REPORTED CASES OF NOTIFIABLE DISEASES IN THE AMERICAS

1961

**PAN AMERICAN HEALTH ORGANIZATION
Pan American Sanitary Bureau, Regional Office of the
WORLD HEALTH ORGANIZATION
Washington, D. C.**

FOREWORD

Measurement of accomplishments in health programs requires collection and study of vital and health statistics. The official reports of cases of notifiable diseases are the source of valuable data for knowledge of the success of programs of control or eradication of communicable diseases. These reports serve to notify local, national and international agencies of the progress toward goals.

This report of notifiable diseases in the Americas for 1961 is the first annual publication in this series. It is hoped that these publications will serve as an annual measurement of progress. However, the more timely their release the greater will be their value to health officials. Efforts will be directed toward prompt publication of data provided by the Health Services.

I wish to express my appreciation for the continued cooperation of the Ministries of Health in the provision of the basic data for these reports.

Abraham Horwitz
Director

INTRODUCTION

Statistics of notifiable diseases are indispensable in all phases of programs for control or eradication of these diseases, not only locally and nationally, but also internationally. Current international exchange of information regarding communicable diseases in the Americas has been progressing year by year. The procedures for the reporting of diseases in accordance with the *International Sanitary Regulations* (1) and the *Pan American Sanitary Code* (2) are described in the *Guide for the Reporting of Communicable Diseases in the Americas* (3).

This publication for 1961 is the first annual one on reported cases of notifiable diseases in the Americas. Three previous issues of this publication have contained data for the years 1946-1955, 1949-1958, and 1959-1960 (4). The present report is based mainly on annual summaries received from the health authorities of the countries in response to a joint request for data from the Pan American Health Organization and Headquarters of the World Health Organization. In the few instances in which it was not possible to obtain a final annual summary for 1961, provisional figures received through

monthly reporting procedures have been used. The national systems for reporting of cases of notifiable diseases differ in the diseases included, in operating procedures, and in the degree of completeness of reporting. The quarantinable diseases, namely cholera, plague, louse-borne relapsing fever, smallpox, louse-borne typhus, and yellow fever, are notifiable by international agreement. Other diseases to be notified in a country are determined by national laws or regulations.

Since data on deaths are essential to an understanding of the epidemiology of these diseases, they are also included in this report whenever available. However, these data obtained from death registration systems are not available as promptly as case reports and thus have not been included for all countries for 1961. For a few countries information provided on deaths may apply to a larger area than that on reported cases.

The Veterinary Services of the Ministries of Health or of Agriculture have contributed to the information on cases of zoonoses in animals.

ORGANIZATION OF REPORT

The report has seven main tables which present the available data for each country or territory in the Region of the Americas. In Tables I and II are shown

the total numbers of reported cases of notifiable diseases with rates per 100,000 population. For comparison the corresponding numbers reported for 1960 and the me-

(1) *International Sanitary Regulations*, Second Annotated Edition, WHO, 1961

(3) *Guide for the Reporting of Communicable Diseases in the Americas*, PASB Misc. Publ. No. 6 (Rev.) 1955

(4) *Reported Cases of Notifiable Diseases in the Americas, 1946-1955*, PASB Sc. Publ. No. 38

Reported Cases of Notifiable Diseases in the Americas, 1949-1958, PASB Sc. Publ. No. 48

Reported Cases of Notifiable Diseases in the Americas, 1959-1960, PASB Sc. Publ. No. 58

dians for the five-year period 1956-1960 are given. When data are not available for every year of this period, medians are based on fewer years in the period, that is, on either four or three years.

This report is the first of the series to include for selected diseases data on reported cases by month, and these appear in Table III. In Table IV are shown the age distributions of reported cases of some diseases. In a few countries these data by age are available for some of the major political divisions but not for all and thus the number of cases with ages not stated is large. The occurrence of the quarantinable diseases and of leprosy, malaria and yaws is presented by major political divisions of each country in Table V. Data on cases of zoonoses in animals and man are contained in Table VI. A new table in the report, Table VII, includes data on deaths from notifiable diseases in 1961.

Two appendix tables provide population figures for the countries and territories of the Americas in 1961. The estimates in Appendix Table A are based on published figures of the United Nations. Table B gives estimated populations of re-

porting areas in six countries, as provided by the national health authorities.

The Introduction contains a short analysis of the occurrence of selected diseases in the Region. Summary tables, 1-12 and Figures 1-16 illustrate the discussion. In several parts of this Introduction data are presented for the purpose of comparison for three regions of the Americas, Northern, Middle and South. Northern America includes Canada, the United States, Bermuda and St. Pierre and Miquelon. Middle America consists of Mexico, Central America, Panama and the Caribbean republics and islands. All countries and territories of South America and the Falkland Islands make up the third region. This division into three regions is in accordance with that of the United Nations, with the exclusion of Greenland which is a part of the European Region of WHO.

In each part of the report the diseases are arranged in alphabetical order. The category number of the International Classification of Diseases is shown in parenthesis after the name of each disease. However, in the previous reports diseases were ordered by these category numbers.

COMPLETENESS OF REPORTING

Interpretation of data on reported cases of diseases requires an understanding of local and national programs. Not only is comparison of data from different countries difficult but also the evaluation of trends of diseases in a single country over a period of years is complicated because of reporting problems. Changes in numbers of reported cases may be produced by intensified case finding activities or variations in criteria for diagnosis as well as in control of the disease. Procedures and coverage of the reporting system vary widely among countries. Large variations also exist in the distribution of medical personnel and diagnostic facilities not only within the Region but also within countries.

In many countries and territories data on diseases such as malaria, leprosy and yaws may be supplied by special health services responsible for their control or eradication. Malaria is an excellent example of the effect of an intensified program on improvement of case reporting with increases in cases in the early phases of the eradication program through the extension of case finding and examination of slides.

For some diseases underreporting is clearly evident from a simple comparison of the numbers of reported cases and registered deaths. Sometimes more deaths than cases are reported, especially for diseases with a high case fatality such as tetanus. For other diseases an unusually

high case fatality may point to the degree of underreporting.

For most countries of the Americas cases are reported for the entire area. In a few, coverage of the reporting system is limited to localities with health services or to selected communities. Estimates of populations in these reporting areas in the six following countries are given in Appendix Table B.

Brazil - Four diseases (leprosy, malaria, plague and yellow fever) are reported to special national health services and the data pertain to the entire country. The area for which reports of other notifiable diseases are included is limited in this publication to the State of Guanabara and the capitals of other states.

Colombia - The reporting area is that in which health services are available and includes 95 per cent of the population of the country.

El Salvador - The reporting area has been increasing and represents 59 per cent of the population in 1961 as compared with 56 per cent in 1960.

Paraguay - Districts with full time health officers make up the reporting area in Paraguay which in 1961 included about 60 per cent of the population of the country.

Peru - Only districts reporting for every month of the year make up the reporting area in Peru in 1961. In preceding years districts were also included which submitted reports for a smaller number of months. The change in 1961 resulted in a decrease in the proportion of population included in the reporting area from 52 per cent in 1960 to 47 per cent in 1961. However, national publications also contain data on total reported cases in the entire country for both 1960 and 1961.

Venezuela - In this country reports of the quarantinable diseases, malaria and rabies are made for the entire country. For other diseases the reporting area covers 67 per cent of the population in 1961, an increase from 66 per cent in 1960. Data on the age distribution of reported cases are available only for the Organized Reporting Area, which includes 45 per cent of the population of the country.

QUARANTINABLE DISEASES

By international agreement all cases of the six quarantinable diseases in the Americas - namely, cholera, plague, louse-borne relapsing fever, smallpox, louse-borne typhus and yellow fever - are to be reported to the Pan American Sanitary Bureau in Washington and to Headquarters of the World Health Organization in Geneva.

