINISTRATION IN LIMA

Through this project PAHO provided assistance to the Government of Peru in fostering institutional development and reforms of the water and sewerage agency serving the metropolitan area of Lima. Excellent results have been obtained, particularly in improving the economic and financial situation of the agency. The explosive population growth and the incorporation of new satellite communities into the metropolitan area require further work to enable the institution to keep pace with the demand for services.

## PERU-2203, WATER AND SEWER ADMINISTRATION IN PERU

The development of plans for water supply services in urban centers in Peru, which has already increased the coverage to 70% of the population, has created the need to provide adequate structures in order to be able to operate, maintain, and administer these systems. This need is urgent in the cities of more than 30,000 inhabitants where population is increasing at an ever-growing rate, which requires that organizations be capable of continually adjusting to the increasing demands. The cities most affected are those on the coast where large numbers of people have settled. This situation presents an administrative problem of great magnitude in providing adequate water supplies in the face of a natural scarcity of water resources in this region.

The purposes of this project are to revise and propose administrative systems and practices in order to upgrade the agencies charged with providing water services; to set up adequate tariff systems to provide sufficient financial resources; and to train engineering and middle-level personnel for the related operations.

#### PERU-2500, AIR POLLUTION

Recent studies carried out in Lima, Peru, demonstrate that hydrogen sulfuride, ammonia, and others in motor vehicle exhaust fumes are the chief components of air pollution in Greater Lima. While present levels do not indicate severe pollution, the topography, meteorology, and explosive development of the city of Lima could unleash a problem of great magnitude. There are several fishing communities with a problem of pollution from the waste products in the manufacture of fish meal; of these, Chimbote is the most severely polluted. There are two rural areas (the Ilo Valley and the Mantaro Valley) which are affected by smelting fumes, primarly sulfur gases. The purpose of this project is to control these sources of air pollution in order to prevent a more serious situation than the present one.

#### PERU-3100, HEALTH SERVICES

The known general mortality rate in Peru in 1969 was 7.9 per 1,000 inhabitants; if this were corrected to include estimated omissions it would probably be 15.6 per 1,000. The age group under five years accounted for 46% of total deaths. Excluding ill-defined causes and senility, the group of diseases from infectious and parasitic causes was responsible for 56.6% of all deaths and for 76.3% of those in the under five age group. Diseases susceptible to control by vaccination caused 5.1% of the deaths; those related to poor basic sanitation caused 13.7%; tuberculosis caused 5.6%; and diseases related to early infancy caused 3.8% of all deaths. Morbidity figures, as a basis for the demand for medical services, show a total of 145,000 known cases of communicable diseases. Those related to environmental contamination constituted 33.6% of the cases; in second place (excluding influenza) was tuberculosis, with 11.4% of the cases. These were followed by communicable diseases susceptible to control by vaccination, 8.8%, and malaria, 2.2%.

The purposes of this project are to raise the level of individual and group health through improved and accelerated economic and social development of the country; to broaden the coverage of health services, especially in the rural areas, coordinating the activity of the sector with programs of integrated development; to expand preventive services, strengthening activities directed to the mother and child and to the mining, industrial, and farming populations; to improve the administration and coordination within and among the various sectors in such a way as to permit full utilization of resources; to improve social assistance activities, developing a program of support for the family and the community; and to stimulate research in the field of health, utilizing the programs of the National Institute of Health, the School of Public Health, and the universities.

### PERU-3106, HEALTH SERVICES - NORTHERN REGION

The purpose of this project is to extend the present agreement between the Government of Peru and PAHO/WHO to include the five remaining hospital areas of the Northern Region of the country, with the following objectives: (1) to raise the level of health of the people in order for them to participate actively in the implementation of the Regional Plan for Economic and Social Development; (2) to establish systems of coordination with agencies charged with the preparation of human resources in order to provide improved training of the professional and technical personnel required by the program, and with other sectors, such as education, agriculture, housing, social mobilization, and development, in order to provide joint action and assistance among all sectors; and to develop the health infrastructure of the zone to assure that programs are carried out in accordance with the needs foreseen each year and with the resources committed to them.

PERU-3500, HEALTH STATISTICS

The existing health statistics systems in Peru are inadequate in coverage, reliability, and timeliness. This constitutes a serious stumbling block in the process of planning and evaluating activities in the field of health. In addition, all the statistical information needed is not available, and there is a marked scarcity of personnel trained in health statistics and medical records at the professional as well as at the auxiliary level.

The purpose of this project is to improve the present health statistics systems in the country, broadening their coverage and reliability and accelerating the processes of collecting, analyzing, and publishing the information in order to make it available within a reasonable period of time. Objectives include (1) redesign of the national system of health statistics, establishing with precision the standards and procedures to be used in each of the processes involved - collection, transmission, processing, analysis, and publication of the information; (2) broadening of the existing system to include all information required by its users, particularly in the field of planning and evaluation of health programs at all levels; (3) utilization of ad hoc statistical studies or surveys as alternatives to obtain the necessary information in the field of health where it is not available from the permanent systems; (4) design and execution of a training program for health statisticians in order to meet the needs of the country; and (5) development of a standardized organization of departments of statistics and medical records in all health establishments.

PERU-3502, DEVELOPMENT OF HEALTH STATISTICS FOR RURAL AREAS

The ten-year goals for health in the Region include the extension of minimal health services to all the rural population. To plan these services, data will be needed on health problems and the level of health of the large numbers of people they are intended to serve. Methods of obtaining data on the services offered, the problems encountered, and the improvement of health must be developed.

Comparison of the low registered rates of child mortality in rural areas with the much higher rates in urban areas immediately brings forth evidence of the incompleteness of registration in rural populations. The Inter-American Investigation of Mortality in Childhood has shown the much higher risk of death in the rural child population included in the study when compared to nearby urban areas. And these rural areas included in the study may well have better health conditions than many others in the same country where problems are more severe.

Many of the studies proposed from time to time, such as the cost-benefit study of rural water supplies, require reliable vital and health statistics to establish the baseline situation and to evaluate changes. The purpose of this project is to develop in rural areas a methodology to collect vital and health statistics.

PERU-4200, NUTRITION

Protein-calorie malnutrition is as high as 55% in children under five years of age in some regions of Peru, and endemic goiter ranges from 18.5% to 39.9% throughout the country. Studies also indicate low hemoglobin levels in schoolchildren. The average diet provides 2,266 calories and 57.1 grams of protein (21.5 of animal origin). Dietetic studies show that a high percentage of families consume less than 75% of the calories and proteins recommended. There are also operational problems, such as scarcity of specialized personnel in nutrition, inadequate nutrition structure in the health sector, need for technical orientation on food and dietetic services in hospitals, and insufficient production and distribution of iodized salt.

The purpose of this project is to reduce the prevalence of nutrition diseases and to improve the nutrition status of the population through the accomplishment of the following objectives: (1) improvement of medical care for malnourished children; (2) establishment of an effective mother and child nutrition program; (3) increase in specialized personnel; (4) training of auxiliary personnel; (5) technical organization of food and dietetic services in hospitals; and (6) orientation of the public in order to achieve better dietary habits.

#### PERU-4500, RADIATION PROTECTION

An estimated 12,000 people in Peru aré directly exposed to radiation in occupations involving the use of radiation equipment, principally in hospitals, health centers, and other industrial, research, and teaching installations. In addition, another 15,000 people suffer circumstantial irradiation from working in nearby areas. Approximately eight million inhabitants (60% of the total population of Peru) are exposed to radiation due to medical diagnostic and preventive measures. There is an urgent need to adopt measures which will eliminate all unnecessary exposure of the general population and will reduce occupational exposure to the levels recommended by the International Commission on Radiological Protection.

The purpose of this program is to establish a national program to include the study and evaluation of risks to the public; development of techniques and procedures to reduce exposure; adoption of corrective measures to control the risk inherent in the use of radiation; training of personnel; and coordination of the work of the agencies involved.

### PERU-4600, INDUSTRIAL HYGIENE

It is currently estimated that the rate of disabilities due to accidents in Peru is 76 per 1,000 among workers in the mining industry, 54 per 1,000 in manufacturing, and 48 per 1,000 in civil construction. A high percentage of all the labor force is exposed to the inhalation of inorganic mineral dust. Between 1949 and 1970 there was a prevalence of silicosis of 30% among miners. The purposes of this project are the reduction of the prevalence of industrial diseases and accidents; improvement of environmental working conditions; and increase in productivity.

# PERU-4800, MEDICAL CARE SERVICES

The utilization rate of services at the Hospital de Aeronautica in Peru is only 40%, which is very low in relation to its installed capacity of 150 beds and even lower when the total capacity of 300 beds is considered. Its costs of operation are excessive, and there is a need to implement administrative systems and techniques to permit satisfactory functioning, with a view to increasing coverage to other sectors of the community. There is also a need for training personnel and for improving the quality of the services rendered. Other hospitals with teaching activities can receive assistance through the same project.

F	UND 1972 1973 1974 1975	FUND	1972	1973	1974	1975
_						

The purposes of this project are to improve utilization of the installed capacity of the Hospital de Aeronautica; to improve quality of professional services, general administration, and complementary services; to assist in the organization and implementation of a system of progressive patient care in the hospitals covered by the project; to collaborate with the School of Public Health in training doctors and other personnel in the field of hospital administration; to increase utilization in the hospitals of the system of unit managers and assistants; and to carry out a study of the needs in the field of rehabilitation and collaborate in the establishment, development, and implementation of the various centers and services needed by the disabled.

#### PERU-4804, HOSPITAL MAINTENANCE AND ENGINEERING

There is a need in Peru to conserve and increase the capital invested in buildings, equipment, and supplies for health agencies, as one method of improving the quality of medical care and providing broader coverage of the population. The purpose of this project is to improve the quality of medical care provided the population and the development of hospital agencies, through the establishment of a policy of hospital maintenance and assistance in the same area to other institutions in the health sector, provided trained professional and technical personnel are available.

## PERU-5101, CANCER CONTROL

The statistics of the cancer registry in metropolitan Lima show that cervical cancer constitutes 34% of all cases of cancer diagnosed. Statistics from the Institute of Neoplastic Diseases indicate a low percentage of survival because of the number of cases with delayed consultation and treatment. In metropolitan Lima there are between 1,500 and 2,000 new patients each year with uterine cancer, but only 10% of them come in when the lesion is in the early stages.

The purposes of this project are to incorporate into medical care routines the taking of cervical-vaginal smears for histological examination; to promote better output and quality of diagnosis through centralization of examinations in adequate laboratories; to train professional personnel and cytotechnicians; and to improve the diagnosis and treatment of a larger number of detected cases.

# PERU-6100, SCHOOL OF PUBLIC HEALTH

One of the problems which provides a stumbling block to the accomplishment of national health plans in Peru is the lack of well trained personnel. The purpose of this project is to make studies on the needs of auxiliary personnel in charge of health posts (the smallest executive unit of the Ministry of Health, located in rural areas) and to organize a program of training for these personnel. At the same time, the project will continue to study in pilot areas the problem of supply and demand of human resources in the health field, in order to provide information on the personnel requirements of the Ministry of Health, and development, in accordance with the needs of the country, of plans for training personnel at professional, technical, and auxiliary levels.

### PERU-6101, INTERDISCIPLINARY ACTION IN HEALTH

An important factor which slows down the changes needed in Peru to adequately prepare professionals both quantitatively and qualitatively in accordance with the current socioeconomic situation in the country is the current lack of coordination between the training agencies and the agencies which use these personnel. This is demonstrated at various levels - between the Ministry of Health and the universities, among the universities, among the various professional careers in the health field, and between the professional colleges and the other agencies involved in problems of education.

On the other hand, there have been some favorable changes in this area: (1) passage of a law which establishes the bases which regulate agreements between the Ministry of Health and the universities in order to properly utilize governmental resources in the teaching of undergraduate and postgraduate courses and which creates an Intersectoral Coordination Committee; (2) a demonstrated interest in the directives of the Associations of Academic Programs concerning the various health professions, with the goal of jointly studying and analyzing problems of common interest; (3) the possibility of establishing a Federation of Associations of Academic Programs; and (4) the sponsorship of several seminars and meetings of a multiprofessional character.

The purpose of this project is to promote, encourage, and facilitate the interchange of opinions and interdisciplinary coordination between the various health professions, the Ministry of Health, universities, and professional colleges. The objectives of these seminars are (1) to analyze the problem of work teams and distribution of functions among the various professionals on the basis of available information; (2) to discuss the feasibility of a group joining together professionals in the same areas of subject matter; (3) to interchange information and experiences among the Ministry of Health, the universities, and professional colleges and associations; and (4) to formulate suggestions on policy, strategy, organization, and programming of activities for preparing and training health personnel. The final goal is the formation of a multiprofessional national group trained to adjust the curricula to the needs of the country on the basis of a common conceptual framework.

### PERU~6200, MEDICAL EDUCATION

The medical education situation in Peru is characterized by the following elements: (1) inadequate and obsolete curricula in relation to the actual needs of the country, and a lack of clearly defined educational objectives which cause discrepancies between the contents of the programs and the functions which the new graduate is expected to perform; (2) a scarcity of professors and insufficient preparation and pedagogical training of the teachers, which results in the utilization of inadequate educational methodology and pedagogical techniques; (3) lack of institutional coordination, manifested at four levels - between the Ministry of Health and the schools of medicine, among the universities, among the various careers in the health professions, and between the professional societies and the medical education agencies; and (4) absence of structured programs leading to the preparation of specialists and to the execution of activities which provide for continual improvement after graduation.

The purposes of this project are to promote curriculum changes with major emphasis on training in preventive and social medicine; to contribute to the preparation of teachers, especially in their pedagogical training; to collaborate with and stimulate the coordination between the agencies which prepare personnel and the agencies which use them, and among the different professions; and to assist and participate in the structuring of postgraduate training in the country.

PERU-6300, NURSING EDUCATION

In accordance with the provisions of the new Educational Reform Law in Peru, the Joint Commission on Nursing has recommended that there be three levels of nursing personnel: (1) Basic level - Nursing auxiliary; (2) Professional education - Nursing program integrated into high school education; and (3) University education - B.S. in nursing. Currently there are 21 centers for training of nursing personnel in the country: 12 university programs of four to five years' duration, and nine schools of nursing with three-year courses. The plans for construction set forth in the National Health Plan for the period 1971-75 indicate a need for increasing the number of professional and auxiliary personnel, estimating a shortage of 4,000 nurses and 11,000 auxiliaries to meet the nursing requirements of the proposed institutions. It will be necessary to adapt the present educational system to the requirements of the new educational law and to review the plans of study at the three levels to conform with the health needs and programs in the country. There are no courses in Peru to provide for the preparation of nurses at the graduate level. It is estimated that there are 200 nurses interested in furthering their education for teaching and administration in courses leading to a degree in nursing.

The purpose of this program is to analyze the system of preparation of nursing personnel and to collaborate in those activities related to the adjustment of the nursing education programs at all levels to the new educational structure in the country.

PERU-6302, TRAINING OF NURSING AUXILIARIES

The scarcity in quantity and quality of professional and auxiliary nursing personnel in Peru, added to poor distribution of existing personnel and the traditional practice of nursing care, constitutes a serious barrier to integration of the services and to attaining the health goals of the country. There are at present 3,932 nurses and 10,396 auxiliaries, a high percentage of whom are untrained; these numbers need to be approximately doubled to provide the following minimum manpower resources for the population estimated for 1980: 50 nursing personnel per 100 beds, 15 of whom will be nurses; and 15 nursing personnel per 10,000 inhabitants, 2.2 of whom will be nurses, for community health care. In order to accomplish the changes and proposed actions of the health plan for the country, a plan needs to be developed immediately providing for the preparation of new nursing auxiliaries and the utilization of those already available.

The purposes of this program are to set up a plan of action based on the priority needs of urban and rural programs of health and on the number of auxiliary nursing personnel required; to train at least 70% of the existing nursing auxiliaries in the functions required in the various health services in the country; to train nurses in methodology and new service techniques and in the training of nursing auxiliaries; and to provide work manuals and teaching materials for auxiliaries.

## PERU-6400, SANITARY ENGINEERING EDUCATION

The demand for technical personnel in Peru has increased in the last few years as a result of the increasing growth of sanitation programs. As a result there is presently a deficit of sanitary engineers in relation to demand. The new and acute environmental problems and the need for development of improved techniques and for acquiring advanced knowledge for their solution adds to the responsibility of the agencies involved in environmental health. The limited activity in applied research in the sanitary engineering field leads to the utilization of design parameters developed in countries with characteristics different from those in Peru. This results in solutions which make poor utilization of the resources and not in line with the economic conditions in the country.

The objectives of this project are to train professionals in the field of sanitary engineering and to carry out technical research for better understanding of the actual situation and potential of the country.

#### PERU-6500, VETERINARY MEDICINE EDUCATION

The demand for food products of animal origin, the need to improve levels of consumption, the control of zoonoses which affect the production, and the high incidence of diseases with dietary implications, as well as the risks originating from the potential dangers of environmental sanitation as it relates to the animal population, indicate a growing need for professional veterinarians in Peru. The schools of veterinary medicine are exerting efforts to produce the curriculum changes necessary to prepare the professionals needed in the country for reasons of socioeconomic development, for meeting health and nutrition problems, and for carrying out the new philosophy of the Government in relation to agrarian reform and social improvement.

There is a marked academic inequality among the various schools of veterinary medicine; the Association of Academic Programs is improving this situation through in-service workshops, seminars, and the application of knowledge on the psychology of learning. Activities of integration are being carried out between veterinary medicine and other health sciences, which provides an excellent opportunity for future multidisciplinary action. Training of teachers in various specialties is needed, particularly in epidemiology, ecology, biostatistics, planning, and programming in animal health, and in pedagogical techniques.

The purpose of this project is to improve veterinary education in Peruvian universities, raising the quality of education, incorporating research in human and animal health into the profession, and developing closer collaboration between veterinary medicine and other health sciences, with the goal of providing improved preparation and adequate use of human resources.

## PERU-6600, DENTAL EDUCATION

There are presently four academic programs in dentistry in Peru. In accordance with recent legislation, the universities have been reorganized in line with new standards, with a departmental structure as a base. The objectives of this project are to strengthen teaching programs in dentistry, especially in preventive and social aspects; to adjust curricula to critical needs; and to train teaching personnel through such media as courses and seminars.

#### BRAZIL - DETAIL

#### BRAZIL-0100, EPIDEMIOLOGY

In Brazil, because of its broad extension across the South American continent encompassing equatorial and subtropical zones, there are various health problems due to the different environmental and sociocultural factors present. The high endemicity of communicable diseases, such as malaria, smallpox, Chagas' disease, plague, tuberculosis, leprosy, schistosomiasis, and the zonoses, as well as diseases which are not caused by infections or parasites, such as malnutrition and other deficiency diseases and cardiovascular, degenerative, and occupational diseases, requires intensive action through a program of control or eradication and through epidemiological surveillance.

The governmental agencies at the state and federal levels, as well as private organizations, are developing activities in various areas and requesting assistance for the improvement of their programs. Of special importance is the improvement of the system of notification and collection of epidemiologically important data, the provision of facilities for clinical diagnosis, and the establishment of communicable disease laboratories to provide adequate control of outbreaks. One important need is the preparation of professional and technical personnel in the field of epidemiology through local courses and in-service training.

### BRAZIL-0114, SURVEILLANCE RESEARCH ON INFECTIOUS DISEASES ALONG THE TRANS-AMAZON HIGHWAY

The opening of the Trans-Amazon Highway offers the opportunity to carry out multidisciplinary studies on diseases and their causative agents introduced by the work force and colonists coming from other parts of Brazil, and on local diseases and infectious agents of the Amazon area which may affect the immigrants. These studies include epidemiological investigations on yellow fever and other arboviruses, enteroviruses, rabies, enterobacteria (with particular attention to salmonellosis), leptospirosis, malaria, leishmaniasis, Chagas' disease, helminth infestation (especially schistosomiasis), and febre negra. Investigations will also be made on reservoir hosts among the wild animals and on the role of certain arthropod vectors.

#### BRAZIL-0200, MALARIA ERADICATION

The malarious area of Brazil contains 6,912,234 km<sup>2</sup> (81.2% of the country), with 40,670,000 inhabitants (40.6% of the people). By the end of 1959 the antimalaria campaign was being converted to an eradication program; integrated insecticide coverage was begun at the end of 1968. In 1969, 1970, and 1971 the number of sprayings was reduced, but again increased in 1972.

In 1972, 176 towns in the State of São Paulo, with 3.4 million people, passed from the consolidation to the maintenance phase, resulting in a total population distribution as follows: 4,265,000 people (10.5%) in the maintenance phase; 14,017,000 (34.5%) in the consolidation phase, and 22,388,000 (55%) in the attack phase. In the Amazon Region there are operational problems and human ecological factors which interfere with the campaign. There do not seem to be any technical problems to impede the eradication of the disease, and endemic malaria has diminished or disappeared where attack measures have been applied. In 1971, 2,012,625 blood examinations turned up 80,294 cases of malaria (4.0%), and in 1972 there were 75,834 cases based on 2,056,509 examinations (3.7%).

# BRAZIL-0300, SMALLPOX ERADICATION

Up until 1967, Brazil had the highest degree of endemicity of smallpox in the Americas. Notification was deficient, and during the smallpox campaign it was discovered that only 2.5% of the actual incidence was reported. In 1969 a combination of intensification of massive vaccination operations and the beginning of a surveillance and containment program produced the discovery of a great number of cases which were rapidly brought under control, reaching the lowest levels of incidence by the end of 1970. In 1971 there was an outbreak in Guanabara, but the last case was notified on 19 April 1971. Since then, despite an intensive search, no further residual foci have been discovered.

The objective of this project is to consolidate the present epidemiological situation through an active program of surveillance and of vaccination of children under five years of age, in programs which include the simultaneous administration of other antigens.

#### BRAZIL-0400, TUBERCULOSIS CONTROL

Sampling studies on the population of Brazil, through the use of x-ray diagnosis, form the basis for an estimate that 0.5% of the people suffer from tuberculosis, which would mean that there are probably 450,000 cases in the country. Mortality from tuberculosis is estimated at 67 per 100,000 inhabitants. Development of a methodology adapted to the country in general and to the various regions in particular would permit adequate control of the disease.

Objectives of this project are to ascertain the most appropriate methodology to be used in accordance with the conditions of each area and to broaden and extend the facilities for bacteriological diagnosis of tuberculosis. These will be accomplished through integrated programs in selected areas for study and comparison of control methods; increasing BCG vaccination; and extension of the network of laboratories for bacteriological diagnosis.

#### BRAZIL-0700, VETERINARY PUBLIC HEALTH

Zoonoses control activities have expanded slowly in Brazil, relying on projects that will provide better information, such as health statistics, federalization of inspection of food products of animal origin, regionalization of laboratories, the animal health planning program in Rio Grande do Sul, and ecological studies related to vampire bat rabies. There are specific programs for rabies and brucellosis in various areas of the country, and these are being gradually extended to all the states. The purpose of this program is to control the principal zoonoses, with emphasis on rabies, providing the technical and administrative structure needed to standardize antirabies treatment, and to extend the program of control and epidemiological research to control of zoonoses and food hygiene.

## BRAZIL-0901, PLAGUE RESEARCH

It is estimated that the area of Brazil in which plague is endemic comprises some 180,000 km<sup>2</sup> and that the disease constitutes an important problem for public health in the country. Between 1963 and 1972, 1,641 cases were notified. The objective of this project is to cooperate with the Ministry of Bealth in a research program on the ecology of rodents and other factors which influence the focalization and epizootization of the disease. The results of this program will provide a basis for reorientation of activities for control of the disease.

### BRAZIL-1000, SCHISTOSOMIASIS

The prevalence of schistosomiasis in Brazil, estimated to be 100 million people, continues to increase, according to studies that are being carried out. There also appears to be a pattern of progressive invasion from the zones of high endemicity to territories originally free of the disease. Schistosomiasis affects great masses of people, particularly in the highly endemic areas of the Northeast - Paraíba, Pernambuco, Alagoas, and Sergipe - where the disease presents grave symptoms and the rate of mortality is high. The national authorities recognize the gravity of the problem and are making an effort to study the most effective means of control. Objectives include a study of the epidemiological characteristics of the disease and evaluation of the long- and short-term results of treatment with hycanthone.

### BRAZIL-1001, CHAGAS' DISEASE

The presence of triatomes in the interior of houses has been verified in the area from the State of Maranhão to Rio Grande do Sul, penetrating also the States of Goiás and Mato Grosso. Epidemiological studies have uncovered the infection in more than 1,700 villages. Prevalence is estimated at approximately 3 million cases, the majority of them apparently asymptomatic. The severy of the disease varies in the different regions.

The Ministry of Health is undertaking the fight against Chagas' disease in all of the national territory, with the purpose of extending the control program to the entire endemic area. The campaign against the disease in Minas Gerais constitutes part of the national program and has as its objective the short-term control of the disease in order to reduce its impact on health and on economic development.

## BRAZIL-2100, ENVIRONMENTAL SANITATION

The purposes of this project are to provide assistance to Brazil in the study and solution of environmental problems such as water supply, collection and disposal of residential and industrial wastes, and control of pollution of water, air, and soil; to encourage and collaborate in studies directed to major improvement in the use of water resources, especially in those river basins where there are problems of water quality control; to participate in carrying out studies and activities such as the collection and disposal of solid wastes, vector control, home and food sanitation, and industrial hygiene; and to train technical personnel at the professional, intermediate, and auxiliary levels.

BRAZIL-2103, DEVELOPMENT OF RESEARCH AND ENVIRONMENTAL POLLUTION CONTROL PROGRAMS (STATE OF SÃO PAULO)

In recent years the industrial and population growth in the State of São Paulo in Brazil has been unprecedented, particularly in the area of Greater São Paulo, where population growth estimates indicate that there will be 20 million inhabitants by the year 2000. The present population of the State is about 18 million people, and industrial production is more than half of the total for the country, which has a population of 100 million people. The continued deterioration of the environment is affecting the health of the population, causing considerable economic losses, interfering with industrial development, and affecting the economy of the State. According to studies carried out by the Government with the assistance of PAHO, the pollution problem is critical, and measures have been adopted to establish an administrative, legal, and financial framework to provide for urgently needed programs of research and control of air, water, and soil pollution. This requires trained personnel, expert technical assistance, and appropriate equipment in order to accelerate the carrying out of these programs and meet the needs of the State of São Paulo.

The objectives of this project are to collaborate in the establishment of a program of environmental control for the State of São Paulo, utilizing current techniques and developing new ones, including the use of mathematical methods and systems analysis; to improve and extend current programs of control of water and air pollution; to carry out research to identify and evaluate problems related to solid wastes; and to train the technical and administrative personnel needed in the control of environmental pollution.

BRAZIL-2104, ENVIRONMENTAL POLLUTION CONTROL IN THE STATE OF GUANABARA

The State of Guanabara in Brazil has a very high population density which is related to its industrial development, and this generates serious problems in the health and sanitation sectors. Pollution of the water bodies increases constantly, interfering with the health and living patterns of the population and at the same time affecting the economy in various ways, such as in a decrease in the flow of tourists because of contamination of the beaches. Guanabara Bay is a good example of this type of situation, having been transformed into a highly contaminated body of water. The presence of about 350,000 vehicles, 8,000 domestic incinerators, and 4,000 industries generates high indices of atmospheric pollution. The production of solid wastes is growing at a rate of 10% per year, currently at a level of 3,000 tons a day. The inadequate systems for collection, transport, and final disposition of these wastes create serious health and esthetic problems.

The purpose of this project is the creation of instruments, including federal legislation, to prevent and control the intensification of water, air, and soil pollution. In order to accomplish this, the development of activities intended to solve the problems caused by the poor quality of water, air, and soil will be accelerated to a pace compatible with the needs of the country.

BRAZIL-2200, WATER SUPPLIES

In 1967 the Statistical Service of the Ministry of Health estimated that 43.32 million out of a total of 85.78 million people in Brazil lived in urban areas. Fifty per cent of these people have water supply service and 25% have sewerage service. In the rural areas the total population served is very small. The National Plan for Basic Sanitation (PLANASA), financed by the Banco Nacional de Habitação, hopes to provide water service to 80% of the urban population before 1980 through the development of statewide water utilities; similar development is expected in the sewerage services.

The purpose of this project is to assist the governmental agencies responsible for the execution of PLANASA. This will require technical and administrative restructuring of the agencies for the purpose of developing technical and procedural standards to provide better utilization of resources and improved efficiency in the operation, maintenance, and administration of services. New or improved methods of water and sewage treatment need to be incorporated, as does further development of personnel to meet the proposed targets.

BRAZIL-2201, WATER SUPPLIES IN SÃO PAULO

The purpose of this project is to establish standards, programs, and procedures for the improvement of the administration of water supply services in the city of São Paulo, Brazil. The first phase, consisting of analysis and evaluation of the various administrative aspects, has been completed, and the second, dealing with the implementation of the recommendations made by the consultants, is under way. At the same time, an intensive training program for personnel at all levels is also in progress.

BRAZIL-2202, WATER SUPPLIES IN BELO HORIZONTE

The water supply and sewerage systems in Belo Horizonte, Brazil, under the responsibility of the Departmento Municipal de Aguas e Esgotos (DEMAE), are currently in a stage of expansion, with the goal of supplying the demand for these services for the next 20 years. The purpose of this project is to assist DEMAE in its technical and administrative development; in the execution of short-, medium-, and long-term plans; and in improvement of the efficiency of the operation, maintenance, and administration of its services.

BRAZIL-2203, WATER SUPPLIES IN ESPIRITO SANTO

The Companhia Espirito Santense de Saneamento (CESAN) is responsible for the execution of the basic sanitation plan in the State of Espirito Santo, the goal of which is to provide water to 80% of the urban population, with an investment of approximately 100 million cruzeiros, in the next eight years. The purpose of this project is to assist CESAN in meeting this challenge. This requires technical and administrative restructuring to provide better utilization of resources and to bring greater efficiency to the operation, maintenance, and administration of water supply and sewerage systems.

BRAZIL-2204, WATER AND SEWER ADMINISTRATION IN BELO HORIZONTE

The purpose of this project is to provide consultant services, as well as some training, to the Companhia Mineira de Aguas e Esgotos (COMAG) in Brazil in reviewing its present institutional organization, standards, and managerial and administrative practices, in order to assist in strengthening this statewide company for implementation of the countrywide plan to provide water to 80% of the population. In the state, particular attention is being paid to economic and financing areas and the establishment of institutional practices to manage over 500 utilities serving the population centers of the state. Criteria, policies, standards and regulations will be introduced to assure better and more rapid use of resources.

BRAZIL-2300, AEDES AEGYPTI ERADICATION

Aedes aegypti was eradicated from Brazil in 1958. However, the vector was reintroduced into the city of Belém (State of Pará) in 1967. Later, epidemiological surveys indicated that the reinsfestation had also affected the cities of São Luiz, Rosario, and Ribamar (State of Maranhão). The purposes of this project are the elimination of Aedes aegypti from the reinfested areas of the country by late 1973; the intensification of epidemiological surveillance to prevent further reinfestations; and the training of technical and auxiliary personnel in eradication and surveillance procedures.

BRAZIL-2500, AIR POLLUTION

The technological revolution in Brazil and the tendency toward urban and industrial growth has significantly increased air pollution, with constantly increasing quantities of gaseous wastes in the form of aerosols and other particulate matter. Certain concentrations of contaminants can cause serious damage, particularly to the respiratory system.

The purposes of this project are to provide quantitative information on the subject, collecting basic data to permit a comparative study of the situation in the affected cities, and to arouse an interest in the air pollution problem in the participating cities, with the object of contributing to adequate administrative structures and giving professional assistance. To attain these objectives, the larger cities in Brazil are integrated into the Pan American Air Sampling Network, organized by CEPIS. Brazilian cities currently participating are São Paulo, Rio de Janeiro, Pôrto Alegre, Belo Horizonte, Recife, and Curitiba.

BRAZIL-3101, HEALTH SERVICES IN STATES AND TERRITORIES

The Northeast Region of Brazil comprises nine states and 29 million people. A large proportion of the population is under 14 years of age, and more than half live in rural areas. The per capita income is low and the illiteracy rate is high. There are high rates of general mortality, infant mortality, and mortality due to communicable diseases. Water supply and sewerage services are extremely limited. Many pre-school children suffer from malnutrition, and a large percentage of the population have no health services. There is a great scarcity of medical personnel and of hospital beds. The structural organization of the health sector shows a multiplicity of systems, lack of coordination and administrative centralization, and local executive disintegration.

The purposes of this project are (1) the technical and administrative restructuring of the central health agencies in the nine states of the Northeast over a six-year period; (2) coordination of the agencies which make up the health sector in these nine states, in a six-year period; (3) organization of a regionalized system for the delivery of health care by each secretary of health; (4) initiation of the health planning process into these secretariats; (5) development of a uniform system of health statistics for the Northeast region, creating proper conditions for the production of the statistics needed, adequate for the purposes of planning and administration of health programs, in a period of six years; (6) incorporation of a nutrition program into the health plans of the region, and implementation of this program within six years; (7) improvement of technical and administrative structures of the agencies which provide the water supply and waste disposal services currently existing in the region, increasing water supply to rural areas in a period of six years; and (8) developing the human resources needed to carry out these programs.

UNICEF cooperates in this project.

BRAZIL-3104. HEALTH SERVICES - SOUTHEAST REGION (SÃO PAULO)

The Southeast Region of Brazil, comprised of the States of Minas Gerais, Espīrito Santo, Rio de Janeiro, Guanabara, and São Paulo, has 10.36% of the land area of the country and 43% of the population. Mortality from communicable diseases is high in this region. In 1967, 12% of general mortality and 37.7% of infant mortality was due to this cause. Measles is one of the principle causes of death in infancy. Rabies is a grave health problem; 22 human cases were diagnosed in São Paulo in 1971. Malnutrition is also an important health problem. It is considered necessary to strengthen the health infrastructure in order to provide greater efficiency in the use of available resources.

The objectives of this project are to develop the process of administration and planning of health activities throughout the region, within the context of the national health policy and in accordance with the national and state development plans; to promote coordination of the health sector in order to outline an integrated system of health assistance in each of the states of the region; and to improve the infrastructure of the health sector to provide broader coverage, especially in the rural areas, for the purpose of strengthening the basic program of medical care, control of communicable diseases, immunizations, nursing care, statistics, and training of personnel.

BRAZIL-3108, HEALTH SERVICES IN RURAL AREAS

In 1971 the rural population of Brazil was estimated to be about half of the total population of the country, and 45% of it was under 15 years of age. Seventy-two per cent of this population lacked water supply services and 95% did not have adequate sewerage systems. Studies on the nutritional status of the inhabitants of the Northeast Region indicate that the average diet contains 1,472 calories and 51.4 grams of protein per day. Health services coverage is insufficient.

The purpose of this project is to contribute to the creation of a health infrastructure for the purpose of reducing morbidity and mortality rates through basic sanitation activities, prevention and control of communicable diseases, maternal and child health programs, and health education, as part of a general program of development for the rural population.

UNICEF cooperates in this project.

BRAZIL-3109, HEALTH SERVICES (AMAZON BASIN)

The purpose of this project is to create a health infrastructure in the Amazon Basin area of Brazil which will progressively, in each of the six federal units which comprise the region, establish a health system with regionalized services of integrated medical care and which will, through a surveillance system and the application of protective measures, bring about control of communicable diseases. In addition, it will provide a system for collection and registry of regional statistical information; incorporate a nutrition program; and establish programs of community organization and of improvement of basic sanitation throughout the rural area.

### BRAZIL-3110, HEALTH SERVICES IN THE SOUTH

The Southern Region of Brazil, comprising the States of Parana, Santa Catarina, and Rio Grande do Sul, has serious problems of health and a sectoral infrastructure that is inadequate to meet the development needs of the respective services. The purpose of this project is to provide an adequate institutional infrastructure for the planning and administration of health services. Specific objectives include technical and administrative restructuring of the health secretariats; institutionalization of the planning process; provision of uniform and adequate statistical systems; development of human resources; establishment of mechanisms of coordination; improvement of sanitation systems; provision of water supplies to 80% of the urban population; and control of water pollution.

BRAZIL-3200, NURSING SERVICES

Among the problems Brazil faces in the improvement of health services and their extension to suburban and rural areas, the situation regarding nursing is one of the most important. The scarcity of nurses (0.9 per 10,000 population) and their concentration in the large urban centers leaves the major portion of nursing services in the hands of auxiliary personnel, many of whom are not trained to assume these responsibilities. There are presently 84,603 nursing auxiliaries, less than 50% of whom have attended formal courses.

