**Home teaching in the North-West: a pilot survey.**

Petrie I; Taylor P

Child Care Health Dev ,Jan-Feb 1980, 6 (1) p57-64, ISSN 0305-1862

Journal Code: C9X

Languages: ENGLISH

The home teaching services in three counties and two metropolitan districts in the north-west were surveyed. A questionnaire was used to gather information relating to the number of children and range and types of problems referred, organization and staffing, and changes and developments in the services. Wide differences were found among the individual education authorities in these various aspects of home tuition. Although home teaching demands high professional skills it does not offer an attractive career structure and is very largely staffed by part-time women teachers.

**Antibiotic misuse in a pediatric teaching hospital.**

Schollenberg E; Albritton WL

Can Med Assoc J ,Jan 12 1980, 122 (1) p49-52, ISSN

0008-4409 Journal Code: CKW

Languages: ENGLISH

Antibiotic use at a pediatric teaching hospital was reviewed for a month. A total of 188 courses of therapy were evaluated with respect to choice of antibiotic, dosage and necessity of treatment. Errors in therapy were noted in 30% of the medical orders and 63% of the surgical orders. The most frequent error, unnecessary therapy, was found in 13% and 45% of the medical and surgical orders respectively. Error rates were highest for the most frequently ordered antibiotics, notably the penicillins. The magnitude of the problem appeared to be similar to that previously reported from general and adult hospitals. The difficulties with solutions such as educational programs and compulsory consultation are discussed.

**Respiratory therapists in the NICU.**

Dawes GW; Gee GN

Respir Ther ,Mar-Apr 1980, 10 (2) p38-40, ISSN

0048-7392 Journal Code: R8L

Languages: ENGLISH

The need for respiratory therapists in a hospital's NICU has not always been apparent, nor has the respiratory therapist's role been entirely understood and adequately defined. Many hospitals do not even recognize the need for respiratory-care services in this specialty area, and among medical staff there is a certain uneasiness in allowing an unfamiliar paramedical profession (such as respiratory therapy) to enter their well-established realm. Training in ICU care for infants and becoming credentialed in this specialty area is still in its beginnings. Loma Linda University Medical Center (LLUMC) is one example of how a respiratory-care department was able to break through the barriers and deliver care to the NICU patients. The background of how this breakthrough actually took place and what role the respiratory therapist first played is discussed, as well as that role's expansion and the progression that has taken place since respiratory care's first involvement.

Languages: ENGLISH

Autopsies are important in the quality control of medical practice, in research, and in teaching. We have attempted to realize more of the service, teaching, and research potential from doing autopsies. The key of all efforts is the involvement of the senior staff. This involvement should be made possible by supporting such a person by a qualified team that consists of the mortuary service, pathologist's assistants, and highly trained and qualified residents. Such a staff person can direct his or her attention toward improving communication with clinicians, answering open questions in-depth, encouraging collaborative clinicopathological projects, developing new approaches to the performance of autopsies, such as the immediate autopsy, and using special laboratory modalities, such as electron microscopy and immunofluorescence. Computer storage of autopsy data and retrieval for special studies seem to make autopsy data available and usable. It is most important that autopsies be performed, that they be done well, and that their findings be carefully evaluated using all available scientific tools and, finally, that the results are adequately communicated.

Regulators have a major opportunity to enhance the community care of former state hospital patients through their power to authorize additional general hospital psychiatric beds. The authors propose a series of clinical criteria for such regulators based on a review of state hospital admissions. These include provisions for patients who have chronic illness with repeated hospitalizations, who are involuntarily admitted, who have alcoholism, and who are impoverished. Further implications for general hospital units include specific changes in their treatment strategy, their links to facilities for ambulatory patients, and their provisions for staff education and support.

**Patient comprehension of written drug information.**

Eaton ML; Holloway RL

Am J Hosp Pharm ,Feb 1980, 37 (2) p240-3, ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

The effect of the readability level of patient drug information materials on patient comprehension of and attitude toward the information was studied. The reading level of 108 outpatients at a Veterans Administration hospital who could read English, read type of normal size, and who were not receiving warfarin sodium was measured. Patients then were given, on a random basis, a warfarin drug monograph written on either the 5th- or 10th-grade level. To test comprehension, all subjects took a true-false test of recall written at the 5th-grade level. A significant relationship was found between comprehension and reading ability (p less than 0.001). Patients receiving the 5th-grade level monograph exhibited significantly better comprehension than those receiving the 10th-grade level material (p less than 0.001). As compared with those getting 10th-grade material, the group receiving the 5th-grade material had a more favorable perception of the level of difficulty, understandability, and clarity of the material. The study indicates that comprehension of written patient drug information can be improved by adjusting the readability of informational materials to the reading level of the patients.

**[Ways of organization for the treatment of malignant neoplastic diseases]**

Organisationsformen für die Behandlung maligner Tumorkrankheiten.

Senn HJ

Schweiz Med Wochenschr ,Jan 1980, 110 (1) p4-11, ISSN

0036-7672 Journal Code: UEI

Languages: GERMAN Summary Languages: ENGLISH

To meet the challenge, quantitative and especially

qualitative, of optimum care for the large number of patients with disseminated neoplastic diseases, it is essential to create new, strongly interdisciplinary patient care systems. Acceptance of "medical oncology" as an important new subspecialty of internal medicine and the establishment of well equipped onco-(hematology) divisions, assuring adequate coordination of "total oncological care" within the traditional structure of large regional hospital centers, represents a necessary prerequisite. Adequate therapy and optimal supportive care for the many tumor types and stages must be critically evaluated in suitable controlled, largely cooperative clinical trials. To facilitate such evaluations and guarantee optimal access and care for the majority of tumor patients, the availability of competent and regional distributed clinical tumor centers, and their close coordination in national and international cancer research groups, is extremely important. These regional interdisciplinary tumorcenters (usually within large "maximal care" type general hospitals), and especially their outpatient departments, need to cooperate permanently on a partner-to-partner basis with physicians and smaller non-specialized hospitals in their neighbourhood. They are also responsible for establishing an adequate teaching and consultancy program for physicians, nurses and the public in their area.

**Patient compliance with a home parenteral nutrition program.**

Hughes BA; Fleming CR; Berkner S; Gaffron R

JPEN ,Jan-Feb 1980, 4 (1) p12-4, ISSN 0148-6071

Journal Code: KGA

Languages: ENGLISH

A systematic study of patient compliance to home parenteral nutrition (HPN) was done by an independent nurse who visited 10 patients and families at varying periods after HPN had been started. A compliance scale was based on assessment of aseptic technique, sequence of steps followed, safety precautions, proper use of equipment, and knowledge of complications. Compliance percentiles ranged from 73 to 97, with a median of 95. Seven of the 10 patients scored 90% or more in overall compliance. The only category that clearly showed a deficiency was patient knowledge of potential complications of HPN. Factors that correlated positively with a high compliance score were male sex, absence of children in the home, and wives who were enthusiastic about HPN and who offered the most moral support. This study shows that patients with chronic disabling diseases of the small bowel and severe malnutrition can be managed safely at home with HPN if they are properly trained and supervised.

0144944 80140839

**Algorithm-directed triage of pediatric patients. A prospective study.**

Wilson FP Jr; Wilson LO; Butler AB; Canales L

JAMA ,Apr 18 1980, 243 (15) p1528-31, ISSN 0098-7484

Journal Code: KFR

Languages: ENGLISH

An Army corpsman used physician-written triage algorithms to rate the urgency of the chief complaints of 2,000 pediatric outpatients. His ratings agreed with subsequent ratings by physicians in 84% of cases. The corpsman assigned a higher care urgency classification in 15% of cases and a lower classification in only 1.2% of cases. No danger to patients resulted from the algorithm-directed screening. Use of a "nonprofessional" as a triage agent spares the pediatrician, pediatric nurse practitioner, and nurse for providing health care. With increasing use of acute care facilities by patients without appointments, physician-written algorithms allow triage agents who lack formal medical training to determine safely the need for care of patients.

**Developing effective institutional managers in the 1980s--Part 1: a current analysis.**

Lees S

J Adv Nurs ,Mar 1980, 5 (2) p209-20, ISSN 0309-2402

Journal Code: H3L

Languages: ENGLISH

Two dominant themes are developed in this two part paper. One is that the organizational behaviour of nurse managers has its origins in the social defence system learned during early nursing; the other is that many of the assumptions which underpin current thinking on management training can do little either to help unlearn these early behaviours or to enable managers to be more innovative in their roles. In part one management training is examined in some detail from the three perspectives of the institution, the management trainers and the nurse managers, and in particular the widely differing assumptions and expectations which each have about the management training process. The social defence system of nursing is then analysed and tentative evidence is offered to illustrate how nurse managers transfer this system to managerial positions, with dysfunctional consequences. Although primarily concerned with nurse management training, there are implications for managers and management trainers in a much wider range of institutions and professions.

**Constructs of relationships and issues of authority in nursing.**

Shaw M; Heyman B  
J Adv Nurs ,Mar 1980, 5 (2) p187-98, ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH

The research on which this paper is based was designed to investigate nurses' perceptions of relationships in their work. The most important issue to emerge from their descriptions of relationships was that of the nature of authority. From their own accounts; examples of which are included in this paper; it can be seen that views of authority in the hospital setting are both complex and varied. We have identified four different types of authority as seen by nurses: parental, reciprocal, political and arbitrary. Our research suggests that any analysis of authority relationships based purely on structural arrangements would be too simplistic. One possible implication of the findings we present might be that more explicit discussion of the nature of authority in nursing relationships should be encouraged both in training and subsequently.

**Effectiveness of self instructional units in post-basic nursing education: with special reference to the use of nursing care plans unit.**

Ogundeyin WM  
J Adv Nurs ,Mar 1980, 5 (2) p169-78, ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH

A self instructional unit (SIU) on nursing care plans was tested to demonstrate its effectiveness on the cognitive performance of three different student achievement groups. Two other text formats: Question Text Type (QTT) and Information Text Type (ITT) were utilized to demonstrate their effect on the cognitive performance of the three achievement groups. The expectation was that the SIU would successfully improve the subjects' knowledge on nursing care plans, and that the post test scores would be related to the text types used during the study. The subjects were 48 B.Sc. (Nursing) degree students in the first year of a post-basic nursing degree programme who were divided into high, middle and low achievement groups, according to the results of a pretest on the theory related to nursing care plans. The results showed that the SIU significantly improved the basic knowledge of subjects on nursing care plans. Furthermore, the SIU and the QTT appeared to be superior to the ITT formats. On the whole there appears to be a relationship between text type and cognitive performance whilst students try to accumulate or review information.

**Recruitment of ethnic and socio-economically disadvantaged**

**students into dentistry.**

Claycomb CK; Moreland D Jr; Park RI  
J Dent Educ ,Apr 1980, 44 (4) p195-7, ISSN 0022-0337  
Journal Code: HY7

Languages: ENGLISH

A program designed to attract and graduate underrepresented minorities and disadvantaged students in dentistry is reported. The program consisted of three phases: career orientation, recruitment, and academic enrichment/retention. In the six years of this program's existence, the number of minority students enrolled increased from 1 to 28, including 12 who were graduated by June 1979. Only two were lost because of academic difficulties. An analysis of grades and tutorial needs showed that students experienced the most difficulty with first-year basic science courses. Recommendations are presented for program improvement.

**Comparison of clinic and home blood pressure measurements.**

Silverberg DS; Rosenfeld JB

Isr J Med Sci ,Jan 1980, 16 (1) p22-4, ISSN 0021-2180

Journal Code: GYO

Languages: ENGLISH

The blood pressures of 26 treated hypertensive patients were monitored throughout a 4-min interview with a physician and during a further 6 min of silence. During the period of conversation, the systolic pressure did not change significantly but diastolic pressure rose by 5.6 mm Hg. During the subsequent period of silence the mean systolic/diastolic blood pressure fell by 19.7/11.3 mm Hg. After a training course, 20 of the patients measured their blood pressure at home for one week. There was no significant difference between the mean systolic pressure taken in the home and that measured after 5 min of quiet rest in the clinic. The mean clinic diastolic blood pressure after 5 min of quiet rest was 3.1 mm Hg higher than that measured at home. Since hypertensive cardiovascular complications are more closely related to home than to casual clinic measurements, and since the blood pressure after 5 min of quiet rest in the clinic closely approximates the home measurement, we suggest that clinic blood pressure be taken only after 5 min of quiet rest.

In summary, the future of retarded citizen in his or her community will encompass the full impact of today's key ideologies in human service, the fruits of research and prevention efforts, and a continuing quest to bring equal rights to a group of citizens who have for too long been termed "unequal". Some current key trends in the care of the mentally retarded strongly suggest that they will involve into postures towards ideology, prevention, treatment-management, advocacy, and economical approaches which will be oriented along the lines of the nine future trends herein presented. A persisting strong advocacy group of parents, interested professionals, and handicapped citizens themselves will keep pushing back the future horizons of help and hope.

**Application of the training in community living program to rural areas.**

Field G; Allness D; Knoedler W  
J Community Psychol ,Jan 1980, 8 (1) p9-15, ISSN  
0090-4392 Journal Code: HUU  
Languages: ENGLISH

In previous work, The Training in Community Living program has been shown to be an effective and feasible mode of community treatment for markedly impaired patients. However, questions have been raised regarding its potential for dissemination to clinical settings in communities other than Madison, Wisconsin. Described are successful experiences in consulting with three rural Wisconsin counties to help them establish community treatment programs modeled on Training in Community Living principles. Also described are the factors responsible for the success of these consultations.

**Parent aides: an intervention program in cases of child abuse and neglect.**

Press-Rigler M; Kent JT; Croot P; Finnila M  
J Assoc Care Child Hosp ,Winter 1980, 8 (3) p64-8, ISSN  
0145-3351 Journal Code: HF6  
Languages: ENGLISH

The article describes a program at Childrens Hospital of Los Angeles that has developed a treatment modality for child abuse and/or neglect families using nonabusive parents as a critical link between the patient families and community and professional resources. A component of a larger intervention program, the Parent Aide Program involves nine aides recruited from the community and given orientation and training to some of the problems of child abusing and neglecting families. Under supervision they are assigned to selected families identified at the hospital and function in a variety of ways. They provide many of the services of a "good neighbor" (e.g., emergency transportation and babysitting) as well as emotional support and encouragement.

**Financing hospitals and clinical pharmacy services.**

Lash MP  
Hosp Pharm ,Feb 1980, 15 (2) p78-88, ISSN 0018-5787  
Journal Code: G98  
Languages: ENGLISH

This article describes the existing health care operating environment and specifically details the reimbursement pressures within the hospital milieu. The paper outlines several financial management subjects that have special relevance to financing clinical pharmacy services. The process of developing new clinical pharmacy services which were subsequently approved for third-party payment is highlighted. The article optimistically concludes that new and extremely relevant clinically oriented pharmacy programs that offer

valuable service to the patient population can be developed and implemented with approval for reimbursement.

**Implementation of a unit dose distribution system for respiratory therapy medications.**

Smith MA; Land MJ; Guzzetti PJ  
Hosp Pharm ,Feb 1980, 15 (2) p71-5, ISSN 0018-5787  
Journal Code: G98  
Languages: ENGLISH

The development and implementation of a comprehensive unit dose distribution system for respiratory medications is described. Initially, an evaluation of carts and unit dose packaging materials for respiratory medications was conducted. Subsequent to the selection, a unit dose processing and packaging program was developed in accordance with the Respiratory Therapy Medical Director's Standard Treatment Orders. A 24-hour exchange system, separate but paralleling the already operational unit dose system, was implemented. The primary advantages attributed to the implementation of this system were 1) a decrease in potential respiratory medication order interpretation/transcription errors; 2) a decrease in the waste of medication solutions; 3) a decrease in potential preparation errors by the respiratory therapists; 4) standardization and accuracy of respiratory medication dosages; and 5) a more equitable method of charging patients.

**Developing an educational safety program for pharmacy employees.**

Hayman JN  
Hosp Pharm ,Feb 1980, 15 (2) p56-60, ISSN 0018-5787  
Journal Code: G98  
Languages: ENGLISH

The need for developing educational safety programs for pharmacy employees is discussed. A three-part program is offered as a guide for structuring a departmental safety program. Part I deals with environmental hazards such as wet floors, poor lighting, and cluttered walk areas. Precautions that should be taken to avoid accidental exposure to patients with communicable diseases are also included. Hazards that may result from improper handling of materials or equipment are addressed in Part II. Included are precautions for handling chemicals, needles, ladders, and electrical equipment. Proper methods of lifting heavy objects are also discussed. Part III details plans to protect staff members in the event of a fire. Plans for reporting fires and evacuating the pharmacy and hospital are discussed. The outlined program requires self-study by staff members during initial employee orientation, followed by annual retraining. Employees are tested and graded on safety topics, and training records are filed for future reference. The program outlined is thought to offer a simple yet effective means of acquainting staff members with established institutional and departmental safety procedures.

**Making pediatrics residency training a community affair.**

Greenberg LW  
Hosp Med Staff ,Mar 1980, 9 (3) p2-9, ISSN 0090-0710  
Journal Code: G93  
Languages: ENGLISH

A successful community pediatrics residency training program was created through a university/community hospital affiliation agreement. Residents get firsthand experience with children on an ambulatory basis through the special office rotation program, and they are exposed to a broad panorama of pediatrics that is not primarily tertiary in nature. Residents also become familiar with community hospital settings--the facilities that they will use most often in their careers.

**'Invisible' resource: women for boards.**

Schwartz FN  
Harv Bus Rev ,Mar-Apr 1980, 58 (2) p6-8, 12-4, 18, ISSN 0017-8012  
Journal Code: GBE  
Languages: ENGLISH

Despite the increased appearance of women on corporate boards in recent years, only 1.8% of the directors of the top 1,300 boards are women. Almost without exception, these women have been highly "visible" for their achievements in government, education, and nonprofit circles. But there are hundreds of other high achievers who are not so visible. The problem for chairmen and nominating committees is two-fold: (1) identifying and selecting the best of this "unknown" but talented pool of candidates and (2) defining and communicating their expectations from women.

**Instilling activism in trustees.**

Stern AR  
Harv Bus Rev ,Jan-Feb 1980, 58 (1) p24-6, 28, 32, ISSN 0017-8012  
Journal Code: GBE  
Languages: ENGLISH

One of the great challenges in America today is the stewardship of its not-for-profit institutions. While the profit motive may be absent in the running of such organizations, the demand for thoughtful budgeting, cost accounting, and financial skills still exists. Voluntary community hospitals in particular--given the economic realities of the day--need leadership, reciprocal education, and future planning. Speaking from his own experience, the author presents an activist's perspective on hospital boards; but service to other types of not-for-profit institutions involves similar demands for change.

**Trends in training: focus on emergency medicine.**

Anwar RA

Ann Emerg Med ,Feb 1980, 9 (2) p60-71, ISSN 0196-0644  
Journal Code: 4Z7

Languages: ENGLISH

A research project was developed to study the process of professional socialization in graduate medical education by describing and analyzing the development of emergency medicine residencies in comparison to those of surgery and internal medicine. Based on the assumption that residency programs have a profound impact on the quality, distribution, and career patterns of physicians, researchers surveyed residents and residency directors in the three specialty groups to determine the following: characteristics of founders of the programs, factors influencing physicians to enter a specialty, variations in residency program organization and structure, and career patterns of physicians entering the specialty. Implications are drawn from the data and applied to the development of residency training. Anwar RAH: Trends in training: focus on emergency medicine.

**Effective algorithm-based triage and self-care protocols: quality medicine at lower costs.**

Vaughn PB; Wolcott BW; Dupont S

Ann Emerg Med ,Jan 1980, 9 (1) p55-60, ISSN 0196-0644  
Journal Code: 4Z7

Languages: ENGLISH

The triage phase of an algorithm-based medical care system was analyzed in three military patient environments. Combat medics triaged 4,799 patients using a physician-prepared triage manual which specified levels of initial health care based on the patient's presenting complaints and a brief history. Evaluation indicated that 36% of those reporting for sick call were eligible for treatment by medically appropriate self-care protocols. Of the remaining 64%, all but 4% could receive initial evaluation by non-physician health care extenders. The study demonstrates that personnel receiving basic medical training and orientation to an algorithm-directed triage system can direct military patients to appropriate levels of health care.