Five of the six quarantinable diseases occur in the Region; cholera has not been present for many years. In Table I is summarized the total number of cases of each quarantinable disease reported in the Americas in the last ten years. The decreases in smallpox and typhus over the decade are readily evident. The other three diseases show considerable annual variation and no definite trend in frequency in the period. However, in 1952 and in the few

1960	258	4	5 158	668	34
1961	308	1	3 278	474	82

(a) In 1952 and 1953 cases of murine and unspecified typhus were included in Chile and a few cases in Guatemala in 1952-1958

years immediately preceding, 1949-1951, the number of yellow fever cases had been elevated. From the data in the table, reports of plague appear to increase in 1960 and 1961 and this trend has continued into 1962 and 1963.

The distribution of the reported cases

by country is shown in Table 2 for 1960 and 1961. Discussion of the diseases, excluding relapsing fever, appears separately under the specific disease headings. Louse-borne relapsing fever occurs only sporadically in the Americas with 4 cases reported in Colombia in 1960 and a single case in Peru in 1961.

DIPHTHERIA

Of 16,126 cases of diphtheria reported in 1961 in the Americas, 76 per cent were from South America, 20 per cent from Middle America and 4 per cent from Northern America. For the three regions, reported cases per 100,000 population, based on selected countries for which data on both cases and deaths were available, ranged from 0.4 for Northern America to 4.9 for Middle America and 15.5 for South America (Table 3). In seven countries rates were

over 10 per 100,000 population and reached as high as 35. In Northern America the number of cases continued to decrease but in general in the other two regions the numbers of reported cases remain at approximately the same level as in preceding years. However, in all three regions in one or more countries, increases have been noted in recent years with the number of cases of diphtheria in 1961 larger than in the few years just previous.

Table 3. Reported Cases and Deaths from Diphtheria with Rates per 100,000 Population in the Three Regions of the Americas, 1961

Region	Cases		Deaths		Reported cases per death(a)
	Number	Rate	Number	Rate	
Northern America	710	0.4	73	0.0	10
Middle America	837	4.9	244	1.4	4
South America	4415	15.5	830	2.6	6

Note: Data refer to 2 countries in Northern America, 7 countries and 3 other areas in Middle America, and 4 countries and 1 other area in South America.

(a) Ratios based on rates since areas of notification and death registration differed in 4 countries.

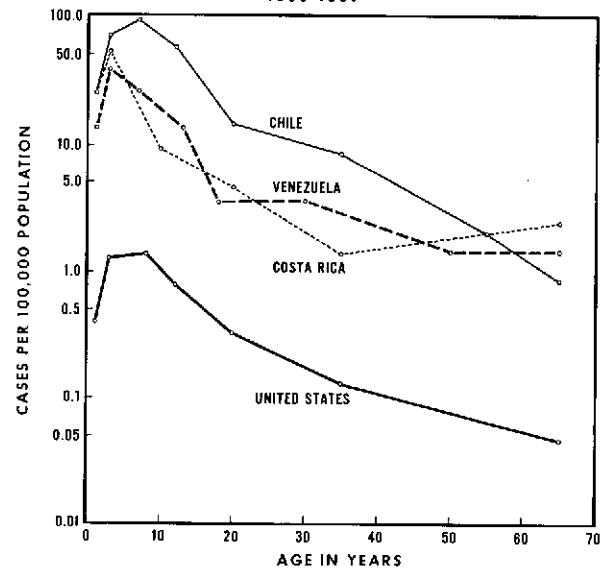

In Figure 1, average annual reported case rates by age are shown for four countries for the period 1959-1961. The highest morbidity rates in these countries are either between 1-4 years of age as in Venezuela or between 5-9 years as for Chile and the United States. Data for Costa Rica although grouped differently by age also suggest that the peak morbidity is in the age group 1-4 years. Diphtheria occurs in all age groups and in the three Latin American countries morbidity remains at higher levels throughout life than in the United States.

Variations in mortality similar to

those for morbidity (Table 3) are observed among the three regions with rates ranging from 0.04 per 100,000 population in Northern America to 1.4 in Middle and 2.6 in South America. For every death registered in Northern America 10 cases were reported while in Middle and South America the corresponding numbers were 4 and 6 respectively. These differences probably reflect both the more serious outcome of the disease in Latin America and also the effect of underreporting of cases. The importance of extending immunization programs for diphtheria is emphasized by these excessive morbidity and mortality rates still recorded in Latin America and by the increased number of cases reported in a few countries.

Figure 1

AVERAGE ANNUAL REPORTED CASES OF DIPHTHERIA PER 100,000 POPULATION BY AGE, IN FOUR COUNTRIES OF THE AMERICAS, 1959-1961

INFECTIOUS HEPATITIS

Infectious hepatitis was reported in 1961 in half of the American countries. In the remainder, the disease was either not notifiable or data were not available on its occurrence. Rates per 100,000 population ranged from 1.1 in Chile where infectious hepatitis was reportable in 1961 for the first time to 67.8 in Canada. In four countries the number of reported cases per 100,000 population was over 30.

For a few countries there exist sufficient series of data to show the epidemicity of the disease despite the fact that it has been on lists of notifiable diseases for only a short period of time (Table 4). Similar patterns emerge for both the United States and Canada with a peak in both countries in 1954 followed by a low frequency in 1956 or 1957 and a sharp increase thereafter to the highest values in 1961. In the United States each

year there is a seasonal increase in occurrence during the winter and early spring months. In the countries in Middle and South America the numbers of reported cases continue in general to grow but epidemic or unusual frequencies are also observed as for example in Costa Rica, Jamaica and Mexico.

In Figure 2 are presented the annual reported cases of infectious hepatitis per 100,000 population by age in the period 1959-1961 in three selected countries. In the United States the rate is highest in the age group of 5-14 years and falls off steadily with increasing age. In contrast, in Costa Rica the highest reported case rate is in the age group under 5 years and from age 15 years on remains fairly constant. On the other hand for Peru a third type of curve exists with two high periods, the first under five years of age and the second, the higher, in the age group 25-39 years. The lowest rate occurs among children of 10-14 years. In both Costa Rica and Peru cases are reported far more frequently above 45 years of age than in the United States. Further study of these differences is

needed in relation to sources of infection, modes of transmission and criteria for diagnosis.

Figure 2
AVERAGE ANNUAL REPORTED CASES OF INFECTIOUS HEPATITIS PER 100,000 POPULATION BY AGE, IN THREE COUNTRIES, 1959-1961

LEPROSY

Each year leprosy is reported from almost all countries or other areas of the Americas. The total number of newly reported cases in the Americas for 1961 was 9,172 of which 93 per cent were in South America. The number of reported cases has remained each year close to 10,000 and it is estimated that there are over 200,000 patients with leprosy in the Americas. Surveys undertaken to measure the magnitude and extent of the problem have resulted in an increase in the numbers of reported cases in some areas.

In Table 5 is shown the distribution of the reported cases by region in the five-year period 1957-1961. In Figure 3 reported cases per 100,000 population are given by major political divisions of each country for 1961.

Table 5. Reported Cases of Leprosy in the Three Regions of the Americas, 1957-1961

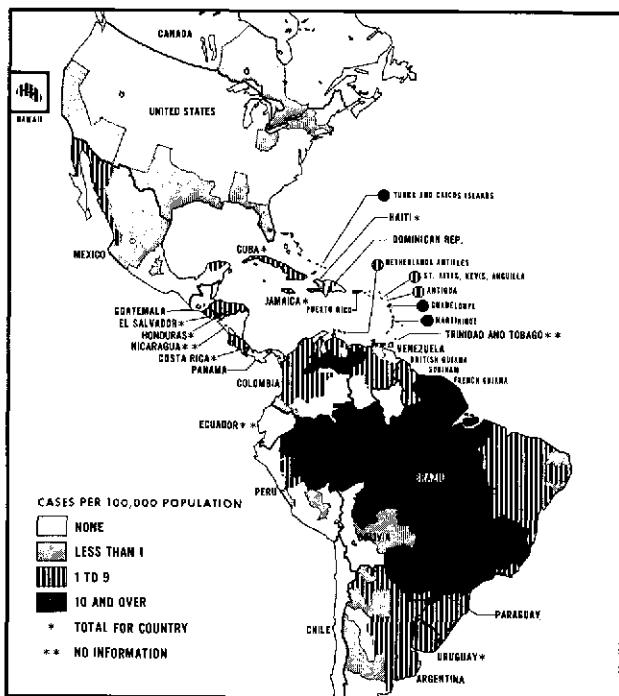

Year	Total	Northern America	Middle America	South America
1957	10 304	52	569	9 683
1958	9 626	59	486	9 081
1959	10 230	50	692	9 488
1960	9 567	56	742	8 769
1961	9 172	64	598	8 510

Note: Excluding Ecuador in 1957-1961, Nicaragua and Trinidad and Tobago in 1961, and other areas for which data were not available in certain years.