Given the immediate demand for nursing personnel for institutions under construction and new services planned, and in view of the scarcity of existing personnel, its limited production, and industrialization, it is necessary to make an evaluative analysis of the present nursing situation and to search for more adequate technical and economical solutions to the nursing problem.

The purpose of this project is to cooperate with the Government in the determination of nursing needs, in programming services, and in training in nursing and obstetrics within the context of national health plans.

BRAZIL-3302, YELLOW FEVER LABORATORY

There are still sporadic outbreaks of selvatic yellow fever in the Americas, and it is necessary to intensify epidemiological surveillance in endemic areas. Vaccination of susceptible groups in these zones must be continued. The Instituto Oswaldo Cruz has been producing lyophilized yellow fever vaccine of high quality, and provides facilities for the pathological diagnosis of yellow fever.

The purpose of this project is to support the Instituto Oswaldo Cruz in order to increase the production of yellow fever vaccine, with the goal of providing it in cases of emergency to other American countries that do not produce it, and to maintain a reference laboratory for the diagnosis of yellow fever.

BRAZIL-3315, IMMUNOLOGY RESEARCH AND TRAINING CENTER

Immunology is a rapidly developing science with significant current developments in tissues and organ transplantation, immunopathology, knowledge and function of immunoglobulins, cellular differentiation, and genetics. Personnel competent in basic immunology and in modern immunological techniques have become indispensable to any major health center.

The purpose of the project is to provide, through the Immunology Research and Training Center at the Instituto Butantan in Brazil, postgraduate training on the theory and laboratory techniques of immunology to students from Brazil and other countries in the Americas. The Center also offers a research program on basic immunological mechanisms and their application to local public health problems.

BRAZIL-3400, HEALTH EDUCATION

FELLOWSHIPS-SHORT TERM

The purpose of this project is to collaborate with the Government of Brazil in reorienting health education programs within the realistic framework of each particular social, economic and cultural situation at national, regional and state levels of work. The major responsibility to achieve this rests with the technical health education units and teaching institutions in the country. Significant progress, however, cannot be achieved without the support of professional organizations and the competence of each public health worker as an agent of sociocultural change in the field of health. Therefore, this task will be carried out through (1) operational studies on health education and comparative interdisciplinary research on sociopsychological, cultural, and educational variables to be incorporated into the health planning process; (2) evaluative meetings at federal, regional and state levels on the orientation and quality of health education services; (3) development of programs of continuing education and in-service training of health education personnel at all levels; (4) integration of the health education component into the general education system; and (5) development and application of methodological evaluation models on health education activities.

#### BRAZIL-3500, HEALTH STATISTICS

Brazil, one of the 10 largest countries in the world in both size and population, is making notable progress in the field of economic and social development. Along with this a program of improvement of economic and population statistics is also developing. However, serious problems with health statistics are encountered in various parts of the country, and data are still inadequate on health conditions and needs, on the availability and utilization of health services, and particularly on the number of births and deaths. Vital statistics are only available for the state capitals, and even some of these are underregistered. Finally, there is a great lack of personnel trained in the field of health statistics.

The purpose of this project is to improve the coverage, availability, and quality of health and vital statistics in the country as a whole, and also in the regions and states; to sponsor courses and training of personnel; to see that health statistics are more widely used in planning, execution, and evaluation of health programs; and to develop closer communication among those who prepare health and vital statistics and those who use them.

#### BRAZIL-3502, HEALTH INFORMATION SYSTEMS

The purpose of this project is to assist the Government of Brazil in setting up a health information system through data processing using electronic computers. A study will be made on the current situation in the country and on the appropriate methodology to use in such a system, and technical advice will be provided on the equipment to be used.

# BRAZIL-3600, ADMINISTRATIVE METHODS AND PRACTICES IN PUBLIC HEALTH

The areas of responsibility at the various levels (federal, state, and municipal) need to be defined in the health agencies in Brazil, since they occasionally duplicate each other's efforts. The changes in jurisdiction between the functions at the federal level and the autonomy of the states sometimes cause administrative difficulties. The great number of administrative agencies produces problems of coordination, supervision, and operation. The lack of flexibility of the administrative systems and services limits the effectiveness of substantive actions.

The basic objectives of this project are to promote the strengthening and development of administrative systems; to provide adequate administrative services for effective support of substantive activities; to develop a system of administrative methods and procedures; and to train administrative personnel at all levels.

BRAZIL-3701, PLANNING FOR HEALTH SERVICES IN THE NORTHEAST

The first two Directive Plans of the Superintendencia de Desarrollo del Nordeste (SUDENE) in Brazil did not include any specific health activities. The III Plan defined programs and included specific assistance to the health sector. The IV Plan established as a fundamental objective the inclusion of health in the process of planning in all the states of the Northeast.

The objectives of this project are (1) to extend the process of health planning to all the nine states of the Northeast Region; (2) to create the technical and administrative conditions needed for orderly development; (3) to develop techniques of health planning, extending them to the local level and to public agencies, in order to provide for formulation of sectoral and state plans and a macroregional plan; and (4) to define and apply health strategies and models to national, state, and regional economic and social development plans.

#### BRAZIL-4101, MATERNAL AND CHILD HEALTH

Limitations in statistical systems in Brazil make it difficult to appraise the maternal and child health situation. Infants and children under 15 years of age were estimated to constitute about 42% of the total population in 1970. Infant mortality in the various states ranges from 51 to 246 per 1,000 live births and accounts for about 37% of total deaths. Principal causes of death and morbidity in infants and children are communicable diseases, malnutrition, and poor basic sanitation.

The purpose of this project is to reduce maternal and infant mortality and morbidity over a four-year period, through a coordinated system of health care which will provide expanded prenatal, delivery, and postnatal care, with the goal of avoiding physical and emotional risks to the mother and of guaranteeing normal physical and mental development to the child. In addition, the project includes training of specialized personnel at all levels through courses, seminars, and other educational activities.

### BRAZIL-4200, NUTRITION

Nutrition studies and research in Brazil indicate that the average daily consumption in the Northeast is 1,472 calories and 51.4 grams of protein; that the average for the whole country is about 2,500 calories and 65 grams of protein; and that in underdeveloped regions these amounts are even lower. There is a high mortality rate of children under five years of age, as well as many nutrition-related problems such as physical and mental deficiency, low resistance to infection, and reduced learning ability. A program of supplementary feeding introduced in recent years reaches only a fraction of the school population. There are many different agencies in the country involved either directly or indirectly in policies and programs related to food and nutrition. Nutrition education and food information for the consumer are not provided in a form that is adequate in quantity or quality to meet the needs of the people.

The Government of Brazil plans to develop an integrated food and nutrition program which would give priority to school-children in the lower grades; to pregnant and nursing mothers and preschool children; and, progressively, to other high-priority social groups. The purpose of this project is to provide assistance in the development of a national food and nutrition policy.

BRAZIL-4203, INSTITUTE OF NUTRITION (RECIFE)

The Northeast Region of Brazil has serious food and nutrition problems, mainly protein-calorie malnutrition in preschool children and lack of adequate institutional and technical facilities to assess the situation through an ongoing surveil-lance process; to propose practical solutions; or to train specialized personnel in nutrition.

The Institute of Nutrition is located at the Federal University of Pernambuco and has a staff of about 35 professionals, almost all of them full-time, who carry out dietetic and nutrition research and experiments with new protein mixtures of high biological value and local origin. The educational activities of the Institute include a four-year course for nutritionists; a special six-week course for physicians; participation in teaching medical students and nurses; training extension personnel of the Associação Nordestina de Crédito e Asistência Rural (ANCAR); and carrying out a postgraduate course for nutritionists, in agreement with UNICEF.

The purpose of this project is to assist in strengthening the structure and functioning of the Institute in three basic program areas - teaching, research and applied nutrition - in coordination with public health services and other related agencies in the field of food and nutrition.

BRAZIL-4300, MENTAL HEALTH

There are various problems related to the mental health situation in Brazil, including (1) inadequate organizational structure in the health area; (2) poor geographical and population coverage to meet the increase of neuroses and mental illness in general; (3) scarcity of specialized personnel who have knowledge of the latest developments in the mental health field; (4) lack of preventive and rehabilitation services; (5) resistance of general hospitals to included mental health services in their programs and structures; and (6) inadequate specialized training in modern aspects of the specialty in schools of medicine. The Ministry of Health has recently indicated an interest in a program of mental health for the country, based in large part on recommendations from the Regional Advisor and from short-term consultants. The purpose of this project is to collaborate with the Government in the reorganization of mental health services to incorporate them into national and state plans, giving major emphasis to preventive, rehabilitative, teaching, and research aspects.

# BRAZIL-4500, RADIATION PROTECTION

There is concern in Brazil for radiation protection in hospitals and other health establishments, as well as a need for trained personnel to provide supporting services for radiotherapy. The purposes of this project are to assist with the control of ionizing radiation, to study the effects of natural radiation, and to develop a training program for specialists in radiotherapy physics.

#### BRAZIL-4701, PAN AMERICAN DRUG QUALITY INSTITUTE

The people of Latin America are currently spending approximately \$2 billion yearly on drugs, and the consumption in Brazil alone is slightly more than a fourth of this figure. In addition, according to recent figures, the amount spent on medicaments is increasing in all countries at a rate of 15% or more per year. In spite of the fact that it is still necessary to import some chemical substances and ingredients, the pharmaceutical industry in Latin America has expanded greatly in the last few years and is currently producing more than 90% of the medicaments used in the area. However, the capacity of the governmental agencies charged with the control of the quality of these drugs, through inspection of the industry and proof of product control, has not developed at an equal rate. The purpose of this project is to increase the capacity of national departments of control in order to provide proper control of the drug industry and to avoid the distribution of products of deficient quality.

## BRAZIL-4800, MEDICAL CARE SERVICES

In Brazil there is a high general mortality rate, an infant mortality rate of more than 100 per 1,000 live births, and a life expectancy of 55 years. The most frequent pathological conditions encountered are communicable diseases, tuberculosis, and infant diarrhea, but the major underlying problem is malnutrition, particularly in the states of the Northeast, North, and Amazon regions. There are 3,300 hospitals with 300,000 beds, about half of which are located in large cities. Approximately 90% of these are in public hospitals. There are about 50,000 doctors, 27,000 dentists, 8,000 nurses, 17,000 nursing auxiliaries, and 50,000 attendants. All these figures vary, and there is no study on health manpower to provide exact statistics. Auxiliary and middle-level personnel bear the weight of medical care, while the professionals, generally underpaid, frequently devote only a few hours a day to medical practice and hold various official posts.

FUND 1972 1973 1974 1975	FUND	1972	1973	1974	1975

There are no data on the number of administrators in the medical care and health field, but an indicator is the fact that only three of 76 university hospitals train administrators. There are inadequate standards for medical care, and the health infrastructure is not adequate to provide for a population whose average per capita income is less than \$200 a year. A series of projections on the coordination of all health services in the country indicates that the Ministry of Health needs to be restructured, with a firm base in legislation on community health care.

The purpose of this project is to cooperate with the Government in providing an adequate medical care organization, broadening coverage of health services, improving current capacity, and increasing human resources, in order to bring about a higher quality of medical care.

BRAZIL-5101, CANCER CONTROL

Cancer constitutes an important health problem in Brazil, as the incidence of the disease increases with longer life expectancy and with the development of the country. Mortality rates, according to official information for the larger cities, vary between 98.3 and 121.7 per 100,000 people. Care of cancer patients is given at most general hospitals and through the National Cancer Service of the Ministry of Health.

The objectives of this project are to carry out campaigns pointing out the dangers of smoking; to emphasize the importance of industrial carcinogens; to prevent death from the disease through detection and early treatment; and to provide rehabilitation where needed. It also provides for collaboration with the Government of Brazil in establishing technical standards for medical care, prevention, and training in the field of cancer control, and in promoting epidemiological and clinical research throughout the country.

### BRAZIL-6102, DEVELOPMENT OF HUMAN RESOURCES

The purpose of this project is to cooperate with the Government of Brazil in the development of human resources in the health field. This will be accomplished through the provision of advisory services to the institutions in charge of education and training of personnel, including a special emphasis in the schools of medicine and public health. Fellowships will be granted for the direct training of top-level personnel in advanced centers in the country or abroad. A plan for the efficient utilization of existing human resources will be formulated, and future needs for new personnel will be established.

#### BRAZIL-6225, STRENGTHENING OF THE BRAZILIAN BIOMEDICAL INFORMATION NETWORK

The fundamental purpose of this project is to improve the biomedical information system in Brazil through the combined efforts of various bodies, centralized in the Regional Library of Medicine (RLM) of the Escola Paulista de Medicina. It also aims at developing a national communications network to exchange information with other Latin American countries. Other objectives include a feasibility study on the establishment of a computerized reference service utilizing the MEDLINE system of the U.S. National Library of Medicine; the creation of an audiovisual unit at RLM to assist medical schools in Brazil; and the training of personnel in the use of the MEDLINE system and in audiovisual techniques.

### BRAZIL-6233, LATIN AMERICAN CENTER OF EDUCATIONAL TECHNOLOGY FOR HEALTH

The purposes of this project are to increase the efficiency of personnel in the preparation of human resources in the field of health through research and development of new educational methods and models; to adapt the characteristics of the learning process to distinct situations in the countries; and subsequently to prepare instructional materials adequate to the needs. This project will deal primarily with Brazil and will gradually be extended to other countries of the Region, providing technical assistance for the improvement of educational methodology, acquisition of equipment, and organization of offices or departments of health sciences education.

### BRAZIL-6302, TRAINING OF NURSING AUXILIARIES

There are 72 courses for nursing auxiliaries in Brazil, with an annual average of 18 graduates per course. There has been a modification of education programs for auxiliaries, shortening the curriculum by one academic year in order to accelerate the training of nursing auxiliaries. The purpose of this project was to cooperate in these educational developments.

### BRAZIL-6305, NURSING EDUCATION

In Brazil there are 0.8 nurses and 9.2 nursing auxiliaries per 10,000 population. In order to meet the goal of the Tenyear Health Plan for the Americas of increasing the number of nurses to three and auxiliaries to 16.1 per 10,000 inhabitants, 35,240 nurses and 95,958 auxiliaries would need to be prepared. There are 34 schools and 12 technical programs for nurses. The output must to be increased 16-fold to meet the demand for nurses. In relation to the courses for auxiliaries, if the present 90 programs reduce their duration to one year, these same courses would need to increase their production six times over. The present reform of the educational system in Brazil, which requires the inclusion of the training of technicians within the secondary portion of the system, has stimulated the multiplication of training programs at that level.

The purpose of this project is to cooperate in the improvement of present teaching programs, principally at the technical level, through training teaching personnel, reformulating curricula, and introducing new educational technology.

## BRAZIL-6401, SANITARY ENGINEERING EDUCATION

There is an extensive water supply program in Brazil, carried out jointly with the National Housing Bank, the state authorities, and the water agencies, aiming to provide water to 80% of the urban population by 1980, with an estimated investment of US\$1,500 million during the decade 1971-80. In addition, important developments have occurred lately in the field of water treatment, which deserve to be widely disseminated among the participating engineers. There is a need to provide additional training to about 60,000 professionals, technicians, auxiliaries, and qualified workers at different levels for this water program in the present decade.

Collaboration will be provided to the universities, training centers, and water agencies in establishing an adequate training program at undergraduate, graduate, and continuing education levels. Grants will be provided to partially finance the cost of short courses.

### BRAZIL-6500, VETERINARY MEDICINE EDUCATION

Brazil has 14 schools of veterinary medicine which are not capable of graduating sufficient numbers of veterinarians to meet the country's present and future needs. The purpose of this project is to collaborate with the Brazilian Association of Veterinary Medical Education and the schools of veterinary medicine in the improvement of the quantity and quality of veterinarians. The objectives include review and revision of curricula, improved teaching-learning methods, training of professors, and establishment of a center for training and developing animal health assistants.

#### ARGENTINA - DETAIL

ARGENTINA-0100, COMMUNICABLE DISEASE CONTROL

The Government of Argentina has a program under way to reduce mortality from preventable diseases. In 1971 a vaccination campaign against poliomyelitis was carried out. A similar campaign is under way against measles. These activities are being carried out simultaneously with other measures having the same objectives: (1) reorganization and improved structure of epidemiological services at all levels; (2) preparation of standards for control of such diseases as tuberculosis and venereal diseases; (3) special studies on Chagas' disease, Argentine hemorrhagic fever, and other diseases constituting important national epidemiological problems; and (4) improvements in statistical information and training.

### ARGENTINA-0200, MALARIA ERADICATION

The Argentine province of Misiones passed from the attack phase of its malaria eradication program to the consolidation phase in July 1972. As a result, the population of the malarious area, some 2,961,000 people, is now divided into areas of maintenance and consolidation in proportions of 62.8 and 37.2%, respectively. Transmission continues in limited areas in the Provinces of Salta and Jujuy, although the number of cases in 1972 (359) was less than the year before (518).

It is necessary to continue the application of antifocal measures, particularly in the areas bordering Bolivia. To implement these actions, both Governments have signed an agreement to facilitate the investigation of cases and the spraying of dwellings with DDT in the areas of mutual epidemiological influence.

# ARGENTINA-0300, SMALLPOX ERADICATION

With the exception of an outbreak in 1970 caused by an imported case, no cases of smallpox have been observed in Argentina in recent years and the level of immunity is generally satisfactory due to vaccination programs. PAHO is cooperating in continuing the vaccination program during the period it has recommended, i.e., for three years after the notification of the last case in the Americas.

### ARGENTINA-0700, PAN AMERICAN ZOONOSES CENTER

The United Nations Development Programme approved a five-year program for the strengthening of the Pan American Zoonoses Center, which is located in Ramos Mejía and Azul. The project expenditures for 1972 were the final costs under this five-year plan. The program of the Center and its continuation are described under inter-country project AMRO-0700.

ARGENTINA-0701, BOVINE RABIES CONTROL

Bovine paralytic rabies causes severe cattle losses in Latin America each year. Efficacious vaccines have been in short supply. The purpose of this project was to evaluate the various types of antirabies vaccines for use in cattle in Argentina.

### ARGENTINA-2100, ENVIRONMENTAL SANITATION

The purpose of this project is to cooperate with the Government of Argentina in the promotion and execution of activities in the field of environmental sanitation. These programs include basic sanitation services in rural communities; control of the quality of water supplies; improvements in the sanitary condition of rural housing, particularly as it relates to Chagas' disease; disposal of solid wastes in cities of over 20,000 population; control of water, air, and soil pollution; occupational health and safety including protection against radiation; food hygiene; and training of personnel.

### ARGENTINA-2200, WATER SUPPLIES

The purpose of this project is to cooperate with the Office of Hydraulic Resources in providing water supplies for urban areas and with the Health Ministry in the planning of water supply services for small communities, as well as in the improvement of administrative structures and training of personnel at all levels. At the end of 1972, 77% of the urban population and 19% of the rural population had adequate water supply services. Currently under way is the construction of 250 new water supply systems that will provide water for about 500,000 of the rural population.

### ARGENTINA-3100, HEALTH SERVICES

The Government of Argentina, in its national development plan for the period 1971-75, has emphasized the expansion of health services coverage; the getting under way of an operating system coordinating the three health subsectors; an increase in the return on present investments in installed capacity; and research into the supply and demand for health services, the feasibility of the system of finances, and the predominant health problems of the nation. The purpose of this project is to cooperate with the Government in these activities.

### ARGENTINA-3200, NURSING

This project proposes to improve nursing services in Argentina through (1) establishment of an effective system of coordination of the national level with the other operating levels (provincial and local); (2) development and strengthening of the organization of nursing services at the various levels, with the goal of providing the minimum quality acceptable in care of the individual, the family, and the community; (3) improved utilization of nursing resources in order to provide coherence between the training level and the complexity of functions which they have to perform, making possible the return to nursing of personnel now utilized in unrelated fields; (4) preparation of nursing personnel at all levels in techniques of administration and continued education in nursing care specialties; and (5) determination of levels and the quantity of nursing personnel to be trained in accordance with the needs of the country, and collaboration in the strengthening of existing programs.

### ARGENTINA-3500, HEALTH STATISTICS

The purpose of this project is to cooperate in the organization and modernization of systems for the production of vital and health statistics in Argentina. Data are processed at the provincial level and, through the use of electronic computers, consolidated at the national level. Statistics on vital events, communicable diseases, and medical care for the public sector are produced. In 1972, collection of data on vaccinations was begun. Also during 1972 the data base was expanded to include information from institutions of the Instituto Nacional de Obras Sociales.

Increasing emphasis is to be given to establishing control of the quality of the data collected; extending the hospital statistics system to the quasi-public sector; producing statistics on morbidity found in outpatient visits; developing more continuous statistics on human and physical resources; and gradually integrating data on other medical care and preventive services into the national system.

## ARGENTINA-3504, CENTER FOR UTILIZATION OF COMPUTERS IN HEALTH PROGRAMS

An agreement entered into by the School of Medicine of the University of Buenos Aires, the Secretariat of State for Public Health, and PAHO, on 19 June 1968, for the conduct of a "program of training, research, and development of the applications of electronic data processing in the health field in the Republic of Argentina," formed the basis for the establishment of the Computer Center of the Faculty of Medicine at the José de San Martín Hospital. This Center, which had been receiving planning assistance under the PAHO/WHO regular program since 1966, was officially inaugurated in April 1970 and currently has a staff of over 60 professional and technical personnel. In mid-1971, the UNDP awarded funds for pre-project activities and in January 1972 approved the full proposal covering a five-year period.

The primary objectives of this project include (1) assisting the Center in the further development and application of health statistics; (2) development and maintenance of a national data bank for health planning, using techniques of multivariate analyses, system analyses, and operations research; and (3) training health personnel in computer applications in the health field. The project is developing satisfactorily in accordance with its proposed calendar of work. Work is continuing on the proposed data bank, and a more rigorous control system for the Center's projects has been implemented. Six programmed instruction courses in different fields of medicine have been held with the use of the computer and teleprocessing techniques. An international course in health information systems, similar to one provided in 1972, is scheduled for this year. This course is open to health personnel from the Region of the Americas.

### ARGENTINA-4202, APPLIED NUTRITION

The purpose of this project is to utilize existing health services and academic resources in the northwest region of Argentina for the definition of major nutrition problems as a basis for nutrition program planning. Activities to accomplish this objective have been carried out by the Institute of Nutrition in Salta, and the National University of Tucuman. The Association of Medical Schools of Argentina has sponsored three seminars on nutrition teaching for medical students (Tucuman, Mendoza, and Corrientes). Training of a medical nutritionist and two nutritionists-dietitians was carried out at INCAP and CRECENA, and the detailed planning of a nutrition survey to be carried out in 1973 in the northwest region has been completed.

### ARGENTINA-4203, NUTRITION STUDIES

The main purpose of this project is to assist in the standardization of simplified methodology for the assessment of the nutritional status of the population of Argentina. Detailed plans have been completed to carry out a nutrition survey in the northeast and northwest in 1973, including a manual of procedures, forms, and cards for data collection and processing. Subsequently, applied nutrition programs will be developed to control identified nutrition problems, as a combined effort of local health, education and agriculture services.

#### ARGENTINA-4400, DENTAL HEALTH

The purpose of this project was to establish programs to assist the Government of Argentina in the implementation of projects for the prevention of dental diseases. In parts of Argentina there exist areas where dental fluorosis has been identified as a problem. The primary focus of this project, therefore, has been to train engineers in the process for the implementation of fluoridation and to reduce excessive quantities fo fluorides from the water supplies where it causes dental fluorosis. During 1972 a plant for the removal of excess fluoride from water was shipped to Argentina to establish a program for the removal of both excess arsenic and fluoride from the water supply.

### ARGENTINA-4602, INDUSTRIAL SAFETY AND HYGIENE

The purpose of this project is to contribute to the economic development of Argentina through the reduction of economic losses due to work accidents and occupational diseases. It is proposed to protect workers from the risks caused by working conditions and the presence of harmful agents in places of work. The objective of this project is to strengthen the organization charged with this responsibility in the Department of Public Health, as well as to improve the services of industrial hygiene in the provinces and municipalities. In this way, the country will take the necessary steps to meet the goals set by the III Special Meeting of Ministers of Health for the industrial hygiene field.

### ARGENTINA-4803, LATIN AMERICAN CENTER FOR MEDICAL ADMINISTRATION

Since medical care in Latin America represents more than 80% of the cost of health services and uses the greater part of the human and material resources in the health sector, the need for a thorough knowledge of the operation and administration of a system for delivering medical care is greatly emphasized. To solve deficiencies in the technical administration of medical care services and underutilization of available resources, the Latin American Center for Medical Administration was created. Its purpose is to collaborate with the Governments of Argentina and other Latin American countries in carrying out research on the delivery of medical care and administration of health institutions, and to train personnel responsible for the administration of these services. The Center is developing advanced and continuing education programs in medical care and hospital administration and is carrying out research on the utilization of health services, the development of human resources, and the financing of medical care services.

# ARGENTINA-4804, HOSPITAL MAINTENANCE

The purpose of this project is to cooperate with the Government of Argentina in the establishment of a program for the maintenance of buildings, installations, and equipment of the hospitals of the country, and in the training of personnel for carrying out these functions.

# ARGENTINA-4900, HEALTH AND POPULATION DYNAMICS

The purpose of this project was to provide supplies and equipment for the Instituto Latinoamericana de Fisiología de la Reproducción. This center has recently been designated by WHO as a research center in human reproduction, and cooperates closely with the Latin American Center for Perinatology and Human Development.

### ARGENTINA-6100, SCHOOL OF PUBLIC HEALTH

In Argentina there is a scarcity of personnel trained in public health at the professional, technical, and auxiliary levels. The country has about 47,000 physicians, about 550 of whom have received advanced courses in public health. Of the latter, 438 have graduated from the School of Public Health of the University of Buenos Aires.

The purpose of this project is to cooperate in the training of human resources in all the areas and levels of public health in order to meet the problems of growing complexity and specialization in this field, as well as to cooperate in strengthening the teaching and research being carried out at the School of Public Health of the University of Buenos Aires.

### ARGENTINA-6200, MEDICAL EDUCATION

There are nine schools of medicine in Argentina with about 30,000 students. The purpose of this project is to cooperate in improving instruction through utilization of modern teaching methods, training instructors, and expanding curricula to include the teaching of social and preventive medicine.

### ARGENTINA-6201, HEALTH MANPOWER STUDY

The purposes of this project were to make a study of health manpower requirements in Argentina and the means of meeting them, and to collect data to enable the medical education and health personnel training programs to be reoriented. Several seminars were held in 1972 to further the purpose of this project.

### ARGENTINA-6400, SANITARY ENGINEERING EDUCATION

There is a scarcity of sanitary engineers in Argentina, as well as a lack of uniformity and efficiency in the teaching programs in sanitary engineering. In a seminar held in 1971 on the teaching of sanitary engineering and environmental sciences to undergraduates, the representatives of the schools of engineering and of the national universities reaffirmed the need for a program to improve the teaching of these specialized fields. The objective of this project is to collaborate with the Institute of Sanitary Engineering of the University of Buenos Aires, and the other schools of engineering, in a program for the improvement of the teaching of sanitary engineering at the undergraduate and postgraduate levels, and in the development of short courses, seminars, and applied research activities.

### ARGENTINA-6500, VETERINARY MEDICINE EDUCATION

There are five schools of veterinary medicine in Argentina with about 200 graduates annually. Curriculum revision, improvement in facilities, initiation of teacher training in teaching-learning principles and practices, and inclusion of public health in the curriculum are needed in the veterinary medical professional program. A top-quality school of veterinary medicine with full professional capability is needed in the western part of the country. It is estimated that there are 3,000 veterinarians in Argentina and very few of them have had training in public health. There is at present a tendency to separate schools for teaching veterinary medicine from the schools with mixed curricula in agronomy and veterinary medicine.

The purpose of this project is to cooperate in the improvement of teaching through analysis of present plans of study, training of teaching personnel, strengthening of the teaching in public health, and in better planning of curricula in general.

## ARGENTINA-6700, TRAINING OF STATISTICAL PERSONNEL

In 1971 the University of Buenos Aires began the organization of higher-level training in medical records in two stages:
(1) a specialized one-year course in hospital records, and (2) a course in health information systems. A prerequisite for admission to the first stage is completion of the technician-level course in health statistics. The first hospital records course was given in 1972 with 17 students and was repeated in 1973. The first course on information systems is planned for 1974. The purpose of the project is to cooperate in these endeavors, including the technician-level courses in health statistics. Students successfully completing the three courses will be awarded a degree in health information systems.

#### CHILE - DETAIL

\_\_\_\_\_

CHILE-0100, COMMUNICABLE DISEASE CONTROL

Communicable diseases constitute an important cause of morbidity and mortality in Chile. There has been notable progress in the last five years in the fight against the diseases susceptible to control through vaccination, but there are others such as typhoid fever which have remained stable through the years. In 1971 acute communicable diseases, including intestinal infections, caused 6,264 of a total of 83,240 deaths notified in the country. If tuberculosis is added, the deaths related to this heading total more than 8,500, or 11% of the total in the country, even though tuberculosis has shown a continued decline, especially since 1965. These diseases include measles, diphtheria, whooping cough, and infectious hepatitis. Poliomyelitis has diminished notably in relative importance as a result of increased levels of protection from massive vaccination campaigns. Venereal diseases remain stable or show a slight increase.

The purpose of this project is to collaborate with the Government of Chile in maintaining eradication of smallpox, absent from the country for several years; in continuing the reduction in the incidence and mortality from other diseases which are controllable through protective measures; in maintaining the decrease in tuberculosis cases; and in increasing control measures for venereal diseases.

CHILE-0400, TUBERCULOSIS CONTROL

Despite improvements in recent years, tuberculosis remains a major health problem in Chile. Studies have shown that the index of infection among schoolchildren age seven in Santiago is 16%, and the prevalence of the disease in inhabitants over 15 years old is estimated at 0.5%. In the interior of the country, prevalence is about 1.0%. Deaths from tuberculosis are about 3.5% of all those registered. The purpose of this project is to cooperate in the organization of available resources for tuberculosis control, in training personnel, and in the development of operational research.

CHILE-0700, VETERINARY PUBLIC HEALTH

There are persistent foci of active canine rabies in the provinces of Santiago, O'Higgins, and Malleco in Chile, and the continued presence of bacterial anthrax in endemic form in the province of Nuble. The purpose of this project is the eradication of canine rabies throughout the country, through the application of such measures as massive vaccination of the canine population, capture of stray dogs, installation of a system of epidemiological surveillance, and control of the movement of dogs. At the same time it will provide for control of anthrax through the application of vaccine to cattle and sheep.

## CHILE-2100, ENVIRONMENTAL SANITATION

The purpose of this project is to collaborate with the Government of Chile in the planning, promotion, and integrated execution of programs for the improvement of environmental conditions in the country. The activities of the project will include, among others, the preparation of environmental sanitation plans as an integrated part of national health plans; the adoption of a policy for training and retaining the necessary personnel, both professional and auxiliary; collaboration in a new program of water supply in rural areas; the design of a system for the collection and disposal of solid

FUND 1972 1973 1974 1975	FUND	1972	1973	1974	1975

wastes in the metropolitan areas and for the establishment of a national program in this field; the installation of a program designed to eliminate any unnecessary exposure of the general population and of laboratory personnel to radiation above the level recommended by international standards; and collaboration in the training of personnel and in the search for solutions to problems of industrial hygiene.

CHILE-2200, WATER SUPPLIES

This project provided assistance to the Government of Chile in planning, programming, financing, and executing national programs of water supply and sewer systems. Principal areas of required assistance included strengthening of the administrative infrastructure, financial organization, and legal framework. A national water resources policy is also required, with the specific goal of integrated development of river basins. In the water supply sector, emphasis is needed in connection with the rural population requirements.

CHILE-2201, WATER AND SEWERAGE IN CITIES AFFECTED BY EARTHQUAKES

The object of this project in Chile is to recommend intermediate and long-term solutions to provide water and sewerage services to the cities of Valparaiso, Viña del Mar, and adjacent zones and to the urban populations of the region affected by the earthquake of 1971. Included in the project is a study of the Aconcagua basin, which will comprise a review of existing and anticipated sources of water pollution and water uses and needs, and determine the impact on water quality. The modelling techniques utilized will serve as prototypes for studies of other basins.

CHILE-3100, HEALTH SERVICES

The health policy included in the development plans of the Government of Chile includes the following objectives: (1) to extend coverage of health services; (2) to provide equal service to the various socioeconomic groups; (3) to provide these services on a free basis; and (4) to eliminate bureaucracy from the administration. The Government has established the following priority areas in the field of health: (1) maternal and child health; (2) oral health; (3) care of the aged; (4) rehabilitation; (5) environmental health; (6) the fight against accidents; (7) defining a food and nutrition policy; (8) increased production and distribution of pharmaceutical products, biologicals, and health equipment; (9) training of professional personnel; (10) creation of a unified health system; and (11) humanization of care for the mentally ill. This will require change in and perfecting of existing structures; the improvement of technical, accounting, and administrative areas; and the training of needed personnel.

The purposes of this project are to collaborate with the Government of Chile in the establishment of fixed standards in its national health policy; to assist in the training of personnel at all levels; to provide assistance in the technical-administrative aspects of health services; to collaborate in the determination of the mechanisms which will be needed to improve planning of sector activities; to cooperate in studies on human resources in the health sector; to collaborate in the budget analysis in this area; and to establish a multisectoral program to provide for socioeconomic development of the Region of Los Lagos, through integrated community development activities.

### CHILE-3105, HEALTH MANPOWER STUDIES

After concluding the first stage, covering the period 1968-71, during which a general study was made, this project in Chile was extended to 1974 to permit the development of more intensive studies in specific fields. The purpose of the project is to complete the studies undertaken in order to determine (1) the indices that should be utilized to determine the probable demand for personnel in the field of health services; (2) the relationship between prenatal care and complications during delivery, maternal and prenatal mortality, and the effect of the quantity and quality of the resources utilized in resolving these problems; (3) the type of functions which can be justifiably delegated; (4) the epidemiology of dental damage and the way to focus on the solution to these problems; (5) the functions, training, and availability of pharmaceutical chemists; (6) the activities of nurses and midwives, the indices of investment yield, and the influence of nursing care and other specialized fields on health; and (7) the studies required for the optimal development of human resources.

### CHILE-3200, NURSING SERVICES

The purpose of this project is to collaborate in the identification of nursing needs for health services as well as for teaching institutions; preparation of personnel; formulation of standards; and organization of nursing departments in hospitals and other health agencies. PAHO will cooperate in the identification of nursing needs; the improvement of basic, postbasic, and continuing education programs; and the promotion of research to define and resolve problems in the services and in training.

#### CHILE-3301, BACTERIOLOGICAL INSTITUTE

The Bacteriological Institute in Chile is responsible for the sanitary control of foods and medicaments; the diagnosis of contagious diseases; the production of vaccines and sera; and the investigation of public health problems. The purpose of this project is the modernization of the laboratory facilities, as well as the methods and procedures for diagnosis, production, and control of biologicals. The quantity and variety of biological agents will be increased with the goal of providing adequate vaccines for the communicable disease programs; the facilities for the control of foods and medicaments will be expanded and modernized; and there will be applied investigation in the field of public health.

# CHILE-4100, MATERNAL AND CHILD HEALTH

The purpose of this project is to provide training to multidisciplinary groups of professional personnel in Chile in the biological and social aspects of human reproduction and child development and in the administration of maternal and child health programs. Research is also carried out in maternal and child health, with emphasis on child growth and development and the analysis of perinatal risk. Training is provided to both national and international participants.

### CHILE-4101, EXPANSION OF THE MATERNAL AND CHILD HEALTH AND FAMILY WELFARE SERVICES

The purpose of this project is to reduce, within a period of four years, maternal mortality by 50% and infant mortality by 40% in selected areas of Chile where these rates are now highest. Simultaneously, activities will be increased in family welfare and in education in human reproduction and human development. During 1972, diagnosis of the situation was completed in the 25 areas which are to be incorporated in the program, and training of personnel was begun. In 1973, 10 areas will be included in the program. These areas encompass 25% of the maternal and child population of the country. Fifteen hundred individuals will receive training in maternal and child health, including human reproduction and development. Social and epidemiological research will be carried out in order to permit evaluation of the program and its impact on community practices and attitudes.

### CHILE-4103, CLINICAL AND SOCIAL PEDIATRICS COURSES

Of the 83,165 deaths in Chile in 1970, 20,750 were children under one year of age. One of the causes of this high infant mortality rate is the lack of sufficient medical information on the diagnosis and treatment of diseases in this age group. The purposes of this project are to train pediatricians through the establishment of residencies in specialties such as neonatology, nutrition, hematology, and communicable diseases; to train a larger number of specialists in pediatrics education and to improve this field; and to organize courses in clinical and social pediatrics for pediatricians charged with administration of programs and services of maternal and child health.