**Guidelines for hospital emergency medical service in a university hospital in France: a progress report.**

Murat JE; Vaur JL; Bernard JL; Pasdeloup J

Am J Surg ,Feb 1980, 139 (2) p240-3, ISSN 0002-9610  
Journal Code: 3Z4

Languages: ENGLISH

The emergency department has become a major portal of entry in university hospitals for patients with life-threatening conditions as well as for nonurgent cases. A fourfold increase in 10 years (28,263 patients in 1977) allows an analysis of

admissions according to the Abbreviated Injury Scale and of the value of diagnosis. Results emphasize the need for complementary surgical consultant and operator structures, a rapid and good quality approach and a specific coordination on an equal basis between the emergency department and other specialized departments. Teaching of practical emergency care should be adapted and increased.

**Optimal use of portable and stat examination.**

Eisenberg RL; Akin JR; Hedgcock MW

AJR ,Mar 1980, 134 (3) p523-4, Journal Code: 3AE

Languages: ENGLISH

Using previously published criteria for "justification" of requests for portable and stat radiographs, a prospective study was instituted in a 300-bed teaching hospital. The rates of "unjustified" portable and stat examinations were 5% and 10%, respectively, significantly lower than in a previous study. The results indicate that close cooperation between radiologists and referring clinicians and proper education of house staff can result in more optimal use of these valuable, though often overused, techniques.

**Sickle cell centers of tomorrow. Part I: Regional information centers.**

Diggs LW  
South Med J ,Feb 1980, 73 (2) p188-91, ISSN 0038-4348  
Journal Code: UVH

Languages: ENGLISH

Regional sickle cell organizations are needed to assemble, catalogue, and distribute information, to maintain teaching programs, to serve as referral agencies, and to aid individuals with sickle cell hemoglobinopathies in obtaining maximal benefit from existing community services. The governing body should be representative of the entire area. More than half of the voting members should be adults with the sickle cell trait or sickle cell disease and/or their relatives. A suggested minimal staff could consist of a secretary-librarian and a director. The usefulness of the "Center" to patients, especially at the time of their recurrent painful episodes, could be greatly extended by the maintenance of a 24-hour telephone answering service. Funding of the "Regional Sickle Cell Information Center" by the United Way is recommended.

**Evaluation of television consultations between a large neonatal care hospital and a community hospital.**

Jones PK; Jones SL; Halliday HL  
Med Care ,Jan 1980, 18 (1) p110-6, ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

Two-way television consultations between community hospital nurses and neonatologists at a nearby teaching hospital were conducted over a two- and one-half year period of time and were evaluated with respect to a baseline time period in which the television was not available. Screening for illness and prematurity in neonates occurred in a high risk population residing in a black, economically deprived, innercity area. Outcomes including transfer of sick babies from the community hospital to the large teaching hospital are analyzed in relation to prenatal maternal risk characteristics. Apgar scores, birth weight and gestational age. Evidence available suggests that television consultations facilitated formation of appropriate criteria for interhospital transfer and that routine clinical screening tests were performed more consistently following initiation of interhospital consultations.

**Organization and operation of a home parenteral nutrition program with emphasis on the pharmacist's role.**

Gaffron RE; Fleming CR; Berkner S; McCallum D; Schwartz N; McGill DB

Mayo Clin Proc ,Feb 1980, 55 (2) p94-8, ISSN 0025-6196  
Journal Code: LLY

Languages: ENGLISH

A home parenteral nutrition program was organized at Mayo Clinic-Rochester Methodist Hospital in 1975. To date, 26 patients with chronic malnutrition usually due to either severe short bowel syndrome or extensive Crohn's disease have been trained in home parenteral nutrition for a total treatment period of 430 patient-months. Home parenteral nutrition is an attractive alternative for these patients in that it dramatically improves nutrition, promotes rehabilitation at home, and probably decreases long-term expenses. The numerous medical, psychosocial, and financial problems confronting patients on home parenteral nutrition are managed through a multispecialty team consisting of physicians, pharmacists, nurse, social worker, dietitian, physiatrist, psychiatrist, and business manager. The pharmacist is the person with whom the patient has the most contact during a 2-week training period. In addition to patient education, the pharmacist coordinates the transition to home care, offers in-service education on home parenteral nutrition to nurses and house officers, tests and evaluates the equipment, coauthors a training manual, and edits a quarterly newsletter to patients who are on home parenteral nutrition.

**Perceptions of the family physician by patients and family physicians.**

Hyatt JD

J Fam Pract ,Feb 1980, 10 (2) p295-300, ISSN 0094-3509

Journal Code: I4L

Languages: ENGLISH

The professional definition of the family physician is not based on research that considers both patient and family physician perceptions. Questionnaire responses from 86 family physicians and 287 patients from ten family practices in Los Angeles were analyzed to compare their attitudes, perceptions, and expectations of the family physician. Both groups agreed the family physician could handle most medical problems (including hospital care), should provide continuity, should emphasize preventive medicine, and should be caring. The physician's manner and skill were felt equally important. Family physician and patient expectations conflicted in four major areas: referral, the handling of emotional problems, concern with and care of family, and the issue of autonomy. Such research may help the development of family practice and improve the patient-family physician relationship through improved graduate and continuing medical education for family physicians.

Shaul S; Morrey L

Hosp Community Psychiatry ,Mar 1980, 31 (3) p175-9, ISSN 0022-1597

Journal Code: GCJ

Languages: ENGLISH

The issue of whether sex education programs should be offered in public psychiatric facilities is delicate and complex. It raises a number of questions about the sexual rights of patients and whether the programs help or harm them. The authors discuss such issues and describe a sex education

program for patients in the adult transitional living program at Western State Hospital. They believe such a program is necessary for patients who will be released from the hospital and thus expected to cope with the complexities of society. Staff members also attended educational sessions to give them an opportunity to discuss sexual issues. Recommendations for others interested in setting up a sex education program are included.

**Regulation, adaptation, and leadership in psychiatric facilities.**

Astrachan BM

Hosp Community Psychiatry ,Mar 1980, 31 (3) p169-74, ISSN 0022-1597

Journal Code: GCJ

Languages: ENGLISH

The public policies of the sixties led to new organizational forms, expansion, significantly increased services, and inflation. The policies of the seventies, characterized by cost containment and regulation, have dramatically modified health care institutions. The impact of changing public policy and regulation is mediated by the effectiveness of executive groups, whose members must have the skills to ensure that institutional values are preserved during organizational changes. The author maintains that the future of health care organizations lies primarily in their members' clinical competency and commitment to excellent practice, but is also dependent on their knowledge of such administrative tasks as planning and budgeting and the management of the physical plant and its employees.

**Multidisciplinary team malfunctioning on a state hospital unit: a case study.**

Gomez EA; Ruiz P; Langrod J  
Hosp Community Psychiatry, Jan 1980, 31 (1) p38-40,  
ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

The use of multidisciplinary teams in the care of psychiatric patients can be countertherapeutic unless attention is paid to the dynamics of team functioning. The authors present a case study of team malfunctioning on an inpatient unit in a state hospital that resulted from staff's role confusion and insecurity. Patient care was relegated to second place as major interpersonal conflicts among the staff were played out along ethnic and cultural lines. Resolution of the conflicts required identifying their source, clarifying staff roles, and initiating a special inservice training program focused primarily on the needs of paraprofessional staff.

**Emergency medical services: teamwork to fight sudden death.**

Garvin JM; Miller KP  
Va Med, Jan 1980, 107 (1) p47-9, ISSN 0146-3616  
Journal Code: X6S

Languages: ENGLISH

It is estimated that upwards of 20% of accidental highway

and prehospital coronary deaths could be averted by the availability of prompt, effective prehospital care; this implies that approximately 35,000 deaths from myocardial infarctions and 12,000 deaths from vehicular trauma are preventable. So, statistically, are 13,000 deaths from cerebrovascular accidents, poisonings, drowning, and other accidents. There are nearly 12 million nonfatal injuries each year, the suffering, cost and disabilities of which are incalculable. It is clear that these statistics demand some type of unified multi-professional response. Although not perfect, Emergency Medical Services is clearly the most effective available means of reversing the present rates of sudden death and disability.

**A model for statement of privileges of medical students within the AHEC systems.**

Berens L; Nicholson RM

J Med Educ ,Jan 1980, 55 (1) p23-6, ISSN 0022-2577

Journal Code: J13

Languages: ENGLISH

A combination of factors has resulted in medical students being placed in hospitals not accustomed to their presence. These factors include expansion of the number of medical students in United States schools, an increasing emphasis on primary care education, and the strengthening of medical education programs in hospitals and area health education centers (AHEC) not previously utilized as medical education facilities. The introduction of the students has caused some confusion in these hospitals which may contribute to less than optimal medical education. Some of the confusion is attributable to the lack of a clearly defined role for the medical student and the lack of delineation of the responsibility of other personnel in providing and permitting student access to the system. Presented here is a model of privileges and responsibilities which has been introduced in an AHEC with positive effects on the quality of medical education and improvement of interdisciplinary relations.

**A performance comparison: USMG-FMG house staff physicians.**

Saywell RW Jr; Studnicki J; Bean JA; Ludke RL

Am J Public Health ,Jan 1980, 70 (1) p23-8, ISSN

0090-0036 Journal Code: 3XW

Languages: ENGLISH

To determine whether differences exist in the performance of United States Medical Graduate (USMG) and Foreign Medical Graduate (FMG) House Staff physicians, inpatient hospital audits evaluating individual physician performance on patient histories and physical examinations were conducted in 14 Maryland and Pennsylvania non-federal, short-term hospitals. A total of 3,204 medical records were abstracted from eight diagnostic categories for 898 house staff physicians, 556 of which were USMGs and 342 were FMGs. The results from these audits indicate that while there is evidence of a strong hospital/type of physician interaction for many of the diagnoses, there was no significant overall difference in performance of USMG and FMG house staff physicians. The largest and most consistent differences in physician performance were associated with hospital characteristics, not physician characteristics.

**Diagnosis of deep venous thrombosis in the outpatient by venography.**

O'Donnell TF Jr; Abbott WM; Athanasoulis CA; Millan VG; Callow AD

Surg Gynecol Obstet ,Jan 1980, 150 (1) p69-74, ISSN

0039-6087 Journal Code: VBD

Languages: ENGLISH

One hundred and two patients, presenting at the outpatient departments of two Boston teaching hospitals, underwent clinical examination and venography. History, physical examination and presence of risk factors were unreliable in the diagnosis of deep venous thrombosis. Seventy-two per cent of the patients with deep venous thrombosis had a proximal extension of the thrombus to the femoral vein or higher. The outpatient with deep venous thrombosis appears to differ from the more frequently studied inpatient in the time of diagnosis and its anatomic extent. The high incidence of false-positive clinical examination results has important cost-benefit implications.

**Effect of structured preparation for transfer on patient anxiety on leaving coronary care unit.**

Toth JC  
Nurs Res ,1980, 29 (1) p28-34, ISSN 0029-6562 Journal Code: 09K

Languages: ENGLISH

This study compared the effect of teaching methods on patient anxiety after leaving the coronary care unit. Twenty myocardial infarction patients were studied; half received from the investigator structured pretransfer teaching designed to orient them to differences in the environment and care in the progressive unit. All subjects received unstructured pretransfer teaching by CCU nurses. Data were analyzed using a two-tailed t test for independent groups with a .05 alpha. As measured by a psychological questionnaire, no statistical differences were found in patient anxiety between groups at the time of transfer. However, the anxiety level of subjects who received structured pretransfer teaching was significantly lower than the anxiety level of control subjects on each of four physiological parameters measured: systolic blood pressure the day and time of transfer and heart rates the day and time of transfer. An indication exists, therefore, that a structured pretransfer teaching program is a more appropriate type of nursing intervention than an unstructured one.

**Ambulatory medical care: a comparison of internists and family-general practitioners.**

Noren J; Frazier T; Altman I; DeLozier J  
N Engl J Med ,Jan 3 1980, 302 (1) p11-6, ISSN 0028-4793  
Journal Code: NOW

Languages: ENGLISH

We analyzed data from the National Ambulatory Medical Care Survey to compare the style of practice of two primary-care providers, general internists and family-general practitioners. Whereas internists spent 18.4 minutes with the average patient, family-general practitioners spent 13.0 minutes. Whereas internists used laboratory tests in 73 per cent of visits and x-ray tests in 53 per cent, family-general practitioners used these studies in 34 and 19 per cent of visits. Internists provided instructions regarding health problems in 17.8 per cent of visits, and family-general practitioners in 12.4 per cent. The two provider groups did not differ in terms of therapy for emotional problems, both providing it in a relatively low proportion of visits (3 per cent). Whether by choice or necessity, family-general practitioners spent less time examining and instructing patients, and they ordered fewer laboratory and x-ray studies. The implications of these differences for the cost and quality of primary care need further study.

**Computer use and undergraduate education for computer use in Canadian health care foodservices.**  
Upton EM  
J Can Diet Assoc ,Jan 1983, 44 (1) p64-7, ISSN  
0008-3399 Journal Code: HM9  
Languages: ENGLISH

Surveys were conducted to assess the computer use in 50 selected Canadian health care foodservice facilities and to determine the educational preparation for computer use in seven selected Canadian post-secondary education institutions which educate potential foodservice personnel. Both the foodservices and post-secondary educational institutions selected were represented at two workshops on computer-assisted foodservice management held in June 1980 and in May 1981. Only seven facilities used a computer for foodservice functions; nine foodservices planned to use a computer within the next two years. A list of applications in use, being planned and of future interest showed the priority

areas for these foodservices. Only one post-secondary educational institution actually had an educational foodservice application for student use. The other six educational foodservice facilities covered the subject matter content by readings, lectures and discussions.

**Self-directed learning of hospital pharmacy residents in western Canada.**

Levchuk JW  
Am J Hosp Pharm ,Jan 1983, 40 (1) p78-83, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

The extent of self-directed learning among hospital pharmacy residents in western Canada was studied. A preresidency questionnaire and a postresidency group interview with a set of questionnaires were used. The residents were asked to list learning projects conducted in their residency programs; these learning projects were categorized as self-directed, mutual-agreement, and preceptor-directed. A postinterview questionnaire was used to obtain postresidency measurements of self-directedness and resident autonomy. Twenty-four residents provided data on 164 learning projects. Projects with the most meaningfulness, high achievement contribution, positive motivation, and relevance corresponded with the self-directed approach. Residents who had more meaningful learning entered their residencies with no more self-directedness than other residents, but they did have more autonomy in their residencies. No particular type of project, with respect to learner autonomy, was found to be more problematic than the others. Facilitation of learner autonomy in a hospital pharmacy residency may increase the value of self-directed learning projects in general and improve the resident's self-directedness. Self-directed learning should continue to be part of residency programs.

Microcomputer applications in anesthesiology are increasing rapidly. All areas are affected: research, education, administration and clinical care. In research, microcomputers are accomplishing both process control and analysis, as well as storage of large data banks. In education, computer-aided instruction permits the student to progress at his own speed, while freeing instructor time for individual tutoring. Administrative applications produce more useful information and cost-control with reduced clerical effort. Clinical applications offer the possibility of truly integrated monitoring systems that will make automated anesthesia records possible; eventually this will lead to computer-controlled anesthesia. This paper examines the "state of the art" in applications of microcomputers in anesthesia.

**The content of the medical curriculum at McMaster University: graduates' evaluation of their preparation for postgraduate training.**

Woodward CA; Ferrier BM  
Med Educ ,Jan 1983, 17 (1) p54-60, ISSN 0308-0110

Journal Code: MZ3

Languages: ENGLISH

This paper describes McMaster University medical graduates' perceptions of how well their medical curriculum prepared them for postgraduate training. The graduates view their overall preparation for postgraduate work as sound. These perceptions were compared with independent assessments by internship supervisors for one graduated class. The graduates suggest their preparation for postgraduate work differs somewhat from fellow interns. Graduates reported feeling very well prepared compared to fellow postgraduate trainees in independent learning, self-evaluation and problem solving skills. They also judge their preparation in data gathering skills, behavioural science knowledge, ability to deal with social and emotional problems of patients, medical record keeping skills, preventive, follow-up and in-patient care as very good compared to peers. They identified two content areas, pharmacology and the basic medical sciences, as requiring more attention in the curriculum. These findings are discussed and related to the approach to medical education at McMaster University.

Languages: ENGLISH

Traditional continuing medical education (CME) keeps physicians aware of the state of the art. It has limitations, however, as a quality-assurance tool: it is memory based, involves a group endeavor with diffuse goals, often unrelated to practice, is an inappropriate remedy for many problems in patient care, is hampered by poor-quality evaluation, and is governed more by market factors than educational outcomes. The self-study of practice and practice-linked CME offer rich potential for development. The physician's monitoring of his work, with appropriate improvements in performance, is valuable CME. Computers provide facts and guidance at the time and place the physician is developing diagnostic plans, diminishing reliance on memory. The next step in CME is for hospitals, societies, and medical schools to perfect methods of self-study of practice and practice-linked CME.

**Dermatologic practice: implications for a primary care residency curriculum.**

Branch WT Jr; Collins M; Wintroub BU  
J Med Educ ,Feb 1983, 58 (2) p136-42, ISSN 0022-2577  
Journal Code: J13  
Languages: ENGLISH

The problems encountered, diagnostic procedures performed, and treatments prescribed in dermatology were studied in a primary care practice and in a dermatology clinic. Referrals from a primary care practice to a dermatology practice were analyzed. It was determined that nine disease categories accounted for more than 75 percent of the problems encountered in both settings. Only one diagnostic procedure was performed commonly in both the primary care and dermatology practices--skin scraping for fungal infection. Approximately 90 percent of the treatments prescribed in both settings fell within 13 categories. It is proposed that these findings be the basis for designing the curriculum in dermatology for residents in primary care medicine. The curriculum also should provide practical experience in dermatology and familiarity with selected, rarely encountered dermatologic conditions that have important therapeutic implications.

**Decision-making among emergency room residents: preliminary observations and a decision model.**

Quick JD; Moorhead G; Quick JC; Gerloff EA; Mattox KL; Mullins C  
J Med Educ ,Feb 1983, 58 (2) p117-25, ISSN 0022-2577  
Journal Code: J13  
Languages: ENGLISH

Emergency room residents face a range of clinical decisions and often call on senior residents or faculty members for help. The individual clinical decision process has frequently been analyzed, but little attention has been given to the

social process in clinical decision-making. Based on data from interviews and over 100 hours of direct observation at two large urban general hospitals with busy emergency rooms staffed by medical and surgical residents, the authors suggest there are five basic decision situations. In each situation, the residents appeared to follow implicit decision patterns about involving other medical and surgical staff in the final clinical decision. The decision situations are nonacute, routine acute, nonroutine acute, multispecialty acute, and crisis. These situations call for individual, consultive, or consensual patterns in making decisions. The consequences of these patterns are explored. Improving residents' decision-making should contribute to improved understanding of the resident's role, better resident supervision, and better emergency room functioning.

**Pediatric behavioral science in family practice.**

Poole SR  
J Fam Pract ,Feb 1983, 16 (2) p365-74, ISSN 0094-3509  
Journal Code: I4L  
Languages: ENGLISH

Behavioral science is a well-accepted component of family practice, but official guidelines and proposed curricula have a predominantly adult focus. This paper describes a pediatric behavioral science curriculum for family practice residents that has been successfully integrated into the three-year family practice residency curriculum at the University of Colorado. Details of development and implementation are presented: the requisite knowledge base, skills, and attitudes; the core pediatric behavioral science topics and diagnoses; the family physician's role in handling each core diagnosis; guidelines for making management decisions; suggested approaches to teaching the curriculum; and a reference list for behavioral science faculty.