As in previous years rates were highest, over 10 per 100,000 population, in the central and western states of Brazil extending into most of Paraguay, northern Argentina, bordering departments in Peru and into French Guiana and Surinam. In addition, in several states of Venezuela and a small area of Colombia rates were also over 10 per 100,000. In the Caribbean area case rates were high in Guadeloupe, Martinique and San Cristobal Province of the Dominican Republic.

Figure 3

REPORTED CASES OF LEPROSY PER 100,000 POPULATION BY MAJOR POLITICAL DIVISIONS OF EACH COUNTRY IN THE AMERICAS, 1961

In most of the remaining states of Brazil 1 to 9 cases were reported per 100,000 population. Similarly reported rates were in this group in Uruguay and the northern and northeastern provinces of Argentina, many areas of Colombia and Venezuela and in British Guiana. In Middle America areas with rates between 1 and 9 per 100,000 included Costa Rica, Honduras, El Salvador, northwestern Mexico, Cuba and Jamaica.

In the United States 63 cases were reported in 1961 from ten states and in Canada a single case was notified in the year.

Reporting of cases of leprosy is essential as the first step in establishing control and treatment of the patient's disease and supervision of his contacts.

MALARIA

Malaria eradication programs are underway or completed in all countries and territories of the Americas in which the disease has existed in recent history. The eradication programs stress efforts to improve case reporting and to obtain laboratory confirmation of all cases, but at present cases reported for many countries are not necessarily subject to laboratory confirmation.

The total number of reported cases in 1961, as shown in Table 6, was 198,287 of which 55 per cent were in Middle America and almost 45 per cent in South America. The rates per 100,000 population were 162 and 60 for Middle and South America respectively. Only 75 cases were reported in Northern America. The distribution of cases by country with rates per 100,000 population is shown in Table I. The distribution of cases according to age appears in Table IV and by major political divisions within countries in Table V.

Table 6. Reported Cases of Malaria with Rates per 100,000 Population in the Three Regions of the Americas, 1957-1961

Year	Total	Northern		Middle		South	
		Num- ber	Rate	Num- ber	Rate	Num- ber	Rate
1957	183 518	139	0.07	74 677	122.6	108 702	83.0
1958	205 446	88	0.05	85 332	136.4	120 026	89.2
1959	213 168	72	0.04	89 700	139.4	123 396	88.9
1960	169 562	77	0.04	82 874	124.2	86 611	60.0
1961	198 287	75	0.04	109 484	161.7	88 728	60.5

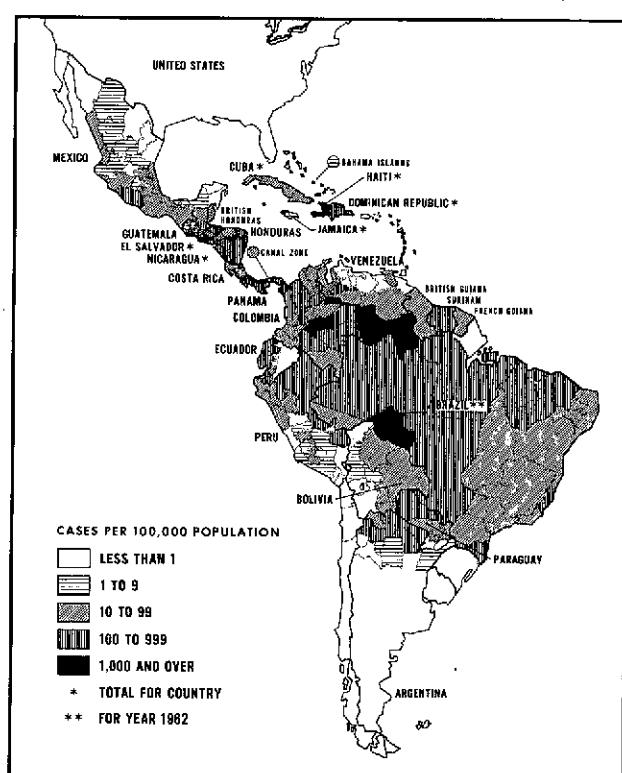

Note: Excluding Trinidad and Tobago in 1961, and other areas for which data were not available in certain years.

Malaria has been eradicated from Barbados, Chile, Martinique, Puerto Rico and the United States, and from considerable areas of Argentina, British Guiana and Venezuela. In Uruguay and many Caribbean islands there has been no recent history of the disease. Following three years of intensive vigilance without autochthonous cases the islands of Grenada, Carriacou and St. Lucia have been registered as having achieved eradication.

The increase in cases from 1960 to 1961 results almost entirely from increases in several countries of Middle America and Brazil (Table I). In Mexico a large increase arises in part from intensified case-finding activities which have been carried on since mid-1960 in certain areas of the country in which problems in persistence of transmission were encountered in the eradication campaign. About 70 per cent of the country, however, is virtually clear of malaria.

In Haiti, the eradication program begun in 1958 was interrupted in 1959 and cases increased steadily through 1961. This campaign came into full operation in 1962. For the Dominican Republic the data shown for 1961 are not comparable with those for 1960, the latter being confirmed cases while the 1961 figures represent all reported cases. Confirmed cases according to the malaria eradication service were 5,548 in 1960 and 2,523 in 1961.

Figure 4
REPORTED CASES OF MALARIA PER 100,000 POPULATION BY MAJOR POLITICAL DIVISIONS OF EACH COUNTRY IN THE AMERICAS, 1961

In South America, Argentina has encountered difficulty in the eradication campaign in areas still malarious and cases during 1961 showed an increase over 1960. In Paraguay spraying of houses with insecticide was interrupted during most of 1961 and the number of reported cases increased.

Colombia shows a steady reduction in reported cases from 1958 through 1961 with a case rate of 168 per 100,000 in 1961. However, confirmed cases as reported by the national malaria eradication service, while much lower, increased from 1959 through 1962, due in part to more intensive case-finding activities. Venezuela had an increase in cases reported in 1960, carrying over into early 1961 but subsiding again in the latter half of the year.