## CHILE-4200, NUTRITION

Food availability in Chile during the period of 1965-69 provided an average of 2,398 calories and 73.9 grams of protein per capita/day. However, dietary surveys have shown that actual consumption was less than 2,000 calories and 54 grams of protein in 37% of the families studied. Nutritional diseases of public health significance are protein-calorie malnutrition, iron deficiency anemias, endemic goiter, obesity, and diabetes. Atherosclerosis and related coronary heart diseases that have some nutrition implications caused 10% of total deaths in 1972.

The purpose of this project is to reduce the prevalence of deficiency diseases and to improve the nutritional status of the whole population as a part of the national food and nutrition policies, which include nutrition surveillance and information; supplementary feeding to about three million mothers, and children under 15 years of age; production of a non-conventional high protein mixture; training and formation of specialized personnel in nutrition; and appointment of 120 nutritionists-dietitians in the national health services.

CHILE-4201, TRAINING IN NUTRITION AND HUMAN GROWTH AND DEVELOPMENT

The objective of this project is to train pre- and post-doctoral fellows in Chile in basic and applied research, as well as in public health aspects of nutrition. Two types of training programs will be offered to professionals from Latin America. In the one-year program the candidates will participate in the standard Master Program of the Institute of Human Nutrition, Columbia University, New York, for eight months, followed by four months of field experience in educational institutions and national health services in Chile. The two-year post-doctoral program will comprise one year of studies at Columbia University and another year at the University of Chile, or any other suitable institution in Latin America. The training will include laboratory, clinical, and public health aspects of nutrition.

CHILE-4300, MENTAL HEALTH

Chile has approximately 3.6 hospital beds for each 1,000 inhabitants, but only 0.6 of these are reserved for the care of mental patients. These beds are all in psychiatric hospitals, whose limited installations and scarce human resources prevent the application of treatment in accordance with modern standards. In recent years psychiatric services have begun to be integrated into general hospitals as part of their health programs. In 1966 a mental health unit was established in the northern area of Santiago in order to develop a mental health program in the community; to demonstrate modern techniques of mental health care, prevention, and rehabilitation, centered directly on work in the community; to train personnel in the hopes of meeting the initial needs of a national program; and to instigate research studies.

The purpose of this project is to develop techniques of community mental health in the northern health area of Santiago for the purpose of later applying them to the rest of the country, and of developing epidemiological studies in mental health.

CHILE-4401, CENTER FOR ORAL PATHOLOGY

There is an acute shortage of oral pathologists in Latin America. Consequently, there are few faculties of dentistry that can provide a high standard of training in this area and few places where good quality diagnostic services in this field are available.

The purpose of this project is to cooperate with the Department of Oral Pathology of the Faculty of Dentistry, University of Chile, in developing a reference center in oral pathology which would systematically collect, catalog, and index clinical pathological conditions existing in Latin American countries and serve as a training center for oral pathologists and technical personnel from countries in Latin America.

### CHILE-4601, INSTITUTE OF OCCUPATIONAL HEALTH

The Institute of Occupational Health and Air Pollution in Chile trains personnel, carries out research, advises the Government and private organizations on subjects within its competence, and assists in matters relating to labor legislation. It has estimated that 6.8 million work-days are lost in the country annually through occupational accidents and diseases. The purpose of this project is to cooperate with the Institute in training personnel in the solution of problems of industrial hygiene and occupational health.

#### CHILE-4800, MEDICAL CARE SERVICES

In 1970, the National Health Service of Chile had 33,611 hospital beds, about 90% of the total beds in the country; in addition, there were 711 clinics for ambulatory care integrated within the hospital system. To maintain a high bed occupation rate (78%) and to increase as much as possible the efficiency of hospitals by decreasing the length of stay, a sustained effort in the area of maintenance is necessary.

The purposes of this project are to determine the present state of maintenance of buildings, installations, and hospital equipment, and to establish a system designed to provide hospital maintenance, which will include the various aspects of the organizational structure of the services, as well as coordination and supervision of activities at all levels.

### CHILE-5000, REHABILITATION

The problem of rehabilitation in Chile is a serious one. Studies on the subject have indicated that mental defects affect 1.2% of the population in Gran Santiago; that there are 2,500 children affected by blindness or near-blindness; and that there are 14,000 people, including 8,000 infants, who are deaf or have diminished hearing. The importance of the rehabilitation problem can also be inferred from the fact that there are 300,000 industrial accidents each year and that accidents constitute the sixth highest cause of death.

The purpose of this project is to provide specialists in the rehabilitation of deaf-mutes through university-level courses, with the purpose of gradually overcoming the nationwide deficiency of this type of professional. It is also proposed to broaden the field of this project to include rehabilitation of the blind and the physically handicapped.

#### CHILE-5100, CHRONIC DISEASES

During the last ten years, and especially during the last five, modifications in the patterns of mortality have been noted in Chile, due to demographic variations, the prevention and early treatment of communicable diseases, and changes in the socioeconomic situation. Circulatory diseases, for example, have increased from 10.8% in 1965 to 15.2% in 1970. In general, there has been a noticeable increase in chronic diseases. Cardiovascular diseases have moved from the fourth to the second most common cause of death, and malignant tumors from sixth to third. PAHO has collaborated with the Government since 1965 in establishing a program of control of uterine cancer, and the School of Medicine of the University of Chile has set up a cytology department to assist this program. The last ten years has seen a pronounced increase in the use of radiation for medical purposes - research, diagnosis, and treatment. This has created a growing demand for properly trained personnel.

The purposes of this project are (1) to collaborate with the Government in the organization of a program to combat chronic diseases and accidents which might be prevented, through medical care and rehabilitation; (2) to develop a program of control of uterine cancer through early detection in the susceptible female population and its extension to other large concentrations of people in the country; and (3) to assist in the clinical use of radioisotopes and in protection against radiation.

CHILE-5101, CANCER

Malignant tumors are the second cause of death in Chile (11.8%). PAHO has been collaborating with the Government since 1965 in the establishment of a control program for cervical uterine cancer, and the School of Medicine of the University of Chile organized a department of cytology to assist in this program. The purposes of this project are to detect premalignant lesions and early cancer of the cervix uteri, to strengthen the periodic control of detected cases, and to develop an in-service training program for medical and paramedical personnel in the practice of cytology.

#### CHILE-6200, MEDICAL EDUCATION

Information is lacking on the existing relationships between health and population dynamics in Chile. There is also a lack of the personnel needed to carry on research and training in this field. One of the basic problems in the proper performance of health services is the quantitative and qualitative lack of human resources. Despite increases in the number of students accepted in the medical schools of the country, there are not enough being graduated to meet the present needs, which will continue to increase, according to current projections. In addition, large sectors of the population with low incomes receive inferior quality medical care; this is most obvious in rural areas. The growing demand for an increase in the quality and quantity of medical care is related not only to the increasing population growth but also to the health policy and the socioeconomic development planned by the Government.

The purposes of this project include (1) training, research, and extension of activities in the field of health and population dynamics at the Department of Public Health and Social Medicine of the University of Chile, contributing to the integration of these and related disciplines into economic development and social change; (2) strengthening of training in the Department of Public Health and Social Medicine of the University of Chile, broadening of methods of training for national and foreign students in public health, and collaboration in undergraduate and postgraduate training and research; (3) collaboration with the Government in increasing the number of professional medical personnel and in strengthening the teaching at the schools of medicine, integrating the concepts of preventive and social medicine into clinical medicine studies; and (4) revision and improvement of the training programs, extending the system to rural areas, training and improving instructors and researchers, and studying the problems related to the teaching of health sciences.

#### CHILE-6300, NURSING EDUCATION

The purpose of this project is to cooperate with the Government of Chile in the organization and development of programs for the specialization of nurses at the advanced level in different nursing areas. The targets are to prepare 62 nurse educators (50% of the present teaching staff) and 230 nurses from the health service (10% of the nurses now in service). The interchange of these nurses between the health services and the educational programs will be promoted in order to improve the quality of the services and of the educational experiences.

#### CHILE-6400, SANITARY ENGINEERING EDUCATION

There is a scarcity of sanitary engineers in Chile. Two universities prepare civil engineers and only one of these, the University of Chile, offers a course on sanitary engineering operations. National environmental programs have increased, and requirements for qualified personnel in this field need immediate attention.

The purposes of this project include the preparation of professionals, particularly in sanitary engineering, and other professionals, in the techniques of environmental sanitation, in the number and quality needed in the country; the provision of programs for high- and intermediate-level technicians; training of auxiliary personnel of agencies in the field of sanitary engineering; and the establishment of a research program in areas of interest to sanitary engineers.

#### CHILE-6500, VETERINARY MEDICINE EDUCATION

In Chile there are two schools of veterinary medicine, one at the University of Chile and the other at the Universidad Austral de Valdivia. Training in preventive medicine and public health is being improved in these schools. The country has initiated plans for the control and eradication of some of the zoomoses, such as foot-and-mouth disease, canine rabies, and anthrax. The first of these is a national program and the others are limited to zones of persistent foci. The Ministries of Health and Agriculture have jointly begun a national program for the control of brucellosis.

The universities, with the cooperation of PAHO/WHO, have established the following objectives for this project: (1) improvement of training by the schools of veterinary medicine in the country, focusing particularly on preventive medicine and public health; (2) conducting research programs; (3) improving the quality of teaching methods; and (4) study of the problems of animal health which affect human health.

#### CHILE-6600, DENTAL EDUCATION

Epidemiological studies carried on in Chile indicate that 98% of the people suffer from dental lesions, with an average of 10.8 caries per person. There is one dentist for each 2,838 inhabitants. The purposes of this project are to improve the dental training at the University of Chile, Catholic University of Chile, and the University of Concepción; to integrate into the total program of studies aspects related to protection, promotion, and improvement of dental health; to promote services of dental health education and improve the practice of the profession in hospitals and in private offices, with closer bonds between the Government and the dental colleges of Chile.

PARAGUAY - DETAIL

### PARAGUAY-0100, COMMUNICABLE DISEASES

Communicable diseases, principally gastroenteritis and respiratory diseases, are the leading causes of death and morbidity (36% of registered deaths) in Paraguay. The objective of this project is to cooperate in the improvement of notifications and registrations of communicable diseases and in the development in a pilot area of a program of control of the most common of these diseases which will be applicable to the rest of the country. From the operational point of view the program will encompass immunization of 90% of the total population against smallpox, 80% of those under four years of age against DPT, 90% of those under one year against tuberculosis, and 80% of those under three years against measles.

### PARAGUAY-0200, MALARIA ERADICATION

The high rates of mortality and morbidity caused by malaria in Paraguay indicate a serious obstacle to socioeconomic development in the country, especially since the disease principally affects the rural areas and the major productive activities in the country are agricultural. Some 2.3 million people (83.3% of the total population of the country) live in originally malarious areas. During 1972 these areas were classified in the attack phase of the program, although improvement of the epidemiological situation has permitted a considerable decrease in operations. It is estimated that in 1973 an area of 300,000 km², including 1.1 million people and corresponding to nine of the 16 areas into which the country is divided, will pass to the consolidation phase. From an epidemic peak of 50,304 cases in 1967, the number has decreased to 10,307 in 1970, 423 in 1971, and 94 in 1972.

# PARAGUAY-0300, SMALLPOX ERADICATION

The purpose of this project is to cooperate in the elimination of smallpox from Paraguay in a period of five years through the immunization of 90% of the population, and the maintenance of this level of immunity. The program will be conducted through the health centers and posts of the Ministry of Health.

### PARAGUAY-0700, VETERINARY PUBLIC HEALTH

The incidence and prevalence of bovine tuberculosis, brucellosis, rabies, and other zoonoses in Paraguay are unknown. The purpose of this project is to diminish the zoonoses by collaboration in the organization of a coordinated program to conduct surveys to determine the prevalence of the diseases and establish pilot programs throughout the country.

### PARAGUAY-2100, ENVIRONMENTAL SANITATION

Diseases associated with unhealthy environmental conditions are the principal causes of morbidity and mortality in Paraguay; these include diarrheal enteritis, intestinal parasites, typhoid and paratyphoid. In 1971, a total of 17% of the people of the country had water supply services, and 0.6% had sewerage services. There were eight cities that had solid wastes collection services, varying in coverage from 5% to 60% of the related population groups; there was no provision for final disposal of solid wastes. Thirteen per cent of the houses in Asunción and 62% of those in the rest of the country were classified as unhealthy. Professional and technical personnel are extremely scarce, with only one sanitary engineer for about 94,000 inhabitants and one sanitary inspector for each 36,000 inhabitants.

The purpose of this program is to improve environmental sanitation conditions through intensification of sanitation programs, emphasizing their importance in the economic and social development of the country. This project will coordinate all the environmental health activities in the country, utilizing the available resources more efficiently. It will also include assistance to agencies which work in this field.

### PARAGUAY-2200, WATER SUPPLIES

This project provided assistance to the Government of Paraguay in decreasing the morbidity and mortality from water-borne diseases through the construction of new water supply systems and the expansion of existing ones. Investigation into ground and surface water sources for potable supplies and stimulation of financial assistance from both internal and external sources were included. Raising the level of production of local materials for construction of water supply and sewage collection systems should benefit the country.

# PARAGUAY-3100, HEALTH SERVICES

The level of health in Paraguay is conditioned by a series of factors inherent in the environment, in the socioeconomic situation, and in cultural and nutritional factors that determine a high incidence and prevalence of communicable diseases. The general mortality rate has remained fairly constant during the last ten years, between 12.6 and 9.3 per 1,000 inhabitants (only about one-half the deaths are registered with the Ministry of Public Health). Infant mortality has varied between 80 and 108 per 1,000 live births during the same decade.

FUND 1972 1973 1974 1975 FUND 1972 1973 1974 1975

The public health sector has five institutions. There is a plan for the period 1970-74 which gives emphasis to improvements in institutional coverage of the population, currently estimated to be about 65% covered. From an operational point of view, the country is divided into six health regions with about 233 health centers and health posts.

The purpose of this project is to cooperate in the strengthening of the health infrastructure to cover 80% of the population, especially that of the rural area. In addition, the national plan for 1971-75 includes a program against communicable diseases; supervision of maternal and child care services; control of some chronic diseases; development and extension of health and welfare services; training of personnel; strengthening of the administrative services of the Ministry of Health and other institutions; improvement in vital statistics; and a program of research.

UNICEF cooperates in this project.

### PARAGUAY-3103, HEALTH SERVICES IN DEVELOPING AREAS

Health care in Paraguay is provided by six main health agencies, each of them through a network of sanitary posts, health centers, and hospitals located for the most part in the urban centers of the country. Each agency acts in isolation from the others, with very little coordination among them. Most of the medical care resources are concentrated in Asunción and in some other urban areas, but the 40% of the population in the rural sector has practically no medical attention. The Government of Paraguay has begun to develop the rural areas through several comprehensive regional programs centered around the settling of the population in agricultural colonies as a means to improve the overall socioeconomic condition of the country. This development will bring with it the need for additional health care. The extent of health programs in rural areas is not well known because of lack of statistical information, but there are high incidence rates from gastroenteritis, intestinal parasites, bronchial and pulmonary diseases, and maternal and child health problems.

The purpose of this project is to set up a network of rural health services throughout the country, through a regionalized system of health care which would reach 80% of the rural population through conventional services and the other 20% through mobile units.

### PARAGUAY-3500, HEALTH STATISTICS

The system of health statistics in Paraguay is inadequate, with serious deficiencies in the coverage, accuracy, and quality of the information. Vital and morbidity statistics, as well as those related to the delivery of services and the use of health resources, depend partially on the Ministry of Public Health. These statistics cover only 52% of the total population of the country. Statistical personnel at all levels are insufficient in number and inadequately trained; this points up the need for continuing education in this field, as well as the requirement for adequate equipment, material, and transportation in order to improve the operational capacity of the services.

The purpose of this program is to improve the quality and coverage of vital and health statistics, establishing standards for periodical evaluation. With the collaboration of PAHO/WHO, courses at all levels, technical seminars, fellowships, consultants, and supplies will be provided.

### PARAGUAY-4200, NUTRITION

Although Paraguay is a major food-producing country, it faces a range of primary and secondary nutrition problems related mainly to protein-calorie malnutrition (28.7% of children under five years of age suffer from severe and advanced PCM), anemia, endemic goiter, and vitamin A deficiency. Food intake is inadequate, especially in low socioeconomic groups, although food availability is around 2,350 calories and 65.5 grams of protein per capita/day.

The purpose of this project is to improve the nutritional status of the population, with special emphasis on vulnerable groups, with the overall goal of eradicating malnutrition. Specific objectives include (1) promotion of food production and its adequate distribution and consumption; (2) training of medical and paramedical personnel in applied nutrition; (3) in-service training of personnel in health services; and (4) strengthening of intersectoral coordination, leading to the formulation and implementation of a national food and nutrition policy followed by programs for the control of endemic goiter and protein-calorie malnutrition, anemia, and other nutritional deficiencies.

# PARAGUAY-4300, MENTAL HEALTH

The real incidence and prevalence of mental illnesses are unknown in Paraguay, but, by way of illustration of the problem, in 1971 there were 4,200 consultations (760 first visits) in the mental health clinic of the Ministry of Health. In the same year, mental disorders were the cause for hospitalization of 5.5% of patients discharged. In the public sector, outpatient services are provided through three clinics, and there are about 620 hospital beds assigned to mental disorders.

The purpose of this project is to collaborate in the formulation of a mental health policy and structuring of an organizational unit to implement it in coordination with the general health services of the country. It is also planned to promote the upgrading of the psychiatric hospital, where conditions need to be improved.

### PARAGUAY-4600, INDUSTRIAL HYGIENE

It is estimated that in Paraguay 90% of the industries present potentially serious dangers to the health and safety of the workers. The purpose of this project is to cooperate with the Ministry of Public Health in the improvement of the evaluation and control of occupational hazards through a survey of representative industries, review and revision of existing legislation, training personnel, and structuring a minimum program of prevention and control of risks.

# PARAGUAY-4800, MEDICAL CARE SERVICES

In Paraguay medical care services are provided through five institutions which cover the public subsector. There are 2.1 hospital beds per 1,000 inhabitants; utilization varies according to the region but, in general, is deficient. Average patient stays in hospitals range from 8.0 to 12.5 days, and there are 3.6 hospital discharges per 100 population. Population coverage is poor, since the Instituto de Previsión Social covers only about 10% of the economically active population. The health services of the Armed Forces provide for an additional 2%, and the remaining 88% are left to the care of the Ministry of Health, which is not equipped to absorb this broad responsibility. Other hospital and ambulatory services belonging to the Social Welfare and to the University provide medical care for small, statistically insignificant groups. In summary, health care delivery is highly deficient. This is aggravated by a low productivity of available resources.

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975
				+		
				4	4	

The immediate objectives of this project are to assist national health authorities in the improvement of the administrative organization at the central level, with special emphasis on hospital centers to serve as the basis for a regional system of hospitals and other health facilities. The project is also intended to organize and promote the training of health personnel to staff the services at both the clinical and administrative levels.

### PARAGUAY-4900, HEALTH AND POPULATION DYNAMICS

Paraguay has a birth rate estimated at 42.1 per 1,000 inhabitants; a fertility rate of 190 per 1,000 women in the age group 15-45; a maternal mortality rate of 5.6 per 1,000 live births (1970); and an infant mortality rate of 94.1 per 1,000 live births. The mortality rate for the newborn is 41.3 per 1,000. These rates demonstrate the elevated risk of morbidity and mortality among the maternal-infant group, which is intimately related to the high percentage of births without medical care.

The purpose of this project is to cooperate with the Government in improving the health status of mothers and children through timely and adequate medical care and improved coverage throughout the country.

### PARAGUAY-5101, CHRONIC DISEASES - CANCER

Recent vital statistics from a registration area covering about 52% of Paraguay show that malignant tumors are the fourth cause of death, representing some 7.9% of all deaths with medical certification (about 39% of the total).

The purpose of this project is to cooperate with the Government in determining the incidence, prevalence, and mortality from neoplasms in a sample area with an urban-rural population of about 620,000, to permit planning, administration, and evaluation of a program for the prevention and control of cancer to be applied in the whole country.

### PARAGUAY-6200, MEDICAL EDUCATION

There is only one medical school in Paraguay, which graduates an average of 45 students each year. The ratio of doctors to inhabitants in the country is 1:1,936; this condition is aggravated by the high percentage who practice in the capital city, which results in a rate of 22.7 doctors per 10,000 people there and a rate of 1.8 per 10,000 people in the rest of the country. In addition, there is a high rate of emigration of doctors out of the country. The teaching philosophy in the medical school is not in accord with the actual situation in the country, and this problem is especially critical in the field of public health.

The purpose of this project is the strengthening of medical teaching, with special emphasis on the training of doctors and medical students, with the goal of providing a corps of professionals who will undertake and resolve the various problems in the health sector. Objectives include the improvement of training in basic sciences; the strengthening of training in preventive and social medicine; the preparation of teaching personnel; the improvement of knowledge of public health on the part of graduates and of personnel of the Ministry of Public Health and other health agencies; and the establishment of bases for the formulation and operation of a plan of rural internship for all doctors prior to receiving their degrees, in such a form as to provide adequate utilization of their services in rural areas.

### PARAGUAY-6201, DEVELOPMENT OF HUMAN RESOURCES

Various studies, including the Quadrennial Projections made in collaboration with PAHO/WHO, indicate the scarcity of health personnel in Paraguay. In 1971 there were, for each 10,000 people, the following personnel: 4.5 doctors, 0.8 dentists, 0.1 nutritionists, 1.4 nurses, 2.4 midwives, 0.1 sanitary engineers, 0.3 sanitary inspectors, 6.8 nursing auxiliaries, 0.3 statisticians, 0.4 laboratory technicians, 0.1 health educators, and 0.7 veterinarians. This situation is aggravated by an excessive concentration of professionals in the capital, to the detriment of the rural areas. The number of professionals graduated each year is completely inadequate to meet the growing needs of health programs, and a considerable emigration of professionals adds to the severity of the problem.

There is no well-defined policy of planning to provide the professionals which the country needs, either in quantity or in quality. The institutions who hire the graduates do not participate in the decisions regarding the type of personnel to be prepared. There is no definitive study nor any permanent registry of the human resources existing in the country, and there are no permanent programs of continuing education for health professionals. An Office of Human Resources has recently been created in the Ministry of Public Health, and it is important that it be adequately structured and staffed with sufficient well-trained people in specific fields.

The purpose of this project is to contribute to the integrated development of human resources in Paraguay, in accordance with the actual needs of the country. This will be done through (1) carrying out a study of human resources in order to determine the present personnel situation in the country; (2) formulating a national plan for the preparation of the personnel needed, based on the above study; (3) strengthening the training of technical and auxiliary personnel; (4) contributing to the improvement of plans and methods to be used in preparing health professionals, including the possibility of creating a school of health sciences to cover medicine, dentistry, biochemistry, veterinary medicine, nursing, social services, and technical careers; (5) collaborating in the formulation of a national policy to provide for adequate utilization of the personnel prepared at all levels; and (6) contributing to the establishment of the Office of Human Resources within the Ministry of Public Health.

### PARAGUAY-6400, SANITARY ENGINEERING EDUCATION

In 1971 there were eight sanitary engineers in Paraguay for a population of 2,457,000 inhabitants. In addition there were 18 civil engineers working in the sanitary engineering field, which provided one engineer for each 136,500 people. On the other hand, the knowledge of sanitary engineering of these personnel is not up to date. Although there is a course in the School of Physical and Mathematical Sciences entitled "Urban and Rural Sanitation," its scope is not related to the magnitude of the problems in the country. These factors contribute to a rather precarious environmental health situation.

FUND 1972 1973 1974 1975	FUND	1972	1973	1974	1975

The purpose of this project is to strengthen the teaching of sanitary engineering, with special emphasis on training of professors, students, technicians, and auxiliaries, with the purpose of providing suitable professionals to resolve the problems of the environment as they relate to the health sector. Objectives include the strengthening of samitary engineering subjects of the civil engineering curriculum through the training of professors; improvement of laboratory and library facilities; organization of a series of courses for professional, technical, and auxiliary personnel on environmental subjects; and promotion of applied research.

### PARAGUAY-6500, VETERINARY MEDICINE EDUCATION

There is one school of veterinary medicine in Paraguay, which graduates an average of 27 students each year. In 1971 there were 284 veterinarians in the country, providing a proportion of one for each 8,651 inhabitants, a relatively high figure. However, the underutilization of these professionals is also high, with only 39% working in the public sector and 61% in the private. The most important factor in the situation is the lack of application of modern technology to the cattle-raising industry and to the public health problems of the country.

In 1972 an agreement was signed by the Ministry of Public Health, the National University of Asunción, and PAHO/WHO, with the purpose of improving veterinary medicine education and broadening its academic and professional field, especially in the social and veterinary public health aspects, in accordance with the socioeconomic needs of the country. Objectives include improvement of the basic professional education of veterinarians in aspects of public health, strengthening of the teaching function, broadening of the programs of study to include social problems, and giving special emphasis to preventive medicine and public health.

### PARAGUAY-6600, DENTAL EDUCATION

An analysis of dental care in Paraguay points up the lack of adequately trained professional and auxiliary personnel, as well as their irregular distribution. Sample studies carried out on various groups give evidence of high incidence and prevalence of dental caries in the country. In 1971 there were 0.8 dentists per 10,000 inhabitants in Paraguay, which showed considerable improvement over former years (i.e., 1:6,100 in 1967). However, the problem is aggravated by a high concentration of these professionals in Asunción. There is only one dental school in the country, and it lacks adequate physical facilities, equipment, and supplies for the teaching program.

The purpose of this project is to improve the dental training in the country, orienting it to the preparation of general dentists with major emphasis on clinical work, preventive dentistry, and a social view of the profession. Objectives include revision of the present curriculum, upgrading of the capability of the teaching personnel, and preparation of professional and auxiliary personnel in accordance with the actual needs of the country.

### URUGUAY - DETAIL

URUGUAY-0100, COMMUNICABLE DISEASE CONTROL

Even though mortality from communicable diseases is low in Uruguay, there are occasional important outbreaks such as the measles outbreak in 1972. The purpose of this project is to cooperate in the improvement of an epidemiological system that will provide timely alerts and standards of prevention among both medical and nursing personnel.

# URUGUAY-0300, SMALLPOX ERADICATION

The purpose of this project is to cooperate in a campaign for the eradication of smallpox from Uruguay through immunization of 90% of the population and maintenance of this level of immunity.

TOTAL	Ms	9,959	5,000	-
SUPPLIES AND FOULDMENT		0.050		

# URUGUAY-0702, HYDATIDOSIS CONTROL

There is a high incidence of hydatidosis in Uruguay among domestic livestock, which causes high, direct economic losses as well as producing annually about 500 human cases of this disease. The purpose of this project is to cooperate in the reduction of the prevalence of hydatidosis by interrupting the chain of transmission in those animals that act as intermediary hosts.

# URUGUAY-1000, CHAGAS' DISEASE

The vector of Chagas' disease has been detected in about two-thirds of the territory of Uruguay. About 25% of the population live in this area of some 140,000 houses, whose type of construction favors the presence of the vector. The purpose of this project is to cooperate in a program for the control or elimination of the vector.

### URUGUAY-2100, ENVIRONMENTAL SANITATION

The purpose of this project is to cooperate with the various governmental agencies in Uruguay dealing with the planning and execution of programs of environmental samitation, particularly in those activities for which there is no other specific project.

UNICEF cooperates in this project.

URUGUAY-2200, WATER SUPPLIES

In global terms, public water supply services in Uruguay are relatively satisfactory, but if Montevideo is excluded the picture is different. The total population served through house connections is 86% of the urban population and 16% of the rural population. The purpose of this project is to cooperate in technical and administrative studies of water supply systems and their financing in order to obtain maximum return on present investments and future construction. Principal emphasis is focused on strengthening the administrative, financial, and legal framework and on overcoming the lack of trained personnel.

### URUGUAY-3100, HEALTH SERVICES

The purpose of this project is to cooperate with the Government of Uruguay in the formulation of a national health plan; in the restructuring and integration of existing health services into a national health service to be developed progressively; in establishing an administrative system to support the national health service that will permit active and effective management of the health services; and in the better utilization of health resources, especially through training of human resources.

### URUGUAY-3103, RURAL DEVELOPMENT

This project encompasses four departments in the north of Uruguay with an area of 52,545 km<sup>2</sup> and a population of about 300,000. This is a region with a predominantly rural economy with serious housing, health, and education problems, accentuated by the dispersed population and difficult accessibility to the services provided.

The purpose of this project is to cooperate in improving the level of health, especially in women, children and youth, through the extension of health services to the rural areas and small villages, as part of a broader program to improve the general living conditions of the area.

UNICEF cooperates in this project.

FELLOWSHIPS-SHORT TERM	PR		-	ı	ı	SUPPLIES AND EQUIPMENT FELLOWSHIPS		=	1.500	1.500	1,500

### URUGUAY-3200, DEVELOPMENT OF NURSING SERVICES

Nursing care provided at the various levels of medical care in Uruguay is hampered by the scarcity of professional and auxiliary personnel and also by problems of organization of the services. In 1970, for example, the relation of nursing hours to bed days was 30 minutes in Montevideo and 10 minutes in the interior. In some hospitals the ratio of auxiliaries per nurse reached 78.7 and more than 10% of them had had no preparation.

The purpose of this project is to cooperate in raising the quality of nursing care through improved organization of the Department of Nursing of the Ministry of Public Health; development and strengthening of the organization of local nursing services; standardization of nursing care; and review and updating of educational programs, selecting model clinical areas for teaching new techniques.

URUGUAY-4400, DENTAL HEALTH

Isolated studies have indicated a high prevalence of dental disease in Uruguay. The purpose of this project is to cooperate with the Government in investigating the present status of oral disease in the country and in identifying the existing human and other resources for dealing with the problem. Through this approach it is anticipated that a national plan for dentistry can be developed and dental services in the country improved.

URUGUAY-4803, SYSTEM OF INFORMATION AND DECISION IN HOSPITAL CLINICS

The Clinical Hospital of the University of the Republic in Uruguay has appreciably improved its internal organization, developing a coordinated program of activities in accordance with previously established standards. The complexity of the system makes it impossible to determine by traditional methods the results of this program, the identity and severity of possible problems, and corrections which might be needed.

The purpose of this project is to develop an information-decision system which, utilizing automation to reveal possible faults in the current program and comparing actual results with the goals established for the program, will detect possible defects and provide the basis for judgment that will allow the best possible solution for their correction.

URUGUAY-4900, MATERNAL AND CHILD HEALTH

The objectives of the program are to control maternal and infant morbidity and mortality in Uruguay through the extension and improvement of services for these groups and to provide in-service training for program personnel. To achieve this, methods will be adopted to improve coordination among the various departments of the Ministry of Public Health and other national institutions which carry out maternal and child health activities. A study on abortion in Uruguay will also be carried out during 1973.

### URUGUAY-5100, CHRONIC DISEASES

Uruguay has an elevated incidence of rheumatic disease, partly because of the long life expectancy in the country; this situation leads to a high prevalence of the disabling processes and conditions associated with the disease. The purpose of this project is to cooperate in the epidemiological study of rheumatic disease and in the training of the personnel needed for the treatment and rehabilitation of both ambulatory and hospitalized patients.

### URUGUAY-6201, COLLABORATION WITH THE UNIVERSITY OF THE REPUBLIC

The disequilibrium between the demand for health care and existing professional resources in the health services makes it mandatory to establish a permanent system of evaluation of the training being provided, and to adjust the plans and methods of such training to the adequate preparation of teaching personnel, in order to provide sufficient health personnel in both number and quality. In addition, there is the need for continuing education in order to adjust services to technical process and social change, and the University is expected to create opportunities to satisfy this need.

The purpose of this project is to cooperate with the University of the Republic in the strengthening of its undergraduate and postgraduate training; in the integration of preventive and social aspects into clinical courses; in better coordination between teaching institutions and the health services; in training teaching personnel; and in planning, evaluation, and research.

CANADA-6201, CONFERENCE ON HEALTH MANPOWER PLANNING

Despite the large human and financial investments made in education, there is still a scarcity of health manpower, an imbalance in the increase of expenditures, and inadequate utilization of human potential. The III Special Meeting of Ministers of Health held in 1972, in setting the health goals for the next ten years, recommended the development of an active process of health manpower planning in each country.

The Pan American Conference on Health Manpower Planning will review and assess the status of the health manpower planning process in the Americas and recommend action priorities and subsequent efforts in the field of training, research, and organization of health manpower planning.

## UNITED STATES OF AMERICA - DETAIL

UNITED STATES OF AMERICA-3100, CONSULTANTS IN SPECIALIZED FIELDS

Short-term consultants have been made available to the United States of America in the past on such subjects as mental retardation, public health nursing, gerontology, foreign quarantine, industrial hygiene, cardiovascular and respiratory diseases, medical statistics, accident prevention, epidemiological studies, and staphylococcus serology. Services will continue to be made available upon request.

UNITED STATES OF AMERICA-3108, FIELD OFFICE: UNITED STATES-MEXICO BORDER

The programs of the Field Office in El Paso concern health problems along the frontier of the United States of America and Mexico. The objectives are (1) to stimulate and promote joint study and planning of health activities of the frontier localities in order to assist in strengthening the local services on both sides of the border and to permit the development of coordinated programs to deal with health problems of geographic areas; (2) to assist in the interchange of epidemiological and related information between frontier health authorities; and (3) to serve as the secretariat for the United States—Mexico Border Public Health Association. This is a joint project with Mexico-3108.

The two projects were formerly designated AMRO-3108.

# UNITED STATES OF AMERICA-4225, GRADUATE COURSE IN PUBLIC HEALTH NUTRITION

The limited number of medical personnel specialized in nutrition and of fully qualified nutritionist-dietitians constitutes one of the main obstacles to the adequate development of programs for the development of health manpower and research personnel and the operation of nutrition services in Latin America and the Caribbean. In addition, there are very few regional centers to provide postgraduate nutrition training for Spanish-speaking professionals.

The purpose of this project is to cooperate with the School of Public Health of the University of Puerto Rico in developing a course for a master's degree in public health nutrition, in order to meet the growing demand for advanced training for doctors and nutritionist-dietitians. This work was formerly carried out in project AMRO-4225.

PART III, INTERCOUNTRY PROJECTS - DETAIL

#### AMRO-0100, EPIDEMIOLOGY

The epidemiology services and the systems of epidemiological surveillance of communicable diseases in the countries of the Region are generally not sufficiently developed. The goal of this project is to collaborate with the governments in developing and perfecting epidemiological services, systems of epidemiological surveillance, and programs of control of communicable diseases, including programs of preparing and training epidemiologists in national and international courses. In 1971 the first regional course in epidemiological surveillance was started in collaboration with the Center for Disease Control of the U.S. Public Health Service, followed by another in 1972. In addition, a regional course on the same subject was conducted in 1972 with the collaboration of the Government of Venezuela.

## AMRO-0101, EPIDEMIOLOGY (ZONE I)

The present epidemiological situation in the Caribbean is still unfavorable. There is a limited knowledge of the prevalent communicable diseases, of the immunity level of the population, and of the effects of control and eradication programs; therefore, high priority should be given to all activities in the field of control and prevention of infectious diseases. Some of the factors contributing to the adverse situation are the following: (1) weakness or lack of epidemiological services and laboratory facilities in the countries of the Zone; (2) incomplete and unreliable mortality and morbidity reporting and registration systems, as well as lack of evaluation and utilization of collected information; (3) lack of experience and insufficient understanding of the modern concept of epidemiology and epidemiological surveil-lance and their role in the successful control of communicable diseases; (4) low standard of living of a considerable portion of the population, low level of their health awareness, inadequate nutrition status, and great shortcomings in water supplies and sewage disposal; and (5) heavy infestation of nearly all areas with Aedes aegypti, vector of yellow fever and dengue.

The objectives of this project are to promote and assist in the organization of effective epidemiological surveillance, at both the national and regional levels; to promote the strengthening of epidemiological services in most of the countries of the Zone; to assist governments in assessing local problem areas and in the design, formulation, preparation, implementation, and evaluation of national activities in epidemiology and control of communicable diseases; to stimulate the development of an adequate network of laboratory facilities in the respective countries; to promote and assist in improvements of notification, registration, and utilization of health and vital statistics; to promote, coordinate, and conduct activities aimed at providing continuing education in epidemiology and control of communicable diseases; and to promote vector control and eradication campaigns in the Zone.

AMRO-0102, EPIDEMIOLOGY (ZONE II)

Diseases preventable by immunization strongly affect mortality rates in three of the four countries of Zone II, due in large part to insufficient immunity levels in susceptible population groups. Diseases related to environmental sanitation, especially infant diarrhea, intestinal parasitosis, and certain zoonoses such as rabies and brucellosis, are present in all countries of the Zone.