**A model for teaching ethics in a family practice residency.**  
 Self DJ; Lyon-Loftus GT  
 J Fam Pract ,Feb 1983, 16 (2) p355-9, ISSN 0094-3509  
 Journal Code: I4L  
 Languages: ENGLISH

The model used for teaching ethics at the Ghent Family Medicine Residency at Eastern Virginia Medical School consists of a monthly one-hour noon conference integrating ethical principles and clinical decision making. The underlying objective is to help produce effective physicians by developing their knowledge, skills, and attitudes. The model combines didactic material and clarification of personal values in a case study format. The most important kind of learning to be derived is the self-awareness of one's own value structure and its contribution to the clinical decision-making process. Such a conference will succeed in capturing resident participation in direct proportion to faculty support. Medical ethics teaching in family medicine is appropriate, important, and consistent with the principles of a good family practice residency. An illustration of a typical ethics noon conference on confidentiality is given.

**Geriatric medical education: a project in faculty development.**

Wallace RK; Ford AB; Wallace RW  
 J Am Geriatr Soc ,Feb 1983, 31 (2) p106-8, ISSN 0002-8614 Journal Code: H6V  
 Languages: ENGLISH

To increase the competence of physicians to practice and teach geriatric medicine, the Office of Geriatric Medicine at Case Western Reserve University School of Medicine in Cleveland, Ohio, offered an 11-week course to interested physicians on the faculty. This course, "Medical Management of the Aged--A State of the Art Symposium for Medical Faculty," was conducted as part of an overall plan of the Office to enhance faculty and curriculum development in geriatrics within the School. The weekly sessions consisted of clinical and research information presented by recognized experts in the field of geriatric medicine. Of the 52 formal registrants, 79 per cent were physicians and were from such fields of specialization as internal medicine, family medicine, and psychiatry. The mean attendance was 37. An overview and evaluation of the geriatric faculty development program is given.

**Surgical residency evaluation by residents.**

Beauchamp G; Des Marchais JE; Dulude J  
 Can J Surg ,Jan 1983, 26 (1) p75-8, ISSN 0008-428X  
 Journal Code: CKJ  
 Languages: ENGLISH

A multiple-choice questionnaire was designed so that surgical residents could evaluate their residency program. It was answered anonymously by 344 residents, four times during a 2-year period, at different stages of training. The answers were analysed, comparing individual hospitals and individual programs within the department. The weaknesses and strengths of the department could be identified by the residents. This identification of problems has brought about major changes in the attitudes of staff surgeons towards teaching. The authors believe that the residents' opinions are essential to amend and improve the quality of postgraduate education.

**Report of the Graduate Medical Education National Advisory Committee and health manpower development.**

Pardes H; Pincus HA  
 Arch Gen Psychiatry ,Jan 1983, 40 (1) p97-102, ISSN 0003-990X Journal Code: 72C  
 Languages: ENGLISH

The federally chartered Graduate Medical Education National Advisory Committee projected a shortage of approximately 12,000 general and child psychiatrists by 1990. The committee's methods of analysis and recommendations have been criticized on grounds ranging from the accuracy of its data to the appropriateness of federal involvement in free-market issues. Yet the GMENAC report appears to have contributed to a recent reversal of psychiatric recruitment trends, and psychiatrists should be aware of its further implications for clinical and academic psychiatry. We analyzed the GMENAC process as one element among many that will determine future health care personnel development trends.

**A longitudinal study of residency-trained emergency physicians.**

Anwar RA

Ann Emerg Med ,Jan 1983, 12 (1) p20-4, ISSN 0196-0644  
Journal Code: 427

Contract/Grant No.: HSO2129

Languages: ENGLISH

An annual survey of emergency medicine (EM) graduate physicians from 31 programs was conducted from 1977 through 1979. Results of the 1979 data are presented. Practice patterns show that 96% of the EM graduates are providing patient care, and almost half are working in the states in which they trained. Of those caring for patients, 38.8% practice in an urban location and only 7% work in rural hospitals. Learning new skills and procedures and retaining skills are major problems faced by physicians in rural locations. Other activities of EM graduates include teaching medical students and residents, administration, research, and community emergency medical services. Data are analyzed with attention to long-term commitment to emergency medicine. Implications for manpower needs are suggested.

0227280 83098026

**Underrecognition of patients' psychosocial distress in a university hospital medical clinic.**

Thompson TL 2d; Stoudemire A; Mitchell WD; Grant RL

Am J Psychiatry ,Feb 1983, 140 (2) p158-61, ISSN 0002-953X  
Journal Code: 3VG

Languages: ENGLISH

Seventeen areas of psychosocial distress were evaluated in 87 university hospital internal medicine clinic patients by a self-administered questionnaire and a psychiatric interview. These patients' internists then predicted the patients' distress level in each area. Their predictions correlated significantly with their patients' self-reports of distress-level problems in only 3 of the 17 areas. Even when the internists felt that they had sufficient information to make an accurate prediction, their perceptions were often erroneous, including evaluations of such areas as suicidal ideation and drug use. These data suggest the need for active psychiatric education components in internal medicine training programs.

0227239 83097561

**Impact of inter-physician communication on the effectiveness of medical consultations.**

Lee T; Pappius EM; Goldman L

Am J Med ,Jan 1983, 74 (1) p106-12, ISSN 0002-9343  
Journal Code: 3JU

Languages: ENGLISH

To evaluate the impact of the inter-physician communication on the effectiveness of consultations, consultations performed by general and subspecialty medical consultation services for

one week both early and late in the academic year were prospectively evaluated. Physicians commonly requested consultations to get advice on diagnosis (56 percent), advice on management (37 percent), or assistance in arranging or performing a procedure or test (20 percent). Despite our very liberal definitions, the requesting physician and the consultant completely disagreed on both the reason for the consultation and the principal clinical issue in 22 (14 percent) of 156 consultations. Consultants were twice as likely as the requesting physicians to rate consultations as crucial for management (35 percent versus 18 percent,  $p = 0.001$ ) because they gave significantly higher ratings when they and the requesting physicians did not agree on the reasons for consultation. Consultations ordered for very specific purposes, such as assistance in arranging or performing a test, were rated significantly higher by the requesting physicians. It was found that breakdowns in communication are not uncommon in the consultation process and may adversely affect patient care, cost effectiveness, and education.

**The extent of volunteer faculty integration in teaching hospital settings.**

Simon J; Zippin D  
J Med Educ ,Jan 1983, 58 (1) p34-8, ISSN 0022-2577  
Journal Code: J13

Contract/Grant No.: T32 MH 14664

Languages: ENGLISH

In a survey conducted by the authors, volunteer faculty members were found to be generally satisfied with their role in medical education, despite their acknowledgement of problems involving respect and responsibility when working with academic colleagues. These problems and the indifference of the volunteers to them are delineated. The structural reasons for simultaneous recognition of an indifference to problems are discussed in relation to the erosion of the utilization and authority of volunteer faculty members.

**Baccalaureate preparation for medical school: does type of degree make a difference?**

Zeleznik C; Hojat M; Veloski J  
J Med Educ ,Jan 1983, 58 (1) p26-33, ISSN 0022-2577  
Journal Code: J13

Languages: ENGLISH

Four groups of medical school matriculants (43 with a B.A. degree in social sciences, 68 with a B.A. degree in the humanities, 49 with a B.A. degree in science, and 40 with a B.S. degree in science) were studied. No significant difference was found among the four groups on yearly grade-point averages in medical school or on parts I, II, and III of the examinations of the National Board of Medical Examiners. Those with an undergraduate degree in the humanities considered leaving medical school more frequently than the others. A substantial proportion of medical students with an undergraduate major in the sciences and social sciences reported they would choose the humanities if they were once again high school seniors. Those with a science background were disproportionately more likely than the others to choose residencies in internal medicine and surgery, and those with undergraduate degrees in the humanities and social sciences were more likely to choose psychiatry residencies.

**Predicting performance during clinical years from the new Medical College Admission Test.**

Carline JD; Cullen TJ; Scott CS; Shannon NF; Schaad D  
J Med Educ ,Jan 1983, 58 (1) p18-25, ISSN 0022-2577  
Journal Code: J13

Languages: ENGLISH

The results of a predictive validity study of the new Medical College Admission Test (MCAT) using criteria from the clinical years of undergraduate medical education are presented and discussed. The criteria included course grades

and faculty ratings of clerks in internal medicine, surgery, obstetrics and gynecology, pediatrics, and psychiatry; scores on a comprehensive test of clinical knowledge (including patient management type examinations); and scores on Part II of the examinations of the National Board of Medical Examiners (NBME). While the validity coefficients of the MCAT with the Part II examinations ranged from .03 to .47, they were higher than those of undergraduate grade-point averages with the same criteria. The implications of the small-to-medium size validity coefficients for admissions are discussed.

**Practice management training in family practice residencies.**

Kellerman R  
J Fam Pract ,Jan 1983, 16 (1) p173-6, ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

Recent surveys have suggested that practice management instruction in family practice residency programs is inadequate. The majority of third-year family practice residents graduating in 1980 felt inadequately trained in nearly all aspects of practice management. Thirty-five percent of these residents noted that their residency programs offered no regularly scheduled time for practice management training. Results of four family practice residency graduate follow-up surveys showed that no fewer than 25 percent and, often, 60 to 80 percent of graduates felt underprepared in most areas of practice management.

**Emergency department chart auditing in a family practice residency program.**

Grauer K

J Fam Pract ,Jan 1983, 16 (1) p121-6, ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

A prospective audit of process on 1,200 consecutive patients seen in the emergency department by family practice residents was performed at the Family Practice Residency Program in Gainesville, Florida. The overall quality of care delivered conformed to the standards of "good medical care" as judged by the author in 85.6 percent of cases. Resident errors were detected in the remaining 14.4 percent of cases, and occurred most frequently among physicians in the earlier years of training (P less than .005). Ultimate patient management was changed by the audit in only 1 percent of cases but potentially had an important impact on the care of these patients. Errors of inadequate documentation were common among residents irrespective of their level of training. An ongoing audit of emergency department charts with regular feedback on medical process and recording appears to be useful both as an educational tool and as a method of improving emergency care.

**Extended care in nursing homes: a program for a county teaching medical center.**

Breitenbacher RB; Schultz AL

Ann Intern Med ,Jan 1983, 98 (1) p96-100, ISSN  
0003-4819 Journal Code: 5A6

Languages: ENGLISH

A continuity care program for patients in nursing homes using internal medicine residents in training has been developed in a county teaching hospital. Resident physicians on a paid basis assume primary care responsibility for 1000 patients in 29 private community nursing homes. A faculty internist coordinates the activities of the residents and

monitors patient care through an extended care office in the county hospital. The program has produced a significant upgrading of the continuity and quality of care of patients in these nursing homes as well as providing medical residents with geriatric and nursing home experience. The increased sensitivity and concern for the needs of nursing home patients developed by the medical residents seems to continue after they complete their training.

**Work sampling: a means of determining physiotherapy activities and reviewing caseloads.**

Allen JM

Physiother Can ,Jan-Feb 1983, 35 (1) p31-5, ISSN

0300-0508 Journal Code: PCP

Languages: ENGLISH

Work sampling is a tool used to examine the activities involved in performing a job. A work sampling study was designed to examine the components of physiotherapy care in a 350-bed teaching hospital. The components were related to a physiotherapist's activities and included an examination of the time related to patient treatment, attendance at meetings, record-keeping and preparation, travel, teaching, continuing education (in-service), talking to colleagues (doctors, occupational therapists), and other activities. The purpose of the study was to quantify a therapist's nontreatment activities, and to compare observations concerning treatment with the work sampling data obtained in compliance with the Canadian Schedule of Unit Values and, in particular, its weighted units. The study showed that there was no difference between the "observed" time (sampling time in percentage of total time) spent in direct patient contact, and the weighted units, when the latter was converted to a percentage of time. The Nova Scotia government's standard of 50 000 work units per year was found to be useful in justifying staffing levels; a useful indicator of productivity was also developed using weighted units expressed as a percentage of worked or paid hours. Work sampling would thus appear to be a useful tool for physiotherapy department managers.

Clearly, the department of education has an important role to play in assisting the hospital to become more effective and efficient. The key competencies required of today's manager and practitioner are educational needs assessment, evaluation, and measurement. ASHET educational programs, including the highly successful teleconference "Productivity and Performance Improvement" broadcast nationally last fall, are addressing this need for increased knowledge and skill in educational diagnosis. The key to the success of the health care education and training field depends, to a large extent, on the value, productivity, quality, and cost-effectiveness of our education programs and activities. With the advent of cost-per-case reimbursement, these will play an increasingly important part in the expectations that will be placed on education in the coming years.

**Self-directed learning of hospital pharmacy residents in western Canada.**

Levchuk JW

Am J Hosp Pharm ,Jan 1983, 40 (1) p78-83, ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

The extent of self-directed learning among hospital pharmacy residents in western Canada was studied. A preresidency questionnaire and a postresidency group interview with a set of questionnaires were used. The residents were asked to list learning projects conducted in their residency programs; these learning projects were categorized as self-directed, mutual-agreement, and preceptor-directed. A postinterview questionnaire was used to obtain postresidency measurements of self-directedness and resident autonomy. Twenty-four residents provided data on 164 learning projects. Projects with the most meaningfulness, high achievement contribution, positive motivation, and relevance corresponded with the self-directed approach. Residents who had more meaningful learning entered their residencies with no more self-directedness than other residents, but they did have more autonomy in their residencies. No particular type of project, with respect to learner autonomy, was found to be more problematic than the others. Facilitation of learner autonomy in a hospital pharmacy residency may increase the value of self-directed learning projects in general and improve the resident's self-directedness. Self-directed learning should continue to be part of residency programs.

**Supervised versus independent student laboratories.**

Kloth LC; Morrison MA

Phys Ther ,Feb 1983, 63 (2) p225-8, ISSN 0031-9023  
Journal Code: P6W

Languages: ENGLISH

The purpose of this study was to determine if classroom laboratory time could be reduced in a basic physical agents course. Fifty-seven junior physical therapy students were randomly assigned to three laboratory sections. All students received identical lectures, demonstrations, course materials, and laboratory manuals. The control group, Section 1, received supervision and assistance during laboratory practice. Students in Section 2 and Section 3 worked independent of instructor supervision but could receive assistance from the instructor in an adjacent room. Students in Section 2 were provided with feedback following periodic assessment by the instructor. Attitudinal questionnaire responses indicated that the students preferred the supervised laboratory section. The presence of the instructor during classroom laboratory practice of basic physical agents did not affect student performance. Comparison of written and practical examination results indicated no significant differences in student performance. Classroom laboratory time for faculty and students was reduced when students worked independently.

**Task analysis in neurosciences programme design--neurological problems in general practice.**

Gledhill RF

S Afr Med J ,Feb 5 1983, 63 (6) p206-8, ISSN 0038-2469  
Journal Code: U4R

Languages: ENGLISH

Defining educational objectives is the key to achieving the goal of professional competence in students. The technique of task analysis was selected to determine components of competence in clinical neurology appropriate to the needs of primary care. A survey of neurological problems in general practice revealed that these constitute a significant proportion of consultations, and that teaching programmes have failed to provide the appropriate knowledge and skills to manage the commonest problems effectively. Consideration is given to innovations in curriculum and programme design whereby the graduating student might be more suitably prepared to give primary care.

**Transcutaneous electrical nerve stimulation for postlaparotomy pain.**

Schomburg FL; Carter-Baker SA  
Phys Ther ,Feb 1983, 63 (2) p188-93, ISSN 0031-9023  
Journal Code: P6W

Languages: ENGLISH

This study was designed to evaluate the transcutaneous electrical nerve stimulation (TENS) postoperative program administered by a physical therapy department. A surgeon, a physical therapist, a recovery room nurse, and unit nurses participated in the program which included preoperative evaluation and patient education, application of sterile electrodes parallel to the incision in the operating room, TENS activation in the recovery room, follow-up visits, and data collection. Seventy-five patients who underwent laparotomy and received TENS at the most comfortable machine settings were compared by chart review to 75 patients who had undergone similar surgical procedures performed by the same surgeon before TENS postoperative pain management had been instituted. The TENS was applied for an average of five days; machine settings of intensity, frequency, and pulse width tended to be midrange. The TENS group took significantly less pain medication, but the length of hospital stay was not significantly different. Patients with TENS rated their pain on 10-point scales as more intense than uncomfortable. This study demonstrated that a well-structured interdisciplinary program of postoperative TENS management can reduce the amount of pain medication taken by patients after laparotomy.

**The content of the medical curriculum at McMaster University: graduates' evaluation of their preparation for postgraduate training.**

Woodward CA; Ferrier BM  
Med Educ ,Jan 1983, 17 (1) p54-60, ISSN 0308-0110  
Journal Code: M23

Languages: ENGLISH

This paper describes McMaster University medical graduates' perceptions of how well their medical curriculum prepared them for postgraduate training. The graduates view their overall preparation for postgraduate work as sound. These perceptions were compared with independent assessments by internship supervisors for one graduated class. The graduates suggest their preparation for postgraduate work differs somewhat from fellow interns. Graduates reported feeling very well prepared compared to fellow postgraduate trainees in independent learning, self-evaluation and problem solving skills. They also judge their preparation in data gathering skills, behavioural science knowledge, ability to deal with social and emotional problems of patients, medical record keeping skills, preventive, follow-up and in-patient care as very good compared to peers. They identified two content areas, pharmacology and the basic medical sciences, as requiring more attention in the curriculum. These findings are discussed and related to the approach to medical education at McMaster University.

**The use of computerized learning in intensive care: an evaluation of a new teaching program.**

Skinner JB; Knowles G; Armstrong RF; Ingram D  
Med Educ ,Jan 1983, 17 (1) p49-53, ISSN 0308-0110  
Journal Code: M23

Languages: ENGLISH

A computer-assisted learning program in respiratory intensive care was introduced into the undergraduate curriculum at University College Hospital. Educational effectiveness was assessed. This method of learning was found to be highly acceptable to students. The improvement in students knowledge of the subject was up to three times greater in those who used the computer program, than a control group of students who received only teaching by conventional means, ( $P = 0.016$ ). The results of a questionnaire designed to elicit students' attitudes to this learning experience are discussed.

**The Community Project: the teaching implications of applied epidemiology.**

Epstein LM; Tamir A; Spenser T; Perlman S  
 Med Educ ,Jan 1983, 17 (1) p39-44, ISSN 0308-0110  
 Journal Code: MZ3  
 Languages: ENGLISH

The use of the epidemiological method in primary health care (PHC) has become an accepted part of the service. The team will utilize community-oriented data in order to assess the health needs of the population, perform continued surveillance of changes in the health of the people served and for service evaluation. This development in health services has to find its counterpart in the training programme for the future doctor. This paper describes a 6-year experience with a community project carried out in the framework of a clinical clerkship in Family and Community Medicine. The students were able to define the project, collect the data and analyse it, and frequently see the start of the implementation of the recommendations.

**Difficulties in clinical skills evaluation.**

Harper AC; Roy WB; Norman GR; Rand CA; Feightner JW  
 Med Educ ,Jan 1983, 17 (1) p24-7, ISSN 0308-0110  
 Journal Code: MZ3  
 Languages: ENGLISH

A case-specific method of evaluating clinical skills is presented. The instrument is described together with its evaluation based on results from ninety-two medical students. The method involves direct observation, by pairs of teachers, of student encounters with simulated patients. The purpose of this paper is to explore the methodology of assessing clinical competence. Three aspects of this are addressed: reliability between teachers acting as observers, and the relationship of both observations of process measures and self-assessments with the students' understanding of the patient. Three aspects of clinical skills were evaluated; interviewing, problem orientation and physical examination. The results showed the observers to be highly reliable in observing physical examination but to have a wide range of reliability across cases in their observations of the other aspects of clinical skill. There was no correlation between both teachers' observations and the students' self-assessments with the students' understanding of the patient. This is a worrying finding. The implications of this study are that evaluation of the process of clinical skills is difficult methodologically and, added to which, it is not clear what relevance these observations have to clinical competence. Rather than effort being devoted to refining instruments to measure the process of clinical skills it would seem preferable to devote energy to assessing students' abilities in diagnosis and management, at least until we understand what observations of clinical skills are measuring.