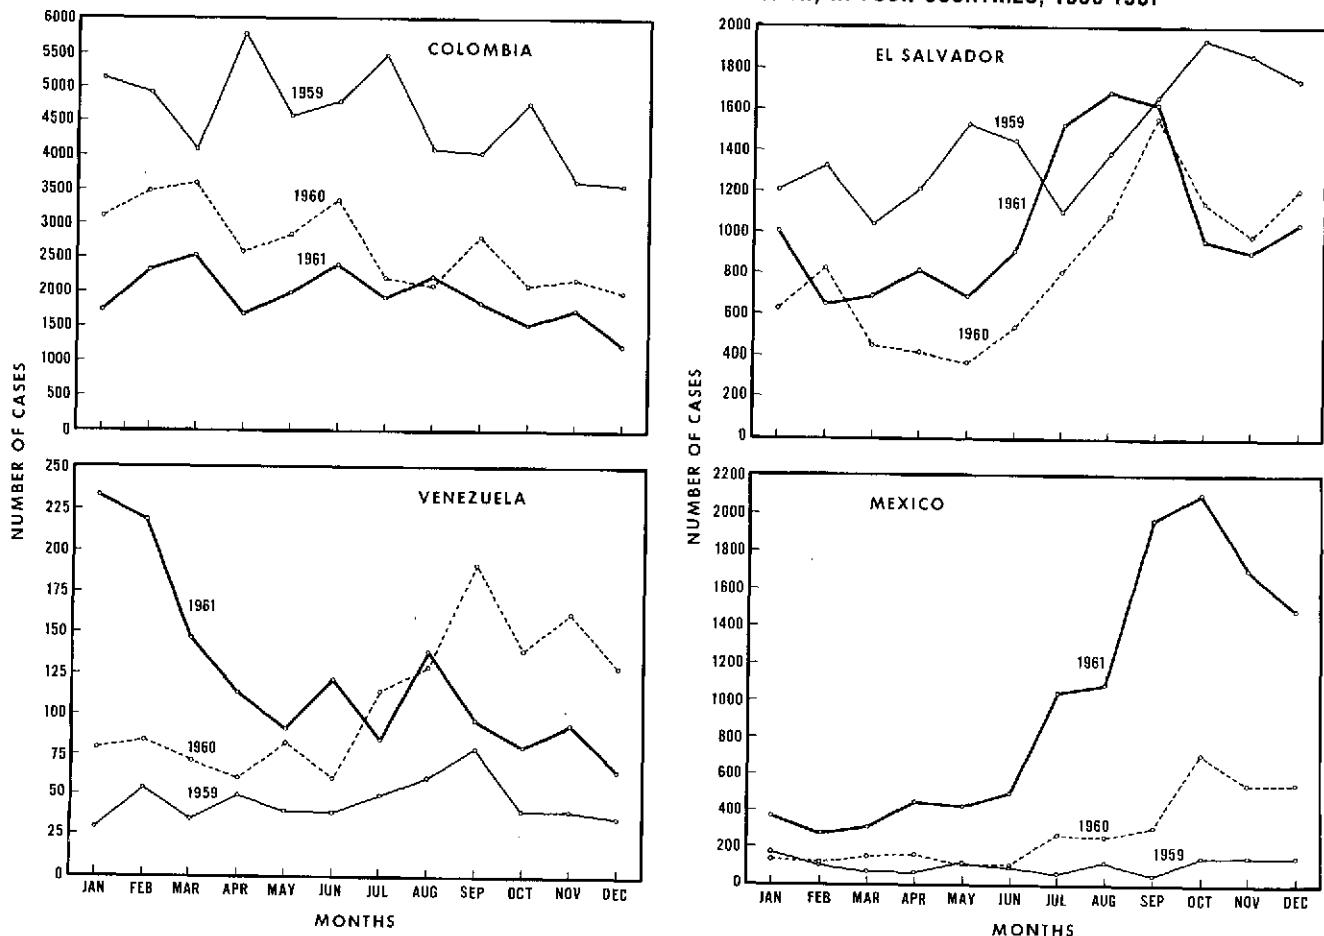

In general the highest case rates per 100,000 were in Middle America -- Haiti, 1034; Nicaragua, 572; Dominican Republic,

524; El Salvador, 502; Panama, 308; Honduras, 306. Surinam also had a high rate of 228 and that of Ecuador was 189. The distribution of cases by major political divisions within each country is shown for 1961 in Figure 4.

In Figure 5 the seasonal trend of reported cases of malaria in 1959, 1960 and 1961 is presented for four countries. In both El Salvador and Mexico the seasonal distribution in 1960 and 1961 is marked and is fairly similar for both years. In contrast in Venezuela an epidemic appears to have occurred from September 1960 through February 1961, but there is no evidence of a corresponding unusual frequency at the beginning of 1960 or the end of 1961. In Colombia no extended seasonal pattern is visible but may be obscured by the downward trend of reported cases in the three year period. Fluctuations from month to month are large.

Figure 5

DISTRIBUTION OF REPORTED CASES OF MALARIA BY MONTH, IN FOUR COUNTRIES, 1959-1961

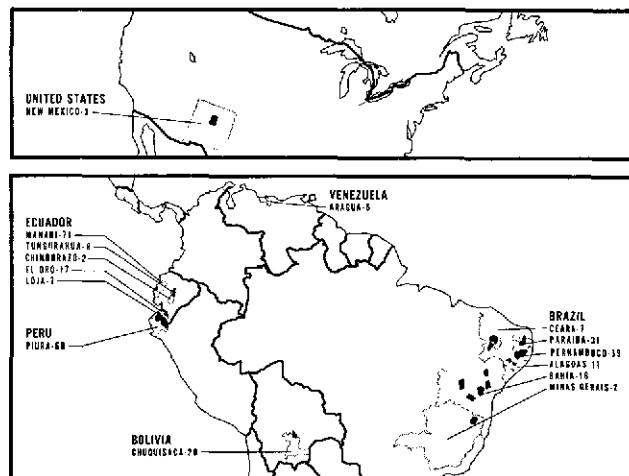

PLAQUE

Three hundred and eight cases of plague were reported in 1961 from six countries of the Americas, the largest number in a decade. Brazil and Ecuador each had over 100 cases and Peru 68. Other countries with fewer cases were Bolivia (20), Venezuela (6) and the United States (3). Wild rodents are the main reservoir of infection in the Americas. However, in 1961, infection was spread to rats in the seaport town of Manta, Ecuador, and for the first time in a decade plague occurred in a port in the Americas. The distribution of cases in the Americas in 1961 by major political divisions appears in Table V and Figure 6. In both Brazil and Ecuador the number of states from which the disease was reported increased in 1961 over the previous two years.

Figure 6

REPORTED CASES OF PLAGUE IN THE AMERICAS, AND LOCATION, BY MAJOR POLITICAL DIVISIONS, 1961

POLIOMYELITIS

Of the 7,217 cases of poliomyelitis reported in the Americas in 1961 only 1,501 or 21 per cent were in the United States or Canada. This number of cases is less than 5 per cent of the annual numbers reported in Northern America in 1949-1955 demonstrating the results of the extensive vaccination programs in these countries beginning in 1956.

On the other hand, reported cases in Middle and South America have remained at about the same levels during the decade. In

Table 7. Reported Cases of Poliomyelitis with Rates per 100,000 Population in the Three Regions of the Americas, 1957-1961

Year	Total	Northern		Middle		South	
		Num- ber	Rate	Num- ber	Rate	Num- ber	Rate
1957	11576	5773	3.1	2820	4.7	2983	4.3
1958	11665	6190	3.2	1973	3.2	3502	5.0
1959	16956	10314	5.3	3005	4.8	3637	5.0
1960	10596	4106	2.1	2640	4.0	3850	5.1
1961	7217	1501	0.7	1542	2.3	4174	5.4

Note: Excluding Trinidad and Tobago in 1961 and other areas for which data were not available in certain years.

1961 reported cases per 100,000 population were 2.3 and 5.4 respectively in Middle and South America as compared to 0.7 for Northern America (Table 7). Because of the combined effects of the epidemic characteristics of the disease, the improvement of reporting of cases and vaccination programs it is not possible to evaluate from these data the results of vaccination for Latin American countries.

Differences in age distribution of cases in the United States and Canada as compared to the countries of Middle and South America have been often pointed out and data for 1961 show no exception. Close to 30 per cent of cases in the United States and Canada are of persons over 15 years of age, while in the remainder of the Americas for which data by age are available only 2 per cent of reported poliomyelitis cases are of persons over 15 years of age. However, cases of infants under one year of age account for only 4 per cent of the cases in Northern America but for 30 per cent in Latin America. Similarly larger proportions of cases occur among children of 1-4 years of age in Latin America than in the two Northern countries.

SMALLPOX

Fewer cases of smallpox were reported in the Americas in 1961 than in any previous year (Table 8). In only two countries were there sizeable numbers of cases, 2,759 for Brazil and 496 for Ecuador. In addition there were six cases in Argentina, 16 in Colombia and one imported case in Uruguay. The data for Brazil pertain only to the State of Guanabara and capitals of certain other states. It is estimated that total cases in Brazil in 1961 were considerably in excess of the reported number.