The purpose of this project is to collaborate with the governments with the goal of diminishing mortality and morbidity from communicable diseases which can be prevented by immunization; improvement of information systems; assisting in research on certain problems related to noncommunicable diseases; improvement of epidemiological services; application of the International Sanitary Regulations; and introduction of the concept of vigilance in existing epidemiological services.

AMRO-0103, EPIDEMIOLOGY (ZONE III)

Among all the dangers to health, communicable diseases continue to occupy a high place in all the countries of Zone III. The situation of diseases preventable by vaccination, identified in the Quadrennial Projections as a primary cause of death, does not seem to have changed. The determining factors in this situation can be summarized as follows: (1) the age group most affected continues to be that under four year of age; (2) with some exceptions, there continues to be inadequate coverage of vaccination programs; (3) there are philosophical and administrative differences in some countries which produce decreased efficiency in the program; (4) most of the countries of the Zone do not have services of epidemiological surveillance adequate to permit systematic follow-up of the disease for the purpose of immediate control and eventual eradication; (5) training of medical and paramedical personnel in administration and epidemiology of communicable diseases has been inadequate; and (6) the funds budgeted by the countries for the control and eradication of communicable diseases have not reflected either the magnitude or the importance of this health danger.

The purposes of this proyect are (1) to continue aiding the countries in the improvement of surveillance, control, and eradication of communicable diseases and to stimulate the restructuring of the epidemiological services; (2) to provide courses in the Zone which will strengthen the present epidemiological programs; (3) to assist in the programs of preparing and training personnel; and (4) to organize meetings of working groups consisting of chiefs of divisions or departments of epidemiology in the countries of the Zone.

AMRO-0104, EPIDEMIOLOGY (ZONE IV)

The countries of Zone IV have high rates of morbidity and mortality from communicable diseases, which could be reduced through various actions in the field of health, particularly through increased immunization. Epidemiological surveil-lance is not a common practice in these countries. Only some phases of this are carried out, almost always as part of some specific program. The lack of trained personnel at various levels constitutes the major deficiency in the services. There is very little coordination between the different agencies in this field in the various countries, nor is there much interchange of information and experience between the national epidemiological services.

The purpose of this project is to control or eradicate diseases which can be controlled through some kind of health action. The objectives are to promote the creation of highly specialized epidemiological services; to encourage training programs at all levels through courses and other means, providing a logical and progressive plan for training personnel; to stimulate research as a way of expanding knowledge of the most prevalent dangers constituting public health problems; to coordinate at a national or international level all epidemiological activities directed at common problems; to periodically evaluate the various country projects in this field, making recommendations on the basis of the evaluations; and to awaken national interest in the use of epidemiologists in the study of noncommunicable diseases, which will in the future be high-priority problems that have a secondary effect on the economic and social development of the countries.

## AMRO-0106, EPIDEMIOLOGY (ZONE VI)

The need to determine the nature, magnitude, and epidemiological characteristics of the communicable diseases prevalent in the countries of Zone VI, and the consequent development of programs intended to control these diseases, requires efficient epidemiological services, with related human and material resources.

The purposes of this program are to establish epidemiological structures or to improve existing ones; to train professional and auxiliary personnel in accordance with the needs at the various levels in these services; to improve systems of collection, recording, analysis, and publication of data of epidemiological interest; to improve diagnostic and laboratory facilities; to provide resources for the isolation and treatment of known cases; to set up efficient systems of epidemiological surveillance which would keep under observation the patterns of occurrence of communicable disease, with the goal of providing control or eventual eradication; to constantly update the techniques required to meet these goals; to aid in the various specific programs of control of communicable diseases; to provide up-to-date and complete information to countries on health problems of international importance; and to coordinate the actions which develop in this field.

## AMRO-0111, SEMINAR ON EPIDEMIOLOGICAL SURVEILLANCE PROGRAMS

To establish efficient epidemiological surveillance systems, it is necessary to encourage the interchange of experiences and opinions on techniques and activities and on the performance of the different systems. The objectives of this seminar are to revise the concepts and knowledge of epidemiological surveillance, its elements, and procedures; to define patterns of surveillance systems; to prepare samples of patterns and guides for the surveillance of certain diseases; and to recommend the testing of those patterns and guides and, after making the necessary adjustments, to incorporate them into the health services.

# AMRO-0112, SEMINAR ON VENEZUELAN EQUINE ENCEPHALITIS

A workshop symposium on Venezuelan equine encephalitis was held in 1971 and was attended by a number of scientists of recognized experience and ability in this field, to review and disseminate the accumulated knowledge on this virus and its disease potential and thereby gain a better understanding of the problem, and to formulate an adequate strategy to remedy the situation. A report on Venezuelan equine encephalitis was prepared and published in 1972.

## AMRO-0200, MALARIA TECHNICAL ADVISORY SERVICES

This project provides specialized technical assistance to national malaria eradication programs for which the assignment of permanent personnel at the country level is not required. The small cadre of multidisciplinary personnel assist country programs in conducting epidemiological investigations of problem areas or foci of persistent transmission, and in the planning of intensified or modified attack measures. Functions also include in vivo and in vitro susceptibility studies of malaria parasites to anti-malarial drugs; preparation of recommendations for treating malaria infections resistant to applied drugs; evaluation of laboratory diagnostic services and training of microscopists; preparation of manuals for management of laboratory services; promotion of appropriate field and laboratory research programs to be undertaken by national malaria eradication programs, including evaluation of the role of hemagglutination and fluorescent antibody tests for malaria surveillance; and collaboration with other institutions carrying out research on malaria. In addition, research on the relationship of malaria to economic development is carried out.

AMRO-0201, MALARIA ERADICATION (ZONE 1)

The purposes of this project are (1) to provide assistance to malaría eradication programs in the countries of Zone I; (2) to coordinate intercountry activities; (3) to promote the maintenance of a high level of epidemiological surveillance

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975

in the areas where eradication has been accomplished; and (4) to provide assistance to research activities on the epidemiology of malaria. Through the collaboration of this project a cooperative research program has been developed in Guyana on the usefulness of hemagglutination and fluorescent antibodies in malaria surveillance programs.

All of the island countries in Zone I have been free of malaria transmission for several years. However, transmission still exists in Guyana, French Guiana, Surinam, and Venezuela. The malaria situation in each of these countries is described in the respective country project.

AMRO-0203, MALARIA TECHNICAL ADVISORY SERVICES (ZONE III)

The objective of this project is to orient, complement, and coordinate the malaria technical advisory services provided by PAHO to the countries of Central America and Panama, whose malarious area covers a total of 450,000 km<sup>2</sup> with a population of some 12,000,000 inhabitants. Programs of malaria eradication were begun in all these countries between 1957 and 1959, but due to technical problems in El Salvador, Guatemala, Honduras, and Nicaragua, and to financial and administrative factors in all the countries, their progress has been limited.

Currently, the outlook for the program is much more favorable due to the introduction in 1971 of a new insecticide (propoxur) with residual action, which is effective against vectors resistant to DDT. During the next three years it is hoped to interrupt transmission in Belize, Costa Rica, and Panama, or at least to reduce it to a few foci, while in the rest of the countries the goal during the same period is to bring about a progressive reduction in malaria incidence.

#### AMRO-0218, PROMOTION OF RURAL HEALTH SERVICES AND ERADICATION CAMPAIGNS

Extension of health services to rural areas has become more pressing in those areas where the malaria eradication campaign is in the consolidation or maintenance phase, in order to assure the success of the campaign. At the same time, advantage is being taken of the personnel and elements used in the campaign to organize simple health posts, in some cases mobile ones, under the direction of the former malaria officials who have been trained in the simple elemental techniques of vaccination, first aid, and other health care.

The purpose of this project is to cooperate in the planning and coordination of this type of program, which includes surveillance of the malaria situation.

#### AMRO-0300, SMALLPOX ERADICATION

The consolidation phase of the smallpox eradication program in the Americas begun in 1967 continues, utilizing epidemiological surveillance, immunization, and vaccine production. Continuing surveys provide assurance of the absence of new cases of smallpox since 19 April 1971, the date on which the last case was notified.

The goal of this project is to collaborate with the countries in the organization of surveillance systems and programs of control of communicable diseases. The assistance provided by Zone and country epidemiologists is progressively expanding, in order to stimulate the development of epidemiological services and the training of human resources, utilizing the organization established during the smallpox eradication program as a base for systems of surveillance and control of other communicable diseases.

## AMRO-0304, SMALLPOX ERADICATION (ZONE IV)

The countries of Zone IV have cooperated in the continental plan for smallpox eradication. There have been no cases in Ecuador and Bolivia since 1964 and none in Colombia and Peru since 1966. The purposes of this project are to maintain the four countries of Zone IV free from smallpox; to give technical assistance to smallpox eradication projects which provide surveillance in these countries; to assure that the programs of smallpox immunization are continued and that useful levels of protection are reached in countries in the attack and maintenance phases; to continue developing ways to stimulate epidemiological surveillance; and to train medical and paramedical personnel.

AMRO-0400, TUBERCULOSIS CONTROL

Despite the technical progress achieved in the last decade, tuberculosis continues to be an important health problem in the Americas. In 1969 the mortality rate for 25 countries in Latin America and the Caribbean area was 5.6 per 100,000 for those under 15 years of age and 40.8 per 100,000 for those over 15. The rate of new cases of tuberculosis notified in 1969 in 25 countries was 68.8 per 100,000. Without doubt, there is a high degree of underreporting in a majority of the countries; it is therefore necessary to take the number of notified cases as the minimum level of the tuberculosis program in the Americas.

The major difficulty encountered is not just the limitation but also the inadequate utilization of resources for tuberculosis control. Another negative factor is the stress in most of the countries on traditional procedures which devote major attention to locating cases through systematic x-ray examinations, to hospitalization of the cases discovered, and to the creation of specialized services in large cities. This program has resulted in a deficiency in the provision of basic health services in smaller cities and rural areas. A major priority, therefore, is a reorientation of tuberculosis control activities. The basic methods which should be used on a national scale are BCG vaccination of the population under 15 years of age, bacteriological diagnosis of patients with respiratory symptoms, and ambulatory chemotherapy treatment. The participation of nurses in the development of these activities is of basic importance.

AMRO-0403, TUBERCULOSIS CONTROL (ZONE III)

Tuberculosis continues to be a serious health problem in the countries of Zone III. Programs of integration of tuberculosis into public health services have been conducted with varying results. Costa Rica, Honduras, and Panama have incorporated antituberculosis activities into health services, while tuberculosis control programs have, in general, developed slowly in El Salvador, Guatemala, and Nicaragua for the following reasons: (1) limitations in the operating capability of the existing health structure; (2) continued use of inadequate diagnostic and treatment procedures; (3) scarcity of laboratories with adequately prepared professional and technical personnel; and (4) inadequate planning and evaluation.

This project proposes to continue improving the tuberculosis control programs in the countries of the Zone. Emphasis will be given to improving levels of BCG vaccination; updating technical diagnostic procedures, with emphasis on bacilloscopy; continuing integration of the program into the national network of health services; and stressing ambulatory chemotherapy treatment as the preferred course for identified cases and their contacts.

AMRO-0404, TUBERCULOSIS CONTROL (ZONE IV)

In spite of the actions to control tuberculosis which are being carried out in the countries of Zone IV to a greater or lesser extent, this disease continues to rank among the five major health dangers. Epidemiological indicators of the magnitude of the problem, such as rates of morbidity, mortality, and infection, are very incomplete, but those that are available indicate an extremely grave situation which each year demands new decisions compatible with the magnitude of the problem. Morbidity, despite the lack of uniformity of diagnostic criteria, averages about 133 per 100,000 in the countries of the Zone.

The purposes of this project are to collaborate with the governments of the countries of Zone IV in the development of integrated control programs, and to reduce the risks of infection, disease, and death from tuberculosis. The objectives are (1) to expand the tuberculosis control program by broadening BCG vaccination coverage to a useful level; (2) to train personnel at all levels in the basic techniques of tuberculosis control; (3) to emphasize and develop the bacteriological diagnosis of tuberculosis, through the formation of a network of laboratories and collection posts throughout each country; (4) to strengthen training in the epidemiology of tuberculosis and in administration of control programs, through medical and nursing courses; and (5) to collaborate in the formulation and evaluation of national tuberculosis control programs.

AMRO-0409, COURSES ON TUBERCULOSIS - EPIDEMIOLOGY

Scientific knowledge accumulated in recent years on the diagnosis, prevention, and treatment of tuberculosis has brought about a radical change in the methods of control of this disease. Tuberculosis control principally requires administrators who can incorporate it into national health programs. In order to meet this goal, specialized training is needed for public health administrators in modern techniques and methods of tuberculosis control, and in effective application of these on a national scale in accordance with the socioeconomic conditions existing in the countries. In the three courses already given 52 doctors have been trained, and it is hoped to train another 60 in the next three years.

AMRO-0410, COURSES ON TUBERCULOSIS - BACTERIOLOGY

The contribution that bacteriology can make to the success of tuberculosis control programs, in diagnosis, orientation, and control of treatment as well as in the production of epidemiological information, has never been completely demonstrated because of the lack of trained personnel. For this reason, PAHO sponsors and cooperates in a regional course on

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975
						,

the bacteriology of tuberculosis, which prepares personnel in methods and techniques, with particular emphasis on their importance to epidemiological information, treatment control, and program evaluation. In six courses given to date 82 laboratory professionals have received training, and it is hoped that training will be provided to another 45 in the next three years.

AMRO-0500, LEPROSY CONTROL

The number of cases of leprosy in the Americas, as in other Regions, has not changed greatly, as reported in 1970, when compared to the 1965 WHO estimate. Progress is noted in some control programs; in others, delays in early diagnosis and treatment, based on diligent case-finding, results in preventable disability and disfigurement and in unnecessary human suffering. Failure to diagnose and treat early cases of leprosy allows the infectious reservoir to continue to spread the disease. In the Americas, the number of institutions for isolation of leprosy is high. Such institutions do not contribute to effective leprosy control but rather detract from it, while draining the scarce resources of the health budget. This project provides technical assistance and guidance in the development, administration, and evaluation of leprosy control programs.

AMRO-0509, COURSE ON HISTOPATHOLOGY OF LEPROSY

Histopathology of leprosy is often essential for proper diagnosis and classification of leprosy. Only thus can an accurate prognosis for the patient be established and appropriate trends of the disease predicted. Also, leprosy is sometimes not considered in the differential diagnosis by the pathologist because he has not been intimately involved with the leprosy control program and fails to remember its unique histopathological features.

This project will provide an opportunity for pathologists, under the guidance of an expert in the pathology of leprosy, to refresh and enhance their knowledge and understanding of leprosy. Beside offering a needed service to the leprosy control program, these pathologists can influence students and other pathologists regarding the accurate diagnosis of leprosy, and thereby upgrade and extend the control program.

#### AMRO-0512, TRAINING AND RESEARCH IN LEPROSY AND RELATED DISEASES

The PAHO Advisory Committee on Leprosy, meeting in Washington in July 1971, observed that the leprosy problem of the Americas is not yet fully and precisely defined; that past approaches to data collection and analysis and leprosy control are not functioning uniformly well; and that there is a real need for developing and evaluating new methodologies. The Committee therefore recommended a coordinated Hemisphere-wide effort in leprosy control, training, and research, through the development of a PAHO international center for training and research in leprosy and related diseases. This project proposes to begin development of such a center, which will include pilot project field studies, first nearby and later throughout the Hemisphere.

### AMRO-0600, VENEREAL DISEASE CONTROL

The incidence of venereal diseases continues to rise in the Americas and in other parts of the world. Under certain conditions, syphilis offers an opportunity for control and ultimate eradication. Gonorrhea has developed to epidemic proportions in most countries. Although venereal disease control is a national problem, international and regional cooperation will be necessary for effective control. The purposes of this project are to assist in the development of programs which will identify the real problem, and to implement effective control programs through case finding and contact tracing, readily available treatment, and laboratory services; and to stimulate research and training of personnel.

# AMRO-0700, PAN AMERICAN ZOONOSES CENTER

The principal objectives of the Pan American Zoonoses Center are to provide technical assistance to the Governments of the Hemisphere in the planning, organization, and execution of programs of control and eradication of the zoonoses. Emphasis is placed upon rabies, brucellosis, hydatidosis, and bovine tuberculosis.

In the field of rabies, programs include improvement in vaccine production and quality control; evaluation of vaccines for human and animal use; improvement in diagnostic procedures; epidemiologic surveillance; and wildlife control.

Field services related to brucellosis include coordination of control activities among countries; promotion of surveys on animal and human brucellosis; promotion of pilot area programs in brucellosis; and provision of laboratory services and reference strains.

Projects under the hydatidosis program include studies on drugs for the treatment of canine echinococcosis; studies on the evolution of taeniid eggs in the peritoneal cavity of meriones unguiculata, on the effect of radiation on the eggs of echinococcus granulosus, and on purification of specific antigens from echinococcus granulosus hydatic cyst fluid; and analysis of the biochemical relationship between host and cyst.

FUND	1972 1973 1979	4 1975	FUND	1972	1973	1974	1975

Services on bovine tuberculosis include the establishment of a mycobacteria reference laboratory; of a pilot tuberculin production plant; and of uniform procedures for registration of tuberculosis lesions in slaughterhouses.

The Center provides training for professionals and technicians in the diagnosis, investigation, and control of the zoo-noses. Close contact with universities is maintained in order to improve their knowledge of the Center's programs. Among other activities, the Center gives attention to serum samples collected in connection with field research and surveillance activities for preservation in a serum bank at the Center; food microbiology is given high priority as a Center activity; and a zoonoses pathology reference section has been established to provide services to the governments in pathological diagnosis of the zoonoses.

# AMRO-0701, VETERINARY PUBLIC HEALTH (ZONE I)

Although official data are not available on population distribution in Zone I, indications are that more than half of the people live in rural areas and are therefore particularly exposed to contact with domestic and wild animals. The governments of Zone I are vigorously promoting the livestock industry, placing considerable emphasis on good husbandry as the basis of high protein production, but the importance of veterinary public health services in the role of maintaining human and animal health has not been highlighted. Almost all the countries of the Zone are importing meat and milk, but the meat-exporting countries are anxious to increase their sales abroad, which means a far greater increase in production. In addition, national programs for control of the zoonoses and for food protection have not yet been developed. There are few veterinary diagnostic laboratories and they lack trained personnel to accurately report diseases. There is an acute shortage of veterinary medical personnel, including auxiliaries, in all Caribbean countries. Animal health control legislation is outdated, with minimal enforcement.

The purpose of this project is to promote and aid in the development of national programs within the ministries of health and agriculture for the control and prevention of these diseases; to provide assistance to the veterinary medical services of the ministries in the design, formulation, preparation, and execution of these national programs; and to promote and assist in conducting training programs for the continuing education of professionals.

#### AMRO-0702, VETERINARY PUBLIC HEALTH (ZONE II)

The losses caused by zoonoses in human and animal populations constitute serious health problems in the countries of Zone II. The purposes of this project are to promote and strengthen the organization of zoonoses control programs; to establish a veterinary public health service; and to improve the training of students and teachers in schools of veterinary medicine.

# AMRO-0703, VETERINARY PUBLIC HEALTH (ZONE III)

The main objectives of this project are the development of veterinary public health services in the countries of the Zone, the improvement of existing programs, the determination of areas of priority, and the establishment of an effective level of cooperation between the ministries of health and agriculture in solving problems of common interest. It is proposed to provide technical assistance to national personnel in the formulation of zoonoses control programs, in the expansion of these activities, and in the provision of adequate legislation. Aid to the Biological Institute of Guatemala for the production of antirabies vaccines will be continued, with the goal of providing a sufficient supply for all the countries in the Zone. Technical assistance will also be provided to the countries in the presentation of projects to IADB for financing zoonoses control programs on a national scale.

## AMRO-0704, VETERINARY PUBLIC HEALTH (ZONE IV)

The social and economic condition of the agrarian sector in Latin America constitutes one of the greatest obstacles to development. Low productivity, unemployment, migration, and low annual per capita incomes are basic problems which produce a state of poverty, accompanied by poor health conditions. This is particularly true of rural and suburban areas where food problems are very serious. In addition, the high prevalence of animal disease produces losses in food production of as much as 35% of the total. Many of these diseases are zoonoses, which also affect human health, and adequate planning, programming, and international assistance is needed in order to control or eradicate them.

The purposes of this project are to collaborate with the governments of Zone IV in the development of veterinary medical manpower training in the fields of preventive medicine and public health; to promote zoonoses control, food hygiene, and reduction of environmental risks caused by animals and their use; to promote wider availability of foods of animal origin; and to aid in the preparation of the human resources needed to handle these problems.

AMRO-0708, RABIES CONTROL

Rabies is enzootic and widely disseminated in most of the countries of the Hemisphere. In spite of the control programs that have been carried out in the Continent in the past few years, the number of reported rabies cases in humans and animals has increased, and in some countries they have reached epidemic proportions. Epidemiological studies of rabies in wild animal species are vital for the complete understanding of this complex disease. There is a pressing need for developing and testing new vaccines and other methods of control. New diagnostic techniques have been perfected. The training of laboratory personnel in these up-to-date techniques is an important aspect of this project. PAHO will assist in training programs and in special studies on rabies epidemiology, particularly wildlife to urban canine transmission and bovine paralytic rabies.

AMRO-0718, SEMINAR ON EPIDEMIOLOGY OF THE ZOONOSES

The zoonoses which have greatest importance to the socioeconomic and agricultural development and public health of the Latin American countries are those which affect domestic animals. Of the 200 diseases which are found in animals, approximately 100 are transmissible to man. When the Pan American Zoonoses Center was founded, priority was given to four of the most important of these diseases: brucellosis, animal tuberculosis, rabies, and hydatidosis. Investigation, coupled with training and control activities, has also been directed toward some of the other zoonoses, such as leptospirosis, anthrax, and trichinosis. With the opening of virgin lands to man for recreational and working purposes, the sylvatic zoonoses are assuming increased importance. Future investigation will be directed toward this important group. The purpose of this project is to organize a seminar which will focus attention on the problem and significance of these zoonoses in the Americas, methods of diagnosis and control, and improvement in disease notification.

# AMRO-0719, CENSUS OF PRIMATES

The natural primate populations in Colombia are important as a renewable resource, since they provide a source of income for various areas of the country. In recent years a growing percentage of the primates exported from Colombia have been used as important tools in biochemical research. The country urgently needs information in order to provide for the intelligent management and protection of these resources. This information can also be used to broaden knowledge on the status of present and the projection of future populations of those animals on which these studies depend.

The purpose of this project is to provide support to a research study on primate populations in the areas of the lower Rio Cauca and the Medio Magdalena, where there are many animals which will be used in biomedical research. Similar primate population surveillance is conducted in the Amazon rain forest of Peru. A permanent consultant stationed in Iquitos directs the study in collaboration with Government of Peru biologists. The purpose of the study is to determine the effects of commercial trade and environmental change on the continuance of the quantity and quality of the populations.

 FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975

At the present time there are no supplies of antigens, commercial or otherwise, for the performance of rickettsial CF or microagglutination tests. These two tests are the preferred means of laboratory diagnosis for all of the rickettsioses. The Department of Microbiology of the University of Maryland, which has been collaborating in the study of attenuated typhus vaccine in Bolivia, will provide both reagents and reference services to those laboratories in Central and South America capable of performing the CF test. Such diagnostic facilities are essential for the proper surveillance of louseborne typhus and any of the other rickettsial infections which may present a public health problem.

#### AMRO-1000, PARASITIC DISEASES

In spite of the fact that morbidity from parasitic diseases is high, programs for their control are generally inadequate. Many countries do not have sufficient information on their incidence and prevalence; one of the causes of this situation is the scarcity of public health parasitologists. The purpose of this program is to aid countries in the promotion and improvement of national programs of investigation and control of these diseases.

## AMRO-1007, SCHISTOSOMIASIS

Although the technical information on which to base an effective schistosomiasis control program is available, such programs are generally inadequate or non-existent. The purpose of this project is to urge countries to undertake control programs or to improve existing ones. To accomplish this it will be necessary to adopt highly efficient control measures and to encourage their application through adequate large-scale planning and evaluation of progress. In all the countries special attention will be given to training of personnel at all levels. In some cases it will be necessary to work with the countries in soliciting outside aid to support the control programs.

#### AMRO-1008, CHAGAS' DISEASE

This project will continue to give priority attention to the improvement of diagnostic laboratory techniques for Chagas' disease. A standard reference serum for laboratory diagnosis has been developed and is available to the countries. Consultations will continue on the procedures to adopt in order to produce a standard antigen, with the goal of being able to determine more precisely the prevalence of this disease in the countries. The purpose of this project is to collaborate with the countries in the organization of more adequate control programs.

#### AMRO-1013. STUDY GROUP ON LEISHMANIASIS

Leishmaniasis is widely distributed in the Americas and continues to be a serious health problem. The visceral form is an important disease in children, especially in some parts of Brazil. The cutaneous and mucocutaneous forms cause serious injury to health and may cause mutilation. This meeting will bring together specialists to make recommendations on a Region-wide program. Subjects to be covered include the importance of the disease, diagnosis, immunity, immunization, transmission, and treatment.

#### AMRO-1014, STUDY GROUP ON CONTROL OF INTESTINAL HELMINTHS

Although intestinal helminth infections are extremely prevalent and of considerable public health importance, they do not receive enough attention. Usually, national control programs are inadequate and poorly designed, with the result that little or no progress is being made against these parasites. This meeting would be designed to review existing control programs and to consider improvements in them. Consideration will be given to the feasibility of demonstration programs in mass chemotherapy, administered through local health units, to determine their value and cost.

### AMRO-2100, ENVIRONMENTAL SANITATION

In the Quadrennial Projections most of the countries have reported growing problems in the area of environmental pollution, mainly those affecting the air, water, and soil, in addition to the more traditional areas related to water supplies, sewerage systems, housing and urbanization, vector control, and food sanitation. Many of the countries have initiated activities in setting up air-sampling stations and in the development of water pollution studies at river basins and coastal waters, and there is an increasing concern for the collection and final disposal of solid wastes and the excessive use of insecticides and pesticides, as well as exposure in industries and mines to chemically toxic substances.

The purpose of this project, in addition to providing technical assistance as needed on specific problems, is to assist the countries in the planning and execution of programs to deal with this vast array of environmental problems which affect the health of their citizens. Special attention will be given to the promotion and stimulation of research and investigations to relate effects on the health of the people to environmental changes, stresses, and tensions. In addition, this project will continue to assist the governments in the planning and development of programs and activities in the fields of solid wastes, vector control, food sanitation, housing, and training of personnel. It also includes the reinforcement of environmental sanitation structures at ministries of health, with the object of developing the necessary operations to maintain the quality of the human environment.

### AMRO-2114, PAN AMERICAN SANITARY ENGINEERING CENTER

The problems of the human environment have acquired a new dimension in the last few years. In addition to the traditional deficiencies in basic sanitation, there is a progressive deterioration in the environment as a result of the rapid population growth, intensive urbanization, and industrialization. The countries of the Region show a growing concern about the deterioration in the quality of the human environment, and special attention is being given to the implications of environmental pollution in the overall process of development. New techniques and coherent approaches are needed to cope with the traditional problems and the emerging ones.

The objective of the Pan American Sanitary Engineering Center is to apply its multidisciplinary capabilities to render expert technical and scientific assistance to the countries of the Region. In addition to providing specialized advisory services, the Center is intended to serve as a reference and information source and to support selected training and research activities. It is anticipated that the Center will also play an important role by collaborating with the countries in strengthening their scientific and technological infrastructure. Experts in the environmental health field are being integrated into a highly effective interdisciplinary team at the Center. To this end, the staffing of the Center has been programmed to progressively cover additional areas of expertise. To supplement and extend the capabilities of Center personnel, use will also be made of short-term consultants.

With the cooperation of the Peruvian Government a modern building especially designed to house the Center will be constructed. This building, expected to be available at the end of 1973, will provide an adequate base of operations for the Center and enable it to install its library and center of documentation, to carry out laboratory and pilot plant studies, and to sponsor seminars and short courses.

Since the developing countries are addressing themselves more and more to the problems of the human environment, especially those related to pollution, the Center is a very valuable resource for collaboration in the formulation of environmental policies. It also plays a leading role in collaborating with the national agencies for the development of a technology compatible with the resources and conditions of the developing countries.

AMRO-2118, REGIONAL POLLUTION MONITORING NETWORK

Pollution of the environment has caused worldwide concern in recent years. Because of the potentially damaging effects on humans, plants, animals, and structures and on vital ecological balances affecting the supply of oxygen and food, solar energy, water balance, and climate, monitoring of basic environmental characteristics has become increasingly important.

This project seeks to identify, particularly in the developing countries of the Region, the existing monitoring activities; to obtain information on baseline levels of pollution; and to examine alternative approaches to monitoring systems and to evaluate their feasibility. CEPIS serves as the focal point for this project.

# AMRO-2120, CONFERENCE ON ENVIRONMENTAL IMPROVEMENTS IN RURAL AREAS

The Quadrennial Projections for the period 1972-75 show that in the Region as a whole, 18% of the rural population are served with adequate water supplies either by house connections or public hydrants, and that only 2% of the same population are provided with sewage disposal facilities. The goal for the past decade called for supplying 50% of the rural population with adequate water supply and sewerage services. Significant progress has been made, as the population served in 1961 was only 7%, but much remains to be done if the goals set for the decade of the 70's are going to be met.

When one compares the achievements to date against the future goals, there is an ever-growing awareness of the need to accelerate the speed with which the rural water projects are being completed. Many ideas and concepts to stimulate this acceleration have been tried in various programs throughout the Region. What would be helpful now is the evaluation and widespread distribution of these concepts for the consideration of all the Member Covernments. The proposed Conference on Environmental Improvements in Rural Areas would bring together members of the various rural water programs in order that they may discuss common problems, listen to new ideas, and give orientation to future efforts in this field.

### AMRO-2124, PROMOTION OF SANITARY ENGINEERING

The Inter-American Association of Sanitary Engineering (AIDIS) is an organization of over 1,500 sanitary engineers from all the countries of the Region who render their services to federal, state, municipal, and local agencies as well as to industry, private practice, and universities and other academic institutions. AIDIS has been in existence for over 26 years and has always collaborated very closely with PAHO. In view of the increased importance of the activities and programs to control the environment and prevent pollution, it is highly desirable that PAHO take full advantage of the vast reservoir of human resources that AIDIS represents. Recently AIDIS established a permanent secretariat, located in one of the countries, which reinforces its potential to serve and participate in regional activities. The main objective of this project is to cooperate with AIDIS so that it can render services to the countries and to PAHO.

AMRO-2200, WATER SUPPLIES

Although several countries of the Region attained or even exceeded, by the end of 1972, the goals defined by the Charter of Punta del Este for supplying water to 70% of the urban population, there is no room for complacency. Of the total rural population, only 27% were served by means of house connections or easy access. While the goal for urban sewerage was the same as for water supplies (70%), the segment of the urban population provided with sewer services was 40% of the total. Only 2% of the total rural population were furnished with similar services. The problems of providing facilities for the large squatter settlement populations constitute a concern of special urgency. This, together with the present gaps described above, diminishes the impact of the considerable progress already achieved. The need continues to exist, therefore, of facing the technical, economic, and social problems connected with the allocation of resources and the meeting of the new goals proposed by the countries at the III Special Meeting of Ministers of Health. The goals for the 1970 decade include (1) to provide water service through house connections to 80% of the urban population or, as a minimum, to supply half the population at present without service; (2) to provide water for 50% of the rural population or, as a minimum, supply 30% of the population at present without service; (3) to install sewerage systems to serve 70% of the urban population or, as a minimum, to reduce by 30% the population at present lacking such services; and (4) to install sewerage systems and other sanitary facilities for the disposal of excreta for 50% of the rural population or, as a minimum, reduce by 30% the number of inhabitants not possessing adequate facilities.

The purpose of this project is to provide technical assistance to the countries in accelerating the rate at which the goals for safe water and waste disposal facilities can be met. The advisory services envisaged in this project extend from the level of national planning for more effective use of available resources for water supply and sewerage development into all phases of the planning, construction and maintenance of these facilities, including identification and preparation of projects for investment; preparation of sector and feasibility studies; development of master plans; and related assistance ranging in complexity from pre-investment studies for large metropolitan areas to short-term consultant assignments covering specific problems.

AMRO-2203, WATER SUPPLIES (ZONE III)

An analysis of available data and of the population increase in Central America in the last three years leads to the conclusion that it is necessary to continue efforts to increase the coverage of water supply and sewerage services to both urban and rural sectors through the execution of larger programs of construction of new systems and expansion and improvement of the existing ones. On the other hand, it is necessary to enlarge programs to provide adequate operation, maintenance, and administration of the systems in order to supply services and to establish self-financing of the systems. For this purpose, it is necessary that personnel be trained and that the technical and administrative structure of the agencies responsible in each country for water and sewerage programs be strengthened.

The purposes of this project are to provide technical assistance through the PAHO project personnel in the countries; to strengthen engineering and administrative services; and to evaluate the methods and procedures which are being utilized in order to bring about technical and administrative changes in the fields of sanitary engineering, administration, and community promotion.

### AMRO-2213, STUDIES AND INVESTIGATION OF WATER RESOURCES

The administration of the water resources in Latin America is not completely satisfactory, a circumstance which makes difficult the optimum utilization of these resources in the acceleration of economic and social development and which impedes the establishment of an adequate infrastructure of public services which will stimulate regionalization of industrial activities.

The purposes of this project are (1) to carry out an integrated study of water resources in the Region and of their present and future use, with special attention to water supplies, and the elimination of liquid wastes and the contamination they cause; (2) to analyze water resources, principally their health and sanitary aspects, for use in planning processes; and (3) to develop standard procedures for the formulation of projects in this field.

### AMRO-2220, INSTITUTIONAL DEVELOPMENT

As the countries of the Region try to improve the quality of life of their citizens, they continue their formidable task of developing, financing, and managing the wide array of public service agencies, authorities, and departments that make this possible. At present, it is estimated that \$10 billion will be needed to cope with the water and sewerage needs of the Region alone. Present goals call for raising water coverage from 70 to 80% in urban areas by 1980. Rural plans, while less ambitious, are nevertheless just as difficult. Dramatic changes must be effected in this area. For example, one major city must increase its service from 140,000 to 380,000 water connections in the next ten years. In addition, large investments must be started in such services as solid waste disposal in order to provide even minimal coverage.

The strategy to achieve these ambitious targets is the establishment of new institutions, or the strengthening of existing ones, in order that the vast resources needed to achieve these improvements may be identified, obtained, and put to use to such a way that they will produce maximum results with minimum expenditures. Further, this effort must result in the establishment and/or operation of strong, viable agencies. Assistance will also be provided to develop ways and means to obtain financing and bring together the credit agencies and the water and sewer institutions. Since 1964 PAHO has assisted 29 agencies. This effort has resulted in the development of an approach by which multidisciplinary teams of consultants work alongside teams of national officials to design and implement the new criteria and policies for the management and operation of these agencies.

#### AMRO-2223, SEMINAR ON PUBLIC SERVICES ADMINISTRATION

A regional seminar on administration and management of water and sewer services was held in 1966. Since then, substantial improvements have been made in the criteria and systems for the administration and management of utilities, but these have been confined to the individual countries.

The purpose of this project is to discuss at a regional level, and with the widest participation possible, the principles, practices, and systems that have been developed and implemented by different countries, thus allowing cross-fertilization and improvement of common concepts and practices.

#### AMRO-2224, CONFERENCE ON RECENT ADVANCES IN WATER TREATMENT

Through this project, PAHO provided a conference on recent advances in water treatment, since these have a very significant economic potential. Such advances make it possible to increase the capacity of many existing water treatment plants at much lower cost than constructing new plants. In Latin America the savings could easily amount to millions of dollars if this information is disseminated and utilized both for the improvement of existing installations and for the construction of new ones.

### AMRO-2225, MANAGEMENT DEVELOPMENT CENTER FOR ENVIRONMENTAL PROTECTION SERVICES

The objectives of this project are (1) to improve the operation and management of water and sewer systems and other environmental services in Latin America by providing a comprehensive management training program for executives, managers, administrators, and supervisors in sound and tested management principles related to the special problems of the sector; (2) to develop through research, testing, and demonstration, model systems of management training, including institutional arrangements, curriculum, teaching materials, financing, and training techniques, and to promote the adoption and use of such systems and their local adaptation throughout the Region; and (3) to foster the development and establishment of management development programs and institutions in countries in the Region through demonstration, consultation, collaboration with national and local institutions, and dissemination of teaching materials and aids.