**Evaluation of a course on medical microbiology for non-medical graduate scientists from medical microbiological laboratories.**

Harris FT; McSwiggan DA; Hurley R; Hibberd JA  
 Med Educ ,Jan 1983, 17 (1) p17-23, ISSN 0308-0110  
 Journal Code: MZ3  
 Languages: ENGLISH

An assessment of the educational value of a series of courses intended to improve the clinical awareness of non-medical graduate microbiologists has been made. Objective and subjective data were collected by means of questionnaires, pre- and post-course multiple choice tests and informal discussion. The format of the courses are described. The increase in cognitive knowledge acquired during three of the courses is comparable with results from another study in clinical students. The anomalous results from one of the four courses may be explained in terms of the composition of that course. The data presented contribute to the information required for the evaluation and assessment of educational courses.

Traditional continuing medical education (CME) keeps physicians aware of the state of the art. It has limitations, however, as a quality-assurance tool: it is memory based, involves a group endeavor with diffuse goals, often unrelated to practice, is an inappropriate remedy for many problems in patient care, is hampered by poor-quality evaluation, and is governed more by market factors than educational outcomes. The self-study of practice and practice-linked CME offer rich potential for development. The physician's monitoring of his work, with appropriate improvements in performance, is valuable CME. Computers provide facts and guidance at the time and place the physician is developing diagnostic plans, diminishing reliance on memory. The next step in CME is for hospitals, societies, and medical schools to perfect methods of self-study of practice and practice-linked CME.

**Dermatologic practice: implications for a primary care residency curriculum.**

Branch WT Jr; Collins M; Wintroub BU

J Med Educ ,Feb 1983, 58 (2) p136-42, ISSN 0022-2577

Journal Code: J13

Languages: ENGLISH

The problems encountered, diagnostic procedures performed, and treatments prescribed in dermatology were studied in a primary care practice and in a dermatology clinic. Referrals from a primary care practice to a dermatology practice were analyzed. It was determined that nine disease categories accounted for more than 75 percent of the problems encountered

in both settings. Only one diagnostic procedure was performed commonly in both the primary care and dermatology practices--skin scraping for fungal infection. Approximately 90 percent of the treatments prescribed in both settings fell within 13 categories. It is proposed that these findings be the basis for designing the curriculum in dermatology for residents in primary care medicine. The curriculum also should provide practical experience in dermatology and familiarity with selected, rarely encountered dermatologic conditions that have important therapeutic implications.

**Decision-making among emergency room residents: preliminary observations and a decision model.**

Quick JD; Moorhead G; Quick JC; Gerloff EA; Mattox KL; Mullins C

J Med Educ ,Feb 1983, 58 (2) p117-25, ISSN 0022-2577

Journal Code: J13

Languages: ENGLISH

Emergency room residents face a range of clinical decisions and often call on senior residents or faculty members for help. The individual clinical decision process has frequently been analyzed, but little attention has been given to the social process in clinical decision-making. Based on data from interviews and over 100 hours of direct observation at two large urban general hospitals with busy emergency rooms staffed by medical and surgical residents, the authors suggest there are five basic decision situations. In each situation, the residents appeared to follow implicit decision patterns about involving other medical and surgical staff in the final clinical decision. The decision situations are nonacute, routine acute, nonroutine acute, multispecialty acute, and crisis. These situations call for individual, consultive, or consensual patterns in making decisions. The consequences of these patterns are explored. Improving residents' decision-making should contribute to improved understanding of the resident's role, better resident supervision, and better emergency room functioning.

**An innovation in physician training: the Clinical Scholars Program.**

Shuster AL; Cluff LE; Haynes MA; Hook EW; Rogers DE  
J Med Educ ,Feb 1983, 58 (2) p101-11. ISSN 0022-2577  
Journal Code: J13

Languages: ENGLISH

The Robert Wood Johnson Foundation Clinical Scholars Program was developed to allow selected physician clinicians to acquire certain skills which are not part of the usual physician's repertoire. Begun in 1969 with support from the Carnegie Corporation and the Commonwealth Fund, funding has been provided since 1973 by the Robert Wood Johnson Foundation. By June 1981, 309 physicians had completed their training as clinical scholars, and a majority were pursuing careers in academic medicine. This paper recounts the factors and forces which led to the initiation and development of the program, its successes and failures, the problems faced, the achievements of clinical scholar alumni, and the program's current status.

Greer DS  
J Am Geriatr Soc ,Feb 1983, 31 (2) p67-70. ISSN  
0002-8614 Journal Code: H6V

Languages: ENGLISH

Hospice is a new system of medical care provision that has undergone remarkable growth and received widespread support in the United States in less than a decade. Its success is apparently related to an accurate reading of social trends and the ability to fill a widely perceived void in the medical profession. Geriatric medicine is developing in the same environment and has not yet established its social or

professional role. A review of the hospice experience suggests directions for the development of geriatric medicine that could promote its growth as a socially useful and professionally desirable new approach to medical education and service.

Wallace RK; Ford AB; Wallace RW  
J Am Geriatr Soc ,Feb 1983, 31 (2) p106-8. ISSN  
0002-8614 Journal Code: H6V

Languages: ENGLISH

To increase the competence of physicians to practice and teach geriatric medicine, the Office of Geriatric Medicine at Case Western Reserve University School of Medicine in Cleveland, Ohio, offered an 11-week course to interested physicians on the faculty. This course, "Medical Management of the Aged--A State of the Art Symposium for Medical Faculty," was conducted as part of an overall plan of the Office to enhance faculty and curriculum development in geriatrics within the School. The weekly sessions consisted of clinical and research information presented by recognized experts in the field of geriatric medicine. Of the 52 formal registrants, 79 per cent were physicians and were from such fields of specialization as internal medicine, family medicine, and psychiatry. The mean attendance was 37. An overview and evaluation of the geriatric faculty development program is given.

A multiple-choice questionnaire was designed so that surgical residents could evaluate their residency program. It was answered anonymously by 344 residents, four times during a 2-year period, at different stages of training. The answers were analysed, comparing individual hospitals and individual programs within the department. The weaknesses and strengths of the department could be identified by the residents. This identification of problems has brought about major changes in the attitudes of staff surgeons towards teaching. The authors believe that the residents' opinions are essential to amend and improve the quality of postgraduate education.

**Audits of antibiotic prescribing in a Bristol hospital.**

Swindell PJ; Reeves DS; Bullock DW; Davies AJ; Spence CE  
Br Med J [Clin Res] ,Jan 8 1983, 286 (6359) p118-22,  
Journal Code: B4X  
Languages: ENGLISH

Audits of antibiotic prescribing were done for periods of up to eight weeks in two successive years on medical, surgical, orthopaedic, gynaecology, obstetric, and urology wards and in an accident and emergency department. Clinical details were matched with antibiotic prescribing, and the appropriateness of the latter was judged independently by two medical microbiologists. Only when they agreed was an individual prescription included in the analysis. Overall, 28% of prescriptions in 1979 and 35% in 1980 were judged as unnecessary, with 17% and 16%, respectively, being for inappropriate choices of antibiotic. An educational programme about antibiotic prescribing carried out between the audits had no beneficial effect overall. Though the results compared favourably with those of audits published, prescribing could still be much improved. To judge by the failure of education, however, this might be difficult to achieve. Most prescriptions were written by junior staff, who in the absence of guidance from their seniors and because of their frequent moves would require a widespread and continual education programme. Published concern about the quality of antibiotic prescribing appears to be justified.

Journal Code: 3XW  
Contract/Grant No.: 1-R25-HL 17016-03; 1-T32-HL 0710-02;

5-PD 50-HS11964-02

Languages: ENGLISH

Three health education interventions for urban poor hypertensive patients were introduced sequentially in a randomized factorial design: 1) an exit interview to increase understanding of and compliance with the prescribed regimen; 2) a home visit to encourage a family member to provide support for the patient's regimen; and 3) invitations to small group sessions to increase the patient's confidence and ability to manage his/her problem. Previous evaluation of the initial two-year experience demonstrated a positive effect of the educational program on compliance with the medical treatment and blood pressure control. Data accumulated over an additional three years, including mortality analysis, are now presented. The study group consisted of the same cohort of 400 ambulatory hypertensive outpatients in the eight experimental and control groups. The five-year analysis shows a continuing positive effect on appointment keeping, weight control, and blood pressure control. All-cause life table mortality rate was 57.3 per cent less for the experimental group compared to the control group (12.9/100 vs 30.2/100, p less than .05), while the hypertension-related mortality rate was 53.2 per cent less (8.9/100 vs 19.0/100, p less than .01). The results from this longitudinal study provide evidence to encourage health practitioners to utilize such educational programs in the long-term management and control of high blood pressure.

JAMA ,Jan 14 1983, 249 (2) p230-6, ISSN 0098-7484  
Journal Code: KFR  
Languages: ENGLISH

Health care for the elderly in the United States remains fragmentary and noncomprehensive despite concern for the needs of an expanding elderly population and a new emphasis on geriatrics. Model health care programs for the elderly have been few and not generally applicable to central city populations. A model health care program has been designed to offer a continuum of comprehensive, multidisciplinary health care to Milwaukee elderly. An acute care unit for the elderly, rehabilitation-oriented nursing home, outpatient clinic, home care service, outreach clinics, rehabilitation day hospital, Alzheimer's Disease Day Care program, and acute geriatric psychiatric unit have been developed and integrated into one continuum of care. The program serves chiefly the frail elderly, who are demonstrated to be markedly impaired physically, mentally, and socially, requiring the services of multiple professionals to enable the patients to achieve maximum independence. Alternatives to institutionalization are emphasized, and geriatric education and research programs are part of the model program.

**Identifying the content of family medicine for educational purposes: an empirical approach.**

Friedman CP; Slatt LM; Baker RM; Cummings SB  
J Med Educ ,Jan 1983, 58 (1) p51-7, ISSN 0022-2577  
Journal Code: J13  
Contract/Grant No.: 2-015-PE8-01-4003  
Languages: ENGLISH

In this article, the authors present a method to assist in curriculum planning and report an application of the method at one institution. Through interviews of 40 selected subjects, the authors identified 27 content elements appropriate for inclusion in a family medicine curriculum for medical students. These elements were organized into four areas portraying family medicine as "a synthesis of content and process," "a field of inquiry," "a career and peer group," and "a value system." A questionnaire employing the method of pair-comparisons was subsequently completed by 38 of the interview subjects, and on the basis of these responses priorities were assigned to content elements within each area. For three of the four areas, there was statistically significant consensus about the priority orderings. Over three years, the content elements themselves and their priority orderings have proved beneficial to curricular planning at the University of North Carolina School of Medicine.

**Practice management training in family practice residencies.**

Kellerman R  
J Fam Pract ,Jan 1983, 16 (1) p173-6, ISSN 0094-3509  
Journal Code: I4L  
Languages: ENGLISH

Recent surveys have suggested that practice management instruction in family practice residency programs is inadequate. The majority of third-year family practice residents graduating in 1980 felt inadequately trained in nearly all aspects of practice management. Thirty-five percent of these residents noted that their residency programs offered no regularly scheduled time for practice management training. Results of four family practice residency graduate follow-up surveys showed that no fewer than 25 percent and, often, 60 to 80 percent of graduates felt underprepared in most areas of practice management.

**Enhancing managerial effectiveness in dietetics.**

Hoover LW

J Am Diet Assoc, Jan 1983, 82 (1) p58-61, ISSN

0002-8223 Journal Code: H6F

Languages: ENGLISH

Environmental pressures from such sources as economic conditions, the government, third-party payers, and inter-institutional competition create managerial challenges. Although cost-containment has received considerable attention, long-term cost-effectiveness is probably the significant issue. Dietitians must become more cost-conscious and effective in resource management to attain desired performance outcomes. Some of the skills and characteristics essential to managerial effectiveness are a marketing orientation, systems design skill, quantitative operations management techniques, financial expertise, and leadership. These abilities facilitate decision-making and achievement of long-term cost-effectiveness. Curriculum enhancement and continuing education are two strategies for improving managerial competency in the dietetics profession. In dietetics education, study of management topics should be enhanced to provide more advanced coverage of management theories and quantitative models so that managerial performance can be at a higher level of sophistication and competency. To assure the viability of the dietetics profession, the emphasis on management must be more comprehensive and rigorous.

When asked how he has been able to effectively stay in one job for so long, the man who has been at the head of one of the nation's largest banking organizations for 16 years, Richard Cooley, chairman, Wells-Fargo Bank, said that he "learned very early that board relations was the most important key to his continuity." Cooley said his strategy over the years has been to meet for dinner about once a year with each member of this board to allow the board member to get to know him, to personally hear the issues that the board member considers most important, and to solicit input on proposed management plans.

**Extended care in nursing homes: a program for a county teaching medical center.**

Breitenbucher RB; Schultz AL

Ann Intern Med ,Jan 1983. 98 (1) p96-100, ISSN

0003-4819 Journal Code: 5A6

Languages: ENGLISH

A continuity care program for patients in nursing homes using internal medicine residents in training has been developed in a county teaching hospital. Resident physicians on a paid basis assume primary care responsibility for 1000 patients in 29 private community nursing homes. A faculty internist coordinates the activities of the residents and monitors patient care through an extended care office in the county hospital. The program has produced a significant upgrading of the continuity and quality of care of patients in these nursing homes as well as providing medical residents with geriatric and nursing home experience. The increased sensitivity and concern for the needs of nursing home patients developed by the medical residents seems to continue after they complete their training.

This study was to determine how effective an activity-centered health curriculum was in providing health information to fourth, fifth and sixth-grade students in the Canton City school system. The assessment was facilitated by a

posttest-only research design. Ten schools were randomly selected to receive a new health program, as compared to a control group of 10 schools which did not. Results indicated that the experimental students achieved significantly higher posttest cognitive knowledge mean scores than the control students. These findings were sustained for each grade level after adjusting for group differences in reading ability.

In 1978, the Task Force on Pediatric Education strongly recommended that all pediatric residency programs include at least one full-time rotation and biosocial pediatric, preferably in the 1st or 2nd year. Since 1977, the University of Maryland has had a structured, integrated, required program in Behavioral Pediatrics, including 2 months in both the PL-1 and PL-2 years for a total of 4 months addition of elective experience is available in the PL-3 year. The development and description of this program is presented as well as a review to the relevant literature.

Various types of intensive training courses to suit radiation workers in different fields were sponsored by both the Atomic Energy Council of Executive Yuan and the National Health Administration of Executive Yuan, Republic of China during the past seven years. During the years 1974-79, the number of radiation workers attending each training course, their age, sex and educational background are presented in detail. The typical course contents for both medical and non-medical radiation workers are given. A summary of the percentage of passes and failures of the final examination given at the end of each training course is also given. The present status of licensing for radiation facilities and workers is described, and its results are indicated. The successful control of ionizing radiation through this kind of intensive training and licensing is evidenced in the film badge records given by a centralized service laboratory located at the National Tsing Hua University.

This study, carried out in a telephone crisis intervention program in which nonprofessional volunteer counselors received 55 hours of prejob training, isolates the effects of prejob training and on-the-job experience. Participants in the study were evaluated on several parameters including knowledge, counseling skills, acceptance of others, and dogmatism. Three groups of volunteers were measured: group 1--measured immediately before and after prejob training, group 2--measured just after prejob training, and group 3--measured after five months of telephone counseling experience. Results indicate that counselor skills and knowledge significantly increased with prejob training, but did not show further improvement as a result of five months of experience. Attitudes such as acceptance of others and dogmatism did not change either as a result of training or experience. Dogmatism was found to be inversely related to both counselor skill and knowledge.

How can we prepare nurses who will have as their focus of practice, the health of the family unit? This paper describes the learning outcomes which were generated from a short term experience in a curriculum where the major thrust is learning to nurse families in a health promoting way. Students were provided with experience with families who were undergoing an important family event, e.g., coping with the short term

hospitalization of a child. An exploration and analysis of these experiences revealed for students the content of nursing families who are in the process of dealing with this particular event of family living. This content related to the acquisition of nursing skills of an interpersonal, technical and decision-making nature as well as the development of knowledge which provides the basis for nursing the family as the unit of care.

 This article presents an opinion on the need for middle-management education in the four basic functions of management: planning, organizing, directing, and controlling. Using nursing management as an example, the author describes the role of middle management in complex organizations and states that the job of management is to ensure the efficiency and effectiveness of work performed by others.

Official residency guidelines for pediatric training of family practice residents focus on the number of months of block time on pediatric rotations and the percentage of pediatric patients in the resident's model practice. These guidelines do not ensure competence in pediatrics. Family practice residencies need a competency-based curriculum derived from actual pediatric experience in family practice. Such a curriculum should define specific knowledge, skills, and attitudes required, define the family physician's role in handling each issue or condition, be used on a daily basis, and form a basis for evaluation of residents and curriculum. This paper describes the development and implementation of such a pediatric core curriculum at the University of Colorado Family Practice Residency.

**A comprehensive program to increase job satisfaction among pharmacy technicians.**

Mahoney CD; Gallina JN; Jeffrey LP  
Hosp Pharm ,Oct 1982, 17 (10) p547-50, ISSN 0018-5787  
Journal Code: G98  
Languages: ENGLISH

A multifaceted personnel management and continuing education program specifically designed to provide job satisfaction for the pharmacy technician is described. Turnover among technicians is often higher than for other personnel categories. One interpretation of a high turnover rate is that it is a direct indication of job dissatisfaction and disillusionment on the part of technicians towards their career potential. Several approaches were initiated at the Rhode Island Hospital to increase job satisfaction among pharmacy technicians and to assist the pharmacy department in stabilizing this category to reflect a more satisfactory turnover rate. These were: (1) initiating a comprehensive continuing education program; (2) establishing a "career ladder" by developing an advanced level of pharmacy technicians; (3) incorporating technicians in a concept of participative management within the department; (4) increasing job responsibilities as new programs are developed; (5) rotating assignments and responsibilities to foster flexibility and interest. The programs enumerated have made a significant contribution toward increasing the stability and job satisfaction of the technician category. The success of the measures described is reflected in the average tenure of an individual in the technician category, which is 41.9 months.

Jaaskelainen M  
Health Policy Educ ,Oct 1982, 3 (3) p249-68, ISSN  
0165-2281 Journal Code: G2I  
Languages: ENGLISH

In this paper, postgraduate and continuing medical education in Finland is described and analyzed. Especially, the contacts with health care policy of Finland are analyzed and presented. First, the roots of CME in basic medical education and its goals are shown. Secondly, the advanced professional medical education (specialization) is presented. Thirdly, the scientific postgraduate system of studies is analyzed. Finally, the system of continuing, complementary medical education and its organization is presented. It is stressed that the CME has close connections with the health care policy in a country. Some problems in this respect are presented.

**Improving the selection of family medicine residents through development of multi-dimensional policy models.**

Parker BR; Skinner BD

Health Policy Educ ,Oct 1982, 3 (3) p229-47, ISSN  
0165-2281 Journal Code: G2I

Languages: ENGLISH

The annual cost of training a single family medicine resident may now exceed \$50,000. This, together with the fact that normally only a small fraction of those applying for family medicine residency is selected for admission, creates a decision problem of enormous import to affected institutions. Despite these considerations, the applicant evaluation and selection process remains relatively subjective, with results often disappointing. In the current paper, a preference-based approach is proposed that first models the evaluation/selection process on the basis of well-defined cognitive and noncognitive criteria. It is suggested that validation of this model be based on future performance levels of both the accepted and rejected cohorts during and following their residencies. Discrepancies between future success levels and predicted outcomes may then be translated into appropriate control actions designed: (1) improve the definition/measurement of selection criteria; (2) enhance the evaluation/selection policies and decisions of the admissions committee; and (3) better inform potential applicants of the department's program and selection philosophies. The approach is applied to two recent, accepted cohorts of the University of North Carolina Department of Family Medicine. Preliminary results indicate that the procedure is capable of improving the in-residency success levels of selected applicants, and that these levels can be better predicted than when no formal, i.e., analytic, process is followed.