The success of vaccination programs for the eradication of smallpox is evident. In 1951 the disease was reported to be present in 12 countries and three other areas of the Americas, five years later in eight countries and by 1961 in only five. The geographical distribution of the 3,278 cases in 1961 is shown in detail in Figure 7.

(g) Clinical diagnosis not supported by epidemiological evidence.

TUBERCULOSIS

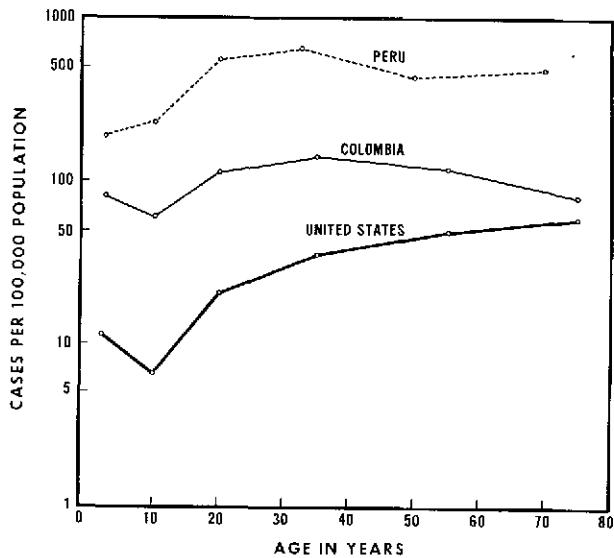

Tuberculosis continues to be one of the important public health problems in the Americas even though there has been a marked reduction in the numbers of deaths since the introduction of chemotherapy. The number of reported cases of tuberculosis has declined steadily in Northern America but the trend in Middle America and South America is more difficult to evaluate. An upward trend since 1957 in Middle America may be due to the improvement of case-finding activities in the region. Table 9 gives the reported number of tuberculosis cases with rates per 100,000 population in the three regions for the period from 1957 to 1961. Reported cases per 100,000 population are twice as high in Middle America as in Northern America and four times as high in South America. By country, reported cases varied from 441 per 100,000 population in Peru to the low of 29 in the United States. Among areas of the Americas other than the countries the range of reported case rates was from 11 to 140. The seven countries with over 100 cases per 100,000 population included Brazil (capital cities), Colombia, Ecuador, El Salvador, Honduras, Peru and Venezuela.

Table 9. Reported Cases of Tuberculosis with Rates per 100,000 Population in the Three Regions of the Americas, 1957-1961

Year	Northern		Middle		South	
	Num- ber	Rate	Num- ber	Rate	Num- ber	Rate
1957	75 162	40.0	29 373	49.8	87 107	141.4

1961	59 540	29.6	36 966	55.1	85 265	131.0

Note: Excluding Chile in 1957-1961, Honduras in 1957, Trinidad and Tobago in 1961, and other areas for which data were not available in certain years.

Figure 8
AVERAGE ANNUAL REPORTED CASES OF TUBERCULOSIS PER 100,000 POPULATION BY AGE, IN THREE COUNTRIES, 1959-1961

Analysis of the cases by age group gives another method of comparison of the disease in the Americas. Figure 8 presents annual reported cases of tuberculosis per 100,000 by age group for 1959-1961 in three selected countries, Colombia, Peru and the United States. The curves for case rates for the three countries are far apart with the rates always lowest in the United States and highest in Peru. The greatest differences between the two South American countries and the United States are observed under 35 years of age and smallest over 45 years. In both Colombia and Peru age specific rates are highest in the age group 25-44 years. In the United States the highest is among those of 65 years of age and over. This would appear to point to the present lower infection rates at younger ages in the United States in comparison with those in Latin American countries. Also in the United States, the high reported case rates in the older age group may be the result of the high infection rates in early life in the past.

TYPHOID FEVER

Reported cases of typhoid fever in the Americas in 1961 totalled 45,270 (Table 10). Only 1,080 of these cases were in Northern America and the remainder were divided between Middle America (11,332) and South America (32,858) with rates per 100,000 population for the three regions of 0.5, 16.9 and 42.7 respectively. High mortality rates in Middle America from typhoid fever, over twice those in South America, point to an underreporting of cases in Middle America.

In Figure 9 the distribution of reported cases by month shows a definite seasonal increase in the summer in countries in temperate zones and a more even spread of cases throughout the year in tropical countries. June through October are months of elevated frequency in both United States and Mexico, while from November through March or April the number of cases is excessive in Argentina and Chile. In Venezuela, Peru and Colombia consistent and prolonged seasonal patterns

Table 10. Reported Cases of Typhoid Fever with Rates per 10,000 Population in the Three Regions of the Americas, 1957-1961

Year	Total	Northern		Middle		South	
		Num- ber	Rate	Num- ber	Rate	Num- ber	Rate
1957	44314	1516	0.8	8117	14.0	34681	50.5
1958	47009	1348	0.7	11238	18.3	34423	49.0
1959	46928	1409	0.7	13313	21.0	32206	44.1
1960	45390	1151	0.6	12114	18.5	32125	43.0
1961	45270	1080	0.5	11332	16.9	32858	42.7

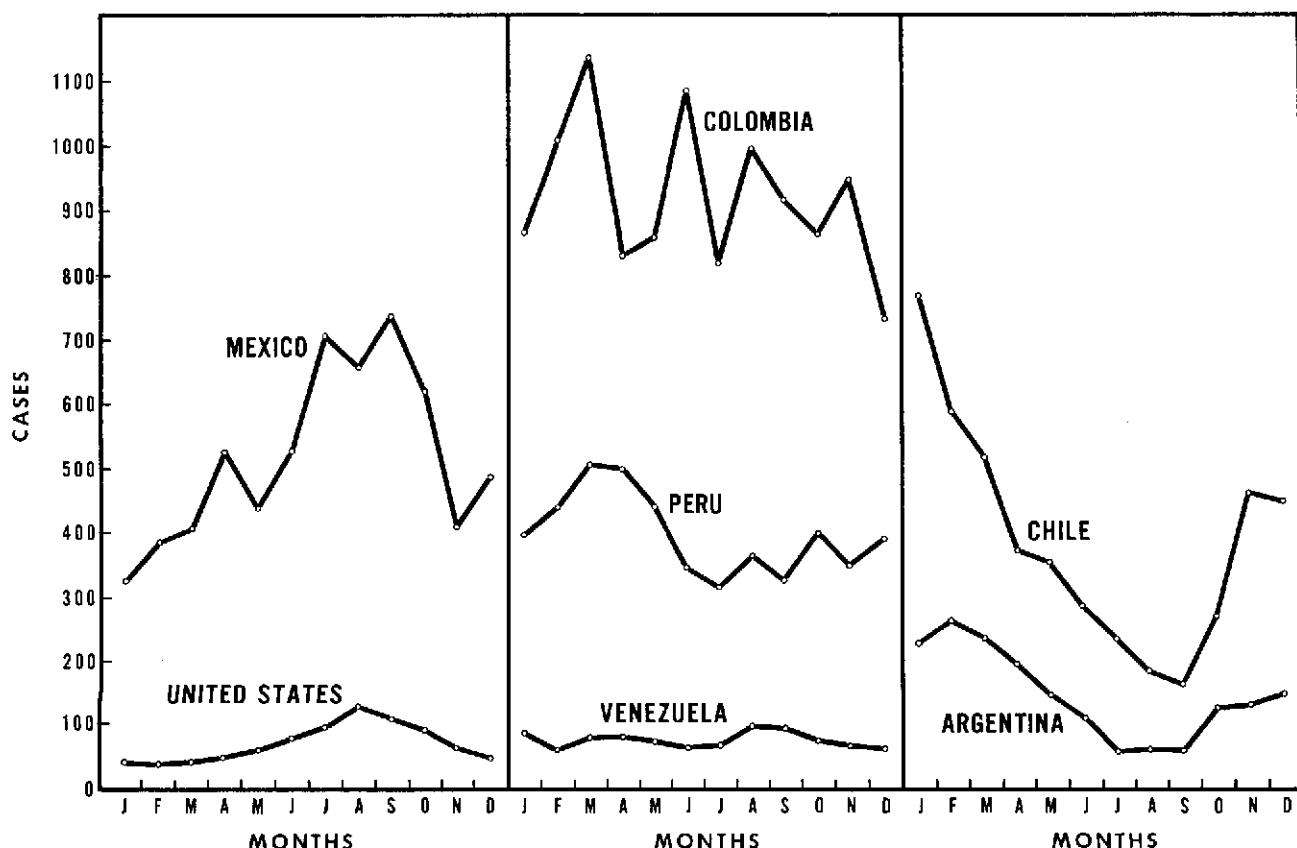

Note: Excluding Trinidad and Tobago in 1961 and other areas for which data were not available in certain years.

are less evident. In Colombia fluctuations are large from month to month and during March and April of 1961 the number of cases increased in Peru.