AMRO-2226. RESEARCH ON RURAL WATER SUPPLY PROGRAMS

In collaboration with the World Bank (IBRD), PAHO examined the economic and health benefits that can be derived from supplying potable water in rural areas. Based on the results of this study, IBRD plans to develop a set of criteria under which it would accept rural water loan applications.

#### AMRO-2300, AEDES AEGYPTI ERADICATION

In 1971 there were 28 cases of jungle yellow fever in three countries of the Hemisphere, raising to 2,288 the total number of cases from 1950 to 1971; three of these were of the urban type. The dengue epidemic which struck Colombia in 1971-72 raised to more than half a million the number of cases of that disease from 1960 to 1972. Although this figure is high, it does not approach the real number because epidemiological surveillance activities related to the disease are inadequate. Identification of dengue virus types II and III in some Caribbean countries constitutes a threat and carries with it the possibility of the appearance of the hemorrhagic form of the disease. Yellow fever virus continues to be active in the enzootic areas of the Continent, increasing even more the danger to urban areas of Aedes aegypti infestation.

A cost-benefit study on the prevention in the Americas of diseases transmitted by Aedes aegypti was completed in 1972 and concluded that eradication of the vector would be worth the trouble involved and that this would be the best policy for the Americas. In July 1972 the following countries and territories continued to be free of the vector: Argentina, Bermuda, Belize, Chile, Ecuador, Guatemala, Nicaragua, Paraguay, Peru, Uruguay, and the Canal Zone in Panama. Panama and the Cayman Islands have begun eradication in their territories, and Brazil is in the process of total elimination of the reinfestation detected in the northern region of the country. The campaigns are developing favorably in Barbados, French Guiana, and St. Lucia. Colombia reorganized its campaign in 1972, and Cuba intensified its activities in the attack phase. Dominica, Montserrat, and St. Vincent started the attack phase during 1972. In addition, there are active campaigns in Antigua, Costa Rica, Grenada, Guadeloupe, Guyana, Martinique, Mexico, the Netherlands Antilles, Surinam, and Trinidad and Tobago. There are limited activities in El Salvador and Venezuela, and programs are being organized in Anguilla, the Bahamas, the Virgin Islands, and Jamaica.

The purpose of this project is to collaborate with the various countries in continuing programs of eradication of Aedes aegypti and in maintaining the area free from reinfestation through effective surveillance services.

## AMRO-2301, AEDES AEGYPTI ERADICATION (CARIBBEAN)

All the countries of Zone I, except Bermuda, the Cayman Islands, Aruba, and Bonaire, are infested, some heavily, with Aedes aegypti, vector of urban yellow fever, dengue, and hemorrhagic dengue. The yellow fever virus is known to be present in the Amazon, Orinoco, and Magdalena River basins. Three deaths from yellow fever in Guyana and Surinam in 1968-69 and an epidemic of yellow fever in the States of Barinas and Portuguesa in Venezuela, with 22 cases in 1972, emphasize the grave danger to which these Aedes aegypti-infested countries are exposed. The recent isolation of dengue Types II and III in the Caribbean now further exposes the population of the region to the risk of hemorrhagic dengue. Any epidemic of the above-mentioned diseases could deal a severe blow to the many countries of the Zone whose economies are largely dependent on tourism. The heavy traffic by land, sea, and air throughout the Caribbean provides the means for reinfesting those countries in the area which have eradicated the vector at great cost. Eradication campaigns are in progress in

FUND 1972 1973 1974 1975	FUND	1972	1973	1974	1975

16 political units of the Zone, while preparatory work is progressing in four others. Because of budgetary limitations a number of countries are unable to undertake country-wide programs.

The purposes of this project are to provide technical and advisory services to the countries of the Zone to enable them to eradicate Aedes aegypti; to promote campaigns in those few remaining countries without campaigns; to coordinate eradication campaigns in the region as a whole; and to assist in the training of professional and field personnel in all the countries of the Zone.

## AMRO-2303, AEDES AEGYPTI ERADICATION (ZONE III)

The countries in Zone III have in recent years been reinfested with Aedes aegypti. Guatemala and Panama have again achieved eradication, and the other countries are developing programs with this same goal. The objective of this project is to collaborate with the countries of the Zone in order to eradicate Aedes aegypti in those infested countries and to maintain a permanent surveillance system in those which have already eradicated it.

# AMRO-2311, DENGUE SURVEILLANCE IN THE CARIBBEAN

The PAHO Scientific Advisory Committee on Dengue recommended in March 1972 that (1) at least two epidemiologists be employed through PAHO to assist in the dengue surveillance program in the Americas, one to be assigned to the Dominican Republic to work in the northern area of the Caribbean and a second to be stationed in Colombia to assist in investigations in the southern portion of the Caribbean; (2) PAHO establish an effective system of information exchange through a quarterly newsletter distributed to all the laboratories and national health authorities in the Region; (3) PAHO develop specific entomologic, epidemiologic, and virologic technical guidelines pertinent to the investigations of dengue viruses and their diseases and make them available to public health personnel of the Member Countries; and (4) PAHO prepare film strips or other audiovisual aids to assist in the education of physicians, nurses, and paramedical workers on dengue diagnosis, including its complications in hemorrhagic manifestations. This project will provide the necessary funds for the implementation of these various recommendations, which in sum will greatly strengthen the surveillance activities for dengue and related Group B arbovirus infections in the Caribbean and adjacent areas.

AMRO-3107, PUBLIC HEALTH ADMINISTRATION (CARIBBEAN)

The framework for administrative action has not been fundamentally changed to match corresponding changes in the overall constitutional status of the countries in Zone I. This results in confusion in the delimitations of public service functions, responsibilities, and authority. There is no logical relationship between problem areas, policies and objectives, and administrative action. The pattern of health management was established before the political changes of the sixties; the rigidity of administration served the purpose of preserving an existing situation. In spite of progress being made, systems and attitudes today do not have the flexibility and ability required for the achievement of government-stated goals of social and economic development. The nature and intensity of training and education programs does not generate sufficient motivation and leadership among public servants in the updating of systems and behavioral changes.

The project was established to stimulate definition of health policy and objectives based on the nature of the problems and to assist in developing management systems to meet the demands of such policies and objectives; to promote administrative improvements that facilitate the existing decision-making process, create a situation of readiness and responsiveness to specific programatic efforts, and have a favorable impact on staff morale and leadership; and promote changes of attitudes and skills required for the continuous management and updating of new systems. For 1973-75 the advisory services of PAHO, previously provided in this AMRO project, are included in each specific country project.

AMRO-3108, FIELD OFFICE: UNITED STATES-MEXICO BORDER

The United States-Mexico Border Field Office has the following functions: (1) to stimulate and promote joint study and planning of health activities in frontier localities in order to assist in strengthening local services on both sides of the border and to permit the development of coordinated programs to deal with health problems of geographical areas; (2) to assist in the interchange of epidemiological and related information between frontier health authorities; and (3) to serve as the Secretariat for the United States-Mexico Border Public Health Association.

In response to the interest expressed by the Governments through the resolutions approved by the United States-Mexico Border Public Health Association and special committees, PARO stimulates and coordinates the development of a plan of action adjusted to the needs formulated by the technical personnel of both countries, to be implemented in a gradual and progressive manner through the inclusion of a system of surveillance of the problems considered to have priority.

It has now been decided that this project will be divided into two country projects, Mexico-3108 and United States of America-3108. Please see those projects for details for 1972-75.

#### AMRO-3110, COORDINATION OF INTERNATIONAL RESEARCH

The purpose of the project is to stimulate, plan, develop, and coordinate PAHO's biomedical and health-related research programs through the promotion of multinational collaboration and communication among scientists, the acceleration of the the training of research workers, and the development and implementation of research projects related to the health goals of the Americas.

The PAHO Advisory Committee on Medical Research, composed of 15 eminent scientists and educators from the Americas, assists PAHO in developing the program and recommends the basis for long-term research policy. The Committee meets annually to review current and proposed research programs and to recommend to the Director those that PAHO might consider undertaking.

During the Twelfth Meeting of the PAHO Advisory Committee on Medical Research, a two-part, one-day symposium on the application of basic research to practical problems and on general problems of the organization of medical research in Latin America, and a half-day symposium on the use of medical auxiliaries, will be held.

### AMRO-3125, SPECIAL SEMINARS IN ZONE III

PAHO has participated in seminars held in collaboration with the public health ministries in Central America and Panama. The purposes of these seminars have been to analyze, before the annual meeting of the ministers of health, the health problems in the countries of the Zone and to establish coordinated plans and priorities for the programs of action to be followed to resolve these problems. During the budget period PAHO will continue this collaboration through its technical personnel and by financial support of travel costs for the participations.

## AMRO-3126, OPERATIONS RESEARCH

The public health administrator is often confronted with problems created by the limited availability of the financial and human resources required to meet the increasing demand for health services. Such problems can be at least partly solved by the application of modern methods of analysis and decision-making. Such methods are contained in the curricula

FUND 1972 1973 1974 1975	FUND	1972	1973	1974	1975

of operations research, management sciences, industrial engineering, and economic engineering. In particular, underutilization of resources due to inefficient and ineffective work management and the use of suboptimal work procedures may be reduced through the application of cost/benefit and/or efficiency studies which isolate technically feasible alternatives and predict the results in applying them.

The purposes of this project are to promote the use of concepts and methods of systems analysis and industrial engineering in health services planning; to develop and apply techniques to solve specific problems; and to collaborate with the Governments of the Member Countries in using such methods.

#### AMRO-3129, RESEARCH TRAINING IN BIOMEDICAL SCIENCES

The number of qualified investigators in the biomedical sciences in Latin America is below the basic needs of most countries. To take advantage of the training potential of institutions and laboratories in Latin America and the Caribbean whose research activities are well recognized, an exploratory program for advanced training in clinical research has been developed in cooperation with the Wellcome Trust. The program is limited to nationals of these countries and to training within the same geographic area. The scheme offers the advantage that trainees will be oriented toward the problems and conditions they are likely to find in their own countries when they return, and that there will usually be no language barrier. This approach to research training can contribute to moderating the emigration of scientific personnel from Latin America. So far, 14 training grants have been awarded in the following fields: hematology, electron microscopy, perinatology, endocrinology, immunology, and cytogenetics.

## AMRO-3130, CONFERENCE ON MYCOLOGY

In 1970, a symposium reviewed comprehensive information on the public health aspects of mycotic infections, including recent advances in diagnostic procedures, therapy, ecology and epidemiology, training, and direction of mycologic research. The symposium produced a series of recommendations for future activities. Funds remaining from the original grant are being used for research.

# AMRO-3135, DEVELOPMENT OF RIVER BASINS

A growing number of countries have initiated studies on the development of their more important watersheds, some international, as part of their national plans for social and economic development. The purpose of this project is to cooperate in the study of costs, benefits, and risks to health associated with the use of water resources; in the programming of measures and services for health care and protection for the population that will live in the zones being developed; and in the definition of models for development which will incorporate health as one of their components.

### AMRO-3138, DIAGNOSTIC EFFICACY OF SPHERULIN

This project supported a research study on the diagnostic efficacy of spherulin in human beings sensitized by mycotic infections. Spherulin was compared with mycelial coccidioidin in regions of Mexico where coccidioidomycosis is endemic and in areas with low and high reactor rates; histoplasmin control determinations were also made.

### AMRO-3139, PAHO RESEARCH GRANT PROGRAM

In most countries of the Region, there is a need for (a) strengthening of health services; (b) promoting cooperation among scientific and professional groups to contribute to the advancement of health; (c) promoting a good standard of teaching of health and related fields; and (d) promoting and conducting research in the field of health.

To meet the above needs the PAHO Research Training Program provides (1) individual research grants, to provide assistance to research projects proposed by individual investigators; (2) exchange of research workers to assist in the exchange of research experiences and the improvement of communication among scientists, through investigators' visits to different countries; and (3) reference center activities to assist in the development and maintenance of a high standard of work in specific fields and to achieve improved precision, reliability, consistency, and comparability in results from national and international studies.

GRANTS		-	-	50,000	50,000

## AMRO-3141, DEVELOPMENT OF RIVER BASINS (ZONE IV)

There are in the countries of Zone IV river basins which constitute development foci. The use of these bodies of water for irrigation, water supplies, and as a depository for the discharge of waste water, requires preferential attention. Efficient use of water resources will be endangered in the future unless optimum utilization is made of the supply in the river basins to provide both the quantity and quality of water.

The purpose of this project is to collaborate in the development of river basins in Zone IV, providing optimum development of water resources with due consideration of the conditions of the environment, through the services of technical assistance, studies on the utilization of water resources, and protection and promotion of health, with special emphasis on the labor force and on family groups who live in the contiguous areas.

AMRO-3142, COORDINATION OF INTEGRATED HEALTH SERVICES IN FRONTIER AREAS (ZONE IV)

There are many common health problems in the frontier zones of the countries in Zone IV. In developing health programs in these border areas, preference has been given to the control of communicable diseases. Other problems that can utilize joint action between countries are malnutrition, which affects a high percentage of the population and results in a precarious socioeconomic and cultural situation, and the lack of adequate systems of water supply, waste disposal, and other measures of environmental health.

The purposes of this project include the improvement and coordination of existing health services and the creation of those deemed necessary for border areas, in such a way as to continue present country programs, broaden their coverage, and reorient them toward joint action among countries.

CONSULTANT MONTHS	₩R	-	-	_	2	PERSONNEL-CONSULTANTS		_	_	_	4.000

AMRO-3143, STUDY ON THE PARTICIPATION OF OTHER PUBLIC SECTORS IN THE DEVELOPMENT OF HEALTH SERVICES (ZONE IV)

The concentrated effort of the health sector to provide more integration among its various functions - development, prevention, recuperation, and rehabilitation - and broader coverage of its services can only reduce the indices related to health problems to a certain extent. In order to lower these indices further and to reach significant levels of improvement in the well-being of the community, it is necessary to provide active, conscious, and coordinated collaboration with other development sectors. The purpose of this project is to study the degree of coordination of the health sector with housing, education, agriculture, and public service programs, with the goal of achieving an effective contribution of these sectors in such areas as improvement of health and prevention of disease.

CONSULTANT MONTHS	PR	_	_	_	7	PERSONNEL -CONSULTANTS		_	-		4,000

## AMRO-3145, EMERGENCY PREPAREDNESS

Natural disasters occur in some areas and countries of the Region every year with loss of natural and installed resources and, above all, of human life. During the period 1965-69, about 74 of these disasters occurred, with more than 68,000 deaths and more than 5 million victims. In 1970 alone, ten disasters occasioned the loss of life of more than 67,000 persons. The risks to health which such disasters impose demand the creation, in each country or area at risk, of an organization capable of responding immediately to the need for emergency services.

The purpose of this project is to cooperate with Member Governments in the organization of emergency services within the health structure for the prevention and/or remedy of damages caused by natural disasters.

# AMRO-3200, NURSING SERVICES

Provision of nursing care within the health services continues to be one of the principal problems in the health care systems of the Region. The scarcity of adequate nursing care is aggravated by underutilization of available human resources. This is attributable in part to the lack of a clear definition of the function of nursing and to inadequate administration. The purpose of this project is to cooperate with the countries of the Region in improving the provision of nursing services.

AMRO-3201, NURSING (ZONE 1)

Within Zone I there is a lack of nursing posts to plan and program nursing services and education at the national level. The inadequate number of other health personnel results in nurses carrying out non-nursing functions and reducing the amount of time available for nursing care. Ministries of health are expanding health programs without a commensurate expansion of the production of personnel, quantitatively or qualitatively. The main purpose of this project is to assist governments in determining nursing needs and resources; programming nursing and midwifery services with emphasis on better utilization of personnel; and improving educational programs for nursing personnel.

TOTAL		2		7	?	TOTAL	9R 	41,137	41,866	39,868	42,130

AMRO-3202, NURSING (ZONE II)

The average number of nurses per 10,000 people in the four countries of the Zone is 9.17 and that of auxiliaries, 23.36. The percentage of trained auxiliary personnel varies from 22 in one country to 100 in another. There is a scarcity of personnel, who are poorly used, with inequitable geographical distribution; a lack of coordination between the educational programs and the health systems; limited participation at the various decision-making levels; fragmented systems; and outmoded methods.

The purpose of this project is to provide systems of nursing adequate to the needs and compatible with the health system through development of leadership; establishment of policies, standards, plans, and programs based on actual conditions; coordination and adaptation of the programs for providing human resources to the systems which will utilize them; rational use of resources; and extension of coverage of urban and rural populations to a useful level.

AMRO-3203, NURSING (ZONE III)

In none of the countries of Zone III is there a nursing system in which functions corresponding to the various personnel levels are defined or practiced. With the exception of Panama, which has 8.2 nurses per 10,000 inhabitants, the countries in this Zone have 4.1 or fewer nurses per 10,000, and with the exception of Panama and Costa Rica, which have 18.7 and 18.2 general nursing personnel per 10,000 respectively, the rest have 13.4 or less. The ratio of nursing personnel to hospital beds varies between 48.2 in Panama and 26.8 in Costa Rica. From these figures it is not possible to expect even minimal nursing care, except in Panama. The coverage in the rural areas of the countries of the Zone is inadequate. Interest has been aroused in creating intensive care units in many of the hospitals, but there are insufficient trained nursing personnel to provide this service. Psychiatric hospitals are still in the initial stages of improving mental health care and

FUND 1972 1973 1974 1975	FUND	1972	1973	1974	1975
				÷.	\$

of developing preventive psychiatry. An average of 1.3 nurses per doctor are trained each year in the countries of the Zone. The ratio of nursing auxiliaries being trained to nurses varies from 1:1 in El Salvador to about 16:1 in some other countries.

The objectives of this project are to assist the governments in improving nursing care through (1) the establishment of standards for better care and preparation of nursing personnel; (2) better planning and utilization of nursing resources in light of the needs of the health services; (3) increasing the number of personnel in accordance with the requirements and absorption capability of the health services; (4) concentrating nursing activities on priority areas; and (5) providing training for nursing personnel in the areas of nursing care, teaching, and administration.

AMRO-3204, NURSING (ZONE IV)

Statistical information on the four countries in Zone IV indicates that there are 3.7, 5.0, 9.7, and 13.1 nursing personnel per 10,000 inhabitants in Bolivia, Ecuador, Colombia, and Peru, respectively. Emphasis is currently being given to the preparation of auxiliary personnel in the four countries, in view of the immediate need for nursing resources for institutions under construction or projected in the near future. Of particular concern is the very low production of professional nurses, especially in Colombia and Ecuador. Collaboration is being given to governments and nurses in seeking ways to increase the number of candidates for nursing schools. This project will assist the governments in defining a system of nursing in accordance with the programs and needs of the health services through (1) identification of the problems existing in nursing services and nursing education; (2) provision of the advisory services required for the solution of these problems; and (3) implementation of research in clinical and educational areas for development of new approaches to nursing care delivery and production of nursing personnel.

AMRO-3206, NURSING (ZONE VI)

This project provides for collaboration with the countries of Zone VI in the determination of needs and the utilization of available resources, mainly through the development of a plan of activities in the area of nursing and obstetrics. The principal functions of the project are to collaborate with the nursing and health authorities in determining the levels of nursing personnel needed to provide effective nursing and obstetrical participation in the health programs of the countries; to promote and collaborate in the development of programs to prepare and train nursing personnel at various levels; to stimulate better coordination between the areas of nursing education and service in order to provide better attention for the patient, the family, and the community, and better fields of practice for the students; to undertake studies to determine the best possible utilization of nursing and obstetrical personnel; and to coordinate and supervise the advisory services provided by nursing consultants assigned to the various projects.

AMRO-3210, HOSPITAL NURSING SERVICES

The quality of nursing care provided in many hospitals often does not meet a minimal level of safe care. Furthermore, with emphasis being given to the establishment of unit management in hospitals, it is imperative that nurses undertaking these new duties be retrained to acquire additional skills and knowledge to improve nursing care. The purpose of this

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975

project is to improve the quality of nursing practice so that the minimal level of care is provided; its target is to improve 60% of the hospitals of 100 beds or more by the end of the decade.

### AMRO-3213, SEMINAR ON ADMINISTRATION OF NURSING SERVICES

This project provides for a continuation of the 1971 seminar on administration of nursing services, for the purpose of defining the role of nurses who occupy posts at the central or regional levels and who are responsible for the nursing care given to hospitalized patients in hospitals of the ministries of public health, as well as in those of social security agencies. The 1973 course will be presented for instructors in schools of nursing.

# AMRO-3214, DEFINITION AND IMPLEMENTATION OF POLICY FOR DEVELOPMENT OF NURSING

In the majority of the countries, the delivery of health care is hindered by inadequate nursing resources. For Latin America and the Caribbean there are only 11.1 nursing personnel (composed of 2.3 nurses and 8.8 nursing auxiliaries) per 10,000 inhabitants. There are three physicians per nurse, the inverse of what it should be. This shortage of nursing personnel is resulting in the lack of coverage of the population with health services and is jeopardizing the patient's safety by not providing minimal nursing care. It is attributable to inadequate development of the nursing component of health programs and, subsequently, to the lack of definition of nursing needs and the planning to provide them.

The purpose of this project in each country is (1) the development of planning for the provision of the nursing component in the different health programs; (2) the establishment of a permanent mechanism to ensure the participation of nursing in the overall planning process; and (3) the incorporation of the information needed for programming nursing into the general health information system.

### AMRO-3215, STUDY ON FACTORS AFFECTING NURSING GROWTH

The shortage of nursing personnel has been cited as one of the most critical problems in the extension and improvement of the delivery of health care. As of 1969 only four countries had achieved the minimal staffing ratio for nurses and nursing personnel proposed in 1960. Ten countries did not achieve even 60% of the minimal ratio for nurses. In four countries of the Region - Costa Rica, Cuba, El Salvador, and Guatemala - there was a decrease in the percentage achievement of the ratio applied to the population and beds of 1957 as compared with that of 1969. However, little factual data exist as to the factors that act as the constraint to the development of the system of nursing nor on the degree to which they influence it. The purpose of this project is to identify the factors acting as constraints to the development of nursing and provision of required care.

CONSULTANT MONTHS	PR	5	_	_	_	PERSONNEL-CONSULTANTS		8,970	-	_	-	

#### AMRO-3216, STANDARDS IN NURSING PRACTICE

Nursing care given to hospitalized patients in the Region is frequently inadequate in quantity and quality. For example, (1) medical and treatment orders are frequently not carried out fully and on time; (2) patients often acquire infections and suffer accidents during their hospital stay; (3) sanitary conditions are unsatisfactory in many institutions; and (4) personnel, supplies, and equipment are inadequate. One of the factors which would contribute to improving this situation would be to establish standards of nursing care which would serve as quantitative measures for improving patient's safety, reduce infections acquired in hospitals, assure implementation of medical order, and nursing indications.

In order to accomplish this, the countries of the Region have been divided into four groups, three Spanish-speaking and one English-speaking. A series of working group meetings will be held in each of these areas (1) to establish the methodology to be used in the preparation, approval, and implementation of standards, and (2) to formulate the standards.

### AMRO-3217, DEFINITION OF ELEMENTS OF NURSING FOR PLANNING

A seminar on administration of nursing services was held in Guatemala in 1971, and a recommendation was made to utilize the planning process in nursing care of hospitalized patients. In 1972 an advisory group of nurses met for the purpose of developing indicators to determine the level of nursing care in hospitals in the Region. Basic elements for nursing care included the carrying out of medical orders; hospital-caused infections due to nursing care; and accidents and injuries due to nursing care. Using these elements, the group proposed standards related to the conditioning factors in the level of nursing care in hospitals.

### AMRO-3219, CONFERENCE ON PUBLIC HEALTH NURSING

The rapidly growing population, intensified urbanization, large percentage of rural population, broadening of medical services to cover more of the people, scarcity of nursing personnel, and economic limitations on governments, are creating serious problems in the countries of the Region in their efforts to provide traditional nursing care. In order to meet these new problems and to come up with more effective solutions than traditional methods can provide, new techniques and foci are needed.

In 1973 a conference will be held on the practice of nursing in public health in order to study the problems which confront nursing leadership and public health ministers in their effort to provide nursing care to individuals and families in the community. It is hoped that the conference will recommend practical policies and directions.

### AMRO-3220, NURSING SERVICES IN RURAL HEALTH PROGRAMS

In 1970, 46% of the population of Latin America lived in rural areas. Efforts are being made to increase health coverage to these people who live on the margin of social and economic progress. Existing health services are frequently staffed by auxiliary personnel with little or no training, receiving infrequent and deficient supervision.

The purpose of this project is to improve the nursing services provided to rural communities through improved preparation of auxiliaries, as well as improved organization, supervision, and guidance.

# AMRO-3222, TECHNICAL ADVISORY COMMITTEE ON NURSING

The Technical Advisory Committee on Nursing met for the first time in 1968 to discuss problems related to the preparation and utilization of nursing personnel, to planning, and to publications and textbooks. Future meetings of the Committee represent a second stage of development, in that it is now necessary to analyze and evaluate specific areas of nursing care instead of studying nursing in general.

In order to be able to plan future programs of operation, PAHO needs to make an analysis of the current situation and to propose recommendations in the following areas: (1) nursing care in rural areas; (2) control of communicable diseases; and (3) research both in clinical areas of nursing care and in administration.

AMRO-3223, SYSTEMS OF NURSING

In the majority of the countries the quantity and quality of nursing care and resources available are not adequate to provide the nursing input required by the health program. The expectation of the health authorities as to nursing contribution for program achievement far exceeds what can be provided with the type and quantity of resources being funded. In order to overcome this problem, there is need for each country to define its system of nursing in such a way that the functions of nursing personnel, the type and quantity of nursing personnel, and the programs required for their preparation are determined in relation to health program goals and within the social, cultural, and economic context of the country. The purpose of this project is to assist countries in defining their systems of nursing.

AMRO-3225, UTILIZATION AND TRAINING OF THE TRADITIONAL BIRTH ATTENDANT

A significant proportion of deliveries in the countries of Latin America continue to take place in the home, and the TBA (traditional birth attendant) still attends from 50 to 80% of the births occurring in the countries of the Region. A few countries have training and supervision programs for the empirical midwife, but none of them has gained sufficient momentum to make the needed impact on the maternal-newborn situation with its elevated morbidity and mortality rates. It is the usual rule not to prepare professional or auxiliary health personnel to seek out, train, supervise, or use the TBA as an extended arm in maternal and child health and family planning, especially in rural and rapidly expanding marginal urban areas.

The purpose of this project is to change attitudes toward the lay-midwife and to retrain cadres of nurses and midwives in their own countries to plan, implement, and continue orientation and supervision programs for the TBA. It is planned to hold an interdisciplinary conference of health professionals to discuss the situation and make suggestions for effectual action. This is to be followed by brief annual retraining courses for nurses and midwives responsible for TBA orientation and supervision. Supplies and equipment, such as simple bags, are to be provided to the oriented TBA's as a stimulus for their sustained collaboration with health centers.

AMRO-3300, LABORATORY SERVICES

Most of the countries of Latin America and the Caribbean need to modernize their laboratory services, broaden their coverage, and improve their efficiency and productivity. Only 10% of health centers which provide outpatient services alone have any type of laboratory, while coverage in hospitals reaches a level of 70 to 95%. In general, in the countries there is a lack of programs to modernize the laboratory services, expand their coverage, and improve their efficiency and productivity. Moreover, there is frequently no policy for organizing the laboratories on a national scale or to standardize their techniques according to the different operational levels.

The purpose of this project is to provide technical assistance to the governments for improving and developing national health laboratories in accordance with the needs and resources of the related health services.

#### AMRO-3302, LABORATORY SERVICES (ZONE II)

The objectives of this project are to assist the four countries of the Zone in the improvement and expansion of their health laboratory services. This includes revision of the existing organization and technical and administrative procedures and promotion of the necessary changes; expansion and improvement of laboratory facilities for better diagnosis and applied research; incorporation, if necessary, of new techniques to improve the control of biologicals, food, beverages, and drugs; and expansion of opportunities for training and specialization for professional and technical staff.

### AMRO-3304, LABORATORY SERVICES (ZONE IV)

Laboratory services in the four countries of Zone IV have each developed separately from the others in the various aspects of diagnosis, research, and biological production. It is now important that attention be given to the continued development of these services through a network of laboratories capable of meeting the real needs of each country. In addition, with the creation of the Andean Pact, problems related to the standardization of biological products and the quality of drugs and food produced in the countries of the Zone require assistance and permanent orientation on the part of PAHO/WHO in future years.

Services for Zone IV will now be provided in project Colombia-3300.

### AMRO-3306, LABORATORY SERVICES (ZONE VI)

Health laboratories in the four countries of Zone VI need to be strengthened and expanded. The program intended to improve these services includes development of technical and administrative guides for the standardization of the laboratories; training of personnel; establishment of regional centers for reference and control; broadening coverage; better use of available resources; and coordination between health laboratories and clinical and epidemiological services.

# AMRO-3310, CONFERENCE ON VIRAL AND RICKETTSIAL VACCINES

A conference was held in 1970 to summarize present knowledge and future needs in the field of viral, rickettsial, and bacterial vaccines. Three hundred scientists from all parts of the world attended, and 67 scientific papers were presented. PAHO Scientific Publication No. 226 records the proceedings of the Conference.

TOTAL	PG	30,045	-	_	-		
SEMINAR COSTS		30.045	_	_	_		

### AMRO-3311, TRAINING LABORATORY PERSONNEL

In the programs of organization and development of health laboratories, the preparation and training of personnel constitutes a factor of vital importance. The traditional university professional programs frequently fail to produce the kind of specialist needed for the health laboratory programs of each country, and in most of them there is a lack of training in epidemiology, statistics, and organization and administration of laboratories. Subprofessional careers, which could provide important short-term solutions to the personnel shortage, have not yet been properly developed and accepted. Training outside the country is usually limited to a relatively small group of professionals and technicians, because of the language barrier and the risk that the student might not return to his home country.

The purpose of this program is to collaborate with the governments in the formation, training, and utilization of the personnel needed for health laboratory services and faculty needs.

### AMRO-3316, PRODUCTION AND QUALITY CONTROL OF BIOLOGICALS

Recent statistics on mortality from diseases controllable through vaccination in the countries of Latin America and the Caribbean indicate that a considerable number of deaths could be avoided through adequate immunization of the susceptible population. Fourteen countries in the Region currently produce vaccines in ministry of health agencies. At least ten of these are in the process of improving and broadening their production, four of them with economic aid from UNDP. For this reason, PAHO has been asked to provide technical assistance in the organization and development of programs of production and control.

The purpose of this project is to increase the capacity and diversify the production of biologicals in existing laboratories and to improve their quality and distribution. Objectives include collaboration with the countries of the Region, especially with those having projects financed by UNDP, in the promotion, organization, and development of programs related to the production and control of biological products; modernization of methods and techniques to provide for production on an industrial scale; establishment of national control laboratories and international reference laboratories; coordination of the production programs between countries, where possible, in order to improve interchange of information and distribution of excess supplies; training of personnel for the production programs; distribution of technical information on methods and standards of production and control; and distribution of biological reference material for the purpose of standardization.

## AMRO-3400, HEALTH EDUCATION

The Governments of the Member Countries have repeatedly reaffirmed that a well-informed public and active public cooperation are vital to the improvement of the health of the people. In addition, in many countries there is a growing effort

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975

to encourage community participation in the whole process of promotion, protection, and improvement of health. Thus, it is necessary to organize health education in such a way as to properly direct this mobilization of community resources in support of actions taken by health agencies.

The objectives of this project include (1) development and improvement of health education services in interested countries, in order to improve them and obtain community support; (2) coordination between the health education programs of general education systems and those of health agencies, to provide a multiplier effect on actions in this field; (3) training of personnel in health and related fields in the doctrine and practice of health education; (4) research on human and group behavior in the area of health, on new techniques for promoting health education in the community, and on evaluation systems; and (5) preparation of prototype educational aids for use in training health and related personnel in the subject of health education.

### AMRO-3401, HEALTH EDUCATION (CARIBBEAN)

In general, health programs were initiated in the Caribbean area without proper consideration that community participation is essential to improve the health of the people and that health education is the means to obtain this participation. In this area, about 50% of the population is under 15 years, but an extremely small number of this age group receive relevant health instruction as a part of their general education. Resolution XX of the Fifth Meeting of the Caribbean Health Ministers, held in Dominica in 1973, recommended that each country formulate and implement a plan for stimulating community participation through the development of sound health education programs and services.

The long-term objective of this project is to establish effective health education programs and services in all countries, both in schools and in the community. The immediate objective is to train health education specialists, health workers, and personnel of related fields in order to enable them to perform health education responsibilities.

## AMRO-3402, HEALTH ASPECTS OF FAMILY PLANNING

The purpose of this project was to assist Central American health authorities, especially those of El Salvador, in strengthening their health education services as a support to family planning activities, by means of assistance in the examination of the educational efforts developed in the integrated maternal and child health programs and in planning educational approaches in which the present needs of the health programs, the available resources, and the peculiar characteristics of these countries would be taken into consideration.

AMRO-3410, TRAINING OF TEACHERS IN HEALTH EDUCATION

In 1970 the education system in Latin America covered more than 52 million students, 80.4% of whom were primary students, 17.2% secondary, and 2.4% at a higher level. In almost all of the countries there is a notable scarcity of trained teachers in health education. The purpose of this project is to cooperate with the governments in the design of studies which will improve and expand the teaching of health education; to review the teaching of health in the programs of general education; and to organize and strengthen the systems of work in the health and education sectors in order to obtain a better participation of the schools in the programs of community health.

### AMRO-3500, HEALTH STATISTICS

The Regional Advisory Committee on Health Statistics provides guidelines for the development of the regional program in health statistics. At the past meetings of this Committee, recommendations have been formulated on the education and training program in health statistics, on the utilization of computers in health, on hospital statistics, and on an intensive improvement program for national statistical systems. Meetings are scheduled at two-year intervals. In 1973, discussions will center on (1) methods and indicators for continuing evaluation and surveillance of the quality and completeness of vital and health statistics, and (2) methodology for developing vital and health statistics of rural populations.

### AMRO-3501, HEALTH STATISTICS (ZONE I)

The quality, availability, and coverage of information relevant to the needs and demands for health services, resources, and health services rendered are generally deficient in Zone I. Skill and capacity for effective use of information on the administration, management, and planning of health services continue to be latent and require promotion and practical demonstration. Trained personnel are still in short supply, although this constraint is being eased at the auxiliary level. As the infrastructure of personnel is developed there will be an increasing need for more highly qualified people to direct statistical services.

In the field of medical records and hospital statistics, several aspects need to be considered. Trained medical records personnel, although mostly at the auxiliary level, are becoming more generally available, but their effectiveness and productivity are limited by inadequate facilities and equipment; the massive accumulation of medical records has reached a critical level in most hospitals and other health facilities; and there is difficulty in getting the medical records completed promptly and made available for processing. The records of district health services are generally inadequate, and the methods used are inefficient and ineffective in respect both to patient care and as a source of useful information. The reporting of communicable diseases continues to be incomplete and delayed. Procedures for the routine feedback to reporting medical officers exist in only a few countries.

Registration of vital events is believed to be reasonably complete in most of the countries, although it is subject to delay. Legal measures governing the period of registration are seldom, if ever, enforced. The methods and procedures for registration of vital events and for the storage and retrieval of this information are, without exception, archaic, and inefficient, and thereby unduly costly.

Many of the countries of the Zone are very small. This factor of size will perpetually limit their capacity to produce refined statistical information unless some program of shared data processing facilities can be developed. Standardization of basic records format is an essential step toward implementation of such a long-term plan. The low priority for access to mechanized data processing facilities usually accorded to health and vital statistics is an important deterrent

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975

to timely preparation of tabulated data. This situation exists within countries now and would apply also to any program of shared data processing capacity between countries. An enhanced and extensive appreciation of the economics of health and of health services is essential to rectify this operating problem.

The purpose of the health statistics program is to provide relevant, reliable, and timely information for the administration, management, and planning of health services and for research and related activities. The objectives are to assist with planning and developing health statistics information systems suitable to the needs and commensurate with the capacity and facilities of each country; to stimulate the interest and assist with the development of capacity of senior medical officers and administrators to utilize statistical information; to assist and support an on-going training program for health statistics personnel; to promote a review and, if possible, a revision of methods and procedures for registration of vital events; and to recommend and introduce, where advisable, the use of standard basic records as desirable formats per se and in preparation for shared data processing facilities.

### AMRO-3502, HEALTH STATISTICS (ZONE II)

The countries of Zone II do not have enough reliable and up-to-date statistical information to adequately plan, administer, and evaluate health programs and activities. PAHO collaborates with the governments with the purpose of designing, organizing, and evaluating systems of health statistics and of preparing standards, guides, and procedures for the collection, tabulation, and analysis of data. It promotes the training of personnel and the organization of intermediate- and auxiliary-level courses. It gives assistance to schools of medicine and public health in carrying out studies, in revising statistical programs, and in preparing teaching materials, and it supports the development of seminars on medical and public health statistics.