**Some challenges in the management of community health education.**

Timmereck TC  
Health Policy Educ ,Oct 1982, 3 (3) p223-8, ISSN  
0165-2281 Journal Code: G2I  
Languages: ENGLISH

Health Educators are often expected to fill managerial roles yet are not always trained in management skills. The Health Educator's role is constantly changing but training has not always kept up, especially in the area of management. Job descriptions are often less than adequate and coordination between the jobs and the training institution could be better. Health Educators, due to frustration caused by inadequate role definition, may choose administration as a career as it is easier identified. Barriers to successful management can also be frustrating for the Health Educator, i.e., political constraints, lack of skills, etc. Planning should be a major activity of any Health Education program in order to ensure a successfully managed Health Education project.

**Characterization of pharmacy workload and pharmacist activities in a Canadian community pharmacy.**

Boyd R; Parker WA; Yung DK  
Contemp Pharm Pract ,Fall 1982, 5 (4) p219-25. ISSN  
0162-3761 Journal Code: D09  
Languages: ENGLISH

The present study was undertaken to obtain data which would characterize pharmacist activities and prescription workload in a community pharmacy. Data on pharmacist activities were obtained by using a work sampling methodology. The proportion of time spent on each of 44 activities was obtained, and it was found that the proportion of time spent on professional activities (17.6 percent) was notably less than the time spent on nonprofessional activities (82.4 percent). Data on prescription workload were obtained by the design of a data sheet which was to be completed by each pharmacist for every prescription dispensed. The collected data characterized the number of prescriptions dispensed, which were related to the time of day and day of the week; they also provided information on the types of prescriptions dispensed, the age of patients (e.g., pediatric, geriatric), and the methods of payment.

**A conjoint psychiatry-internal medicine program: development of a teaching and clinical model.**

Shemo JP; Ballenger JC; Yazel JJ; Spradlin WW  
Am J Psychiatry ,Nov 1982, 139 (11) p1437-42, ISSN  
0002-953X Journal Code: 3VG  
Languages: ENGLISH

At a time when psychiatry's repertoire of successful treatment strategies is burgeoning and the public is seeking primary medical care with greater emphasis on humanistic issues, psychiatry has been paradoxically losing status and trainees, partly because it has failed to make its expertise integratable by nonpsychiatric physicians. In response to the educational and patient care deficiencies that result, two universities developed a teaching and clinical program that leads to partial integration of their departments of psychiatry and internal medicine. This collaborative approach includes a conjoint internal medicine-behavioral medicine inpatient unit and a residency program leading to Board eligibility in both specialties.

**Improving compliance among hypertensives: a triage criterion with cost-benefit implications.**

Eastaugh SR; Hatcher ME  
Med Care ,Oct 1982, 20 (10) p1001-17, ISSN 0025-7079  
Journal Code: LSM

Contract/Grant No.: HL-17016, MH-14567; 1-32(HL)-07180

Languages: ENGLISH

Triage method based upon individual patient characteristics is developed to determine the most effective health education interventions for hypertensive patients. The sample included 402 patients randomly assigned to experimental and control groups. The efficacy of a triage process, whereby patients are subdivided into groups that are more predisposed to benefit from a given health education approach, is discussed. From a limited cost-benefit evaluation, it appears that the benefits of the triage method for achieving medication compliance clearly outweigh its costs only in the case of the highly depressed patients (24 per cent of the sample). Different levels of depression were found to be differentially responsive to different health education treatments for achieving adherence to medication. The most depressed patients were more responsive to family member reinforcement, a 156 per cent increase in the number of high compliers as compared to no intervention.

**Selective patient enrollment: a tool for improved residency training.**

Hainer BL; Curry HB  
J Med Educ ,Nov 1982, 57 (11) p835-40, ISSN 0022-2577  
Journal Code: J13

Languages: ENGLISH

Providing a full range of problems to be managed in a model family practice unit is the goal of selective enrollment of patients at the Medical University of South Carolina. A computerized problem-oriented medical record is used to help distribute families with selected chronic diseases equitably to residents. Attention to the demographics of each resident's practice panel can help influence the distribution of health problems which a resident may experience at the model unit. Knowledge of the demographics of families at the model unit can help determine how representative they are of the surrounding community. Reallocation of families to new resident physicians when their old resident physicians complete training is logically planned. Work loads of resident physicians are monitored to adjust family assignments in their practice panels. The patient enrollment process is responsive to resident and faculty input regarding deficiencies in the health care experiences of the resident.

**Needs assessment in continuing medical education: a practical guide.**

Laxdal OE  
J Med Educ ,Nov 1982, 57 (11) p827-34, ISSN 0022-2577  
Journal Code: J13  
Languages: ENGLISH

The identification and assessment of learning needs and the setting of priorities are the foundation of successful program planning in continuing medical education (CME). The present report includes recommendations concerning optimal procedures for the assessment of the learning needs of individual physicians, small groups, and large groups. The vital role of learners and their perceived needs is emphasized. Appropriate and accurate needs assessment contributes greatly to the success of CME programs. The most effective needs assessment involves the dynamic interaction of teachers, learners, and experienced program planners. The recommendations in this report are based on studies and interviews conducted in several major academic health centers in the United States and Europe over a period of one year. Research efforts to improve needs assessment techniques are greatly needed. As improved methods of needs assessment are adopted, CME planners may be assured that their programs will become more attractive and effective.

**Training supervision as a separate faculty role.**  
Borus JF; Groves JE  
Am J Psychiatry ,Oct 1982, 139 (10) p1339-42, ISSN  
0002-953X Journal Code: 3VG  
Languages: ENGLISH  
Training supervision is a longitudinal, nonclinically  
focused personal relationship between a faculty member and a  
resident for exploring the latter's professional development.  
In the authors' program the training supervisor meets with the  
supervisee monthly over the 3-year residency. The training  
supervisor's role is that of a nonevaluative senior colleague  
who orients and advises the resident and systematically  
reviews training progress and problems. The authors discuss  
the evolution of the training supervision concept, explore  
potential role conflicts for the training supervisor, who may  
serve other functions in the residency of the supervisee, and  
present positive and negative resident and faculty evaluations  
of their program.

**Behavioral science teaching in U.S. medical schools: a 1980  
national survey.**  
Blackwell B; Torem M  
Am J Psychiatry ,Oct 1982, 139 (10) p1304-7, ISSN  
0002-953X Journal Code: 3VG  
Languages: ENGLISH  
The teaching of behavioral science in medical school has  
become increasingly complex in the attempt to integrate  
biological, social, and psychological knowledge. The authors  
sent a survey questionnaire to determine actual and preferred  
organizational structures to 130 medical schools; 90  
responded. The most frequent structure--46 schools (51%)--was  
unidepartmental. Thirty-four schools (38%) were  
multidepartmental, and 10 (11%) had a matrix organization.  
Schools with a unidepartmental structure reported a higher  
degree of satisfaction and more organizational advantages.  
Multidepartmental and matrix models offered some educational  
advantages at the cost of administrative efficiency. During  
the 1980s, funding for unidepartmental schools may prove more  
cost effective than funding for schools with different  
organizational structures.

**study in New Mexico.**  
Kaufman A; Kiepper D; Obenshain SS; Voorhees JD; Galey W;  
Duban S; Moore-West M; Jackson R; Bennett M; Waterman R  
South Med J ,Sep 1982, 75 (9) p1110-7, ISSN 0038-4348  
Journal Code: UVH  
Languages: ENGLISH

To address the dual problems of maldistribution of  
physicians and an increasing need for physicians who are  
lifelong learners, an experimental curricular track was  
developed at the University of New Mexico School of  
Medicine. Increased student responsibility for learning is  
encouraged by student-centered, small-group, problem-based  
tutorial learning, and early, primary care role modeling is  
offered during an early, lengthy, rural preceptorship.  
Preliminary outcomes reveal there is reinforcement of career  
interest in rural primary care with important linkages forged  
between the university and communities as a program  
by-product. Further, the experimental students, as compared to  
students in the conventional track, showed a greater  
appreciation of their learning environment, showed less  
stress, and failed to become cynical. The reorientation of  
undergraduate medical education toward the future health care  
needs of communities and the learning needs of physicians may  
require major modifications of curriculum design and role  
modeling experiences.

This study provided evidence that the Cardiovascular School Health Curriculum was successful in increasing the knowledge levels of high school students and maintaining significant portions of that knowledge during a six month period, indicating that with a strong, well developed curriculum, relatively permanent change in knowledge levels can be achieved. This was particularly gratifying to the researchers who believe that the appropriate knowledge of the cardiovascular system, heart diseases and methods of preventing heart and circulatory problems are essential foundations for having positive impact of youths' future behavioral choices. Additional longitudinal studies are planned to augment the findings of this study.

As part of a study to evaluate health education about breast cancer, a campaign to encourage the early reporting of breast symptoms was organised jointly by Community Medicine, University of Southampton and Southampton Health Education Service. A thorough account of all aspects of the preparation and implementation of the campaign is presented. It is hoped that other organisations, considering a similar campaign, could utilise the materials specially produced to convey our message and benefit from our experiences.

Journal Code: 4Z7  
Languages: ENGLISH  
The purpose of the study was to design an EMT-A course for freshman medical students that maximized practical work and minimized lecture hours. A 48-hour required course was given

up to 101 members of the first-year class at The Medical College of Pennsylvania. Ten hours of lecture-demonstration time were included. Test scores were comparable to scores of regular EMT-A candidates and medical students who had a full lecture series included in their course. Means of further decreasing the number of hours of the course are discussed. By decreasing the number of curricular hours, it is hoped that medical schools not having EMT-A certification programs in their preclinical years will be encouraged to do so.

A questionnaire was developed to obtain information from the graduates of the Marquette University Program in Physical Therapy from 1956, the year the program was established, to 1980. The response rate was 65 percent, with 433 graduates from 25 classes returning the questionnaire. The profile derived from the responses is of a graduate who remains employed in physical therapy full time or part-time, is satisfied with the undergraduate preparation received, and is a member of the American Physical Therapy Association. Compared with other studies, this survey reveals that lower percentages of physical therapy graduates are employed in hospital settings, higher percentages are earning graduate credits, and the dropout rate from the profession has decreased significantly. Other information obtained from the questionnaire is presented relating to demographics, continuing education, and participation in professional organizations.

The amount of geriatric and gerontology content in a nursing curriculum does not appear to influence students' attitudes about aging. However, based on the findings of this study, specific content areas should be addressed in nursing curricula. These content areas include: 1) social changes as well as physical changes that occur to elderly persons and adaptation patterns of these individuals; 2) usefulness of aged persons and the contributions they can and do make to society; 3) characteristics of the well elderly as opposed to total concentration on the sick elderly. The inclusion of these content areas might assist the nursing student in developing a more positive attitude about aging.

**Development of a model practice for pediatric residents.  
Economic and administrative considerations.**

Mankad VN; Shell RT  
Clin Pediatr (Phila) .Sep 1982, 21 (9) p519-24, ISSN  
0009-9228 Journal Code: DHE  
Contract/Grant No.: 5528 PE 14236-04  
Languages: ENGLISH

A model pediatric residents' group practice which functions independently of the hospital administration and, to a large extent, of the university administration was developed for the specific purpose of training pediatric residents. During the second year of operation (1981), the residents' group practice met 91 per cent of all expenses, including faculty and resident salaries. The residents' group practice shares many characteristics of private practice (e.g., continuity of physician-patient relationship, appointment keeping, efficient patient flow, and physician participation in practice management). Through their involvement in the management of the practice, residents learn about socioeconomic aspects of pediatric practice and learn how to provide affordable primary care of high quality. Suggestions for developing similar models elsewhere are described.

This paper illustrates some of the problems associated with a nationally organised training programme. The limit on entry numbers is on the 'best guess' for manpower requirements and not on the number of training posts available and hence a challenge can always be made on the grounds that a 'closed shop' is being operated. Experience has shown that to date this is not a valid criticism. However, there is little room for expanding the number of training posts available so that the annual intake cannot be expanded significantly beyond present levels. The selection criteria and methodology are discussed in detail, representing our current practice without any claim to have established an ideal technique. Finally, when a trainee is seconded from an overseas programme and the question of approval of his time in this country is raised, it is most important that the host institution have data relevant to both the local and the national scene.

A survey of graduates of the Independent-Study Programme (ISP) at the College of Medicine, University of Illinois, was conducted in order to assess the impact of the ISP on their subsequent careers. Responses from ninety-nine of these graduates, when compared with their classmates, lend strong support to the idea that such an independent study programme has long-lasting effects on the participants. The ISP graduates are selecting a medical subspecialty in a much higher percentage than their classmates or the national average. They also are engaging in more research, administration, and teaching. Differences between the ISP and the traditional graduates are explained in terms of unique educational opportunities, contact with teachers and peers, orientation towards independent learning and curricular requirements.

p29-36, ISSN 0279-3695 Journal Code: JUW

Contract/Grant No.: 1 T24 MH15430

Languages: ENGLISH

This consumer-nurse study was part of a larger project, Research in Mental Health Education, which compared the priorities of educators and practitioners within and between three core mental health professions and between the professionals and consumers. In the consumer-nurse portion of the study, the objectives for graduate education in psychiatric-mental health nursing were validated by psychiatric-mental health nursing educators (N=20) based in four university programs in the East, West, and Midwest. Another sample of nurse educators and practitioners in this specialty area, drawn from nine states, prioritized these objectives. A separate deck of objectives for mental health professionals was generated and prioritized by consumers (N=15) who were members of the Mental Health Association of Minnesota. Standardized procedures for generating and validating the objectives for nurses and consumers and the

same task, the Priority Sort, were used by all subjects, nurses, and consumers, to prioritize the objectives. Similarities and differences between nurses and consumers are discussed. Differences between nurse educators and practitioners, which are statistically significant, also are described. Implications for consumer and practitioner input into curricular decisions are discussed as well as interdisciplinary courses that could conserve faculty time and budgetary resources.

In 1977, the Occupational Therapy faculty at San Jose State University, with support from a Special Improvement Grant, embarked on a 3-year curriculum revision. One issue of particular concern was the need to devise a system for involving the clinical faculty in the revision process

regardless of geographic relationship to the university. The system that evolved became known as Mini-Councils, regional groups consisting of students and clinical and academic faculty who participate in fieldwork experience at the University. Mini-Councils replaced the on-site visit system and shifted the emphasis from supervision of individual students to discussion groups focusing on general educational issues of mutual concern to faculty and students. The Mini-Councils have also strengthened the relationship between academic and clinical educators by providing a practical, efficient means of maintaining contact with students in fieldwork, and by helping integrate academic and clinical education.

In 1975, the African Regional Health Education Centre (ARHEC) inaugurated two training programmes in health education: a two-year postgraduate course leading to a master's degree, and a one-year course preparing for a non-graduate diploma. The purpose of the latter was to give advanced training and updating to experienced health personnel who had either received a diploma in health education some years before or had been functioning as health educators. This was intended to be a temporary course, to phase out in three years. However, due to its popularity, it was extended in spite of certain negative aspects, mainly the fact that new graduates often return to their former positions with little opportunity to utilize fully their new skills. Those who succeeded best tried to merge health education with their basic professional practice (for example, nursing with patient education). ARHEC decided therefore to modify the programme of its advanced diploma course, which now provides for the teaching of a basic core of health education subjects to all students, and includes three modules to which students are assigned according to their previous training and their future professional activities: community health education and primary health care; hospital-based patient and family health education; and school health education. The practical field work, which is an essential aspect of the course, is tailored to the interests of students in each module. Preliminary evaluation indicates that this programme provides a better response to the needs of students and their employers and eliminates the problem of two categories of health educators (diploma and masters level). It is intended to create other modules dealing with the media, occupational health, and so on.

**Innovation, ideology and innocence.**

Maddison D

Soc Sci Med ,1982, 16 (6) p623-8, ISSN 0277-9536

Journal Code: UT9

Languages: ENGLISH

Innovative solutions are required to deal with the inadequacies of existing medical education programmes, in both the developed and developing countries, if we are to promote the evolution of more acceptable, more efficient and more effective health care. The newly formed Network of Community-oriented Educational Institutions for Health Sciences is attempting to promote a series of educational and organisational innovations, aimed at the preparation of health professionals who will be better equipped and better motivated to meet the real health needs of the populations they are to serve. Such innovations encounter many obstacles, of which ideologically-based inflexibility of thought is the most important. Ideologies are here defined, in Barnett's words, as "patterns of belief ... quasi-conceptual, quasi-affective sets assumed to be true", having the power to prohibit "rigorous or experimental examination of novel experience." Such systems of thought have 'negative, restrictive and pathological effects' on the development of innovative solutions to complex problems. A particularly destructive and inhibiting stereotype has flowed from an ideological commitment to the achievement of 'international excellence'. A state of what in this paper is called 'innocence' is regarded as mandatory for the implementation of studies based on a commitment to the empirical approach, to the null hypothesis and above all to the evaluation of the process and outcome of educational and other interventions in the health care system.

**Maternity-patient teaching--a nursing priority.**

Brown B

JOGN Nurs ,Jan-Feb 1982, 11 (1) p11-4, ISSN 0090-0311

Journal Code: KS2

Languages: ENGLISH

The overall positive response of the parent participants has validated the utility of the program. Future program expansion and revision will be based on social and technological change. Participant responses to the program will be monitored continually to determine whether their needs are being met. The program clarified the role nursing personnel have in teaching maternity patients. It serves to increase the new parents' self-confidence in being able to adjust to their new roles. One possible future expansion of the program might be post-discharge group discussion sessions, supervised by nursing personnel. During those sessions, mothers could discuss feelings that they are experiencing, any difficulties they may have adapting to their new roles, and other topics they feel are relevant. Nurses would attend these sessions to serve as resource persons and group facilitators. The need for patient teaching in obstetrics is being recognized increasingly as a priority by health professionals in the field of maternal-child health. A concise and accurate means of documentation is necessary to ensure that consistent, comprehensive instructions are given to all new parents.

**A long-term geriatric teaching ward in an acute-care hospital: a three-year experience.**  
Clarfield AM  
J Am Geriatr Soc ,Jul 1982, 30 (7) p457-65. ISSN 0002-8614  
Journal Code: H6V  
Languages: ENGLISH

The development and management of a long-term geriatric ward in an acute-care teaching hospital are described. Structure, function, and costs are discussed, and issues of service and medical education are emphasized. A full geriatric team (physician, nurse, social worker, physiotherapist, and occupational therapist) assessed 165 long-term patients in the general wards of the hospital and accepted 98 for admission to the new long-term geriatric ward. Of these, 31 were discharged; 29 per cent went to a facility that encouraged more independent living. Eighteen patients died during their stay in the geriatric ward; autopsies were obtained in 33 per cent--a higher autopsy rate than the average for general hospitals. General hospitals may continue to have large

populations of chronically ill patients. This model for a geriatric ward may offer a way of dealing with a difficult situation.

**Models of nursing as the basis for curriculum development: some rationales and implications.**

Smith L  
J Adv Nurs ,Mar 1982, 7 (2) p117-27. ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH  
Within this paper the notion of a model of nursing as a basis for curriculum development is explored. Firstly the factors which a curriculum developer in nursing might take under initial consideration are discussed. It is then argued that a nursing faculty must identify and define its conceptualization of nursing and what it is to be a nurse. The process of conceptualizing nursing itself is examined. The paper goes on to argue that once a nursing faculty has reached a consensus view as to what constitutes nursing, then it either designs or selects a model of nursing which supports their particular conceptualization. Educational literature is cited to support the view that curriculum design, process and content are interrelated and that student learning is facilitated when the relationship between these three factors is coordinated. It is suggested that a nursing curriculum can achieve such an integration if a model of nursing is used as the conceptual framework. Finally some of the implications of adopting a model of nursing are stated.