The extension and improvement of water supply systems should be an important factor in the prevention of typhoid fever in the Americas.

Figure 9

DISTRIBUTION OF REPORTED CASES OF TYPHOID FEVER BY MONTH, IN SEVEN COUNTRIES, 1961

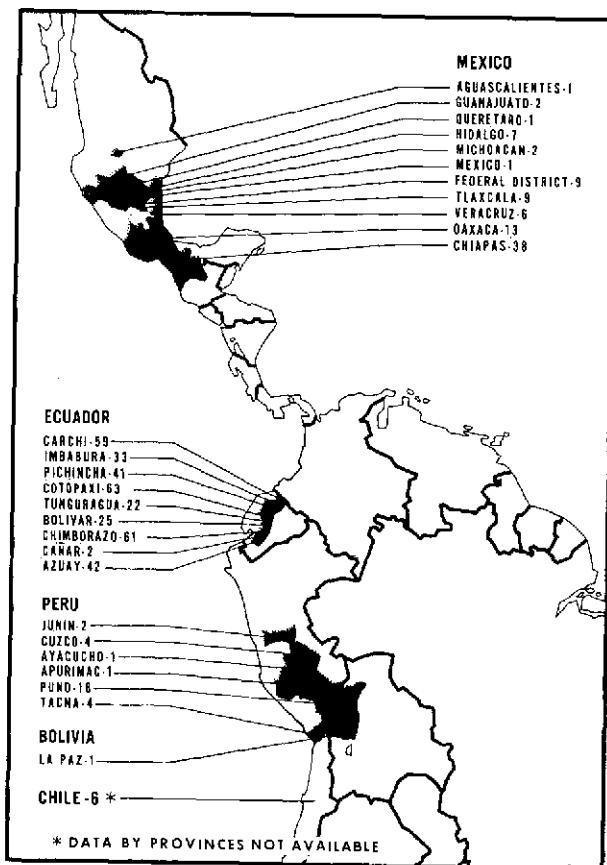

LOUSE-BORNE TYPHUS

Decreases in the number of reported cases of louse-borne typhus in 1961 occurred in all of the countries where the disease is usually present. Between 1951 and 1961 the number reported in the Americas declined from 3,815 to 474. Of the 1961 total, 348 or 73 per cent were in Ecuador and another 89 or 19 per cent in Mexico. Other countries with reported cases were Bolivia, Chile and Peru. For the first time no cases were reported in Colombia. The geographical distribution shown in Figure 10 and Table V is less extensive in the countries with cases than in previous years.

Figure 10

REPORTED CASES OF LOUSE-BORNE TYPHUS IN THE AMERICAS,
BY MAJOR POLITICAL DIVISIONS OF EACH COUNTRY, 1961

WOOPIPING COUGH

Despite the availability of effective immunization against whooping cough, this disease remains a serious problem in Latin America, contributing to the excessive mortality of young children in this Region. In

Table 11. Reported Cases of Whooping Cough with Rates per 100,000 Population in the Three Regions of the Americas, 1957-1961

Year	Total	Northern		Middle		South	
		Num- ber	Rate	Num- ber	Rate	Num- ber	Rate
1957	200 973	35 785	19.1	47 282	78.5	117 906	182.7
1958	197 321	39 141	20.5	66 523	107.3	91 657	138.9
1959	231 865	47 367	24.3	62 387	97.7	122 111	180.1
1960	208 266	20 803	10.5	41 597	63.2	145 866	210.1
1961	150 884	16 946	8.4	61 862	92.8	72 076	106.6

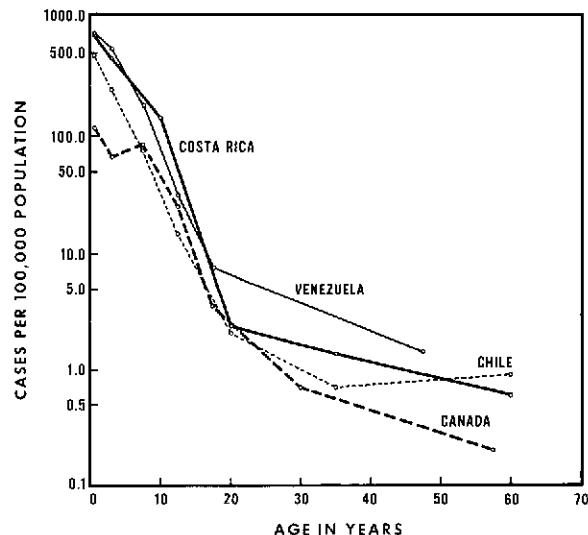

Note: Excluding Ecuador in 1957-1961, Trinidad and Tobago in 1961, and other areas for which data were not available in certain years.

In 1961 the numbers of reported cases per 100,000 population were over ten times as high in both Middle and South America as in Northern America (Table 11). In eight countries over 100 cases were reported per 100,000 population. The range of rates in the countries of the Americas was from 223 per 100,000 population in Peru to 2 in Cuba. An epidemic in Grenada resulted in the highest case rate in the Region, 843 per 100,000 population. The numbers of reported cases in 1961 compared with those in 1960 showed an increase in Middle America and decreases in Northern and South America. Changes in a single year for this disease cannot be interpreted in view of its epidemic nature.

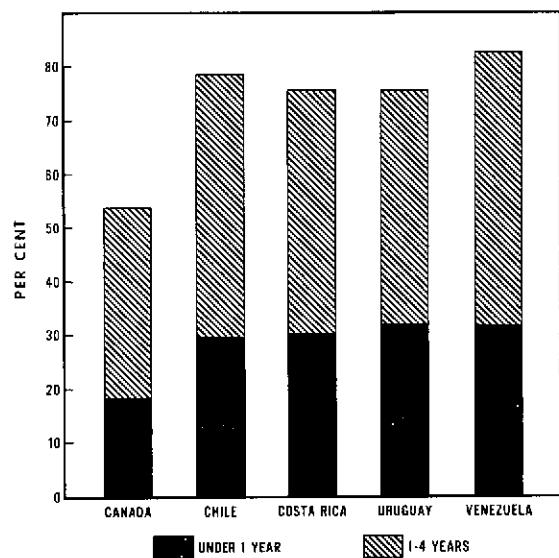

In Figure 11 are shown reported cases per 100,000 population by age for three Latin American countries and for Canada. Rates among infants and children 1-4 years of age are four to seven times higher in the Latin American countries than in Canada. Less difference among countries is evident for children of school age.

Figure 11

AVERAGE ANNUAL REPORTED CASES OF WHOOPING COUGH PER
100,000 POPULATION BY AGE, IN FOUR COUNTRIES,
1959-1961

*Figure 12*

PERCENTAGE OF REPORTED CASES OF WHOOPING COUGH UNDER
1 YEAR AND 1-4 YEARS OF AGE IN FIVE COUNTRIES, 1961

The earlier age at which children contract whooping cough also is demonstrated in Figure 12. In the four Latin American countries for which data are shown, a larger proportion of reported cases are under one year of age, and in all, proportionately more of the cases are in the age group 1-4 years than

in Canada. The proportion of the cases less than five years of age is at least 75 per cent in these countries compared to 54 per cent in Canada. These data highlight the continuing need for immunization of children early in life.