## AMRO-3503, HEALTH STATISTICS (ZONE III)

The present situation of health statistics in the countries of Zone III is negatively affected by the following principal problems: underregistration of vital statistics on a large scale in two countries; considerable deficiencies in morbidity statistics and in the reporting of communicable diseases; insufficient equipment in most of the countries; inadequate or non-existent administrative structure for health statistics in the ministries of health, with a lack of stability; and a scarcity of trained personnel at all levels. In addition to these traditional problems, a growing demand for statistical information is generated from day to day by the new programs and activities of the health sector, such as family planning, control of air pollution, and modern techniques of management and decision-making.

The objectives of this project are the establishment of an adequate administrative structure in the statistical departments of the ministries of health; the organization or reorganization of departments of statistics and medical records in hospitals, principally those with 100 or more beds; the training of personnel through national courses for auxiliaries and through fellowships to train people outside their countries at higher levels; and assistance in special research and teaching programs.

AMRO-3504, HEALTH STATISTICS (ZONE IV)

The principal problem in the field of health statistics in the countries of Zone IV is that the health statistics are not utilized as a fundamental element in formulating decisions to effect changes in the health sector. This problem is the result of two major factors, among others. First, insufficient material and financial resources are provided for the establishment of statistical systems which have adequate coverage and reliability. As a result, most of the systems suffer from underregistration of events and from poor transmission of reports, lack of supervision, and difficult and delayed tabulation of the information. Secondly, there is a scarcity of trained personnel at all levels (auxiliaries, technicians, and professionals) and existing personnel are less qualified than that in other health fields.

The purpose of this project is to encourage the development of statistical systems as the source of the information which is basic to decision—making at all levels of the health sector. This will be accomplished through improvement of the coverage and reliability of existing statistical systems with the timely production of statistical information and through the establishment of those systems that are needed for the planning and evaluation of health activities; development of a standardized organization for departments of statistics and medical records in the health institutions; carrying out of special studies in those fields or areas in which it is not possible to develop permanent statistical systems or where this alternative may be more efficient; training of the personnel needed at all levels; and contributing statistical information and analytical methodology in appropriate form to the decision—making capability, using both of these as instruments for change.

AMRO-3506, HEALTH STATISTICS (ZONE VI)

The process of health planning, with growing emphasis on the adequate utilization of health resources, has stimulated improvement of the health statistics programs in the countries of Zone VI. The purpose of this project is to bring about needed changes in the health statistics systems, in the training of sufficient personnel, and in the use of statistical methods in the fields of health and medical research.

The production of statistical information has been strengthened through the use of electronic computers, especially in Argentina where the Computer Center in Health has been established. There are permanent training programs at the technical level in Argentina and Chile. In addition, programs of training at the professional level in the field of health statistics are being offered at the University of Chile and in medical records at the University of Buenos Aires. The latter started setting up a three-year program in health information systems in 1971, with health statistics and medical records constituting the first two years. In Paraguay and Uruguay increasing importance is being given to the organization of courses at the auxiliary level for personnel from hospital medical records and statistics units. In both countries the development of such units in medical care institutions is an important goal.

### AMRO-3513, INTER-AMERICAN INVESTIGATION OF MORTALITY IN CHILDHOOD

The Inter-American Investigation of Mortality in Childhood was initiated in 1968 in 13 areas of Latin America. Its goal is to develop accurate and comparable death rates in infancy and early childhood by the study of the nutritional, sociological, and environmental factors responsible for excessive mortality. Data collection and processing on 35,000 deaths occurring in the two-year period has been completed, as well as the comparable nutritional, sociological, and environmental data for a probability sample of households with 20,000 living children under five years of age in the same study areas.

Analysis of data is under way and will continue in 1973 and 1974. The study provides the basis for instituting preventive measures and for developing operational research on the delivery of health services and epidemiological studies in human reproduction. It highlights the deficiencies in vital and health statistics and methods of improvement. A report of the Investigation was published early in 1973 as Pattern of Mortality in Childhood. Additional analyses will be made and consultant services will be rendered to countries in implementation of the recommendations, which include development of related research.

## AMRO-3515, CENTER FOR TRAINING IN USE OF COMPUTERS IN HEALTH STATISTICS

Each year more of the ministries of health in the Region acquire electronic computers or access to equipment in other ministries in the country. Advisory services and guidelines are essential to ensure that the equipment selected and installed is appropriate for the intended use in the country and that systems are prepared and personnel trained in order to obtain the maximum benefits.

AMRO-3516, REGIONAL SEMINAR ON DATA PROCESSING

Coordination of national programs on data processing in the health field will enable the countries to obtain the greatest possible yield from their resources and avoid duplication of efforts in solving their problems. Exchange of information will include documentation, software and hardware specifications, and literature on the use of computers in the life sciences and clinical medicine. The Regional Advisory Committee on Computers in Health meets at two-year intervals to formulate recommendations to PAHO on its regional program. The uses being made of computers in the health field, including the processing of vital and health statistics, health information systems, and research, as well as training in computer science technology, are reviewed.

AMRO-3600, ADMINISTRATIVE METHODS AND PRACTICES IN PUBLIC HEALTH

Difficulties in the areas of management, organization, planning, decision-making, and adequate utilization of present resources continue to be the most fundamental problems confronted by the health services. Through this project, PAHO provides support and coordination of activities and assistance to the governments of the Region in overcoming these deficiencies. Health services delivery systems are recognized as a major public service manned by a complex multidisciplinary team of workers (professionals, technicians, and auxiliaries), oriented towards community needs and the growing government responsibility. During the past decade, the countries of the Americas have made progress in improving public administration. Nevertheless, the results do not meet the expectation, particularly in the health sector where, although a major contribution has been made in streamlining present organization structures and administrative machinery, management problems continue to be the most important single factor affecting the returns on investments made in the health sector.

Resolutions adopted at major international conferences have given PAHO a clear mandate to promote and assist governments and health sector institutions in updating administrative processes, streamlining infrastructures, and training the personnel required by the health services in order to achieve their goals. The purpose of this project is to provide additional support and coordination to present activities of administrative services, research, and training intended to overcome deficient organization and administrative patterns of national and local health agencies.

AMRO-3601, ADMINISTRATIVE METHODS AND PRACTICES IN PUBLIC HEALTH (ZONE I)

Organizational structures and administrative practices and procedures in Zone I have not kept pace with technological advances in the field of health and are therefore inadequate to meet the requirements of the services. Methods and procedures presently employed in managing the health institutions are conducive to inefficiency and waste. The managerial skills required in the discharge of duties and responsibilities as a rule have not been achieved. There is an increasing interest by health authorities to undertake structural change and to establish policies and procedures to facilitate the management of both old and recently created institutions.

The purpose of this project is to assist governments in a redefinition of policies for the health sector and in the development of adequate health services, organization, and administrative methods and procedures, in order to contribute to the general improvement of health standards sought by the countries.

AMRO-3602, ADMINISTRATIVE METHODS AND PRACTICES IN PUBLIC HEALTH (ZONE II)

The administrative aspects in the health services constitute a significant problem area in Zone II, and the Quadrennial Projections confirm this fact. In general terms, there exist deficiencies with regard to organization and structure of the administrative services; standards and procedures which have no relation at all with technical progress; and inadequately trained administrative personnel.

The purposes of this project are to provide the governments of the countries of the Zone with support and technical assistance to improve the structures, standards, organization, and administrative procedures in the public health services, and to promote the development of administrative systems and better utilization of resources.

AMRO-3603, ADMINISTRATIVE METHODS AND PRACTICES IN PUBLIC HEALTH (ZONE III)

The principle objective of this project is to provide technical assistance for the improvement of administrative organization of the health sector to the countries in Zone III, in order to obtain a higher compliance from the administrative services. Critical areas include personnel administration, budget, programming, accounting and costs, supplies, maintenance and general services, and the need for training qualified personnel.

AMRO-3604, ADMINISTRATIVE METHODS AND PRACTICES IN PUBLIC HEALTH (ZONE IV)

The administrative systems in health services and institutions in the countries of Zone IV are of minimal efficiency compared to those required to adequately support the essential function of health. The goal of this project is to modernize the administrative systems and training of corresponding personnel in order to improve and strengthen the infrastructure of the health institutions of the countries so that they will provide effective community service.

The objectives are to support and technically assist the government officials in charge of structuring and developing programs of administrative modernization in the health sector institutions; promote activities of administrative modernization to obtain a better institutional coordination in the health sector and structure adequate systems; participate in the establishment and execution of training programs in health services administration and administrative techniques; collaborate, when needed, in programs carried out by international agencies trying to improve health conditions in countries of the Zone; and cooperate with the Zone Office in the development of different administrative matters, in order to obtain adequate functioning of the Zone Office.

AMRO-3607, MANAGEMENT OF HEALTH SERVICES

Inadequate structures in organizational patterns as well as outdated administrative practices and procedures have been identified as important factors affecting the necessary efficiency and effectiveness of the health services in achievement of their objectives in a gradual and orderly fashion.

The objective of this project is to assist the ministers of health in their programs of improvement of overall management of health services systems in general, and of administrative services in particular, providing support and assistance in the establishment of broad administrative policies for specific large-scale programs, research activities, and personnel training.

### AMRO-3700, HEALTH PLANNING

The purpose of the project is to promote the processes of health planning in all the countries of the Region and to assist in their development; to cooperate with other international agencies and projects in activities related to health planning; to collect and analyze data on the status of planning in the countries; to cooperate in training activities in planning and health administration; to prepare the necessary guides for implementing, evaluating, and readjusting the Ten-year Health Plan for the Region; and to complete and improve the system of quadrennial projections as the basic instrument for planning PAHO cooperation with the Member Governments in order to obtain maximum return on the utilization of PAHO resources.

In the period 1973-75 it is planned to cooperate with all the countries of the Region in the incorporation of the goals of the continental health plan for the 1970's into national health policies, plus the formulation or readjustment of strategies for reaching these goals. Other objectives for this period are (1) to promote and cooperate in the development of national health planning processes; (2) to cooperate in the development and installation of a control-decision information system in four states of Brazil, Costa Rica, Ecuador and Colombia, and in others on request; (3) to train 600 health professionals in basic planning courses to be carried out at the national level in schools of public health and in special courses; (4) to train 250 professionals in seminars on national information systems and in seminars on administration planning and information; (5) to provide in-service training in programming within PAHO; (6) to design the model for determining the cost of the health sector and to apply it in five countries; (7) to develop and test in two geographic areas, models of investments in health and human resources directed toward definition of policies in these fields; (8) to cooperate in the development of methods for evaluating health planning processes and for studying the internal restrictions in the health sector; and (9) to provide information on planning to all countries of the Region.

### AMRO-3701, HEALTH PLANNING AND ORGANIZATION (ZONE I)

Almost all the countries and territories of Zone I appreciate the need to rationalize the use of their resources and accept systematic health planning as a means of doing this. The planning process, however, is not completely implemented in any of these countries. This is largely due to the shortage of trained personnel, except in Venezuela, and there is therefore an urgent need for training. In many of the countries that have asked for assistance, there is no organization for comprehensive health planning, neither is there an information system for modern planning procedures.

The purpose of this project is to promote the acceptance and practice of systematic planning of health services within the context of overall government socioeconomic plans. The immediate objectives are the training of personnel, both locally and regionally, and assistance in the organization of planning. The project will promote and organize regional and local training courses for different levels of personnel; prepare one or more programs applying planning procedures, and assist with formulation, implementation, and evaluation of plans, as applicable; provide reference material for national as well as international staff; set up machinery in ministries of health responsible for health planning activities; and initiate and increase communication with socioeconomic planning units.

# AMRO-3703, HEALTH PLANNING (ZONE III)

The purposes of this project are to extend and consolidate the planning process in the countries of Central America and Panama in the period 1973-75; to extend health plans and programs in the sector or in the principal agencies which constitute it; to correct the administrative obstacles which complicate the operation of health programs; to increase training for the personnel utilized in the planning process at the central and regional levels; and to improve the structure and organization of the planning offices at the sectoral and agency levels.

### AMRO-3704, HEALTH PLANNING (ZONE IV)

The second half of the 1960 decade brought an overall focus on the problem of selection of priorities among the growing needs of health and on the optimum utilization of resources. Outward signs included methodology, training, creation of health planning units, and formulation of plans. However, uncoordinated agencies, urban concentration of resources, poor coverage of the population, and low productivity still persist. It appears that the limited articulation in the planning field, both public and administrative, is the principal factor responsible for the current situation.

In order to resolve this problem, this project will collaborate in the process of expanding the quantity, quality, and content of training, and in the increase of coverage of the planning process in its institutional, geographical, and program aspects. In this way, planning, policy, and administration will become more dynamic and will be better articulated. Besides these general activities, this project will contribute to the redesign of the health systems in Bolivia, Colombia, and Ecuador.

### AMRO-3715, PAN AMERICAN PROGRAM FOR HEALTH PLANNING

The purpose of this project is to contribute to the establishment and/or strengthening of the process for planning for health, through training, research, and provision of information. This program began operations in 1968 as a regional project in 14 countries. The program of activities for 1971-74 gave priority to training, especially in the first two years of the period, in such form that these activities might be partially transferred to the governments. In parallel,

FUND 1972 1973 1974 1975	FUND	1972	1973	1974	1975

and progressively, activities related to the provision of information and to research are increasingly being developed, since the plans for 1975-78 give priority to information services.

The proposal for 1975 corresponds to a proposal to the United Nations Development Program for a second phase of the project. The Governing Bodies of PAHO, as well as the III Special Meeting of Ministers of Health, have approved these measures. It is possible that the amounts for this year may be presented within the programs of the various countries.

AMRO-4100, MATERNAL AND CHILD HEALTH

During the III Special Meeting of Ministers of Health of the Americas attention was given to the risks that affect the health of mothers and children in most of the countries of the Region. One recommendation to help solve present problems was to formulate, carry out, and evaluate national maternal and child health and family welfare programs. The enforcement of technical administrative units, the development of teaching systems, and the promotion of operational investigations were recommended for this purpose. This project has the purpose of facilitating the attainment of the proposed recommendations through advisory services in the countries.

AMRO-4108, CLINICAL AND SOCIAL PEDIATRICS

Maternal and child health problems are very serious in most of the countries of the Region. One of the main reasons for this situation is the lack of necessary health professionals with social interest and adequate training. Specific recommendations were established during the III Special Meeting of Ministers of Health of the Americas to promote the creation and expansion of maternal and child health regional and subregional courses. Clinical and social pediatrics courses have been given in Santiago, Chile, and Medellín, Colombia, since 1962, and 375 professionals have been trained in them. The purpose of this project is to provide financial support through fellowships for selected physicians and nurses who participate in these courses.

### AMRO-4109, NURSING MIDWIFERY

Midwifery services in the countries of the Region continue to be provided to a great extent by the traditional birth attendant, especially in rural areas and marginal urban settlements. Also, because of insufficient MCH nursing professionals, inadequately trained auxiliaries necessarily take on midwifery and MCH activities (including delegated medical functions) without proper supervision. Existing educational programs, both professional and auxiliary, generally have inadequate MCH nursing and midwifery content, and the faculty have insufficient preparation in this field or in family planning.

The purpose of this project is to collaborate with Member Governments in the planning, development, and evaluation of both the training of nursing-midwifery personnel and of the services they provide the health structure of their country.

### AMRO-4117, STAFFING MATERNAL AND CHILD HEALTH SERVICES

This project provided assistance to research activities in selected countries in the Region on staffing patterns and activities in maternal and child health services, to serve as Latin American guides for the determination of a role model as well as a pattern for the more realistic distribution and utilization of personnel in this priority health care area.

TOTAL	-					TOTAL	PK ~	4,318	<u>-</u>	-	
CONSULTANT MONTHS	PK	4	_	-	_	PERSONNEL-CONSULTANTS		4.318	_	_	_

## AMRO-4118, STUDY GROUP ON NURSING-MIDWIFERY SERVICES

Findings in regional studies in nursing-midwifery show that both nurses and midwives carry out multiple functions and responsibilities in common. It is expected that the research concerning the role model and staffing in selected maternal and child health services will provide factual in-depth data on the tasks which the different levels of nursing-midwifery personnel perform in extending services to mothers and children.

It then remains to prepare a guide for the improved organization and operation of nursing-midwifery services, which would include standards, plans for care, and procedures realistically geared to Latin America. This is to be achieved through a meeting of nurses and midwives who would work together in drawing up the guide. It is expected that these professionals would promote the adoption of the report on return to their own countries, that it would receive wide circulation within the countries of the Region, and that it would also serve as a reference for basic and advanced educational programs in nursing and midwifery.

### AMRO-4126, LATIN AMERICAN CENTER FOR PERINATOLOGY AND HUMAN DEVELOPMENT

PAHO plans to expand its research and research training efforts in human reproduction and development through the Latin American Center for Perinatology and Human Development. The World Health Organization's Expanded Program in Human Reproduction Research and Training has created a research and training center utilizing the "Three Nations Program" as a focus and has provided funds for collaborating centers in Brazil, Mexico, and Chile. PAHO plans to use this network of facilities to assist in the development of additional research and training capabilities in other countries of the Region.

The purposes are to strengthen research generally, with specific emphasis on fertility regulation and contraceptive technology development; to improve teaching and instruction in medical and other health science institutions; and to provide the scientific basis for maternal and child health and family planning program improvements.

AMRO-4200, NUTRITION ADVISORY SERVICES

Nutrition and dietary surveys carried out in the last decade throughout the Region clearly indicate that serious food and nutrition problems still persist in Latin America. Energy availability is below 2,500 calories and protein is less than

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975
			_			

60 grams per capita per day in half of the countries. In many of them - amounting to 70% of the total population - the mortality rate among children 1-4 years of age is 10 to 33 times greater than in developed countries, mainly due to the high prevalence of advanced protein-calorie malnutrition which varies from 10 to 20% in two-thirds of the countries. Prevalence of nutrition anemias in pregnant women ranges from 29 to 63%. Endemic goiter affects 10 to 60% of school-children in 14 countries, and vitamin A deficiency is present in 5 to 45% of the general population in 13 countries.

Development of nutrition services in the ministries of health varies considerably in the countries, and adequate systems of planning, administration, and evaluation of nutrition programs need to be established as a permanent and integrated component of general health services. As a general rule, there is a scarcity of specialized personnel in nutrition and food sciences, as well as of health professionals trained in nutrition. There is also a recognized need to improve the existing information systems related to nutrition and food that allow a continuous surveillance and assessment of the nutrition status of the population.

The purpose of this project is to assist the governments in carrying out programs aimed to the control and prevention of nutrition diseases and the promotion of an optimal nutrition status for the population. Objectives include (1) development and expansion of training programs for specialized nutrition personnel in the areas of teaching, service, and research, and support of academic centers; (2) technical and administrative organization and strengthening of nutrition units at different levels of the national health structure; (3) reliable and comprehensive diagnosis of the nutrition and food situation in each country, and surveillance of changes and trends; (4) strengthening of nationwide supplementary feeding and nutrition education programs directed to children under five years of age and pregnant and lactating women; (5) technical and administrative organization of food services in hospitals and other institutions; and (6) effective iodized salt programs in those countries where endemic goiter is a health problem of great magnitude.

AMRO-4201, NUTRITION ADVISORY SERVICES (ZONE I)

Data from the Quadrennial Projections reveal that mortality and morbidity from deficiency diseases, in particular proteincalorie malnutrition (PCM), are still relatively high in the countries of Zone I. Mortality from PCM in children under
five years of age varies from 13.4 to 235.2 per 100,000. The prevalence of second and third degree PCM varies from 16.5
to 29.1%. Where hemoglobins have been determined, in two nutrition surveys, it has been shown that anemias are also a
problem: in children under five, 30.4 and 32.7%; in schoolchildren, 9.3 and 46.2%; in females over 14, 19.0 and 41.9%;
and in pregnant and lactating mothers, 46.1%. The Quadrennial Projections also reveal a high incidence of infectious diseases in children under five. In addition to the known contributing socioeconomic causes, there is still the problem of
food availability. The food balance sheets show a relatively low availability of animal protein, which varies from 29.6
to 54.8% of total protein. Although one country has, in addition to a central level unit, at least one nutritionist/dietitian in each of its 23 health regions, there is a scarcity of adequately trained nutrition staff in most of the territories and no well-developed structures to implement nutrition programs. There is also lack of a biologically oriented
food and nutrition policy.

The objectives of this project are to provide nutrition advisory services to the countries of Zone I in planning, organizing, implementing, and evaluating the nutrition component of national health plans, and in the formulation of food and nutrition policies; to promote and conduct research aimed at providing and disseminating information and guidelines in the planning, execution, and evaluation of nutrition programs; to promote and undertake the organization of training activities to increase the quantity and quality of human resources in health and nutrition; to promote the organization of institutional dietary services and training of staff; and to collaborate with other international and bilateral agencies working in the field of nutrition in order to improve the effectiveness of cooperation.

AMRO-4203, INSTITUTE OF NUTRITION OF CENTRAL AMERICA AND PANAMA

After 23 years of services to Central America, INCAP has consolidated its organization and is providing increased technical assistance in the fields of training, research, and applied nutrition. In addition, INCAP is expanding specialized advisory services to other countries in the Region. Strengthening of public health nutrition departments in Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, and Panama is leading to expanded applied programs, such as nutrition education and supplementary feeding of vulnerable groups, education and nutrition recuperation centers, iodized salt, and vitamin A sugar fortification.

The School of Nutrition and Food Sciences, in operation at INCAP since 1966, admits an average of 15 students a year from the countries of Central America, in order to provide trained personnel for the ministries of public health. In addition, INCAP is giving postgraduate courses in public health nutrition, food sciences, and amimal nutrition. The research program at INCAP has received international recognition. Among its contributions has been the development of several food formulas of great nutritive value and low cost, which are in use in the member countries and beyond. In addition, programs of mutual concern have been worked out with ministries of agriculture and of economics.

The funds needed by INCAP to finance its programs come from three sources. Its basic budget is financed by means of fixed annual contributions from the member countries, Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, and Panama. PAHO, in charge of administering INCAP, constitutes the second source of funds. The third source is provided by groups interested in nutrition, especially the U.S. National Institutes of Health and the U.S. Army Medical Research and Development Command, and private groups such as the Nutrition Foundation, the Williams-Waterman Fund, the W. K. Kellogg Foundation, and the Josiah Macy, Jr., Foundation.

AMRO-4204, NUTRITION ADVISORY SERVICES (ZONE IV)

There are not enough qualified personnel in nutrition and dietetics in Zone IV - especially medical nutritionists and nutritionist-dietitians - nor is there any country with a well-defined food and nutrition policy that takes into consideration the biological requirements of the population.

The purpose of this project is to assist the Governments of the countries in Zone IV to promote the planning, development, and evaluation of national food and nutrition programs, with the following objectives: (1) formulation and implementation of national food and nutrition policies; (2) strengthening nutrition structures and incorporation of nutrition activities in the general health services; (3) preparation and training of personnel for research, teaching, and service in nutrition and related fields; (4) reliable evaluation and monitoring of the food and nutrition situation; (5) development of nutrition education and supplementary feeding programs, especially directed to the most vulnerable groups; (6) technical organization of institutional food and dietetic services; and (7) basic and operational research in the field of nutrition and food technology, mainly to develop non-conventional, high-protein, low-cost mixtures for mothers and children, and to provide food fortification and enrichment, such as iodized salt.

#### AMRO-4207, CARIBBEAN FOOD AND NUTRITION INSTITUTE

As confirmed by recent surveys, the following nutrition problems are still significant in the Caribbean area, in spite of recent improvement in some respects: (1) protein-calorie malnutrition in early childhood; (2) nutritional anemia of mothers and children under five years of age; (3) inadequate growth of school-age children; (4) inadequate calorie intake among some manual workers; (5) heavy dependence on imported foods; and (6) obesity and its consequences among women over the age of 35 years. The tendency of the first four problems is to improve; of the latter two, to worsen.

The Caribbean Food and Nutrition Institute was established in 1967 under the authority of PAHO/WHO, FAO, the University of the West Indies, and at first two (and recently all) of the 16 English-speaking Governments of the Caribbean, whose peoples, ranging in number from 5,000 to 2,000,000, it serves. The project receives assistance from UNICEF, UNDP, the Research Corporation of New York, and the Freedom From Hunger Campaign of the United Kingdom, as well as of the establishing authorities mentioned above.

To achieve its ultimate objective of assisting these governments and peoples in the attainment of a satisfactory nutritional status, the main activities of the Institute are the assembly, by research and other means, of the data necessary to form a sound basis for the planning and evaluation of food and nutrition programs and policies; operational research into the cost/effectiveness of such programs and policies; teaching of nutrition-related subjects in unidisciplinary and multidisciplinary courses at several levels; disseminating generally technical information concerning such subjects in the local context, and promoting interest in and awareness of them; aiding and strengthening local nutrition units and programs; and provision of technical advice to the governments.

#### AMRO-4211, RESEARCH IN PROTEIN-CALORIE MALNUTRITION

Protein-calorie malnutrition is one of the major public health problems in this Hemisphere. In recent years, new information has accumulated on the etiology, prevention, and treatment of protein-calorie malnutrition and on its socioeconomic implications. Differences of opinion in certain areas have an important bearing on the preventive measures to be adopted and need to be resolved as far as possible. A study was conducted during 1971-72 to determine the socioeconomic factors that result in earlier and more frequent marasmic protein-calorie malnutrition, as well as their public health significance.

The purpose of this project is to cooperate in the assessment of the relative importance of deficiencies of protein-calories and other nutrients in the etiology of malnutrition, and also in the revision of practical approaches to the prevention of protein-calorie malnutrition in the Region.

### AMRO-4212, RESEARCH IN NUTRITION ANEMIAS

Nutritional anemias occur widely and are most likely to develop during periods of rapid growth, such as infancy and adolescence, and during the child-bearing years in women. Collaborative studies on nutrition anemias in 10 countries of the Region and other research studies seeking practical means for the prevention of nutritional anemias indicate the need to periodically review research developments in this field and, on the basis of findings, to update public health recomendations for the prevention and control of this nutrition disease in the Americas.

The purpose of this project is to assist regional collaborative research centers on nutrition anemias through specialized technical consultantship and fellowships. The Third Scientific Group Meeting on Anemias will be held in 1974.

# AMRO-4213, IODINE DETERMINATION IN ENDEMIC GOITER

An estimated 13 million or more inhabitants are affected by endemic goiter in Latin America. The prevalence rate ranges between 12 and 75%, with varying degrees of severity. A further serious aspect of this situation is the sequelae of maternal iodine deficiency in the form of endemic cretinism, deaf mutism, and other neuromuscular disorders affecting the newborn. In some areas where endemic goiter is severe, up to 10% of the population is handicapped with neurological disorders of this type.

This project has developed an effective method of prophylaxis by the use of intramuscular iodized oil which will serve as a control measure in areas where iodization of salt is not feasible. An iodine reference center has been set up in Chile to check iodine determination techniques in monitoring endemic control programs and to assist in training of laboratory personnel.

The purpose of this project is to cooperate with the governments in reviewing public health and administrative problems associated with the implementation of effective salt iodization programs and to adopt practical solutions as required in each particular country. The Fourth Scientific Group on this subject will be held in 1973 to review and update present knowledge on the prevention and control of endemic goiter in Latin America.

#### AMRO-4221, SEMINAR ON NUTRITION IN FOOD AND HEALTH POLICIES

Prevention of nutrition deficiency diseases and promotion of an optimum nutritional status for the whole population in the Region requires the formulation and implementation of a well-defined food and nutrution policy in each country, with active participation of several interrelated sectors - agriculture, food production, education, and health - and receiving strong and permanent support from the highest national planning body.

The purpose of this project is to assist the countries of the Region, in cooperation with other international agencies, in formulating and executing biologically-oriented food and nutrition policies. Several subregional conferences will be held to discuss the bases, methodology, and strategy to successfully carry out such policies.

### AMRO-4225, GRADUATE COURSE IN PUBLIC HEALTH NUTRITION

The limited numbers of medical personnel specialized in nutrition and fully qualified nutritionist-dietitians constitutes one of the main obstacles to the adequate progress of programs for the development of health manpower and research personnel and the operation of nutrition services in Latin America and the Caribbean. In addition, there are very few regional centers to provide postgraduate nutrition training for Spanish-speaking professionals.

The purpose of this project is to cooperate with the School of Public Health of the University of Puerto Rico in developing a course leading to a master's degree in public health nutrition, in order to meet the growing demand for advanced training for doctors and nutritionist-dietitians.

This work is now being carried out under project United States of America-4225.

### AMRO-4230, NUTRITION TRAINING

The countries in the Region are making efforts to solve existing nutrition problems and prevent the extension and development of new ones. As a result, the programs have increased demands for well qualified nutrition personnel, especially to work through the health services and other related agencies.

The purpose of this project is to strengthen nutrition training in university degree programs through (1) review and improvement of curriculum planning; (2) technical consultation in specific areas; (3) guidance in developing appropriate field experience internship; and (4) education grants for faculty members in schools of nutrition and dietetics, medicine, and nursing.

### AMRO-4233, NUTRITION TEACHING IN MEDICAL SCHOOLS

Nutrition education in the schools of medicine and public health in the countries of the Region is generally unsatisfactory. Since physicians have a primary responsibility for the diagnosis, prevention, and treatment of nutrition diseases, it is necessary to improve and strengthen nutrition teaching for medical students and postgraduates in courses of public health. Several technical meetings have previously been sponsored by PAHO/WHO and recommendations have been made on this subject matter. However, they are still not fully incorporated into the general curriculum of all teaching institutions of medicine and public health.

The purpose of this project is to encourage the incorporation and strengthening of nutrition education in schools of medicine and public health, through the provision of advisory services and fellowships, and the conduct of three seminars with participation of medical and public health faculty in selected areas of the Region.

### AMRO-4238, NUTRITION RESEARCH

The strategy for improving nutrition in the present decade must include relevant research at all levels. Research is needed to define more clearly the extent of the various types of malnutrition and their effects on individuals and the community as a whole, to devise the most effective measures for the improvement of nutritional status, and to evaluate the results of adopted measures. The type of research that is needed ranges from biochemical studies at cell level, through sociological studies in representative groups, to operational studies on cost-effectiveness benefits. The purpose of this project is to assist latin American countries to develop research work in the field of protein-calorie malnutrition, nutritional anemia, endemic goiter, hypovitaminosis A, and low-cost, high-protein food products.

### AMRO-4242, FOOD IRON FORTIFICATION IN INFANTS AND MENSTRUATING WOMEN

The purpose of the workshop on food iron fortification in infants and menstruating women, held in São Paulo, Brazil, in 1972, was to prepare a project proposal for a collaborative study to be carried out by a number of investigators from the Americas on the means of fortifying food with iron in such a way as to be both practical and effective in improving the iron balance of the infant and the adult menstruating female. The proposed study would explore the current availability of iron in food in various areas of Central and South America and would parallel studies already going on in the United

AMRO-4247, SURVEILLANCE OF NUTRITIONAL STATUS

There is a need to develop simplified methodology, uniform tests, analysis, and interpretation of data for defining nutrition problems and for continuing surveillance of nutrition status and evaluation of intervention programs. Such data are essential in the formulation and implementation of national food and nutrition policies. Past experience indicates that certain key measurements which are simple and low in cost can be adapted to yield reliable baseline assessment of nutrition and health status.

The purposes of this project are to establish guidelines for interpretation of anthropometric, biochemical, and dietary data; to provide meaningful, simple, low-cost tests for assessing nutrition and health status; to systematize computer analysis of the survey data; and to update, review, and publish a simplified manual on nutrition surveillance for use in Latin America.

AMRO-4248, NUTRITIONAL AND NON-NUTRITIONAL FACTORS AFFECTING GROWTH AND DEVELOPMENT

Optimal growth and development is the ultimate goal of all child health measures. Since the emergence of child care as a scientific discipline, it has been recognized that the provision of an adequate diet is an essential requirement for achieving this. Studies in several countries have pointed out the physical and behavioral lag present in survivors of chronic severe malnutrition in early life. More recently, attention has been given to the significance of growth retardation in the uterus, particularly to the long-term consequences of causes extrinsic to the fetus.

The purpose of this project is to provide assistance in carrying out studies of growth of children throughout the Continent. Ecological studies to isolate one variable or a cluster of variables thought to be significant will also be carried out in selected localities in Latin America and the Caribbean. A seminar will be conducted to review existing knowledge in the field and to make plans for future investigations.

AMRO-4249, OPERATIONS RESEARCH IN METHODS OF PREVENTING MALMUTRITION AND IMPROVING NUTRITIONAL STATUS

For most of the major nutrition problems confronting the Americas, alternate strategies are now available with resource requirements and degrees of feasibility varying from country to country. Some of the least promising have been vigorously promoted to the neglect of simpler and more economically feasible measures. While the selection of preferred courses of action is rarely susceptible to the formal quantitative application of systems analysis or cost-benefit calculations, these concepts should be taken into consideration in the evaluation of alternate strategies.

What is required is research prior to selection of major programs and courses of action which will disclose the advantages and disadvantages to the fullest degree possible; built-in evaluation procedures to determine the functioning of the program or measure in practice; and a systematic means of modifying programs on the basis of such evaluations. The scope of research into alternate strategies cannot be limited to measures available to ministries of health and therefore needs to be carried out at the interministerial level in collaboration with the national planning commission.

#### AMRO-4300, MENTAL HEALTH

The problems of mental health in the Region as a whole are basically due to the absence of a definite policy in many countries, deficiencies in organizational structure, and inadequate coverage. The objectives of this project are to give support to the governments in this field, particularly in evaluation of services, planning of activities on a national scale, training of personnel, and dissemination of technical information. Twelve countries have received assistance in the preparation of their national programs, and 15 have utilized PAHO help in various aspects related to preparation of personnel, opening of new services, and evaluation of training, among others.

### AMRO-4312, COURSES IN COMMUNITY PSYCHIATRY

The lack of coverage of psychiatric and mental health services is a common problem in all the countries of the Region and arises from the scarcity and poor distribution of psychiatrists. The delegation of certain psychiatric functions to general and public health doctors is one way to increase the coverage of services through the use of non-specialized physicians. Some basic training of short duration, followed by a longer period of supervision, could prepare general physicians to meet some types of problems with emergency psychiatric assistance, to provide follow-up services, and to administer simple psychotherapy.

The purpose of this project is to promote the creation of programs of continuing education in the various countries, beginning with short courses and continuing through a longer period of supervised practice. Last year four courses were offered in three countries, and these were attended by 60 doctors.

### AMRO-4313, NURSING IN MENTAL HEALTH

There are several problem areas related to psychiatric nursing in the Region: (1) complete reorganization of the administrative and operational structures of mental hospitals needs to be carried out if nursing service is to be provided at even minimal levels of quantity and quality and if psychiatric nurses are to be adequately prepared; (2) psychiatric nursing manpower is inadequate; utilization of existing resources is inefficient, due mainly to the use of nurses in peripheral areas, thereby decreasing the amount of time devoted to nursing; (3) the new concept of community mental health centers is difficult to establish because existing personnel are not trained in this area; (4) mental health information is not provided in the training of nursing and auxiliary personnel; (5) there is no coordination of needs, programs, and attitudes in the mental health field in the countries of the Region; and (6) there are insufficient postbasic programs to prepare nurses in sufficient quantity and properly oriented to carry on the programs of mental health.

The purpose of this project is to broaden the knowledge of nurses on mental health and psychiatric nursing subjects, and to assist the participants in applying what they learn to the performance of their duties. This will be accomplished through the incorporation of mental health concepts into nursing courses, strengthening the curricula in this area, and

FUND	1972 19	973 1974	1975	FUND	1972	1973	1974	1975

training the teaching personnel required; development of postbasic and continuing education courses in psychiatric nursing and community mental health in selected countries; and integration of mental health information into nursing activities, in the psychiatric units of general hospitals as well as in psychiatric hospitals.

### AMRO-4314, EPIDEMIOLOGICAL STUDY ON EPILEPSY

Resolutions of the Coverning Bodies recommended the promotion of research on the frequency and distribution of epilepsy in the Hemisphere, since it is suspected that in certain areas the incidence and prevalence of that illness is very high. Epidemiological studies are to be made in order to ascertain the magnitude and distribution of the problem, to plan services accordingly, and to uncover causes underlying higher frequency in some regions. PAHO is cooperating in these activities.