**Resolved: that a fifth year of dental education be a requirement. Remarks for the negative.**

Brown WE; Bohannon HM; Colman HL  
J Dent Educ ,Jun 1982, 46 (6) p332-4, ISSN 0022-0337  
Journal Code: HY7  
Languages: ENGLISH

Those representing the affirmative side of the issue have failed to provide convincing evidence supporting the necessity of a required fifth year of dental education. The mechanism is already in place for additional education and experience through expanding general practice residency programs for students desiring additional experience. A required fifth year would increase the cost of dental education for all students at a time of diminishing resources and would undoubtedly result in greater health care costs for the public. The overcrowded curriculum can be addressed successfully and far more economically by restructuring the present pre-dental/dental curriculum continuum instead of adding a required fifth year. In conclusion, the negative side asserts that there are more practical, less expensive, and more feasible ways to address the issues confronting dental education today than by adding a mandatory year to the education process.

**Resolved: that a fifth year of dental education be a requirement. Remarks for the affirmative.**

Morris AL; Hasler JF; Mulvihill JE  
J Dent Educ ,Jun 1982, 46 (6) p327-31, ISSN 0022-0337  
Journal Code: HY7  
Languages: ENGLISH

Evidence has been presented that leading deans of dental schools and leaders of the AADS support the assertion that the current four-year dental curriculum is overcrowded. Furthermore, it has been shown that the magnitude of the problem of overcrowding is regarded as serious and has been so recognized for at least twenty years. Evidence was also presented that educators, students, and the practicing profession support the assertion that the current four-year curriculum does not prepare students adequately for dental practice. Evidence was then presented that the overcrowding and inadequacies of the current curriculum cannot be corrected by merely manipulating or restructuring curricular elements within the context of pre-dental and four years of predoctoral education. Finally, it was shown that, in the opinion of educators and students, the overcrowding and inadequacies of the current four-year curriculum can be overcome by establishing a fifth year of dental education as a requirement.

This article presents a critical analysis of the ten-year experience of the Department of Oral Biology of the University of Kentucky College of Dentistry with a nontraditional basic science curriculum. The factors that led to the adoption of this curriculum are outlined, and its effects on students, faculty, and the college's administration are described. The pitfalls inherent in this approach and in the individualized self-instructional format for teaching the basic sciences to dental students are discussed. This critical evaluation is aimed at providing information for those contemplating similar sweeping curricular changes in the future to enable them to make rational decisions and to help them predict the effects of such changes on the educational program.

Pender N  
Br J Orthod ,Apr 1982, 9 (2) p73-6, ISSN 0301-228X  
Journal Code: AZV  
Languages: ENGLISH

A study was undertaken to assess the views of recent graduates on the undergraduate orthodontic curriculum. The opinions of dental graduates qualified since 1968 from The Welsh National School of Medicine, the University of Birmingham and the University of London were acquired by postal questionnaire. The three samples were in close agreement in the majority of data supplied. A close relationship existed with Central Government figures, where these were available. General Dental Practitioners were found to treat a small and diminishing proportion of the orthodontic case load in the General Dental Services. The Advice Service has a limited application. Consultants acquire small numbers of patients from many sources, whilst practitioners limited to orthodontics receive larger numbers of patients from fewer sources. The undergraduate course was considered to be too short and lacking emphasis on complex therapy. Chairside,

small group teaching on a greater variety of cases might improve diagnostic ability at the expense of a reduced individual case load.

A questionnaire was sent to directors of occupational therapy curricula and faculty members, to directors of occupational therapy clinics and clinicians, to deans of medical schools, and to hospital administrators in order to determine the professional and administrative relationships between occupational therapy academic programs and clinical programs. Results of the survey, analyzed by groups, indicated that informal relationships were prevalent, whereas other relationships were poorly delineated. Strengths and weaknesses of formal and informal relationships are presented. Finally, a model for interaction is proposed.

**Current status of direct gold in teaching and licensure.**

Miranda FJ; Willer RD

J Deht Educ ,May 1982, 46 (5) p290-2, ISSN 0022-0337

Journal Code: HY7

Languages: ENGLISH

A questionnaire on the teaching of direct gold was mailed to each dental school in the United States, and a telephone survey of direct gold requirements on all state and regional licensure examining boards was conducted. While the vast majority of schools still teach direct gold in some form, there is a definite trend toward deemphasis of this material both in dental education and in licensing examinations. Cited as major reasons for this decline are (1) the observation that relatively few practicing dentists offer direct gold as a treatment alternative, (2) the decline in faculty motivation and dedication in teaching the techniques, and (3) the shifting of available curriculum time away from direct gold to other areas of restorative dentistry.

**Promoting employee acceptance of a consumer bill of rights in a complex medical care organization: a case study.**

Mullen PD; Leifer BH

Health Educ Q ,Spring 1982, 9 (1) p3-22, ISSN 0195-8402

Journal Code: G20

Contract/Grant No.: No. 5T324L07180-04

Languages: ENGLISH

To develop strong health education programs, health educators working in complex medical care organizations must often secure professional cooperation across disciplines, coordination of services, and orientation of policies, procedures, and personnel toward patient preferences and needs. Frequently, they undertake these tasks against the tide, within a problematic organizational structure. The

present case study illustrates the difficulties posed by introducing change in medical care organizations in the context of an education program to acquaint employees of a large HMO with a consumer bill of rights mandated by the consumer Board of Trustees. The underlying assumption was that in a bureaucratic institution, an employee-centered and modest system reform strategy would be effective in bringing about client-centered outcomes-in this case, increased recognition of client rights. The case analysis and results of a post-intervention, cross-sectional survey suggest that in units where a threshold level of participation was reached, there were improvements in knowledge about the Bill and employee attitudes. The program was less successful with hospital nurses whose feelings about physicians were not taken into account fully, and with physicians whose relative lack of integration into the policy and managerial domains made them harder to reach.

**Feeder area approach: an impact evaluation of a prevention project on student drug abuse.**

Kim S

Int J Addict ,Feb 1982, 17 (2) p305-13, ISSN 0020-773X

Journal Code: GQ8

Contract/Grant No.: 1E07DA 01562

Languages: ENGLISH

To determine the impact of a primary prevention project at the community level, a feeder area approach has been implemented for a period of 2 years. The operational objective of the approach has been to concentrate most of the prevention agency's programs in one small area rather than scattering its resources throughout the country at large. It has been assumed that the country as a whole is too large a unit to have a measurable impact in a short period of time. The feeder area chosen therefore is used as an experimental group while the rest of the country is viewed as a control group in a natural social setting. Through countrywide drug surveys implemented before and after the project, it has been determined that there is a significant reduction in the current users of various drugs in the selected feeder area when compared to the rest of the country.

The increasing importance of effective leadership and management in medicine in the United States has been discussed. Examples of continuing-education courses for physicians and scientists have been cited as an indication of enhanced awareness of this importance. Development of a minimal academic foundation in this area has been suggested as a desirable addition to our current postgraduate educational programs, and an example of a formal graduate course designed to address this need has been presented.

The Department of Preventive Medicine of the University of the West Indies was established in 1957 with the idea of improving undergraduate teaching facilities to enable medical students to study patients in their homes and social environment. The authors describe the two public health diploma programs available at the University and cite

pertinent enrollment and geographic distribution statistics. Candidates for the Diploma in Public Health are registered medical practitioners who take a series of compulsory and elective subjects and have a period of supervised field training and research during the 12-month course. The Diploma in Community Health trains students in the health and diseases of man in his total environment. Students choose among three program options: the general program, specialization in health education, or specialization in health services administration/hospital administration. The general program is the most popular because it gives the student a rounded education suitable to the needs of small states. The 12-month diploma course features the interdisciplinary approach where students from various fields discuss important issues in community health. Comprehensive courses in these areas include health services administration, social sciences, environmental health, epidemiology and biostatistics, family health, communication science, and community mental health. The authors state that the candidate for the Diploma in Community Health is assessed on the basis of course and field work, a special project report, and a final written and oral examination.

**The preregistration houseman in general practice.**

Freeman GK; Coles CR

Br Med J [Clin Res] ,May 8 1982, 284 (6326) p1379-83,

Journal Code: B4X

Languages: ENGLISH

During 1979-80 an experimental preregistration house physician post in general practice was conducted at Aldermoor Health Centre in Southampton in rotation with medical posts at Southampton General Hospital. Ten house physicians took part in the experiment that lasted for 19 months and each doctor spent two months in general practice. The house physicians settled quickly into general practice and found the experience both enjoyable and worth while. The hospital consultants, general practitioners, and the house physicians themselves thought that this was a valuable extension to preregistration education. The experiment raised several questions, some of which were specific to the type of rotation organised and others that were more fundamental to the whole concept of the preregistration house physician in general practice. If the experiment is to be repeated a longer period in general practice is strongly recommended. A full year rotation is suggested with four months each of surgery, medicine, and general practice.

Languages: ENGLISH

Medical experiences encountered in the activities of an emergency department are important for the development of a well-trained internist. Therefore, a rotation in the emergency department must remain an integral part of any program in internal medicine. At the University of Pittsburgh, faculty members from both the internal medicine and emergency medicine departments worked together in order to develop the emergency department to its fullest capacity as part of a broad educational program. The faculty attendings provide supervision, immediately available consultation, and an on-going curriculum, including daily lectures and chart review. The results of their programmatic change have been the following: 1) enthusiasm and satisfaction on the part of the housestaff; 2) a 20+ increase in admissions to the hospital from the emergency department; 3) decreased utilization of the observation unit; and 4) fewer patients leaving without being examined.

**Personality type and curriculum preference in primary care.**

West M; O'Donnell M

Med Educ ,Mar 1982, 16 (2) p94-6, ISSN 0308-0110

Journal Code: MZ3

Languages: ENGLISH

The study was conducted to examine the impact which personality types may have on the selection process of two preclinical medical school curricula. The two curricula run concurrently at the University of New Mexico School of Medicine. One curriculum has a conventional-lecture format, and the other a new student-centered curriculum, which is designed to graduate students planning careers in rural primary-care. Results indicated that those students preferring the innovative curriculum were personality types unlikely to enter rural primary-care, whereas students preferring the conventional curriculum had personality profiles more consistent with those making rural primary-care career choices. Discussion deals with the implications of personality type and curriculum choice in terms of the curriculum goals and educational method.

An in-service program for Radiologic Technologists is, for some departments, more of a burden than a benefit. Resources and time are limited, as well as interest in many instances. Utilizing some basic steps of coordinating and assessment, in-service sessions can develop into worthwhile learning experiences instead of just a requirement being met.

The teaching of respiratory therapeutics in medical schools has lacked structure and cohesiveness. Comprehensive, formal programs which address the clinical needs of fourth-year students in the areas of acute and non-acute respiratory therapy problems have not been reported in the literature. A report on a pilot program in respiratory therapeutics, including a development and implementation model, is presented. Prerotational and postrotational evaluations are described. Significant improvement in specific competency areas related to clinical skill areas is also reported.

A survey was made of academic institutions in the United States having an American Dietetic Association (ADA) approve Plan IV program and/or a graduate program in public health nutrition. Data from the respondents encompassed enrollment, ADA Plan IV and its implementation, and ADA active membership qualification. The number and kinds of dietetic-related programs, number of enrolled master's level students, and the perceived process of evaluating the transcripts of such students in accordance with ADA's Plan IV were reported. Results underscore the need for clarification and standardization of the evaluation process.

By 1979, 77% of medical school primary teaching hospitals had functioning general internal medicine units; less than 5% had existed before 1970. These units were established to meet institutional needs for primary care internal medicine teachers and clinicians. By the end of the decade they had achieved major administrative and staffing responsibility for a wide variety of general education and service activities. The scope of general internal medicine units goes beyond the narrow definition of primary care internal medicine, to include activities traditionally considered those of the entire department of medicine.

This survey of baccalaureate nursing curricula was conducted to identify content and methods being used to help students develop beginning competence in health education. Catalogs from 200 schools revealed only minimal explicit attention to the teaching role of nurses. The 36 schools which gave evidence of health education and sent course materials showed little agreement on what health education encompassed or what reasonable expectations were for the baccalaureate nursing student. While there can be no generalization of these findings to baccalaureate nursing education, serious questions are raised concerning the thoroughness with which nursing educators are treating the health education component of the baccalaureate curriculum. Given the centrality of health education to prevention, health promotion, greater client

control over his own health, reduced anxiety and more appropriate utilization, it would appear that health education is scarcely an area to be dealt with superficially in baccalaureate nursing education.

Wong MY; Kline OR Jr  
Ophthalmic Surg ,Nov 1982, 13 (11) p934-5, ISSN  
0022-023X Journal Code: OIC  
Languages: ENGLISH

Intraocular lens (IOL) operations performed by Wills Eye Hospital residents over a three-year period were reviewed retrospectively. The growing numbers of implants performed, the trends in methods of cataract extraction, the trends in types of intraocular lenses, and the relative safety of the procedure were examined. The estimate for the total number of intraocular lenses implanted by Wills Eye Hospital residents this past year was 600, or 60 per senior resident, and the percent of patients seeing 6/12 or better was 93.2%. There has been a great increase in the number of intraocular lenses implanted by residents at Wills Eye Hospital, with planned extracapsular cataract extractions and posterior chamber lenses currently favored. This analysis documents a very high visual success rate and acceptably low complication rate in closely supervised residents' surgery.

**The content of the medical curriculum at McMaster University: graduates' evaluation of their preparation for postgraduate training.**

Woodward CA; Ferrier BM

Med Educ ,Jan 1983, 17 (1) p54-60, ISSN 0308-0110

Journal Code: MZ3

Languages: ENGLISH

This paper describes McMaster University medical graduates' perceptions of how well their medical curriculum prepared them for postgraduate training. The graduates view their overall preparation for postgraduate work as sound. These perceptions were compared with independent assessments by internship supervisors for one graduated class. The graduates suggest their preparation for postgraduate work differs somewhat from fellow interns. Graduates reported feeling very well prepared compared to fellow postgraduate trainees in independent learning, self-evaluation and problem solving skills. They also judge their preparation in data gathering skills, behavioural science knowledge, ability to deal with social and emotional problems of patients, medical record keeping skills, preventive, follow-up and in-patient care as very good compared to peers. They identified two content areas, pharmacology and the basic medical sciences, as requiring more attention in the curriculum. These findings are discussed and related to the approach to medical education at McMaster University.

**Detection and correction of house staff error in physical diagnosis.**

Wray NP; Friedland JA

JAMA ,Feb 25 1983, 249 (8) p1035-7, ISSN 0098-7484

Journal Code: KFR

Languages: ENGLISH

A significant number of errors in physical examination can be detected when house staff are observed by attending

physicians. In this study, observation of residents and interns showed a total error of 13.1% and 15.6%, respectively, with incorrect findings of 3.3% and 4.9% and omitted findings of 9.8% and 10.7%, respectively. Approximately two thirds of all patients examined had at least one error noted. A method was instituted for detecting and correcting these errors that can be integrated into daily attending rounds. Using this method, a statistically significant decrease in the number of errors was shown. The method used emphasizes the physical examination pertinent to the patient's main problem, consumes very little rounding time, and is well received by both attending physicians and house officers.

**Dermatologic practice: implications for a primary care residency curriculum.**

Branch WT Jr; Collins M; Wintroub BU

J Med Educ ,Feb 1983, 58 (2) p136-42, ISSN 0022-2577

Journal Code: J13

Languages: ENGLISH

The problems encountered, diagnostic procedures performed, and treatments prescribed in dermatology were studied in a primary care practice and in a dermatology clinic. Referrals from a primary care practice to a dermatology practice were analyzed. It was determined that nine disease categories accounted for more than 75 percent of the problems encountered in both settings. Only one diagnostic procedure was performed commonly in both the primary care and dermatology practices--skin scraping for fungal infection. Approximately 90 percent of the treatments prescribed in both settings fell within 13 categories. It is proposed that these findings be the basis for designing the curriculum in dermatology for residents in primary care medicine. The curriculum also should provide practical experience in dermatology and familiarity with selected, rarely encountered dermatologic conditions that have important therapeutic implications.

**Decision-making among emergency room residents: preliminary observations and a decision model.**

Quick JD; Moorhead G; Quick JC; Gerloff EA; Mattox KL; Mullins C

J Med Educ ,Feb 1983, 58 (2) p117-25, ISSN 0022-2577  
Journal Code: J13

Languages: ENGLISH

Emergency room residents face a range of clinical decisions and often call on senior residents or faculty members for help. The individual clinical decision process has frequently been analyzed, but little attention has been given to the social process in clinical decision-making. Based on data from interviews and over 100 hours of direct observation at two large urban general hospitals with busy emergency rooms staffed by medical and surgical residents, the authors suggest there are five basic decision situations. In each situation, the residents appeared to follow implicit decision patterns about involving other medical and surgical staff in the final clinical decision. The decision situations are nonacute, routine acute, nonroutine acute, multispecialty acute, and crisis. These situations call for individual, consultive, or consensual patterns in making decisions. The consequences of these patterns are explored. Improving residents' decision-making should contribute to improved understanding of the resident's role, better resident supervision, and better emergency room functioning.

**Pediatric behavioral science in family practice.**

Poole SR

J Fam Pract ,Feb 1983, 16 (2) p365-74, ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

Behavioral science is a well-accepted component of family practice, but official guidelines and proposed curricula have a predominantly adult focus. This paper describes a pediatric behavioral science curriculum for family practice residents that has been successfully integrated into the three-year family practice residency curriculum at the University of Colorado. Details of development and implementation are presented: the requisite knowledge base, skills, and attitudes; the core pediatric behavioral science topics and diagnoses; the family physician's role in handling each core diagnosis; guidelines for making management decisions; suggested approaches to teaching the curriculum; and a reference list for behavioral science faculty.

**A model for teaching ethics in a family practice residency.**

Self DJ; Lyon-Loftus GT

J Fam Pract ,Feb 1983, 16 (2) p355-9, ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

The model used for teaching ethics at the Ghent Family Medicine Residency at Eastern Virginia Medical School consists of a monthly one-hour noon conference integrating ethical principles and clinical decision making. The underlying objective is to help produce effective physicians by developing their knowledge, skills, and attitudes. The model combines didactic material and clarification of personal values in a case study format. The most important kind of learning to be derived is the self-awareness of one's own value structure and its contribution to the clinical decision-making process. Such a conference will succeed in capturing resident participation in direct proportion to faculty support. Medical ethics teaching in family medicine is appropriate, important, and consistent with the principles of a good family practice residency. An illustration of a typical ethics noon conference on confidentiality is given.

In 1978, the Task Force on Pediatric Education strongly recommended that all pediatric residency programs include at least one full-time rotation and biosocial pediatric, preferably in the 1st or 2nd year. Since 1977, the University of Maryland has had a structured, integrated, required program in Behavioral Pediatrics, including 2 months in both the PL-1 and PL-2 years for a total of 4 months addition of elective experience is available in the PL-3 year. The development and description of this program is presented as well as a review to the relevant literature.

**Needs for psychiatry in the general hospital.**

Strain JJ  
Hosp Community Psychiatry ,Dec 1982, 33 (12) p996-1001,  
ISSN 0022-1597 Journal Code: GCU  
Contract/Grant No.: MH-16438  
Languages: ENGLISH

Thirty to 60 per cent of the patients in general hospitals suffer from significant psychological dysfunction or psychological dysfunction secondary to their medical illness. In addition to helping medically ill patients adapt to their illness and hospitalization, psychiatrists who work in general hospitals should develop the biopsychosocial model of diagnosis and management and improve the staff's capacity to detect, diagnose, and manage their patients' psychological problems. The author discusses specific needs for consultation-liaison psychiatry in the general hospital such as development of prevention scheme, case detection, continuing education programs for staff, and education groups for patients and families. He also describes structural innovations to meet the increasing demands for psychiatric services in the general hospital setting. These innovations include the establishment of a biopsychosocial data-base system and the use of screening devices, medical-psychiatric inpatient units, and medical-psychiatric aftercare clinics in ambulatory facilities.