YAWS

Eradication programs through detection and treatment of infectious cases of yaws and their household contacts have brought

Table 12. Reported Cases of Yaws in the Americas, 1954-1961

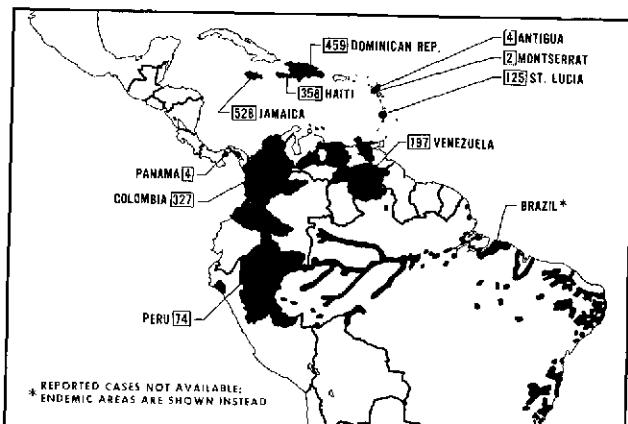

Year	Number
1954	26 548
1955	7 838
1956	6 153
1957	5 538
1958	4 896
1959	3 910
1960	2 788
1961	2 078

Note: Excluding Brazil; Cuba and St. Vincent in 1957-58 and 1961; Dominican Republic, Jamaica and Guadeloupe in 1954-1958; Peru in 1960; Trinidad and Tobago in 1961; and Surinam in 1959-61.

about a great decrease in yaws during the last decade (Table 12). Lack of reports from several countries and areas for one or more years makes comparisons for this period difficult. Yaws has existed in the Americas mainly in the Caribbean islands and in tropical areas of South America. Figure 13 shows the major political areas in the Americas for which cases of yaws were reported in 1961. Data for Brazil are not available but since yaws is considered to be a serious health problem and an eradication program is in progress in that country, endemic areas have been shown on the map instead of reported cases.

In 1961, reported cases of yaws totalled 2,078 of which almost three-quarters were from the Caribbean area, the largest numbers being reported from Jamaica (528), Dominican Republic (459) and Haiti (358). Data were not available for Trinidad and Tobago for which cases were reported in previous

Figure 13
REPORTED CASES OF YAWS IN THE AMERICAS, BY MAJOR POLITICAL DIVISIONS OF EACH COUNTRY, 1961

years. Other Caribbean islands for which reports of the presence of yaws were received include Antigua, Montserrat and St. Lucia.

The three countries in South America with reported cases were Colombia (327), Peru (74) and Venezuela (197). Despite the widespread geographic distribution of these cases in Colombia, one-third of the reported cases were in a single department. The reported cases in Peru were from four departments with the majority occurring in Loreto. For thirteen states or areas of Venezuela cases were reported in 1961.

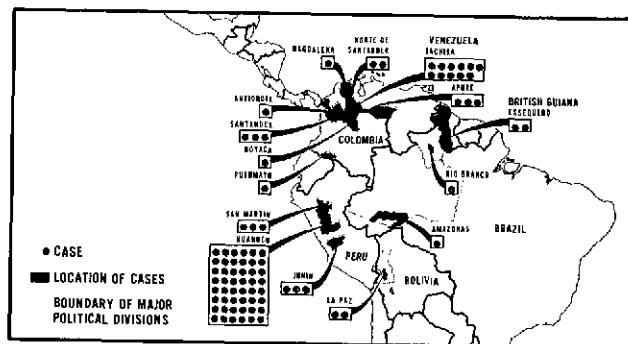

With progress in the eradication programs for yaws, procedures are essential for coordination of the program and systems for reporting notifiable diseases. In the surveillance phase of the eradication program and after eradication is completed, personnel in health services must be alert to the importance of newly reported cases and measures to be taken.

YELLOW FEVER

Figure 14

Eighty-two cases of jungle yellow fever were reported in the Americas in 1961, the largest number since 1954 and over twice that in 1960. An outbreak in the Tingo Maria area, Huanuco Department, Peru, accounted for 48 of the 82 cases. Two cases were reported from the interior of British Guiana, the first since 1948. The remaining 32 cases were from other jungle areas in Bolivia, Brazil, Colombia, Peru and Venezuela. The areas in which human cases were reported in 1961 are shown in Figure 14 and the distribution by major political divisions appears in Table V.

REPORTED CASES OF JUNGLE YELLOW FEVER IN THE AMERICAS, AND LOCATION, BY MAJOR POLITICAL DIVISIONS OF EACH COUNTRY, 1961

ZOONOSES

To measure the magnitude of the problems of zoonoses in the Americas information usually must be obtained from several sources, for the combined knowledge of incidence of the diseases in man and animals is essential to definition of the problems. Health Services are generally the source of

data on reported human cases. Sometimes veterinary units in the health services have knowledge of cases in animals but often this latter information must be secured from veterinary services in other ministries such as the Ministry of Agriculture. The effect of zoonoses on human health with the resulting loss of

Figure 16

REPORTED CASES OF RABIES IN ANIMALS, IN THE AMERICAS, 1961

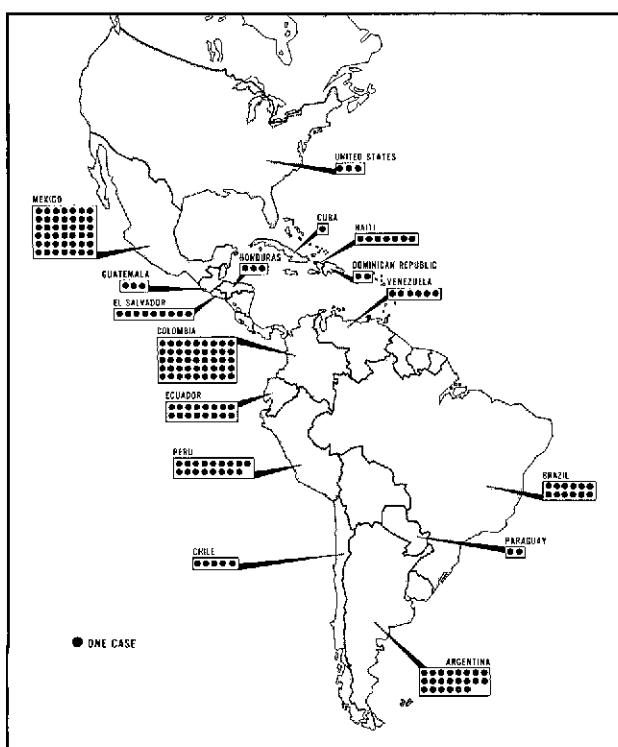

life is of primary importance but the loss through disease of animals has serious economic consequences.

In Table VI the numbers of reported cases of seven important zoonoses for which data are usually available for animals as well as for man are given for the Americas in 1961. All of these diseases have a broad geographic distribution in the Region. The seven diseases include anthrax, brucellosis, arthropod-borne encephalitis, hydatidosis, leptospirosis, rabies and trypanosomiasis. In addition information on bovine tuberculosis in animals only is included in this table. For each disease the numbers of cases are shown only for countries reporting at least one case. In countries not listed, the disease either may not have occurred or may not have been diagnosed or notifiable. Tables I and II also contain data on these and other zoonoses in man.

Rabies is a problem in all countries of the Americas with the exception of Uruguay. The numbers of reported cases in man for 1961 are shown geographically in Figure 15 and for animals in Figure 16. Altogether 195

Figure 15

REPORTED CASES OF RABIES IN MAN, IN THE AMERICAS, 1961

cases of rabies were identified in the 16 countries or territories reporting at least one case, and over 9,000 cases in animals from 18 countries or other areas. The largest numbers of cases in man were reported from Colombia (45) and Mexico (42). In animals the highest numbers were for the United States (3,599), Argentina (1,252) and Canada (1,071).