### AMRO-4315, STUDY GROUP ON TRAINING PSYCHIATRISTS

Training programs for psychiatrists in Latin America are scarce and are usually tailored to the needs of the private practitioner. There is a tremendous lack of specialists adequately prepared for work within the community. Although there is a tacit agreement on the need to modify the curricula and introduce modern concepts and practices in the training of psychiatrists, the training programs in most of the countries are still designed along traditional lines. It is advisable to reach an agreement on curricula content, length of studies, introduction of social studies, training in team work, psychotherapy, consultation, and basic administration. Through this project PAHO sponsored a study group to discuss these issues and to make specific recommendations to governments and academic authorities.

## AMRO-4316, EPIDEMIOLOGY OF SUICIDES

Suicide is a leading cause of death in the age group 15-45 years in several Latin American countries. Statistics from Europe and the United States of America show that suicide is a problem of later ages (65 years and over). Furthermore, in several Latin American countries, high rates of suicide coexist with high rates of homicides, an observation which does not support theories based on statistics from other regions.

The natural history of suicide is almost completely unknown, hindering the planning and implementation of sound preventive programs. The present project aims at the study of the incidence of suicide, characteristics of the victims, and associated factors that must be taken into account. Five countries in which the problem is particularly serious have been selected for the study.

AMRO-4317, STUDY GROUP ON TEACHING MENTAL HEALTH IN SCHOOLS OF PUBLIC HEALTH

The preparation usually received by public health administrators in Latin America does not include mental health. On the other hand, very few psychiatrists in the Region have received any formal training in public health. None of the schools of public health offer specialized courses in mental health and community psychiatry, and only a few offer a separate course in mental health as part of the curriculum. Psychiatric care and mental health coverage of the population is inadequate and is limited to the urban populations. Only specialists provide these services, occasionally delegating some of their functions to other members of the health team.

The present study group plans to promote a greater interest in mental health among the directors of schools of public health, supporting the inclusion of this discipline in the regular programs for doctors, nurses, and other personnel, and continuing to encourage the inclusion of academic mental health programs as a subspecialty of public health.

### AMRO-4318, EPIDEMIOLOGY OF ALCOHOLISM

Alcoholism is a grave health problem in Latin America, but its magnitude is not completely known. The objectives of this project are to study the prevalence of alcoholism in both urban and rural areas in a pilot area which includes eight cities and two rural areas in Latin America; to determine the most frequent forms of alcoholism, attitudes of the people, and the way that the habit of drinking alcohol is acquired; to distribute scientific information on the problem to interested governments and agencies and to collect information on studies in progress; and to promote study centers on alcoholism in various countries where personnel will be prepared, techniques demonstrated, and research undertaken. The first proposed center of this type will be in Costa Rica.

# AMRO-4320, SEMINAR ON MENTAL RETARDATION

The prevalence of mental retardation in Latin America is high, and services which deal with it are scarce, poorly distributed, underfunded, and understaffed. In many cases the services provided are not selective enough to make distinctions between mental retardation and other neurological states or emotional disturbances, and children with all types of disturbances are put together in custodial institutions. There are very few programs of special education and vocational rehabilitation for the retarded, and most of these have resulted from private initiative. This seminar proposes to bring together doctors, educators, and rehabilitation personnel in order to analyze existing resources and to present recommendations on providing more adequate medical care and prevention programs.

### AMRO-4322, DEVELOPMENT OF PSYCHIATRY AND MENTAL HEALTH LIBRARIES

The majority of psychiatric departments in Latin America have no libraries or very small ones. Few psychiatric and mental health journals are received and some of these are of doubtful utility, making it difficult for the faculty, students, and residents to keep themselves up to date in their specialties. The purpose of this project is to provide a limited number of basic psychiatric journals to a selected number of psychiatric departments.

### AMRO-4400, DENTAL HEALTH

Throughout Latin America there is a high prevalence and incidence of dental disease, especially in children. Only a limited number of people receive dental services, and with a growing demand for these services has come a realization that these must be made available. There is a lack of dental personnel, both professional and auxiliary, and no adequate systems, either private or public, to provide the necessary services.

The purpose of this project is to cooperate in (1) definition of the methodology for conducting dental health surveys and developing dental health planning; (2) improvement of the status of dental health through application of preventive and curative measures; (3) development and implementation of methods for utilizing available local dental resources in a coordinated and efficient manner in order to extend dental services to greater numbers of people; (4) development and implementation of systems for dental care payment to overcome financial barriers; and (5) advice to governments on the development of national dental programs with improved health delivery systems and on developing personnel capable of analyzing, planning, and implementing such systems at the national and local levels.

### AMRO-4407, DENTAL EPIDEMIOLOGY

Although there is a high incidence and prevalence of dental disease in the Region, few countries have adequate, well-documented data on the extent of these diseases. It is necessary to remedy this situation, identify possible causes associated with presence or absence of disease, and measure the effectiveness of programs in terms of improved dental health. The purpose of this project is to cooperate in training personnel in dental epidemiology and in the implementation of studies in this field; in improving basic knowledge of dental health conditions in the Americas and providing means for exchange of such information; and in evaluating the impact on dental health of curative and preventive dental programs.

### AMRO-4409, FLUORIDATION

The fluoridation of water supplies has been accepted as an effective method for the prevention of dental caries. Even though over 20 million persons are consuming water with adequate fluoride content, the implementation of fluoridation in Latin America has been slow; with the exception of the United States of America, only three countries in the Region produce fluoride compounds. There is still a lack of adequate dissemination of information on the technical aspects of this subject, and a shortage of trained engineers. Knowledge of the existing fluoride levels in community water supplies in countries is lacking. There is a need to institute well-defined fluoridation programs and initiate fluoridation in more countries and major cities. A stimulus needs to be given to the production of fluoride compounds in the Region and the use of local resources.

The purpose of this project is to cooperate in (1) extending the fluoridation of water supplies in the Region to cities with over 50,000 population; (2) training engineers and students in fluoridation and incorporating the teaching of this subject as a regular factor in engineering curricula; and (3) investigating and applying new methods by which fluorides can be utilized to prevent dental disease.

### AMRO-4410, LABORATORY FOR CONTROL OF DENTAL PRODUCTS

The lack of standardization and quality control of dental materials in Latin America is a major problem in the provision of dental services, although the production of certain materials has commenced in various countries. Until the initiation of the PAHO program, no Latin American country had a laboratory for quality control of dental products. There is no governmental control of dental products and no coordination between teaching on dental materials and their clinical application, either in private practice or in health service programs. There is a lack of trained personnel and absence of adequate literature on the subject. Dental materials utilized are of a traditional nature and are not oriented towards the treatment of large population groups under the conditions encountered in Latin America.

The purpose of this project is to cooperate in establishing a mechanism for improving and controlling the quality of dental products produced locally or imported into a country, and establishing up-to-date national specifications for dental products; in training teachers and research workers in dental materials; and in conducting basic and applied dental materials research, especially in systems for the better delivery of dental care to large population groups.

#### AMRU-4411, HUMAN AND MATERIAL RESOURCES IN DENTISTRY

In Latin America there is a scarcity of human and material resources necessary to provide the preventive, curative, and rehabilitative services necessary to meet the needs of the people. The resources that do exist are poorly utilized and distributed in terms of national needs; dental equipment is manufactured in only three countries in Latin America. Modern management techniques are necessary to produce effective interaction between the human, technical, and socioeconomic systems. The purpose of this project is to complement the study and analysis of dental health problems and to assist national governments in planning the most effective utilization of dental health resources.

## AMRO-4500, HEALTH ASPECTS OF RADIATION

Radiation has been used for the diagnosis and treatment of diseases since soon after the discovery of x-rays nearly 80 years ago, and the dual problem facing the health authorities of every country of the Region is to obtain the benefits for health that are possible while controlling unwarranted radiation exposure. To date, the major effort of this program has been made in the radiation protection area; however, the trend is toward an increased emphasis on the optimum use of radiation in medicine, which includes diagnostic radiology, radiation therapy, and nuclear medicine.

The program of PAHO is designed to (1) provide for training of professional as well as technical personnel; (2) promote the teaching of basic radiological sciences; (3) encourage national studies of the utilization of radiation sources; (4) encourage the effective application of radiation in medical practice, public health, and research; and (5) promote the adoption of international recommendations in legislation and regulations concerning radiation protection.

#### AMRO-4507, RADIATION HEALTH PROTECTION

Inherently associated with the beneficial uses of radiation is the necessity of providing adequate protection for radiation workers as well as the general public. In recent years a number of health ministries have shown an interest in correcting deficiencies in the area of radiation protection. The objective of this program is to help establish the nucleus of a national radiation protection service within the health ministry through the provision of expert consultation, training, and the basic equipment needed to detect and measure radiation.

### AMRO-4509, RADIATION SURVEILLANCE

As a result of nuclear weapons testing in the atmosphere, there has been a worldwide pollution of the environment with radioactive elements, and various health ministries have requested assistance to establish a system for detecting and measuring these contaminants. Air samples are collected in 10 countries (Argentina, Bolivia, Chile, Colombia, Ecuador, Guyana, Jamaica, Peru, Trinidad and Tobago, and Venezuela) and milk samples are collected in five countries (Chile, Colombia, Ecuador, Jamaica, and Venezuela). This environmental sampling network is supported through technical assistance, training, and supplies furnished by PAHO.

SUPPLIES AND EQUIPMENT	7,109	1,900	2+000	2,500

# AMRO-4515, COURSE ON RADIATION THERAPY PHYSICS

The consensus of expert opinion is that at least one-half of all cancer patients would benefit from radiation therapy, alone or in conjunction with some other form of treatment. In most Latin American countries investments have been made in sophisticated and costly equipment, and radiation therapy services are being offered. The optimum use of this equipment is doubtful because the education and training of both physicians and technical support personnel has not paralleled the installation of equipment.

By means of a course for specialists in radiation therapy physics, basic training will be given in the calibration of therapy equipment, radiation dosimetry, and treatment planning. It is expected that the nucleus of a training center for radiation therapy will be formed by this course.

AMRO-4700, FOOD AND DRUG CONTROL

This is a continuing project to help the countries improve their organization and procedures for ensuring the safety and satisfactory condition of their food and drug supplies. The actions taken under this project include (1) development of guidelines for the organization and operation of national food and drug control agencies; (2) study of the food and drug control situation in the various countries (these studies by PAHO result in reports to the countries recommending actions for achieving better quality control of foods and drugs); and (3) providing training for analysts, inspectors, and law administrators from the national food and drug control agencies.

AMRO-4703, FOOD REFERENCE LABORATORY (ZONE III)

The countries of Zone III do not have sufficient resources to establish and maintain food control laboratories with adequate equipment and personnel to support the expensive and complicated analyses needed to maintain control of sanitation standards and of processed foods, whose production, transportation, and consumption has increased rapidly since the inauguration of the Central American Common Market.

The purpose of this project is to establish within INCAP a food reference laboratory which will cooperate with national food control services in the countries of the Zone, placing at their disposal highly advanced analytical services, and which will serve as an arbitration center in the case of differences between laboratories, while also providing training and assistance.

This project has been combined with Guatemala-4701.

AMRO-4708, FOOD HYGIENE TRAINING CENTER

In the past few years, the Ministers of Health have shown a greater interest in problems related to food hygiene, but the activities carried out have been limited due to the lack of properly trained personnel. This problem has increased with the growth of food industries in the countries of the Continent beyond the limits of the technical and sanitary control of the existing health services.

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975
	252555					

The main objectives of this project are to operate a center for training in food hygiene and to provide instruction on inspection and control techniques, as well as on the basic principles of food technology. The program of the Center will give advanced training for professionals and basic courses for inspectors. In addition, consulting services in specific problems will be furnished at the request of the governments.

The Center was established in Caracas, Venezuela, in March 1971, using the facilities of the School of Public Health, Caracas. Courses were held in 1971 and 1972. In addition, a food hygiene demonstration area has been established with the cooperation of the Ministry of Health in the metropolitan area of Caracas, where field in-service training will be provided to professionals and inspectors from the regional health services of Venezuela and from other countries of the Hemisphere.

### AMRO-4709, REGIONAL DRUG INSTITUTE

The governments' obligation to ensure the quality of pharmaceutical preparations presents serious difficulties in many countries. These difficulties are becoming greater because of the increasing number of new products, many of which are difficult to test. This problem has been discussed in a number of reports issued by the WHO Director-General, and concern about the need to improve drug testing programs has been expressed in various resolutions of the World Health Assembly and of the Governing Bodies of the Pan American Health Organization.

PAHO is sponsoring creation of a regional drug institute to provide advanced training for government analysts and other government drug control personnel, as well as other kinds of assistance for the national drug control agencies. This proposal has been endorsed by the PAHO Governing Bodies.

#### AMRO-4715, FOOD HYGIENE

Food-borne diseases create a constant hazard to man. The increasing pollution of the environment, the rapid transportation of animals and food, the concentration of animals for their feeding and handling, the changes in feeding habits and in the techniques for preparation of foods, and the rapidly developing food contamination and health hazard caused by indiscriminate use of pesticides, have increased in many ways the hazards of food-borne diseases in all the countries of the Hemisphere. The purpose of this project is to cooperate with the health services of the countries of the Region in the planning, promotion, coordination, and supervision of programs related to the inspection and protection of milk, meat, and other foods, as well as the proper application of sanitary principles in the production, processing, and distribution of foods.

### AMRO-4716, TRAINING IN ANALYSIS OF FOOD AND DRUGS

Present-day laboratory procedures for testing pharmaceuticals utilize complex methods that require skilled scientists with training in the manipulation of recently developed instruments. Generally speaking, this training is presently available

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975

in only a few centers, such as the pharmaceutical testing laboratories of the U. S. Food and Drug Administration and the Canadian Food and Drug Directorate. The purpose of this project is to assist in the training of drug analysts.

#### AMRO-4717, SEMINAR ON FOOD HYGIENE

The food industry of Latin America is developing at a faster rate than programs to control the problems related to production, distribution, processing, and commercialization. Many diseases that affect the total population of several countries, particularly in the Andean region, are related to food of animal origin. The mass migration of people to the urban centers is further compounding existing food-related public health problems.

A seminar is planned to bring together health, agriculture, and food industry officials for a critical analysis of the situation. Recommendations from this group will be the guide to motivate, design, and prepare national food hygiene control programs.

# AMRO-4800, MEDICAL CARE SERVICES

The main objective of this project is to provide support and financial resources for the regular activities of medical care services. Thus, the project intends to promote the organization of a health services system in the countries of the Region, including within the general concept of systems the decentralization of administrative procedures through a regional distribution of establishments and activities; the improvement of hospital administration with a view to better utilization and higher productivity of available resources; the architectural design of buildings and the maintenance of installations and equipment for the expansion and preservation of the hospitals' physical facilities; and the training of personnel for hospital administration, trying to promote the establishment in each general hospital of 200 beds or more of an administrative team composed, at least, of a medical director, a hospital administrator, a chief nurse, a chief dietician, a pharmacist, a hospital engineer, a statistician, a personnel officer, and a supply officer.

During the period 1973-1975 PAHO will give assistance at the request of countries in the drafting of bills of law and regulations intended to offer the legal structure for the development of health and medical care systems.

## AMRO-4801, MEDICAL CARE SERVICES (ZONE I)

The health sector of the English-speaking countries of Zone I suffers from administrative over-centralization; nonexistent or antiquated health legislation, particularly in relation to medical and institutional care; a shortege of qualified personnel; antiquated systems and procedures; and institutional physical facilities and equipment which are frequently very old and unrelated to the clinical needs of patients, institutional service requirements, or geographic locality. The

FUND 1972 1973 1974 1975	FUND	1972	1973	1974	1975

purpose of this project is to assist the governments of the eastern Caribbean area, Guyana, and Surinam in matters related to the planning, organization, and operation of hospitals and health centers as an integral part of the respective national health plans.

AMRO-4802, MEDICAL CARE SERVICES (ZONE II)

The purposes of this project are to collaborate with the governments of the countries of Zone II in improving the administration of health care services, emphasizing the coordination of health services, hospital planning, and general problems of hospital administration; and in developing programs of training and applied research related to medical care in the schools of public health and medicine and in other health sector institutions.

AMRO-4803, MEDICAL CARE SERVICES (ZONE III)

In the countries of Zone III the medical care needs of the population are not satisfactorily met due to a continuing increase in the population growth, now surpassing 3% a year, and a growing demand for more and better services because of persistence of preventable diseases, greater accessibility of the population to health services, increase in coverage, and improvement in the health knowledge of the people. Services have developed slowly due to the lack or incomplete development of investment plans. In general, personnel of all kinds are scarce. This situation is aggravated by a high concentration in the large cities to the detriment of rural areas, low production rates, inefficient organization, and poor preparation.

Public financing is insufficient to meet the operational needs, although data are not available on the actual operational costs and expenditures of the institutions. Services are not fully utilized and their turnover is low. Their organization and functioning is deficient, due to the different independent health systems within the sector which lack structure, executive coordination, planning, financing, technical and administrative standardization, and information systems.

The purpose of this project is to support and collaborate in the national medical care programs in the countries of the Zone to better meet their actual needs, through extension and wider regionalized distribution of services, particularly in the unprotected rural areas, in order to provide total coverage by 1980; improvement of services, maintaining the current rate of bed capacity and increasing ambulatory care; improved coordination between medical care programs and those of maternal and child care, family planning, applied nutrition, cancer, and mental health; more exact knowledge of the state of operations and maintenance of the installed capacity with a perpetual inventory and maintenance program; elaboration of an investment program within the sector's project, integrated and coordinated with overall development plans; preparation of personnel and establishment of administrative disciplines in medical care and hospital services through courses, seminars, and meetings of Zone-level personnel from all the countries; study of health costs and of the utilization among the national health systems of the various sources of funds; improvement of the services' administration to make possible optimal use of resources to increase their turnover; and development of the concept of progressive patient care and programs of rehabilitation.

AMRO-4804, MEDICAL CARE SERVICES (ZONE IV)

The countries of Zone IV are unable to develop an efficient organization of their health institutions for a variety of reasons, among which are the following: scarcity of economic resources, with few qualified personnel and poor coordination between the various health entities; inequality of distribution of personnel in the various institutions, low salaries, and lack of incentives to motivate efficiency; provision of services to only about half of the rural population

FUND	1972	1973	1974	1975	FUND	1972	1973	1974	1975
~~	<b>-</b>								
								_	4

because of poor accessibility and lack of adequate regionalization; lack of advisory assistance and supervision for construction and equipping projects of several institutions, some of which are in initial stages and others being developed through external financing; lack of adequate research of the needs of the people, resulting in poor distribution and provision of services; and lack of proper maintenance for buildings and equipment, which would provide a better quality of medical care, conserve investments, and provide more comfort to the patient.

The objectives of this project are to collaborate in a study of the needs and the solutions to the existing problems, providing the assistance that the governments need in order to improve the quality and administration of medical services; to improve coordination and integration of resources to strengthen and improve the efficiency of existing facilities; to promote and collaborate in programs of engineering, maintenance, and equipping of health sector institutions; and to strengthen and develop programs which will increase and improve training of personnel for administrative and technical services in the hospitals, centers, and health posts.

AMRO-4806, MEDICAL CARE SERVICES (ZONE VI)

The purpose of this project is to collaborate with the governments of Zone VI in the establishment of coordinated medical care services in accordance with the health policy of each country. Among the principal objectives are the establishment of a basic scheme for a system of regionalization of hospitals and other health centers to provide medical care services, the standardization of physical and administrative structures, and the training of personnel at all levels. The activities to be carried out in order to establish a regionalized health plan include the training of personnel and the improvement of the physical and administrative structures of the health establishments, equipment, and hospital installations.

G-4 SECRETARY	PR	-	1	1	1						

#### AMRO-4813, HOSPITAL PLANNING AND ADMINISTRATION

The construction, expansion, and modernization of hospitals is of great concern to the Member Governments due to the considerable effect that their costs have on the investment of public funds. Nevertheless, governments are increasing the installed capacity to meet the growing demand for medical service, and they are trying to achieve the optimum utilization of the hospital resources with a view to increasing population coverage and to improve medical services.

The purpose of this project is to cooperate with the Member Governments in determining hospital bed requirements, including the number and distribution of existing ones, as well as requirements for physical structures and trained clinical and administrative personnel to provide efficient services. PAHO will continue to cooperate with the Member Governments in the application of new concepts of functional planning and architectural design and in the establishment of programs of maintenance of buildings, installations and equipment to protect existing capital investments. In addition, the project collaborates in the establishment of administrative systems that facilitate and aid the work of the clinical group and that provide the most efficient functioning of the departments of the hospitals.

### AMRO-4815, TRAINING FOR MEDICAL CARE AND HOSPITAL ADMINISTRATION

The objectives of this project are (1) to improve the quality of care and the utilization of medical care resources through scientific administration training of professional personnel at the management level; and (2) to incorporate training in the principles and methods of medical care administration in the undergraduate plan of studies of the schools of medicine and other health sciences.

In relation to the first objective, there is low availability and poor utilization of trained professionals in administration, lack of a definite policy for such training, insufficient regular programs of training to provide the administrators needed in the countries of the Region, absence of a policy of incentives to attract and retain professional personnel at the direction level, absence of a salary scale with attractive pay, and lack of opportunities for continuing education. The goal in this area in the next few years is to train all staff at the management level, in short— and long—stay hospitals of more than 200 beds, in scientific administration.

As for the second objective, it is known that doctors play a basic role in proper utilization of hospital resources by determining admissions; ordering examinations, treatment, and special diets; indicating nursing and consultative procedures; and other decisions, all of which directly affect the quality of attention and hospital costs, and determine who will be able to utilize hospital services. However, many doctors show lack of understanding, indifference, disinterest, and even hostility toward the function of administration at the management level. During the next four years it is proposed to collaborate in the inclusion of scientific administration training for professors or preventive, social, and clinical medicine and for directors of university hospitals.

### AMRO-4816, PROGRESSIVE PATIENT CARE

The objective of this project is to develop the concept of progressive patient care in the hospitals of Latin America in order to improve the quality of medical care and to increase utilization of the related resources. This project specifically covers the reorganization of six teaching hospitals in Latin America according to the concept of progressive patient care. The first phase has been completed with the planning and establishment of intensive care units in teaching hospitals in Brazil, Chile, Colombia, Peru, Uruguay, and Venezuela. The second phase includes the consolidation of six units and the organization of intermediate care pilot areas. In addition, a special study has begun on ambulatory care services with the purpose of defining their principal characteristics as well as the role which they play in the delivery of medical care services. The administrative structure of six hospitals is being strengthened through the organization of a service of unit managers, as well as through the improvement of supporting services.

### AMRO-4826, IMPROVEMENT OF MEDICAL CARE ADMINISTRATION LIBRARIES

The purpose of this project is to improve the programs of medical care and hospital administration in nine schools of public health in Latin America and in the Latin American Center for Medical Care through improvement of their respective libraries. These libraries will each receive 2,000 books for the different disciplines which constitute the plan of study for medical care and hospital administration, as well as subscriptions to 35 new publications. In 1971, they acquired 10,000 books and 10 librarians were trained in a special nine-week course. Between 1972 and 1973 another 10,000 volumes will be purchased.

### AMRO-4829, HOSPITAL MAINTENANCE AND ENGINEERING

The purpose of this project is to establish an international hospital maintenance and engineering center of the Americas, capable of rendering consultation, guidance, information, and assistance in the areas of engineering and maintenance of health care facilities to the countries desiring such aid. This organization will consist of nationals and PAHO/WHO advisory staff. The program will be designed to strengthen the organization of programs for maintenance and engineering of health care facilities, and will be patterned after the programs and materials developed by the Hospital Maintenance and Engineering Center in Caracas, Venezuela.

The basic concept of this project is that assistance will be provided to the countries with the objective of developing the individual country's own capabilities and resources, to obtain their own results, and to determine the methods of application of the existing technology to meet their individual needs.

## AMRO-4831, STUDY GROUP ON MAINTENANCE SYSTEMS IN LATIN AMERICA

In Latin America there are 14,589 hospitals with a bed capacity in excess of 813,699. If each bed costs \$12,000, there is already an investment of over \$9.6 billion. Planning in the health care area indicates that 200,000 additional beds will be needed during the next 10 years. This will increase property investment to \$12 billion. To maintain and protect this staggering investment, less than one-half of 1% of the health care facilities employ qualified hospital engineers or technicians, but countries are becoming aware of the need to develop appropriate maintenance organizations and systems, and to train technicians who are presently unavailable.

To establish the bases of an effective maintenance program, a study group is proposed to study maintenance programs in South America with a view to recommending changes and/or modifications to present work methods.

### AMRO-4900, HEALTH AND POPULATION DYNAMICS

.3888

The rapid growth of population in many of the countries of the Region has a substantial effect on the development goals of those countries, both in the health and the socioeconomic sectors. The program of health and population dynamics provides technical assistance in the technology required to solve problems of fertility and population structure, thereby furthering the achievement of national development goals.

The program provides assistance in the structuring and implementing of family planning service projects, especially the integration of family planning into the health services structure; the development of manpower capabilities; and demographic and human reproduction research. The program is also assisting in family life education, family planning education, program evaluation, and the dissemination of program-related information throughout Latin America. The program supports many regional activities, as well as 18 country projects. In addition, the program works closely with other national, international, and voluntary agencies in meeting the demands of the health and population dynamics field.

AMRO-4901, HEALTH AND POPULATION DYNAMICS (ZONE I)

Governments in the Caribbean area are increasingly concerned at the alarming rate of population growth and the effects of this growth on their economic development. The high rate of natural increase is produced by the interaction of many factors, mainly a rapid decline in mortality and the persistence of a high birth rate. Overseas emigration is now severely restricted and limited mostly to sorely needed professionals. While appreciable declines have occurred in infant mortality rates, further improvements are desirable throughout the region. The population structure is characterized by a large group of young children (nearly 45% in 0-15 years age group). Women of child-bearing age constitute about 22% of the population. These two groups represent a significant proportion of the total population and place a heavy burden on the provision of health services.

Maternal and child health services are provided to a great extent by inadequately trained professional and auxiliary nursing personnel who need to improve or refresh their knowledge of maternal and child care. Beyond their concern about the demographic consequences of unregulated fertility, the governments in Zone I are becoming increasingly aware of the effects of out-of-wedlock pregnancies, family size, and inadequate spacing of children on the well-being of individuals and families. Awareness of the need for better understanding of health concepts and for attitude changes in the population is increasing national demand for health education services.

The purpose of this project is to contribute to the harmonious balance between development and population growth, to decrease morbidity and mortality associated with procreation, and to promote better health conditions for the child from conception to age 15. Whenever appropriate, PAHO will provide technical guidance and advisory services to help formulate, develop, and promote family planning programs and family life education as an integral part of maternal and child health services.

AMRO-4902, HEALTH AND POPULATION DYNAMICS (ZONE II)

The present situation in relation to problems of maternal and infant health varies widely in the countries of Zone II, both as to availability of resources and the degree of development of programs. The main purpose of this project is to

FUND 1972 1973 197	4 1975	FUND	1972	1973	1974	1975

provide assistance to the Governments in the expansion of programs designed to broaden the coverage and improve the quality of maternal and child care programs, emphasizing the adaptation of goals, the strengthening of the technical administrative structure, and the training of personnel at various levels.

TOTAL		1	•			TOTAL	PR -	11,420	32,833	<del>-</del>	<del>-</del>

#### AMRO-4903, HEALTH AND POPULATION DYNAMICS (ZONE III)

Most of the countries of Central America and Panama have active programs in population dynamics and family planning, usually related to or integrated with maternal and child health services. In order to assist in the successful development of these family planning programs, it is proposed to continue advisory services for the analysis and assessment of the impact of the programs. Special emphasis has been placed on the development of the comprehensive maternity-centered family planning program approach in these countries.

#### AMRO-4906, HEALTH AND POPULATION DYNAMICS (ZONE VI)

The four countries of Zone VI have given high priority to the extension of maternal, child, and family health services, as well as to the strengthening of training activities and improving the personnel in these services. In order to accomplish this, they have requested assistance from PAHO/WHO, which has been provided through specific projects funded from a variety of sources. The purpose of this project is to promote the development and improvement of these programs, and it provides for coordination, assistance, and supervision through short-term consultants and designated persons in each country.

#### AMRO-4909, EDUCATION AND TRAINING IN HEALTH AND POPULATION DYNAMICS

There is a scarcity of personnel trained in maternal and child health, family planning, demography, and human reproduction. The capabilities of educational institutions and national programs are inadequate to meet the growing demands of programs related to health and population dynamics. The purposes of this project are to develop and improve the capability of educational institutions and national programs to carry out training activities in health and population dynamics in order to increase the number of professional and non-professional personnel in this field.

### AMRO-4910, RESEARCH IN HEALTH AND POPULATION DYNAMICS

There is a need to extend the knowledge of the relationships between human fertility and health. Criteria need to be developed in order to measure the impact of family planning services upon health.

The objectives of the program are to support research aimed at the investigation of the relationships between health and population dynamics; to develop health criteria which are suitable for the evaluation of family planning programs; to develop a methodology for evaluating family planning programs; and to carry out evaluation of the PAHO program in this field. Among others, research is considered in the areas of nutrition, fertility, postpartum attitudes, comparisons of social factors and fertility in urban and rural settings, and determinations of high perinatal risks.

# AMRO-4912, SEMINAR ON NURSING-MIDWIFERY ASPECTS OF MCH AND FAMILY PLANNING

Women of child-bearing age and children under 15, the groups exposed to maternal and child health risk in the countries of the Americas, comprise 63% of the population. The accelerated population growth and the high rates of maternal and child mortality place maternal and child health and family planning programs among the highest health priorities in the Region. The responsibility of nursing in maternal and child health and family planning programs has been emphasized by all countries of the Hemisphere.

FUND 1972 1973 1974 1975	FUND	1972	1973	1974	1975
		¢	\$	¢	ŧ

The purpose of this project is to develop a seminar to orient a group of 35 nurses and midwives, holding either service or teaching positions, from 22 Latin American and Caribbean countries, in changes in nursing-midwifery, and in maternal and child health and family planning, as well as to provide the opportunity for them to exchange ideas through group discussions on the possible application of these trends in their own countries for the betterment of maternal, child, and family health.

#### AMRO-5000, REHABILITATION

The purpose of this project is to cooperate with Member Governments in planning and executing specific projects in the field or rehabilitation, in accordance with the national health programs of countries within the Region, and in providing short-term advisory services in physical medicine, physical therapy, occupational therapy, prosthetics, orthotics, communications therapy (speech and hearing), rehabilitation of the blind, and social and psychological rehabilitation, as well as in providing social and vocational rehabilitation services through agencies other than those dealing directly with health problems.

# AMRO-5010, STUDY GROUP ON HUMAN COMMUNICATIONS

The countries in the Region are becoming aware that, although at least one and a half million people in Latin America have serious speech and hearing problems, services of rehabilitation reach only about 5% of those affected. These defects prevent many otherwise healthy persons from living a normal family, social, and economic life. Effective techniques are available today to enable many of those affected to integrate satisfactorily into their communities. Children with this impairment are often classified as mentally retarded, while they could be returned to a normal life.

The purpose of this project is to set up a study group on human communications to analyze the problem in the light of present experiences and to recommend solutions. Recommendations will be made concerning the specialized personnel who should be providing these services in Latin America and the type of training they should receive.

#### AMRO-5100, CHRONIC DISEASES

Chronic diseases have increased in importance in Latin America as control of communicable diseases has advanced and the proportion of older people has increased. Cardiovascular diseases and malignant neoplasms constitute a major cause of death in many of the countries of the Continent. The purposes of this project are to collaborate with the governments of the Region in an analysis of the importance of chronic diseases and in the preparation of research, control, and prevention programs related to this type of disease.

#### AMRO-5108, SURVEY ON SMOKING PATTERNS IN LATIN AMERICA

The purpose of this project is to investigate smoking patterns and attitudes in eight Latin American cities where reliable mortality statistics and demographic information were already available. The survey provided information on the prevalence of smoking and on the social, cultural, and demographic characteristics of persons indulging in the habit. The data will assist the national public health agencies of the Region in the formulation of national policies regarding cigarette smoking and will permit the estimation of the baseline needed for an accurate evaluation of the effectiveness of future antismoking programs.

## AMRO-5109, CANCER CONTROL

The effective reduction of communicable diseases has been accompanied in Latin America by a rapid increase in the relative and absolute frequency of chronic diseases, particularly cancer. During the last decade, many countries have shown increasing interest in improving cancer control activities; this decision emphasizes the need for epidemiological knowledge in the planning and evaluation of related programs, but this focus is seldom utilized. Uterine cervical cancer and cancer of the breast and stomach need particular attention because of the high mortality and morbidity rates from these causes.

The purposes of this project are to organize systems of information on the incidence of cancer, including registries, studies, and other methods adapted to local situations; to carry out epidemiological studies oriented to better planning of programs of control and determination of causes; and preparation of the human resources needed for programs of control in all areas and levels of action.

AMRO-5110, CONTROL OF THE HABIT OF SMOKING

Cancer of the lung, larynx, mouth, and bladder, chronic bronchitis and emphysema, systemic heart disease, and gastroduodenal ulcers are diseases whose risk is significantly greater in habitual smokers than in those who do not smoke. The Inter-American Study of Mortality revealed that the cigarette smoking habit constituted a serious risk for the health of the Region, since diseases associated with it were responsible for 20% of the registered deaths in men from 35-64 years of age living in 10 large cities in Latin America.

The purposes of this project include adoption of definite policies regarding tobacco on the part of Member Governments; establishment of coordinating agencies to combat the smoking habit in the countries most affected; putting into effect programs of control of smoking in those same countries; a decrease of 30% in the number of smokers over the next 10 years in those countries where it is most frequent; and a decrease in the morbidity and mortality from diseases related to smoking.

AMRO-6000, MEDICAL EDUCATION: TEXTBOOKS AND TEACHING MATERIALS

One of the most difficult problems in medical education in Latin America is the inaccessibility of a large part of the student body to the books used or recommended as textbooks in schools of medicine. Among the many causes of this situation is the financial inability of a majority of the students to purchase these very costly books. In addition, there are not enough teaching books in the libraries of the medical schools to meet the demand, and there is inadequate utilization of some of the existing ones because many are written in foreign languages or are available only in outmoded editions.

The objectives of this program are to provide textbooks in some 22 courses of medical training at low cost, through cash or credit sales, to a total of about 100,000 students in some 150 schools of medicine in Latin America; to set up a revolving fund which will, after five years, support the textbook program through the use of funds from sales of books, and to revise and structure the training programs for the preparation of doctors in such a way that they will more adequately meet the health problems of Latin America.

AMRO-6100, EDUCATION AND TRAINING IN PUBLIC HEALTH

The purpose of this project is to provide assistance for the training of public health personnel at all levels. Besides support for the various schools of public health, the project will provide technical assistance for the development of undergraduate and postgraduate teaching of preventive and social medicine and its integration with public health. The project gives emphasis to in-service training of professionals and development of research on health problems. Activities related to the Pan American Health University are included in this project.

#### AMRO-6101, HUMAN RESOURCES PROGRAM IN THE CARIBBEAN

The purpose of this project is to strengthen and develop the educational and training systems of human resources for health in relation to the problems and health needs of the population, in quantity as well as quality. Some of the principal objectives are (1) to strengthen the relationship between PAHO and the University of the West Indies and other institutions which train human health resources in the area; (2) to provide technical assistance to all educational and training systems in order to strengthen their administration; (3) to provide technical assistance to the medical schools in the development of postgraduate training programs; (4) to strengthen the teaching of social and preventive medicine and introduce the teaching of social and behavioral sciences into the schools of medicine; (5) to improve the knowledge and understanding of educational methodology among teaching personnel; (6) to develop manpower studies to broaden knowledge on human resources for health and to collect basic data for future projections; (7) to promote investigation of problems of health; and (8) to provide technical assistance in curriculum planning.

## AMRO-6113, TRAINING OF PARAMEDICAL PERSONNEL IN THE CARIBBEAN

In the English-speaking Caribbean region as a whole, the number of doctors per 10,000 population is only 2.87 and dentists much less than one. This insufficiency is accentuated by the maldistribution between urban and rural areas and between hospitals and community health services. However, it is the poor utilization of medical manpower, particularly paramedical manpower, which makes the total situation in the Commonwealth Caribbean countries really critical. With low paramedical densities, the workload of doctors and dentists is excessively high and, as a result, a large percentage of the population is virtually without health care.

In summary, the health manpower problem in this area is characterized by insufficiency, maldistribution, poor utilization, and a high percentage of untrained staff at the vocational and aide levels. Its solution demands a coordinated attack on two fronts — an increase in the output of medically qualified graduates oriented towards community health, and the education and training of large numbers of many categories of paramedical personnel at the professional, vocational, and aide levels. This project has as its main purpose carrying out the latter aspect.