**A survey of consultation-liaison psychiatry program characteristics and functions.**

Tilley DH; Silverman JJ  
Gen Hosp Psychiatry ,Dec 1982, 4 (4) p265-70, ISSN  
0163-8343 Journal Code: FNK

Languages: ENGLISH

A survey of medical school affiliated consultation-liaison psychiatry programs has provided useful information on several aspects of current C-L program activity, including: (a) patients seen and treatments provided; (b) C-L training; (c) program structure (and fiscal operations); and (d) subjective appraisal by program directors. Data on patients, diagnostic categories, and treatments support the findings of similar, previous studies. Training and research appear to be continuing at past levels rather than increasing. Limited information on fiscal operations and program structure preclude adequate assessment of their strengths and vulnerabilities. Recording of better data and the development of more aggressive management techniques are proposed as appropriate foci of attention for C-L program leaders.

**Surgical residency evaluation by residents.**

Beauchamp G; Des Marchais JE; Dulude J  
Can J Surg ,Jan 1983, 26 (1) p75-8, ISSN 0008-428X  
Journal Code: CKJ  
Languages: ENGLISH

A multiple-choice questionnaire was designed so that surgical residents could evaluate their residency program. It was answered anonymously by 344 residents, four times during a 2-year period, at different stages of training. The answers were analysed, comparing individual hospitals and individual programs within the department. The weaknesses and strengths of the department could be identified by the residents. This identification of problems has brought about major changes in the attitudes of staff surgeons towards teaching. The authors believe that the residents' opinions are essential to amend and improve the quality of postgraduate education.

**A longitudinal study of residency-trained emergency physicians.**

Anwar RA  
Ann Emerg Med ,Jan 1983, 12 (1) p20-4, ISSN 0196-0644  
Journal Code: 427  
Contract/Grant No.: HSO2129  
Languages: ENGLISH

An annual survey of emergency medicine (EM) graduate physicians from 31 programs was conducted from 1977 through 1979. Results of the 1979 data are presented. Practice patterns show that 96% of the EM graduates are providing patient care, and almost half are working in the states in which they trained. Of those caring for patients, 38.8% practice in an urban location and only 7% work in rural hospitals. Learning new skills and procedures and retaining skills are major problems faced by physicians in rural locations. Other activities of EM graduates include teaching medical students and residents, administration, research, and community emergency medical services. Data are analyzed with attention to long-term commitment to emergency medicine. Implications for manpower needs are suggested.

0227325 83098473

**Attitudes of patients, housestaff, and nurses toward postoperative analgesic care.**

Weis DF; Sriwatanakul K; Alloza JL; Weindraub M; Lasagna L  
Anesth Analg ,Jan 1983, 62 (1) p70-4, ISSN 0003-2999  
Journal Code: 4R8  
Languages: ENGLISH

A survey was carried out among housestaff and nurses involved with postoperative patient care to assess their knowledge of analgesics and their attitudes toward postoperative analgesic care. Only one-fifth of the respondents prescribed for complete pain relief. There were some misconceptions about adding other drugs to narcotic analgesics as well as fear of the addictive properties of

these narcotics. The respondents lacked confidence about their knowledge of narcotic analgesics. Fear of respiratory depression was less prominent. Nine percent of the physicians and 31% of the nurses believed that response to a placebo indicates factitious pain. Fifty-four percent of the physicians and 74% of the nurses believed that patients receive adequate pain relief. Eighty-one patients were questioned on their beliefs about pain and its relief. Sixty-six of these were monitored postoperatively to assess the effectiveness of pain relief, which was judged by the authors to be ineffective (i.e., moderate to severe pain at the peak of analgesia) in 41%. Seventy-five percent of the patients reported that their overall postoperative pain relief had been adequate. There was no correlation between the amount of analgesic required postoperatively and either the degree to which patients believed pain builds character or the degree to which they rated themselves sensitive to pain. This study emphasizes the need for better and more comprehensive training of housestaff and nurses in analgesic care.

0227280 83098026

**Underrecognition of patients' psychosocial distress in a university hospital medical clinic.**

Thompson TL 2d; Stoudemire A; Mitchell WD; Grant RL  
Am J Psychiatry ,Feb 1983, 140 (2) p158-61, ISSN  
0002-953X Journal Code: 3VG  
Languages: ENGLISH

Seventeen areas of psychosocial distress were evaluated in 87 university hospital internal medicine clinic patients by a self-administered questionnaire and a psychiatric interview. These patients' internists then predicted the patients' distress level in each area. Their predictions correlated significantly with their patients' self-reports of distress-level problems in only 3 of the 17 areas. Even when the internists felt that they had sufficient information to make an accurate prediction, their perceptions were often erroneous, including evaluations of such areas as suicidal ideation and drug use. These data suggest the need for active psychiatric education components in internal medicine training programs.

0227239 83097561

**Impact of inter-physician communication on the effectiveness of medical consultations.**

Lee T; Pappius EM; Goldman L  
Am J Med ,Jan 1983, 74 (1) p106-12, ISSN 0002-9343  
Journal Code: 3JU

Languages: ENGLISH

To evaluate the impact of the inter-physician communication on the effectiveness of consultations, consultations performed by general and subspecialty medical consultation services for one week both early and late in the academic year were prospectively evaluated. Physicians commonly requested consultations to get advice on diagnosis (56 percent), advice on management (37 percent), or assistance in arranging or performing a procedure or test (20 percent). Despite our very liberal definitions, the requesting physician and the consultant completely disagreed on both the reason for the consultation and the principal clinical issue in 22 (14 percent) of 156 consultations. Consultants were twice as likely as the requesting physicians to rate consultations as crucial for management (35 percent versus 18 percent,  $p = 0.001$ ) because they gave significantly higher ratings when they and the requesting physicians did not agree on the reasons for consultation. Consultations ordered for very specific purposes, such as assistance in arranging or performing a test, were rated significantly higher by the requesting physicians. It was found that breakdowns in communication are not uncommon in the consultation process and may adversely affect patient care, cost effectiveness, and education.

In a survey conducted by the authors, volunteer faculty members were found to be generally satisfied with their role in medical education, despite their acknowledgement of problems involving respect and responsibility when working with academic colleagues. These problems and the indifference of the volunteers to them are delineated. The structural reasons for simultaneous recognition of an indifference to problems are discussed in relation to the erosion of the utilization and authority of volunteer faculty members.

**The impact of pediatric surgery training on the attitudes and practice patterns of general surgeons.**

Wesley JR; Coran AG

J Pediatr Surg ,Oct 1982, 17 (5) p660-5, ISSN 0022-3468

Journal Code: JMJ

Languages: ENGLISH

In order to evaluate how experience in pediatric surgery during residency training affects attitudes and practice

patterns of general surgeons, questionnaires were sent to the 51 residents who graduated from our general surgical residency program since the establishment of a Section of Pediatric Surgery in 1974. There were 51 respondents (100%) of whom 50 were male and 1 female. Three were pediatric surgeons and their responses to the questionnaire were not included in the analysis. During the past year, 29 of the respondents had performed from 2 to 55 pediatric operations, with a mean of 23.7. Most of these were herniorrhaphies, appendectomies, and sub-specialty cases. Thirty-two of the 48 respondents referred most pediatric cases to a board certified pediatric surgeon nearby. Ninety-two percent of the respondents indicated that pediatric surgery rotations were of great value in their training (6.3 mean response on a scale of 7) and 92% felt that pediatric surgery was a necessary part of a general surgery training program. Respondents had a mean exposure of 1.8 mo to pediatric surgery as junior residents, and 2.1 mo as senior residents; 90% felt that their operative experience was good to excellent (5.5 mean on a scale of 7). Most respondents felt qualified to do many more pediatric procedures than they actually performed; however, their perception was that these cases were best done by fully trained pediatric surgeons. The 51 graduates of our general surgical residency program considered pediatric surgery an important factor in the development of their technical skills and surgical judgment.

Recent surveys have suggested that practice management instruction in family practice residency programs is inadequate. The majority of third-year family practice residents graduating in 1980 felt inadequately trained in nearly all aspects of practice management. Thirty-five percent of these residents noted that their residency programs offered no regularly scheduled time for practice management training. Results of four family practice residency graduate follow-up surveys showed that no fewer than 25 percent and, often, 60 to 80 percent of graduates felt underprepared in most areas of practice management.

Grauer K  
J Fam Pract ,Jan 1983, 16 (1) p121-6, ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

A prospective audit of process on 1,200 consecutive patients seen in the emergency department by family practice residents was performed at the Family Practice Residency Program in Gainesville, Florida. The overall quality of care delivered conformed to the standards of "good medical care" as judged by the author in 85.6 percent of cases. Resident errors were detected in the remaining 14.4 percent of cases, and occurred most frequently among physicians in the earlier years of training ( $P$  less than .005). Ultimate patient management was changed by the audit in only 1 percent of cases but potentially had an important impact on the care of these patients. Errors of inadequate documentation were common among residents irrespective of their level of training. An ongoing audit of emergency department charts with regular feedback on medical process and recording appears to be useful both as an educational tool and as a method of improving emergency care.

A continuity care program for patients in nursing homes using internal medicine residents in training has been developed in a county teaching hospital. Resident physicians on a paid basis assume primary care responsibility for 1000 patients in 29 private community nursing homes. A faculty internist coordinates the activities of the residents and monitors patient care through an extended care office in the county hospital. The program has produced a significant upgrading of the continuity and quality of care of patients in these nursing homes as well as providing medical residents with geriatric and nursing home experience. The increased sensitivity and concern for the needs of nursing home patients developed by the medical residents seems to continue after they complete their training.

Parietal cell vagotomy was performed in 48 patients at the Parkland Memorial Hospital and the Dallas Veterans Administration Hospital between April 1977 and January 1981. The maximum follow-up time was 50 months and the average was 28 months. Seventy-five percent of the patients were followed for more than 1 year. There were no operative deaths. Four patients (8.3 percent) had persistent postoperative side effects including two documented ulcer recurrences (4.2 percent). Acid secretion studies were reviewed to characterize the longterm effect of parietal cell vagotomy. These studies demonstrated marked postoperative reductions in gastric acid secretion. The results of this study suggest that with the simplified technique described in this paper, parietal cell vagotomy can be performed with minimal mortality and morbidity by surgical residents under direct staff supervision.

The authors surveyed women and men psychiatric chief residents who were near the end of their residency training. The findings documented the active participation of women in leadership roles as psychiatric residents in education, administration, and clinical care. Men and women reported remarkably similar job descriptions, opportunities, and difficulties. Women were less likely than men to participate in research activities during the chief residency or to accept full-time faculty positions after training.

Am J Psychiatry ,Dec 1982, 139 (12) p1607-10, ISSN  
0002-953X Journal Code: 3VG

Languages: ENGLISH

The authors investigated the evolution of psychotherapeutic skills over time in a group of psychiatric residents in their third year of training. A 29-item Supervisors Evaluation Scale measuring psychotherapy skills was developed. Each resident who began his or her clinical experience in conducting individual analytically oriented psychotherapy was rated by his or her supervisors on this scale toward the beginning of training and again 8 months later. Statistically significant changes were found for 7 of the skills measured. The authors feel that these may reflect those aspects of psychotherapy which the beginning therapist can readily learn with supervision and experience.

Pediatric residents should learn to manage family crises such as informing parents that their child has a potentially life-threatening illness. Unfortunately, few training programs prepare residents to counsel parents of a child with cancer. An experiential parent crisis counseling program has been developed at the Children's Hospital National Medical Center in Washington, DC; this program has demonstrated that pediatric residents, with limited instruction, can be taught to give bad news to parents using effective information-giving and interpersonal skills.

**Moral reasoning and decisions in dilemmas of neonatal care.**

Candee D; Sheehan TJ; Cook CD; Husted SD; Borgen M

Pediatr Res ,Oct 1982, 16 (10) p846-50, ISSN 0031-3998

Journal Code: OWL

Languages: ENGLISH

The relationship between levels of moral reasoning and decisions in dilemmas of neonatal care was investigated in a sample of 452 pediatricians. Subjects included residents, faculty members, and practitioners recruited from a variety of university-affiliated and community hospitals. It was hypothesized that physicians whose moral reasoning was more fully developed would less actively treat particular cases. Such cases might include those where a patient's family requested such a limit (designated "negative family attitude") or the quality of life likely to be led after therapy was so low as to preclude even a minimal degree of human activity or social interaction (designated "unsalvageable prognosis"). The hypothesis was tested through the use of two questionnaires. The first questionnaire, devised by Crane, assessed the physician's reported degree of activism in treating six cases of infants born with severe defects. The structure of moral reasoning was measured by a second questionnaire, Rest's Defining Issue Test. Subjects were scored by the degree to which they use universal, ethical principles in resolving a series of moral dilemmas. Results of the absolute level of activism (Table 1) showed that among both residents and postresidents, the degree to which cases are actively treated depends, for salvageable patients, on the type of damage and on the possibility for research. Results involving moral reasoning showed a different pattern among residents and postresidents. Among residents, a significant correlation exists between principled reasoning and the absence of active treatment ( $r = -0.41$ , Form A;  $r = -0.23$ , Form B). As predicted, such correlations were strongest for cases of negative family attitude or of unsalvageable prognosis. The pattern of correlations among postresidents showed either no relationship to moral reasoning or the reverse of the residency pattern ( $r = -0.08$ , Form A;  $r = 0.30$ , Form B). The influence of the type of institution a resident operates within was assessed by analysis of variance. Inasmuch as moral reasoning and institutional type both had significant main effects (Form A), their magnitude differed. Institutional type accounted for 43% of the variation in mean activism scores whereas moral reasoning accounted for only 4%; however, because one could, a priori, expect institutional norms and customs to be powerful determinants of behavior, any additional, identifiable influence deserves attention. The structure of individ

The study reported here documents a variety of psychiatric educational needs of residents in internal medicine. By studying 150 medical outpatients, the authors found that 59 percent of the patients had probable emotional disorders, 48 percent suffered from significant symptoms of depression, negative life events and low social support were significantly associated with both probable emotional disorder and depressive symptoms, only 20 percent of the patient charts contained psychiatric diagnoses, 78 percent of the charts contained no mental status data, patients on the average could report only 56 percent of their diagnoses and 60 percent of their management plans, and 70 percent of the patients reported that they were not asked about personal problems. These results have formed the basis for a psychiatric educational program in internal medicine at the University of Alabama in Birmingham and will serve as pretraining comparison data for the evaluation of outcome.

Official residency guidelines for pediatric training of family practice residents focus on the number of months of block time on pediatric rotations and the percentage of pediatric patients in the resident's model practice. These guidelines do not ensure competence in pediatrics. Family practice residencies need a competency-based curriculum

derived from actual pediatric experience in family practice. Such a curriculum should define specific knowledge, skills, and attitudes required, define the family physician's role in handling each issue or condition, be used on a daily basis, and form a basis for evaluation of residents and curriculum. This paper describes the development and implementation of such a pediatric core curriculum at the University of Colorado Family Practice Residency.

**Alteration of emergency room usage in a family practice residency program.**

Benz JR; Shank JC  
J Fam Pract ,Dec 1982, 15 (6) p1135-9, ISSN 0094-3509  
Journal Code: I4L  
Languages: ENGLISH

A patient education program was instituted that emphasized the importance of telephoning the physician prior to making an emergency room visit and defined an inappropriate visit in simple terms. The purpose of the program was to reduce the percentage of nonurgent or inappropriate emergency room visits each month. A total of 3,825 emergency room visits were reviewed. The percentage of inappropriate visits dropped from 29 percent in the control period to 18 percent in the patient education period (P less than or equal to .001). This included significant decreases in the four major reimbursement groups: self-paying (P less than or equal to .005), group insurance (P less than or equal to .001), Medical Assistance (P less than or equal to .01), and Medicare (P less than or equal to .01). Also during the patient education period there was a trend toward increased telephone calls prior to emergency room visits.

**Utilization of pneumococcal vaccine in a family practice residency.**

Brownlee HJ; Brown DL; D'Angelo RJ  
J Fam Pract ,Dec 1982, 15 (6) p1111-4, ISSN 0094-3509  
Journal Code: I4L  
Languages: ENGLISH

Pneumococcal diseases continue to account for a significant amount of morbidity and mortality in family practice. Daily charts audits revealed significant underutilization of pneumococcal vaccine in a family practice residency. Identified primary factors for pneumococcal vaccine underutilization were inadequate physician knowledge regarding the vaccine and failure to consider vaccine need during physician-patient encounters. A physician education update regarding vaccine indications and use was completed. A questionnaire was developed and given to each patient, allowing the physician to quickly evaluate each patient's need for pneumococcal vaccine. Evaluation of the first 1,000 questionnaires revealed the approximately 20 percent of the patients had indications for pneumococcal vaccine. Evaluation of immunization records revealed significant increased utilization of the pneumococcal vaccine following initiation of the questionnaire. Patient questionnaires such as this can prove to be a useful tool in the evaluation and provision of preventive medicine services in the family practice setting.

**Contributions in teaching consultation-liaison psychiatry. The use of the medical team model on a consultation-liaison teaching service.**

Guggenheim FG  
Gen Hosp Psychiatry ,Sep 1982, 4 (3) p219-24, ISSN 0163-8343  
Journal Code: FNK  
Languages: ENGLISH

This paper describes a consultation-liaison (C/L) teaching service that uses a medical team rounding model; four teams cover distinct geographic areas of the hospital, each team consisting of an attending psychiatrist, a resident, two medical students, and a psychology graduate student. Daily attending rounds on the medical/surgical wards provide prompt and direct patient care supervision for the team members, allowing for coordination of their activities and communication with the attending physician, who serves as a role model. Psychological testing can be readily integrated into the clinical setting; neurology and family practice

residents can also get their psychiatric training in this setting. The medical team model of rounding is different from other models used on C/L services; its pros and cons are discussed.

**Psychiatric manpower in Canada-The 1980 surveys.**

el-Guebaly N; Leichner P  
Can J Psychiatry ,Oct 1982, 27 (6) p486-515, ISSN 0706-7437  
Journal Code: CLR  
Languages: ENGLISH

The estimation of manpower needs is a complex endeavour due to the multiplicity of variables involved. Part I of this report presents national and interprovincial comparisons of demographic and practice data collected through a questionnaire survey of 1089 psychiatrists listed in the provincial specialists registers (i.e. 51.6% response rate). Of our respondents, 57.9% practice in urban areas of 500,000 inhabitants or more; the male-female ratio is 9 to 1; 37.9% are foreign medical graduates; and 98.5% of the specialists are exam qualified. General adult psychiatry accounts for 57.6% of the time spent in clinical practice and the total professional week is estimated to be 48.9 hours. The experience gathered towards the design of a monitoring system, the significance of the psychiatrist-to-population ratio, the comparison of our data with other manpower studies and a review of recruitment variables conclude the report.

**Consultation Liaison training in Canadian psychiatric residency programs.**

Agbayewa MO; Perez E  
Can J Psychiatry ,Oct 1982, 27 (6) p482-5, ISSN  
0706-7437 Journal Code: CLR  
Languages: ENGLISH

Canadian Psychiatry Residency programs were surveyed through questionnaires to determine the status of Consultation Liaison Training (CLT) for the year 1979/80. Virtually all the programs offered CLT as lecture/seminars and clinical postings. The majority of residents who received CLT were in their first and second years, with the average trainee spending less than 6% of total clinical training time in Consultation Liaison work. About 9% of the total core teaching time was devoted to Consultation Liaison Psychiatry (CLP) and related topics. Canadian medical students are exposed to CLP in various forms during their training. There is little interdisciplinary collaboration or post-residency fellowships in CLP at this time. The authors suggest that CLT be offered in the last two years of training when the trainee can be an effective consultant with a consolidated identity as physician and psychiatrist. They also recommend an increase in inter-departmental collaboration and further development of post-residency fellowships in Consultation Liaison Psychiatry.