Brucellosis is another zoonosis which has a wide geographical distribution in the Americas. There are large numbers of human cases in several countries and in addition the infection of cattle in many areas results in large economic losses. Countries from which at least 1,000 cases in man were reported include Mexico (2,001), Peru (1,433) and Argentina (1,133). Information is lacking or inadequate on cases in animals in these three countries. Herds infected in the United States totalled 61,140, and in Canada it was stated that 1.7 per cent of cattle were infected. In these two countries eradication

programs for brucellosis are in operation. The countries of Central America and Panama also have programs against brucellosis and larger numbers of cases are reported in animals in these than in other countries of Latin America.

Anthrax was reported in man in 13 countries or territories of the Americas in all three regions with the largest numbers in Chile and Argentina. Cases in animals were reported mainly from countries of Central America, reflecting again the emphasis on the veterinary programs in these countries. Sufficient data are not available to measure the proportion of human infections of agricultural or industrial origin, but in most countries those of agricultural source probably still predominate.

Of special interest is the reporting of trypanosomiasis in eight countries of Latin

America. American trypanosomiasis, known as Chagas' disease and caused by Trypanosoma cruzi, has a wide geographic distribution in rural areas of Mexico and Central and South America. Another species of trypanosoma, T. rangeli, has been found in blood films of man in Central and South American countries. However it is not known to produce demonstrable clinical disease.

Over three-fourths (1,525) of 1,931 reported cases of trypanosomiasis in man were in Argentina. The remainder were from four Central American countries and Paraguay, Uruguay and Venezuela. No information was available for Brazil where there are areas of high endemicity and where chronic forms of the disease are believed to have serious effects.

Trypanosomiasis in animals was reported from Brazil, Venezuela and British Guiana.

(a) Data for typhoid fever (040) include paratyphoid fever (041).

(b) Data for State of Guanabara and capitals of other states and territories. Data on tuberculosis not available for São Paulo.
(See footnote on page 20.)

(c) Newly reported active cases.

(d) Reporting area.

(e) Including murine and unspecified typhus (101-107).

(f) Including paratyphoid (041) and other salmonella infections (042).

(p) Provisional.

TABLE B. ESTIMATED POPULATION OF REPORTING AREAS IN SIX COUNTRIES OF THE AMERICAS, 1961

Country	Population	Country	Population
Brazil (a)	11,484,000	Paraguay	1,190,000
Colombia	13,750,000	Peru (b)	4,877,000
El Salvador	1,473,000	Venezuela	5,049,000

(a) State of Guanabara and capitals of several other states.

(b) Districts that furnished data for twelve months of the year.

INDEX

	Page		Page
Age, cases by, diphtheria	5, 35	Erysipelas, deaths from	49-52
dysentery, all forms	35	Filariasis, cases of	29
encephalitis, acute infectious	35	deaths from	49-52
gonococcal infection	36	Food poisoning, other, deaths from	49-52
hepatitis, infectious	6, 36	Gonococcal infection, cases of	21
influenza	36	by age	36
leprosy	36	deaths from	49-52
malaria	37	Hepatitis, infectious, cases of	5, 6, 21
measles	37	by age	6, 36
meningococcal infections	37	deaths from	49-52
poliomyelitis, acute	10, 37	Hydatidosis, cases of	29, 47
scarlet fever	38	in animals	47
syphilis	38	deaths from	49-52
tetanus	38	Infectious hepatitis (see hepatitis, infectious)	
tuberculosis, all forms	12, 38, 39	Influenza, cases of	22
typhoid fever	39	by age	36
whooping cough	14, 15, 39, 40	deaths from	49-52
yaws	40	Leishmaniasis, cases of	29
Amebiasis, cases of	19	deaths from	49-42
by month	30	Leprosy, cases of	7, 22
deaths from	49-52	by age	36
Ankylostomiasis, cases of	19	by political divisions	7, 41, 42
deaths from	49, 52	by regions	7
Anthrax, cases of	18, 19, 47	deaths from	49-52
in animals	18, 47	Leptospirosis, cases of	29, 47
deaths from	49-52	in animals	47
Botulism, deaths from	49-52	deaths from	49-52
Brucellosis, cases of	17, 20, 47	Malaria, cases of	2, 8, 22
in animals	17, 47	by age	37
deaths from	49-52	by month	9, 31
Chagas' disease (see trypanosomiasis)		by political divisions	8, 9, 42-44
Chickenpox, deaths from	49-52	by regions	8, 9
Deaths from communicable diseases	49-52	deaths from	49-52
diphtheria	4, 5	Measles, cases of	23
Dengue	29	by age	37
Diphtheria, cases of	4, 5, 20	by month	31, 32
by age	5, 35	deaths from	49-52
by month	30	Meningococcal infections, cases of	23
by region	4, 5	by age	37
deaths from	4, 5, 49-52	deaths from	49-52
by region	4, 5	Months, distribution by, amebiasis	30
Dysentery, cases of, amebic (see amebiasis)		diphtheria	30
bacillary, other and unspecified	20	malaria	9, 31
by age	35	measles	31, 32
deaths from	49-52	poliomyelitis	32
Encephalitis, acute infectious, cases of	21, 35	typhoid fever	13, 32, 33
by age	35	whooping cough	33, 34
deaths from	49-52	Mumps, deaths from	49-52
arthropod-borne	47	Paratyphoid fever, cases of	23
in animals	47	deaths from	49-52

INDEX

	Page		Page
Plague, cases of	3, 4, 10, 24	Tetanus, cases of	26
by political divisions	10, 44	by age	38
deaths from	49-52	deaths from	49-52
Poliomyelitis, cases of	10, 24	Trachoma, cases of	26
by age	10, 37	deaths from	49-52
by month	32	Trichiniasis, cases of	29
by regions	10	deaths from	49-52
deaths from	49-52	Trypanosomiasis, cases of	18, 29, 48
Population of Americas	53	in animals	18, 48
reporting areas	53	deaths from	49-52
Psittacosis, cases of	29	Tuberculosis, cases of	12, 27
Quarantinable diseases	1, 3, 4	bovine	48
(see also names of specific diseases)		by age	12, 38, 39
Rabies, cases of	17, 24, 48	by region	12
in animals	17, 48	deaths from	49-52
deaths from	49-52	Tularemia, cases of	29
Regions, cases by, diphtheria	4, 5	deaths from	49-52
leprosy	7	Typhoid fever, cases of	13, 27
malaria	8, 9	by age	39
poliomyelitis	10	by month	13, 32, 33
tuberculosis	12	by region	13
typhoid fever	13	deaths from	49-52
whooping cough	14	Typhus, flea-borne, cases of	29
definition of	2	deaths from	49-52
Relapsing fever, cases of	25	Typhus, louse-borne, cases of	3, 4, 14, 27
louse-borne	3, 4	by political divisions	14, 45
deaths from	49-52	deaths from	49-52
Reporting areas, Brazil	3, 53	Undulant fever (see brucellosis)	
Colombia	3, 53		
El Salvador	3, 53		
Paraguay	3, 53	Whooping cough, cases of	14, 15, 28
Peru	3, 53	by age	14, 15, 39, 40
population of	53	by month	33, 34
Venezuela	3, 53	by regions	14
Rheumatic fever, deaths from	49-52	deaths from	49-52
Rickettsial diseases, other, deaths from	49-52		
Salmonella infections, other, deaths from	49-52	Yaws, cases of	15, 16, 28
Scarlet fever, cases of	25	by age	40
by age	38	by political divisions	15, 16, 45, 46
deaths from	49-52	deaths from	49-52
Schistosomiasis, cases of	29	Yellow fever, cases of	3, 4, 16, 28
deaths from	49-52	by political divisions	16, 46
Smallpox, cases of	3, 4, 11, 25	deaths from	49-52
by political divisions	11, 45		
deaths from	49-52	Zoonoses	16-18, 47, 48
Streptococcal sore throat, deaths from	49-52		
Syphilis, cases of	26	(see also names of specific diseases)	
by age	38		
deaths from	49-52