#### AMRO-6200, EDUCATION IN HEALTH SCIENCES

In Latin America there are 150 schools of medicine at various levels of development and with a wide diversity of problems, among which are the following: (1) a lack of health personnel throughout the Region, at the professional as well as the technical and auxiliary levels; lack of a clear definition of health professions to permit the establishment of mechanisms for the delegation of functions to the proper personnel; (3) difficulty in training health personnel in order to adapt them to technical responsibility and administrative situations; (4) the number of people hoping to enroll in medical schools is much larger than their operating capacity; (5) a small number of professors, only a few of whom are full-time and totally dedicated; (6) insufficient preparation of the professorial staff in pedagogical methodology and teaching administration; (7) very rigid courses of study which do not reflect the health needs of the community; (8) a lack of coordination at operative levels with health authorities; (9) little or no contribution to the preparation of non-professional personnel, and isolation in relation to schools in other health profession fields; and (10) very limited scientific research with little relationship to local health problems, and little or no educational research.

The purposes of this project are (1) the creation of a permanent mechanism for defining functions and establishing and regulating models, rules, and standards for planning for human resources in health; (2) creation of a permanent mechanism for forecasting and regulating the demand and supply of health sector personnel; (3) coordination of country projects in this field; (4) development of standards and principles applicable to the solution of the problems which confront medical schools in the Region; (5) the development of structural models and pedagogical methodology which will lead to improved integration of institutions involved in preparation of various types of health personnel; (6) assistance to the schools in the development of adequate procedures for the collection and permanent registry of the statistical information required for the continuing analysis and evaluation of their programs; (7) assistance to the countries in the development of studies on human resources, their formation and utilization; (8) editing of the magazine "Medical Education and Health" and coordination of its distribution to various health teaching institutions, as well as to persons and organizations interested in the subject matter; (9) promotion of an interchange of information and a discussion of subjects related to education in health sciences in various public and private agencies and institutions in the Region which are interested in or participate in programs of assistance to health teaching institutions; and (10) organization of a regional system for the collection and dissemination of information related to the preparation of health personnel in the Region.

# AMRO-6203, MEDICAL EDUCATION (ZONE III)

In the countries of Central America and Panama there is a marked insufficiency of human resources in health, characterized by (1) low rates of professional, technical, and auxiliary personnel per number of inhabitants; (2) disproportionate numbers of various types of personnel; (3) inadequate distribution of health personnel, who are concentrated in urban areas to the detriment of rural sectors; and (4) lack of coordinated teamwork by health personnel. Problem areas in medical and dental training which contribute to the situation include (1) insufficient diversification in the preparation of personnel, maintaining priority for medical and dental training; (2) lack of coordination between the institutions training the personnel and the agencies responsible for the health sector; and (3) inadequate teaching resources, both human and material, in relation to the number of students, which increases progressively.

The purpose of this project is the preparation of health personnel in proper quantity and adequate quality to meet the needs of the health sector in the countries of Zone III, through the provision of undergraduate and postgraduate programs at various levels, directly and closely coordinated with national health plans and socioeconomic development.

AMRO-6204, MEDICAL EDUCATION (ZONE IV)

There are 22 schools of medicine in the countries of Zone IV. The degree of development of the schools varies widely from country to country and sometimes even within the same country. These schools require on-going assistance with problems of medical education at the undergraduate, postgraduate, and continuing education levels. Both the universities and the governments demonstrate great interest in improving their medical education programs and in adapting them to the current needs of the countries. The purposes of this project are to provide assistance in matters related to medical education and to collaborate in improving the programs and methods of medical training at the various levels.

AMRO-6206, MEDICAL EDUCATION (ZONE VI)

There are 16 medical schools in the countries of Zone VI - nine in Argentina, five in Chile, one in Uruguay, and one in Paraguay. In general, the schools in Argentina and Paraguay have a structure based on isolated subjects and utilizing traditional teaching methods. Most of the professors are part-time. Training in preventive and social medicine is underdeveloped in both these countries and also in Uruguay. Several years ago the schools of medicine in Chile undertook a revision of their programs and of their teaching-administrative structure. An example of this is the installation in the University of Chile in Santiago of a departmental system for training in all health careers. It is possible that three or four new medical schools will be opened in Chile in the next few years and that these will have progressively more developed health science programs. The School of Medicine in Uruguay has introduced some changes into its curriculum in the last two years, but there are problems related to the definition of objectives, programming, and training in preventive and social medicine, as well as a lack of human and financial resources to provide an adequate teaching staff. In all the countries there is a broadening of medical education, as well as much interest in modernizing their teaching methods and in training the professional staff in pedagogy.

The purpose of this project is to contribute to the improvement of the teaching programs which has been begun in the schools of medicine in all the countries of the Zone, through revision of their reaching plans, utilization of modern teaching methods, pedagogical training of their professors, and development of training in preventive and social medicine.

AMRO-6208, TEACHING OF STATISTICS IN MEDICAL SCHOOLS

In many countries it is recognized that the teaching of medical statistics and the use of statistical methodology in medical research is an essential part of the medical school curriculum. Often, however, faculty members trained in biostatistics are not available in the schools or in the country. Each year, short courses are provided through this project to faculty members in several countries on subjects such as design and analysis of experiments, statistical inference, non-parametric statistics, operational research, and bioassay. Advisory services are also rendered on the development of courses in medical statistics.

AMRO-6216, BEHAVIORAL SCIENCES IN TRAINING OF HEALTH PERSONNEL

The schools of medicine and other health professions in the Region have begun to show an interest in incorporating into their teaching aspects of human and community behavior towards health problems and their relationship to disease. The majority of schools lack adequately trained personnel to head these programs, as well as adequate methodology to permit their integration into the general plan of studies. In Latin America very little research has been undertaken on behavioral sciences applied to health problems, which makes training in this discipline difficult because of lack of factual information with sufficient validity in the various countries.

The purposes of this project are (1) to collaborate in determining the course content in behavioral sciences for preparation of teachers in the various health professions; (2) to present various alternative methodologies to facilitate training in behavioral sciences in a form integrated with other areas of the curriculum, such as biological and clinical sciences; (3) to contribute to improved training of teachers for multidisciplinary work; (4) to assist schools of health sciences in the organization and development of training programs in health sciences; and (5) to promote and collaborate in the development of research projects in behavioral sciences applied to health problems, particularly in their relationship to teaching.

## AMRO-6221, LIBRARY OF MEDICINE

Latin America is still insufficiently provided with both quantitative and qualitative biomedical information. It lacks adequate human resources and proper orientation to new reference works, literature, and scientific progress abstracts and to modern procedures of obtaining bibliographic information. The growing number of scientific periodicals, and particularly the increasing number of articles published in various fields of the health sciences, can only aggravate the problem. This situation results from the large number of active scientific investigators, whose creative productivity constantly increases. It also derives from the division of knowledge into specialties and subspecialties, and the appearance of interdisciplinary sciences involving scientists and technicians from very distinct fields, such as physics, ecology, engineering, mathematics, biochemistry, electronics, and computer sciences. We do not have precise information on the extent of the shortage of human, institutional, bibliographic, and financial resources in the biomedical libraries of Latin America.

The purposes of this project are (1) to provide health workers in Latin America - professionals, researchers, and teachers alike - with better access to a wider collection of publications on biomedical sciences; (2) to train more personnel in biomedical librarianship; (3) to orient health professionals; and (4) to conduct research on the application of modern methods of scientific communications.

### AMRO-6223, TEACHING BEHAVIORAL SCIENCES

It is well established that the efficiency of doctors and of others in the field of health sciences has benefited enormously from the incorporation into the curricula of the basic principles of social science. Studies on the general characteristics of schools of medicine in Latin America have shown that the introduction of the social sciences into their curricula is quite necessary, on a level with their importance in the solution of medical problems and in research programs. However, there are no existing models at either the undergraduate or postgraduate levels to demonstrate this integration; there has been a minimum of research into the subject; and teaching personnel for such a program are lacking.

The purposes of this project are (1) preparation of teaching materials on the application of social sciences to the solution of medical problems; (2) development of teaching materials; (3) selection of publications and preparation of an anthology to serve as a guide for professors and as a text for students; (4) training of teaching personnel in social sciences, in order to provide for proper teaching of this material at both the undergraduate and postgraduate levels; (5) stimulation of the development of research projects applied to medical problems and related to various sociocultural factors in the Region; and (6) organization of postgraduate courses in social sciences for the training of teachers in the health science professions.

### AMRO-6228, MEDICAL EDUCATION IN THE CARIBBEAN

The Medical School of the University of the West Indies was originally created in 1948 as an offshoot of the University of London, England. Since 1966 the University has been an independent autonomous institution serving the countries of the Commonwealth Caribbean and awarding its own degrees. The need is felt by the University to increase the relevance of its education and training programs to meet the needs of its contributing territories, to develop planned postgraduate training programs, and to introduce modern concepts of professional medical education to its overall operation.

The purpose of this project is to develop a long-range plan for strengthening and expanding the functions of the Medical Faculty of the University of the West Indies to include social and preventive medicine; maternal and child health; nutrition; mental health; basic physical, natural, and behavioral sciences; education and training of nurses; and education and training in other paramedical professions — all in relation to the health needs of the population of the contributing territories.

### AMRO-6233, LATIN AMERICAN CENTER OF EDUCATIONAL TECHNOLOGY FOR HEALTH

The purposes of this project are to increase the efficiency of personnel in the preparation of human resources in the field of health through research and development of new educational methods and models; to adapt the characteristics of the learning process to distinct situations in the countries; and subsequently to prepare instructional materials adequate to the needs. This project will deal primarily with Brazil and will gradually be extended to other countries of the Region providing technical assistance for the improvement of educational methodology, acquisition of equipment, and organization of offices or departments of health aciences education.

This project has now been designated Brazil-6233.

## AMRO-6234, PAN AMERICAN HEALTH UNIVERSITY

The aim of this program of studies and research is to improve, at the postgraduate level, the education and training of professional personnel in the health sciences, having in mind the objectives already approved, the goals established by the Ten-year Health Plan for the Americas, and the health goals of the Member Countries. The program will be implemented through the improvement and strengthening of the mechanisms at the disposal of PAHO. An advisory committee will discuss the conceptual and practical aspects of the plan for the development of the University. The implementation of the program will include the awarding of institutional fellowships and the utilization of the funds assigned to project AMRO-3139, PAHO Research Grant Program.

## AMRO-6300, NURSING EDUCATION

In most of the countries of Latin America there is no clear definition of the levels of personnel needed or of a plan for the preparation of nursing personnel, which results in an inequality between the demand, supply, and utilization of these people. There is an increasing interest on the part of the nursing profession and the health authorities in an evaluative analysis of the present system of preparation of personnel. In the XVIII Pan American Sanitary Conference, the Member Governments approved a resolution on nursing, delegating to PAHO the responsibility for providing the collaboration needed by the countries in order to set up a system of education and nursing service capable of meeting the needs of the health programs.

The purpose of this project is to assist the countries of the Region in analyzing the present system of preparation of nursing personnel and in setting up an educational system which will provide personnel at the various levels required through integrated educational programs having the capacity of producing personnel in the quantity and quality needed for the health programs.

### AMRO-6301, NURSING EDUCATION (ZONE I)

Fifteen (68%) of the 22 basic schools of nursing in Zone I surveyed in 1971 met only partially or not at all the criteria established by the Board of Review. Schools need to reexamine their purpose and objectives in terms of the health needs of the countries and need assistance in formulating and implementing curriculum objectives.

There is a recognized need for clinical and functional postbasic programs for nurses. Countries estimate they will need to prepare 3,319 nurses in postbasic courses (2,268 in clinical and 1,051 in functional) by 1976. Nursing leaders indicate that the greatest need in clinical programs is for midwifery, public health, psychiatric, and pediatric nursing. The greatest need in functional programs is for administration and supervision. Countries in 1971 were conducting 32 programs, annually or biennially, for graduate nurses. Thirty of these were clinical programs and two were functional. The one-year certificate course at the Advanced Nursing Education Unit, UWI, can presently prepare a maximum of 30 nurses in either administration or teaching. Except for a three-week supplementary exposure to psychiatric nursing, no clinical content is offered at present. There is a shortage of qualified personnel in all health services and a need to provide for their education within the Caribbean area.

The objectives of this project are to assist schools of nursing to formulate objectives and to plan for the implementation of curricula designed to meet the health needs of the countries; to initiate and support a 4-6 month regional educational program within an existing institution in the Caribbean area with a curriculum emphasizing concepts and techniques related to maternal and child care and including aspects of administration and supervision as well as relevant nursing topics; to assist countries in developing postbasic and continuing education activities for nursing and midwifery; to continue support for the expansion of the Advanced Nursing Education Unit at the University of the West Indies; and to assist in the development of a regional project for education and training of allied health personnel.

AMRO-6306, NURSING EDUCATION (ZONE VI)

There are presently 20 university-level schools of nursing in the four countries of Zone VI, most of which are staffed with teachers who have some type of training in teaching methodology, but only a few of whom have had courses on planning, structure, and development of curricula. A brief analysis of the plans of study in effect show an accumulation of subjects, frequently included in the programs without previous study to determine if they are really necessary, what their relationship is to other courses, and what their position is in the total scheme. It is evident, moreover, that there is a large disproportion between the number of theoretical and practical hours, with predominance given to the former, as well as an increasing disparity between the plans of study and actual needs of the health services.

The purpose of this project is to develop a three-week workshop for teachers from the four countries of the Zone to orient them in the process of curriculum design. The objectives are an analysis of the role of the nurse, in the light of the health needs of the population, to provide a basis for her professional training; identification of the information needed for planning, structuring, and developing the curriculum; and the development of possible model plans, in accordance with the above.

AMRO-6310, NURSING EDUCATION: TEXTBOOKS

There are approximately 275 schools of nursing in Latin America, 14 schools of obstetrics, and 50 postbasic courses, with an estimated total enrollment of 30,000 students. Among the problems related to programs for the improvement of training is the scarcity of textbooks in Spanish and the high cost of the few that do exist. The purpose of this project is to improve nursing and obstetrical training at the basic and postbasic levels through improvement of curricula, revision of programs, and provision of selected textbooks at a cost which the students can afford.

AMRO-6312, SEMINARS ON NURSING EDUCATION (ZONE I)

Poor utilization of nursing and ancillary personnel is a serious hindrance to safe, efficient health services. Functions of different categories of personnel are not well defined or differentiated from each other. The number of programs for nursing assistants has tripled to 21 since 1965. Programs vary in length (10 to 18 months) and their quality is questionable. There is a need to identify, describe, and differentiate the functions of nursing personnel and to examine the relevance of objectives and curricula of nursing education programs.

#### AMRO-6317, SEMINAR ON NURSING EDUCATION

The constant concern with expansion of nursing services and with improvement of the care provided has motivated the creation of numerous programs at different levels for the preparation of nursing personnel. There are 300 programs for the preparation of nurses: 73 at the university level, 57 at the college level, and 170 at the intermediate level. In the latter, students may be admitted after nine years of schooling into a three-year nursing program, and the other nursing programs require a high school education. The teaching content in programs at the same level varies from school to school, with resultant unevenness in the training of nursing personnel. Recent educational reforms, which created different levels of programs and expanded health services, are demanding a clear definition of functions to be performed by the nurses. It is estimated that in the period 1973-80 about 125,000 nursing personnel should be trained, of whom 93,750 would be at the intermediate level.

The purpose of this project is to prepare a group of nurses through seminars or short courses in the area of educational planning and curriculum construction.

## AMRO-6319, TRAINING OF NURSING AUXILIARIES

The active work force providing nursing services is estimated at 300,000 persons, 79.6% of whom are auxiliaries. Approximately 50% of these personnel lack formal training. It is estimated that by 1980 there should be an increase of 120% over the present number, i.e., an average of 36,000 auxiliaries trained per year.

The purpose of this project is to prepare a group of nurses in teaching, research, and application of new educational technology, so that they can in turn train nurse educators as well as in-service nurses to meet the need for training existing and future auxiliaries.

### AMRO-6320, POSTBASIC COURSES IN NURSING

In Latin America and the Caribbean there exists an undetermined scarcity of personnel prepared for teaching, administration of services, and specialized areas of nursing. This scarcity has resulted in the creation of postbasic courses in various areas (about 50 now in existence) whose requirements for admission vary greatly. The purpose of this project is to cooperate in the improvement of postbasic courses in order to meet the local and regional requirements for the preparation of nursing personnel in both the education and health sectors.

AMRO-6324, TRAINING OF PROFESSORS, ADMINISTRATORS, AND SPECIALISTS IN CLINICAL AREAS

The teaching institutions in Latin America in the last few years have been interested in formulating objectives, modernizing teaching, and increasing the productivity of their different programs. One of the major obstacles to making the changes required is the scarcity of teaching resources, both in the academic area and in the services. Existing programs for the preparation of teaching personnel and nursing specialists are inadequate to meet the need. The countries of the Region do not have sufficient resources to establish in each country a center for training teachers and specialists in the various fields.

The purpose of this project is the establishment of a regional center for preparing teachers and specialists in the various nursing areas, utilizing existing resources of the countries, improving these, and creating new sources in priority and deficient areas.

### AMRO-6325, EDUCATIONAL TECHNOLOGY IN NURSING

There are two basic aspects to the problem confronting nursing education in Latin America: (1) the necessity for a rapid increase in the production of personnel, and (2) the need to adapt teaching programs to the present and future requirements of the health services. The goal for the present decade is to have 4.5 nurses and 13.5 nursing auxiliaries per 10,000 population. To meet this goal would require the preparation of about 700,000 members of the nursing profession in the decade, and this would mean increasing the present capacity for training from 10 to 20 times. The present low productivity of the training programs is principally due to scarce human, material, and financial resources, which impedes the utilization of new educational technology.

The purpose of this project is to increase the return from present teaching programs, searching for the maximum efficiency in order to meet the goals of the Ten-year Health Plam at as low a cost as possible, while maintaining a reasonable quality in training. This will be done through training teaching personnel in the use of new educational technology, through improving plans of study and teaching methodology, through use of educational models and audiovisual aids, and through experimentation in new educational foci and development of new systems of evaluation.

### AMRO-6400, ENVIRONMENTAL SCIENCES

Expanded continental programs in environmental health in the Americas in the decade of the 70's require increased technical manpower in number and types vastly superior to what is now available. The countries have manifested their interest

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975

in programs of manpower development. This project aims to: (a) strengthen schools of engineering and public health; (b) establish a continental system of continuing professional education and a system for the training of allied personnel; and (c) stimulate a program of mission-oriented research.

In the last five years more than 310 training activities have been organized with nearly 10,000 participants. An average of 18 projects on research have been maintained. It is expected that this rate will be maintained and expanded during 1973, 1974 and 1975.

AMRO-6401, SANITARY ENGINEERING EDUCATION (ZONE I)

Population growth, urbanization, industrialization, the rapid development of technology, and increasing demands for an improved standard of living in Zone I, have created unprecedented environmental changes and a whole new range of environmental problems. However, the acute lack of trained and experienced personnel to plan, implement, and operate national environmental health programs is a major difficulty in introducing programs to the West Indies. The purposes of this project are to develop specialized training activities in the field of environmental health in order to provide a sufficient number of trained professionals and technicians actively working in the environmental health programs of the countries of the Zone.

AMRO-6414, STUDY GROUP ON PROCESS OF TRANSFER OF TECHNOLOGY

The countries of the Americas are changing from a dominantly handcraft, decentralized, agrarian society to a closely-linked industrialized society. In the developing process, new technological breakthrough must undergo a process of transfer to be incorporated into social institutions, which must simultaneously undergo a process of change. It would be wrong to simply transplant technological innovations from the developed nations into a "hostile" technical and social environment without taking steps to make this environment receptive to the otherwise totally extraneous influence. Transfer of technology in the area of sanitary engineering suffers from the same problem.

The purpose of this project is to study the mechanics of the process of transfer of technology and to analyze ways and means to make this transfer less painful in terms of time and money lost to the developing nations in the area of sanitary empineering.

### AMRO-6500, VETERINARY MEDICINE EDUCATION

In recent years, schools of veterinary medicine in some countries have been assisted in the reorganization of their curricula to incorporate courses on public health or preventive medicine. Progress has been aided by four regional seminars, which were attended by professors and deans representing the schools of the Americas, and a permanent coordinating committee.

FUND	1972 1973 1974 1975	FUND	1972	1973	1974	1975
						_

The purpose of this project is to assist in improving veterinary medical education through direct technical assistance to veterinary medical schools in the Hemisphere, in the review of their teaching programs (especially in preventive medicine and epidemiology), in further training of professors through programs of continuing education, and through provision of teaching aids.

The recommendations of the II Seminar on Veterinary Medical Education held in 1972 call for broad changes in veterinary medical education in Latin America for the coming decade. Implementation of these recommendations will require considerable amplification of administrative and technical assistance if the needs for veterinary manpower are to be achieved through the country programs to control diseases of human and animal health significance.

### AMRO-6600, DENTAL EDUCATION

Most countries in the Region, apart from the Guianas and certain countries in the Caribbean, have dental training institutions. The level of education in these institutions varies, and, although the professional personnel developed have certain community understanding, following three PAHO international seminars on dental education, these concepts are only beginning to be applied. Equipment and facilities are inadequate, both in terms of function and number, and there is a lack of teaching personnel to develop the necessary dental manpower. School education programs are in need of curriculum revisions, incorporation of modern concepts of teaching methodology, and educational materials (including books and audiovisual aids). There is an immediate need for improved organization and administration of dental schools and the improvement of programs for the training of auxiliary personnel. Libraries handling materials for dental schools are in general poorly organized, and there is a shortage of dental librarians.

The purpose of this project is to assist the dental schools in Latin America to review curricula, administration, and physical facilities and to develop new dental schools and continuing education programs, as well as to produce and make available educational materials, programs, and techniques appropriate to the needs of dental education in Latin America.

AMRO-6608, TRAINING OF AUXILIARY DENTAL PERSONNEL

There is inadequate dental manpower in Latin America to attend to the dental needs of the population. The manpower that does exist is not fully productive in terms of modern concepts in dentistry and is poorly distributed between urban and rural areas. Concepts in the use of auxiliary personnel have not been applied effectively, and in total there are only 16,000 dental auxiliaries identified in Latin America. There are no regular courses for dental auxiliaries in dental schools, and no literature is available in Spanish for the training of such personnel.

The purpose of this project is to cooperate in increasing the auxiliary-to-dentist ratio from 1':3 to 2:3 in a period of five years, and in training dental auxiliary educators from each country, who will subsequently establish national dental auxiliary training programs in their own countries.

### AMRO-6700, BIOSTATISTICS EDUCATION

The only health statistics course currently being given in Spanish in the Region is one in biostatistics at the School of Public Health in Chile. There is a great deficiency throughout the Region of professional-level personnel to provide leadership in the improvement of health statistics. The School of Public Health at São Paulo is planning a course in 1973 which will include various specialized aspects of the subject to be taught by short-term consultants; technical advice has already been provided for this course. The objective is the training of a minimum of 350 professional health statisticians within the decade, although even this number would not meet all of the needs. In order to reach this objective, additional courses must be established. There should also be more flexibility in existing courses, adapting curricula to the requirements of the countries.

## AMRO-6707, LATIN AMERICAN CENTER FOR CLASSIFICATION OF DISEASES

The Latin American Center for Classification of Diseases in Caracas, Venezuela, serves as the reference center of WHO for the study of problems in the use of the International Classification of Diseases in Spanish. Teaching materials and manuals are prepared, courses are provided in countries of the Region, and research is carried out on the classification of causes of mortality and morbidity. The Regional Office and the Center coordinate their classification activities in Latin America.

In 1972 a study group met to review proposals received from within the Region and from other Regions of WHO for the Ninth Revision of the International Classification of Diseases. Based on the recommendations of the group, a regional proposal

FUND 1972 1973 1974 1975	FUND	1972	1973	1974	1975
		<i>-</i>			
		4	4		

was developed for changes to be introduced into the Ninth Revision. Research on multiple conditions of morbidity and mortality based on hospital records and death certificates has been carried out in six countries. In 1974-75, activities will center around the preparation of the Ninth Revision in Spanish and Portuguese.

#### AMRO-6708, TRAINING PROGRAM IN HOSPITAL STATISTICS

Through this project, advisory services are provided to schools of public health and ministries of health in developing professional-, intermediate-, and auxiliary-level training in medical records and hospital statistics. Efficient hospital administration and patient care require good medical records and statistics. Hospital records are also the principal source of information on morbidity in a population. Training of personnel for medical records systems and orientation of medical students and hospital administrators on their roles in attaining good medical records and in utilizing the information is a large task for Latin America, which has 14,000 hospitals of varying size and complexity.

Five intermediate-level courses provide training for around 150 students each year, and auxiliary-level courses are reaching close to 1,000 persons. In the coming years, the goals are to train a minimum of three to four times as many. In addition, professional-level courses need to be developed for medical records personnel who serve in teaching institutions, in national health services, and in university hospitals. A new course at this level was recently initiated in Argentina and the development of two others will be fostered.

# AMRO-6712, CONTINUING EDUCATION FOR STATISTICIANS OF NATIONAL HEALTH SERVICES

The small number of statisticans in the health services with training in biostatistics, their heterogeneous educational background, and the need for sound knowledge of statistical methodology in introducing changes into statistical systems, in analyzing data, and in initiating research, has led to a proposal for a program of continuing training.

At a regional meeting in 1972 on the role of statisticians in family health programs, all the participants (one from each national health service) stressed the value of annual meetings dealing with selected areas of work. When queried about literature and reports available to them, it was clear that many were not receiving current information or keeping abreast of developments in health programs, epidemiology, health statistics, and the like.

It is proposed to hold meetings of statisticians from national health services. In addition, a few selected books will be obtained for the health statistics unit in each country and papers and reports will be widely distributed.

<sup>\*</sup>REGULAR BUDGET

<sup>&</sup>lt;sup>a</sup>In order to avoid a cumbersome and divided presentation of the field program, the projects and portions of projects to be financed under this part are included with all the other field projects presented in Part III under the respective country and intercountry headings, where they are identified by footnotes. Since these projects are included in the country and Zone summaries, the numbers marked in these tables are "non-add" figures. See the narrative portion of the "detail" section below for a further explanation of the Special Fund for Health Promotion.

#### PART IV: SPECIAL FUND FOR HEALTH PROMOTION - DETAIL

The Special Fund for Health Promotion is based on an agreement with the W. K. Kellogg Foundation under which the Foundation agreed to lend to the Pan American Health Organization the sum of \$5,000,000 to be used toward erecting a headquarters building for the Pan American Health Organization, Regional Office for the Americas of the World Health Organization. This loan is repayable in annual installments, as agreed, beginning in 1962 and to be repaid in full on or before 1 January 1982, without interest. Instead of being made to the Foundation, however, these annual payments are allocated to a Special Fund for Health Promotion to finance expanded program activities. In view of the nature of this allocation, it is understood that the remaining items of the budget will cover and not reduce regular program activities.

PAHO is required to use the Fund to expand activities relating to (1) community water supplies; (2) nutrition; and (3) educational and training activities, including fellowships, although PAHO may from time to time revise these expanded activities by approval by the Directing Council or the Conference and give notice thereof to the Foundation.

Listed below are all projects comprising the Special Fund, details of which may be found by reference to the index of projects. Individual projects are footnoted throughout this document.

# DETAIL

The XI Directing Council (1959) established a policy for the Working Capital Fund by deciding in Resolution VII "to approve the assignment of a portion of the budget for gradually increasing the Working Capital Fund until the authorized level has been reached, and for maintaining the Fund at that level." Based on a study of requirements over a five-year period and taking into account the fact that the financial year of some major contributors begins in July, it was recommended in the Financial Report of the Director for 1966 (OD 75) that in the future the amount budgeted for the Working Capital Fund be established with a view to attaining a level of 40% of the budget. Accordingly, provision is made for \$450,000 in 1974 and \$550,000 in 1975.

PART VI: FOOT-AND-MOUTH DISEASE - DETAIL

BRAZIL-0800, FOOT-AND-MOUTH DISEASE CONTROL

Brazil has a national campaign to control foot-and-mouth disease, assisted by a loan from the Inter-American Development Bank. The Pan American Foot-and-Mouth Disease Center helps to coordinate the activities of this campaign. In addition, a permanent consultant is stationed in Porto Alêgre, Rio Grande do Sul, to collaborate with the Ministry of Agriculture in the operation of a demonstration area for animal health programs planning. This area is a cooperative effort between AMRO-0700, the Ministry of Agriculture of Rio Grande do Sul, and the Pan American Foot-and-Mouth Disease Center.

COLOMBIA-0800, FOOT-AND-MOUTH DISEASE CONTROL

Colombia is a major cattle-producing country with a high prevalence of foot-and-mouth disease and it is adjacent to a foot-and-mouth disease-free country. Colombia is starting a national campaign to control foot-and-mouth disease and brucellosis with a loan from the Inter-American Development Bank. The purpose of this project is to provide a permanent consultant with technical capability to assist this campaign, and to coordinate activities with the Pan American Foot-and-Mouth Disease Center.

PANAMA-0800, FOOT-AND-MOUTH DISEASE CONTROL

Panama is a foot-and-mouth disease-free country adjacent to a foot-and-mouth disease-affected country. Completion of the Pan-American Highway is scheduled to connect this country with Colombia. The purpose of this project is to provide the services of a permanent consultant to Panama and the Organismo Internacional Regional de Sanidad Agropecuaria. This consultant will provide technical assistance to the disease-free countries north of Panama and in the Caribbean area.

## AMRO-0800, PAN AMERICAN FOOT-AND-MOUTH DISEASE CENTER

Foot-and-mouth disease is the most important animal disease in the countries it affects and is a constant hazard to countries free of the disease. It is one of the most infectious and easily transmitted diseases of animals and will infect cattle, sheep, swine, and goats. It also possesses a multiplicity of viral agents, each antigenically different. In addition to creating severe economic losses for the countries, it interferes with trade in animals and animal products on the world market. Accordingly, it is considered a "political disease."

In recent years it has been clearly brought to the attention of governmental authorities in the countries that the social, economic, and agricultural development of the countries is seriously impaired by the presence of the disease. National and multinational programs to combat the disease have been developed by the countries as a procedure to stem the economic losses and hopefully to place animal products into the free trade of the world market. External financing is being provided by international lending agencies to give financial support to the national programs for controlling the disease. Veterinary medical service units have been established within the ministries of agriculture of the countries to prepare, direct, coordinate, and carry out the control programs.

The Pan American Foot-and-Mouth Disease Center, located in Rio de Janeiro, Brazil, is a cooperative project between PAHO and the Government of Brazil and provides knowledge, technology, and technical assistance to the agricultural authorities of the countries in the fight to control this disease. The Center has been totally integrated into the programs of PAHO since 1968, and its financing results from a system of assessments to Member Countries according to recommendations and resolutions adopted by the Directing Council of PAHO. The Center has three principal categories of activities: technical assistance; research, diagnosis, and reference; and training and information. The field advisory services of technical

assistance operate through the staff of the Center and area consultants in the different countries. The technical council of the Center, made up of the Ministers of Agriculture of the Hemisphere, meets annually at the Inter-American Meeting on Foot-and-Mouth Disease and Zoonoses Control and reviews the budget and program of activities of the Center. The Ministers of Agriculture adopt a resolution recommending that the Directing Council of PAHO approve the budget as reviewed. They also discuss and establish certain lines of activity pertaining to the control of foot-and-mouth disease and make recommendations concurring with the program of activities of the Center, which is developed in line with the four-year projections of the countries for controlling the disease. The quadrennial projections of the Center are developed in a similar manner.

The technical assistance activities of the Center are oriented toward helping each country according to the status of the disease in the country, the national programs to control it, and the profile which has been developed for that country. The profile is a report based on the measurement of the capability of the country, including available financial and human resources, to conduct a control program.

Research, diagnosis, and reference activities of the Center are directed principally toward vaccine development, identification of genetic markers of foot-and-mouth disease virus for the purpose of differentiating between virulent and attenuated strains, and a search to determine the role played by the carrier animal in the epidemiology and pathogenesis of the disease.

The training and information activities of the Center are developed principally around international and national courses and seminars for training personnel in the diagnosis, epidemiology, planning, and evaluation of control programs, and in quality control of vaccine production. The level and quantity of training given to a country is determined largely by the analysis of the profiles of that country, which reveal exactly where training activities should be concentrated. Under the guidance of the training section, the Center publishes a periodical containing reports of major interest to the scientists of the countries. In collaboration with the technical assistance branch, the training branch also publishes the Epidemiologic Report on Foot-and-Mouth Disease and Vesicular Stomatitis.

The program of activities of the Center is reviewed annually by a Scientific Advisory Committee, which in turn recommends to the Director of PASB the direction to be taken on future activities.

FUND 1972 1973 1974 1975 FUND 1972 1973 1974 1975

AMRO-0806, VACCINE PRODUCTION PLANT

The purposes of this project are to provide intensive training in the techniques of industrial production and control of vaccines against foot-and-mouth disease for professionals from the Pan American Foot-and-Mouth Disease Center, from private establishments in Brazil, and from other countries, and to adapt to industrial production new types of vaccines that demonstrate better immunity, with the goal of obtaining a more efficient and economical product.

#### ANNEX 1

#### METHOD OF PREPARATION

#### Form of Presentation

#### General

The proposed program and budget estimates contained in this document are presented in the same manner as those of the previous budget document, including the latest actual year, as well as an attribution of services from intercountry projects to the various Member Governments.

In accordance with Resolution VII of the XVIII Meeting of the Directing Council concerning the Tax Equalization Fund, provision is made for the sum of \$3,329,725 in 1974. This amount represents the difference between the estimated 1974 gross and net salary costs. While the amount of \$3,329,725 is included in the proposed appropriation resolution, it is not included in the body of the budget presentation since it does not affect the total program proposed. The PAHO Regular program in this document is based only upon the effective working budget of \$21,522,310, which includes \$250,000 in miscellaneous income.

In general, the material is self-explanatory. However, some elaboration may be helpful with respect to the portion of the document entitled "Detailed Schedules."

#### Detailed Schedules

All the schedules include narrative explanations, actual expenditures for 1972, and the estimates for a three-year period. The first schedule is for "All Parts - All Funds" and facilitates study of the entire budget in summary form by part and source of fund. The following schedules, starting with Part I, present detailed estimates for each activity. A summary for each part precedes the details.

For Part III of the budget, the presentation is made by section. In Section 1, the Zone Offices are presented together; Section 2 covers Editorial Services and Publications. In Section 3 will be found the country projects, after which is an attribution of services from intercountry projects to the particular country. After the Zones, there are presented the schedules for country projects administered by the Washington Office and for the intercountry programs.

Part IV is devoted to the Special Fund for Health Promotion. In order to avoid division of the field program, the projects falling under Part IV are presented with the other field projects in Part III, under the respective country and intercountry headings, and are identified by footnotes. Part IV also includes a schedule giving a list and estimated costs of all projects to be financed under this fund.

In Part V, Increase to Assets, the amount for increasing the Working Capital Fund is presented in accordance with a decision of the XI Directing Council (Resolution VII). In Part VI, the estimates for Foot-and-Mouth Disease are presented.

#### Method of Computation

All estimates are expressed in U.S. dollars.

For the year 1973, the latest allotment analyses prior to publication of this document serve as a basis for the estimates.

The situation as of 1 March 1973 has been used for projecting salaries and common staff costs for all established positions of the budget for the years 1973, 1974, and 1975. Posts are costed for the full year except for:

- A) New posts, which are costed from 1 May of the year in which they are budgeted; and
- B) Vacant posts, which are costed from the dates they are expected to be filled.

A simplified system of averages has been used for costing of posts financed from PAHO funds. The averages, including all entitlements, were developed to provide figures for filled or vacant posts in the Washington Office or in field activities, by grade of post. The averages are based on the actual total cost of all posts; the estimated cost of a particular office or project may be slightly above or below the actual cost, depending upon the length of service, number of dependents, and other pertinent cost factors of staff members employed in such project or office. This small difference would not affect planning of individual activities or analysis of the budget according to subject groups, since the total budget estimate for personnel costs is the same as under the previous system of detailed costing. The average system has not been applied to posts funded by WHO; these posts are costed on a uniform system in all Regions. Under the WHO system, filled posts are costed individually on the basis of actual entitlements of the incumbent.

#### ANNEX 1 - METHOD OF PREPARATION . . . continued

Estimates for elements other than personnel are based on program requirements as planned.

Potential savings which may accrue from staff turnover and lapse in refilling vacant posts during the actual operating year are not reflected in the budget since any such savings are used for replacement costs, temporary personnel, increments for language proficiency, additional dependents' allowances, education grants, and other factors for which no provision is made in the budget.

The entitlements referred to above include pension, staff insurance, post adjustment, assignment allowance, service benefit, repatriation grant, dependents' allowance, recruitment costs, and home leave travel.