**General internal medicine reappears in the teaching hospital: the experience of the Royal Victoria Hospital.**

Kong HH; Flegel KM; Coke W; Hoey JR  
Can Med Assoc J ,Nov 1 1982, 127 (9) p837-40, ISSN  
0008-4409 Journal Code: CKW  
Languages: ENGLISH

The internal medicine unit of the Royal Victoria Hospital in Montreal was created in 1979 to improve the training of residents and the care of patients. The practices of four internists were brought together in one part of the institution, and within 2 years there were 10 attending staff and 6 residents. The unit now provides continuing care for 2500 patients, many of whom have multisystem or potentially lethal problems. Residents and attending staff share the responsibility of providing 24-hour coverage. The group handles 5000 outpatient visits per year (20% of them being consultations) and provides a general medical consulting service for other hospital departments, with about 300 consultations per year. The creation of the unit, with highly visible role models, appears to have given new prestige to general internists in the hospital. The unit has served as a model for the reorganization of the other medical clinics and provides a base for research in health care delivery.

**Improving the selection of family medicine residents through development of multi-dimensional policy models.**

Parker BR; Skinner BD  
Health Policy Educ ,Oct 1982, 3 (3) p229-47, ISSN  
0165-2281 Journal Code: G2I  
Languages: ENGLISH

The annual cost of training a single family medicine resident may now exceed \$50,000. This, together with the fact that normally only a small fraction of those applying for family medicine residency is selected for admission, creates a decision problem of enormous import to affected institutions. Despite these considerations, the applicant evaluation and selection process remains relatively subjective, with results often disappointing. In the current paper, a preference-based approach is proposed that first models the evaluation/selection process on the basis of well-defined cognitive and noncognitive criteria. It is suggested that validation of this model be based on future performance levels of both the accepted and rejected cohorts during and following their residencies. Discrepancies between future success levels and predicted outcomes may then be translated into appropriate control actions designed: (1) improve the definition/measurement of selection criteria; (2) enhance the evaluation/selection policies and decisions of the admissions committee; and (3) better inform potential applicants of the department's program and selection philosophies. The approach is applied to two recent, accepted cohorts of the University of North Carolina Department of Family Medicine. Preliminary results indicate that the procedure is capable of improving the in-residency success levels of selected applicants, and that these levels can be better predicted than when no formal, i.e., analytic, process is followed.

**Supervising intake diagnosis. A psychiatric 'Rashomon'.**

Spitzer RL; Skodol AE; Williams JB; Gibbon M; Kass F

Arch Gen Psychiatry ,Nov 1982, 39 (11) p1299-1305, ISSN 0003-990X Journal Code: 72C

Languages: ENGLISH

Psychiatric diagnoses based on data collected during routine clinical intake evaluations done by trainees are often later used in research studies and in program evaluation. It is commonly assumed that the supervisory process can effectively overcome errors that trainees make in diagnosis. We designed a study to assess the adequacy of patient-in-absentia supervision for ensuring accurate psychiatric diagnoses. In 30% of the cases there were major diagnostic disagreements between the supervised diagnoses and consensus diagnoses based on information provided by both the trainee and an experienced clinician who sat in on the trainee's initial interview. These findings have implications for clinical care, training, and research.

**A conjoint psychiatry-internal medicine program: development of a teaching and clinical model.**

Shemo JP; Ballenger JC; Yazel JJ; Spradlin WW

Am J Psychiatry ,Nov 1982, 139 (11) p1437-42, ISSN 0002-953X Journal Code: 3VG

Languages: ENGLISH

At a time when psychiatry's repertoire of successful treatment strategies is burgeoning and the public is seeking primary medical care with greater emphasis on humanistic issues, psychiatry has been paradoxically losing status and trainees, partly because it has failed to make its expertise integratable by nonpsychiatric physicians. In response to the educational and patient care deficiencies that result, two universities developed a teaching and clinical program that leads to partial integration of their departments of psychiatry and internal medicine. This collaborative approach includes a conjoint internal medicine-behavioral medicine inpatient unit and a residency program leading to Board eligibility in both specialties.

**The prevalence and ramifications of psychopathology in psychiatric residents: an overview.**

Campbell HD

Am J Psychiatry ,Nov 1982, 139 (11) p1405-11, ISSN 0002-953X Journal Code: 3VG

Languages: ENGLISH

Although estimates of psychopathology in psychiatric residents vary from 4% to 22%, at either end of the spectrum emotional disturbance is a significant problem that merits greater attention. The prevalence of psychopathology may be seriously underestimated when obtained from residency program directors, who may be aware of only the most blatant cases. On the other hand, figures that rely on self-report of the subjective impressions of faculty may be spuriously inflated by transient manifestations of stress commonly experienced during residency training in psychiatry. The author makes recommendations for improved screening of candidates and greater commitment by training programs to recognizing and meeting the emotional needs of psychiatric residents.

**Examination of genitalia in children: 'the remaining taboo'.**

Balk SJ; Dreyfus NG; Harris P

Pediatrics ,Nov 1982, 70 (5) p751-3, ISSN 0031-4005 Journal Code: DXV

Languages: ENGLISH

Trained student observers rated 123 physical examinations by pediatric house staff during health care maintenance visits to assess the frequency of examinations done on male and female genitalia compared with examination of ears, heart, and abdomen. Sixty-five observations were made of 21 male house staff and 58 observations of 18 female house staff. One to five examinations per physician were observed. Whereas physicians examined the ears, heart, and abdomen of pediatric patients greater than or equal to 97% of the time regardless of the sex or age of the child, female genitalia were examined 39% of the time and male genitalia 84% of the time. Female genitalia were examined approximately half as frequently as male genitalia at all ages with a trend to less frequent genital examinations on older children. Both male and female physicians examined female genitalia less frequently than male genitalia. It is concluded that increased emphasis is needed in house staff training programs on the examination of genitalia.

**The effect of quality assurance review on implementation of an automatic stop-order policy.**

Zoebelein E; Levy M; Greenwald RA  
QRB ,Aug 1982, 8 (8) p12-7, ISSN 0097-5990 Journal  
Code: OKP

Languages: ENGLISH

Because of problems associated with overutilization of antimicrobial drugs, particularly antibiotics, Long Island Jewish-Hillside Medical Center, New York, conducted a hospitalwide study to ensure that physicians' orders for antimicrobial drugs complied with an automatic stop-order policy. The original study, conducted in 1980, revealed a compliance rate of only 18.5% for antibiotics. However, after implementation of an extensive educational program for physicians and nurses, a restudy, conducted one year later, showed that compliance with the automatic stop-order policy increased to 54%--a 300% improvement over the first study. In addition, the follow-up study also revealed a 6% decrease in the percentage of patients who received antibiotics.

**Residents' training goals in respiratory knowledge and skills: perspective of three parties.**

Gong H; Sayre JW; Simmons MS  
Med Educ ,Sep 1982, 16 (5) p273-7, ISSN 0308-0110  
Journal Code: MZ3

Languages: ENGLISH

Medical residents, full-time respiratory teaching staff, and community-based doctors rated the importance of fifty-five respiratory training goals involving knowledge and skills necessary for the future practices of all medical residents. Residents also rated their perceived preparedness in these training areas. Intra- and inter-group analyses indicated that residents agreed more often, and consistently assigned more importance (94% of goals) to the training goals, than did the teachers and doctors. Although the residents considered themselves prepared for 69% of the training goals, they also had moderate intra-group disagreement. These results may reflect variable training experiences and/or institutional practices, but areas of less than adequate preparation were identified and can be corrected. The other two groups were in general agreement except regarding some clinical skills. This study offers possible explanations for the group responses and indicates the potential benefit for groups to discuss, identify, and survey training goals.

**Improving physician compliance with preventive medicine guidelines.**

Cohen DI; Littenberg B; Wetzel C; Neuhauser D  
Med Care ,Oct 1982, 20 (10) p1040-5, ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

Similar general medical outpatient clinics with randomly assigned patients were used to evaluate the effectiveness of a program that was to increase house staff compliance with preventive medicine guidelines. Two clinics were designated experimental and two served as controls. In the experimental clinics, age-specific checklists of all recommended preventive procedures (drawn from the Canadian Task Force report on The Periodic Health Examination and American Cancer Society guidelines) were appended to each patient's chart. In addition, house officers were presented with a series of weekly seminars dealing with issues in screening, as well as the specific recommendations included in the checklist. House officers in all four clinics were tested for their knowledge and attitudes toward the preventive program before and after the intervention. Counts of immunizations and mammograms performed and the total populations eligible for these procedures were determined for all four clinics. As predicted, test scores as well as mammography and immunization rates increased significantly (from 2-40 per cent) in the intervention clinics as compared with controls. We conclude that this intervention was clearly effective in the short run. However, follow-up studies will be necessary to determine whether the desired long-term effect has been achieved.

**The effectiveness of health education on home use of ipecac.**

Dershewitz RA; Posner MK; Paichel W  
Clin Pediatr (Phila) ,Apr 1983, 22 (4) p268-70. ISSN  
0009-9228 Journal Code: DHE  
Languages: ENGLISH

It is widely recommended by pediatricians that syrup of ipecac for secondary prevention of poisoning be kept in homes where there are young children. To evaluate the efficacy of this recommendation we measured mother's gain in knowledge of how to use ipecac safely at home. The study population (n = 78) were primarily middle class mothers bringing their 9-month-old infants to one pediatrician at a health maintenance organization for a well-baby visit. The pediatrician delivered health education on poisonings. A before-after study design was used. The highly significant (p less than 0.001) gain in knowledge demonstrates that parents can learn to use ipecac safely at home. The practitioner should limit safety counseling to selected areas most problematic at each age level, and within each topic, should concentrate on the most salient points.

De Haes WF  
Patient Couns Health Educ ,1982, 4 (2) p95-102. ISSN  
0190-2040 Journal Code: PAL  
Languages: ENGLISH

Because health education is aimed at influencing behavior capable of affecting health and disease, patient education is a important constituent of health education. Patient education should demonstrably lead to increased self-assurance, reduced anxiety, better insight into one's ailments, more knowledge about the effects of medicines administered, greater self-acceptance after surgery, and improved social contacts among the chronically ill. It well deserves a place in primary health care. Patient education is not widely practiced in the Netherlands. Small-scale experiments are needed to establish effective modes of intervention.

This report addresses conceptual and practical problems in evaluating the effectiveness of an intervention which used a pyramid training model for improving helping skills for informal helpers in two rural communities. Against a background for a study of help-giving and help-seeking patterns, the transmission of helping skills from professional to community trainers to local helpers was studied. Impacts of the intervention on other aspects of the community are reported.

D'Hondt W; Vandewiele M

Adolescence ,Winter 1982, 17 (68) p855-61, ISSN

0001-8449 Journal Code: 2H8

Languages: ENGLISH

With the help of a questionnaire addressed to 276 training teachers, we investigated the difficulties encountered by these adults during their adolescence with their teachers, their parents and their friends. Three-quarters of our subjects had trouble with their parents and their friends, while only half of them had trouble with teachers. A great proportion (40%) of those who had trouble with their teachers laid the blame on themselves rather than the teachers. Concerning parents, father's authoritarianism received the most criticism and subjects complained that they had little personal freedom. A considerable proportion of subjects (34%) attribute difficulties with their former comrades to themselves.

**Training personnel in the prevention and management of violent behavior.**

Lehmann LS; Padilla M; Clark S; Loucks S  
Hosp Community Psychiatry ,Jan 1983, 34 (1) p40-3, ISSN  
0022-1597 Journal Code: GCJ  
Languages: ENGLISH

The authors describe a training program on prevention and management of violent behavior for the staff of a Veterans Administration hospital. The one-day workshop focuses on preventive identification of potentially violent situations and on methods of verbal and physical management of violent behavior. A study of workshop participants showed that trainees had improved knowledge about and performance in handling violent behavior after completing the program. Future developments in training in prevention and management of violent behavior should include greater availability of educational resource materials and incorporation of the subject in undergraduate and graduate health care training.

In Papua New Guinea (PNG) primary health care in rural areas is principally provided by aid post orderlies (APO's). During 1979-80, all 110 aid posts in Enga Province were visited; 20% were found to be unstaffed. All APO's were from the province and about 50% were providing satisfactory service. Aid posts were judged on standard of cleanliness, daily patient attendance, number of inpatients, number of family planning consultations provided weekly and on the attendance record of TB and leprosy patients. Aid posts usually had sufficient supplies of basic drugs. Despite the presence of a good APO training school in Enga, the standard of graduates was very variable and some of the best APO's in the province had minimal training over 30 years previously. Tribal warfare in Enga continues to be a threat to the delivery of primary health care.

A decentralized nursing structure allows the head nurse to become actively involved in the planning and budgeting process. In Nursing Decentralization: The El Camino Experience (published in November 1981 by Nursing Resources) the authors describe the development of a budgeting system that supports autonomy, accountability, and authority at the practitioner level. For JONA readers, we present, in two parts, an abridged version of the chapter "Budgeting: Holding the Purse Strings." Part 1, which follows, outlines important steps for the development of a successful and efficient budgeting program that can be adapted to meet the needs of other decentralized organizations. Part 2, which details a typical budget session, will appear in the next issue of JONA.

If a nursing service uses agency nurses to help cope with staff shortages, the nursing administrator must manage the cost and quality of care delivered by these nurses. The authors describe their hospital's system for using agency nurses. The components of their system--an orientation program, contracts with the agencies, and systematic performance evaluation--can be used or adapted in other institutions.

**Customizing infection control educational programs within the health care facility. Meeting a challenge vs. just satisfying a requirement.**  
Christel LP  
Am J Infect Control ,Nov 1982, 10 (4) p138-46, ISSN  
0196-6553 Journal Code: 4T6  
Languages: ENGLISH

Infection control practitioners working within health care facilities are charged with the providing of in-service education programs for all new employees and volunteers as well as for all hospital departments, at least annually. To be effective, each program should be customized to meet the needs of the group for which it is given. Such a charge may be viewed as simply a "requirement that must be satisfied," or it may be approached as a challenge to be met with a measure of ingenuity and inventiveness. Academic preparation in the principles and skills germane to teaching are traditionally lacking in the training of health care professionals, and the ICP is thus left accountable for a job function for which she/he may have little proficiency. Customized education programs may be achieved with thoughtful planning and through the use of a few innovative ideas and resource materials available to most practitioners.

**Nursing quality assurance: a process, not a tool.**

Smeltzer CH; Feltman B; Rajki K

J Nurs Adm ,Jan 1983, 13 (1) p5-9, ISSN 0002-0443

Journal Code: JEL

Languages: ENGLISH

A meaningful quality assurance program comes only with appropriate knowledge, communication, and accountability for all quality assurance functions among nurses at all levels. Describing the implementation of their quality assurance program, these authors tell of their eventual realization that, in fact, they had merely implemented a quality assurance tool that brought the nursing staff little benefit and a lot of grief. Highlighting the identified problems, the factors contributing to the program's failure, and the actions they took to develop and meet appropriate objectives, they detail their later, successful implementation of the concept and the process of quality assurance. Their experience provides readers with food for thought and stimulus for critical evaluations of their own quality assurance programs.

This article presents an opinion on the need for middle-management education in the four basic functions of management: planning, organizing, directing, and controlling. Using nursing management as an example, the author describes the role of middle management in complex organizations and states that the job of management is to ensure the efficiency and effectiveness of work performed by others.

 Languages: ENGLISH

In reality, role change among staff RNs is a continuous phenomenon. As medical technology increases, patient care regimes follow suit, and the staff RN is constantly called upon to apply a knowledge base in different ways and to acquire new knowledge and behaviors. The nursing administrator who keeps pace with this growth can capitalize on the phenomenon, guiding the change to see that it is progressive, that it assists the nurse in developing a more advanced nursing (as opposed to mini-physician) identity and that it does improve extant nursing practice. Undertaking a new project of this sort on the unit is likely to create a number of beneficial by-products. For example, nurse-physician rapport and communication increase as each group opens professional boundaries in defining and planning the content of role expansion. The unit's traditional operation must also be examined in the course of building in new functions. System critiques stimulate the unit's nursing manager to weed out less than optimal features of the existing nursing care delivery system. The expanded role has favorably affected nursing care at Mercy Hospital. Physicians, nurses, and most important, the patient have reaped the benefits. The nurse is able to function in a more advanced capacity, and physicians see the benefits to their patients; fewer delays in specific aspects of care delivery with a more sophisticated, higher quality of nursing care. What is exciting about this concept is that the principles could apply to virtually any RN work group that gives direct care to a homogeneous patient population.

The paper describes the impact of a training programme for local authority day nursery staff on the use of the Portage system with handicapped children. The results suggest that the staff mastered the techniques and were able to continue using them, though some modification to the system seems indicated for these settings. These findings were discussed in the light of more general issues about the support needed for day nursery staff.

**A comprehensive program to increase job satisfaction among pharmacy technicians.**

Mahoney CD; Gallina JN; Jeffrey LP  
Hosp Pharm ,Oct 1982, 17 (10) p547-50, ISSN 0018-5787  
Journal Code: G98

Languages: ENGLISH

A multifaceted personnel management and continuing education program specifically designed to provide job satisfaction for the pharmacy technician is described. Turnover among technicians is often higher than for other personnel categories. One interpretation of a high turnover rate is that it is a direct indication of job dissatisfaction and disillusionment on the part of technicians towards their career potential. Several approaches were initiated at the Rhode Island Hospital to increase job satisfaction among pharmacy technicians and to assist the pharmacy department in stabilizing this category to reflect a more satisfactory turnover rate. These were: (1) initiating a comprehensive continuing education program; (2) establishing a "career ladder" by developing an advanced level of pharmacy technicians; (3) incorporating technicians in a concept of participative management within the department; (4) increasing job responsibilities as new programs are developed; (5) rotating assignments and responsibilities to foster flexibility and interest. The programs enumerated have made a significant contribution toward increasing the stability and job satisfaction of the technician category. The success of the measures described is reflected in the average tenure of an individual in the technician category, which is 41.9 months.

**In-class evaluation of behavior modification knowledge: parallel tests for use in applied settings.**

Furtkamp E; Giffort D; Schiers W

J Behav Ther Exp Psychiatry ,Jun 1982, 13 (2) p131-4,

ISSN 0005-7916 Journal Code: HTN

Languages: ENGLISH

A revision of the Knowledge of Behavioral Principles as Applied to Children test (O'Dell, Tarler-Benlolo and Flynn, 1979) is described. The revision includes reduction of the original 50 item test to two 10 item tests through administration of the test to a sample of 164 direct care staff after training in an applied human service setting. Psychometric assessment of the two short forms was done using a second sample of 111 trainees. Reducing the test had little impact on the internal consistency of the tests (from 0.862 to 0.735 and 0.765). The two short forms exhibited some of the characteristics of parallel forms (equal means and variances) and their intercorrelation ( $r = 0.87$ , corrected for attenuation) was sufficient for further use in research or

evaluation settings. Suggestions for further development and use of the two forms were made.

**Motivational management: coping with burnout.**

Richardson M; West P

Hosp Community Psychiatry ,Oct 1982, 33 (10) p837-40,

ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Burnout, the emotional state that accompanies an overload of stress, generally has been ascribed to organizational or personal causes. Motivational management is an approach to identifying the causes of burnout among workers and determining ways to effectively intercede. The authors conducted workshops to help staff combat burnout at a public health agency, a small community hospital, and a preschool for handicapped children. During the first phase of the workshop participants generated a list of problems that contributed to their sense of burnout. They then assigned each problem a personal, organizational, or environmental cause. During the second phase participants decided who should accept responsibility for developing and executing strategies for change. The authors believe motivational management techniques can also be used to explore burnout in other roles such as those of parent, child, friend, or community member.

Languages: ENGLISH

A system of in-service assessment of trainee psychiatrists by their supervisors is reported. It has been used for four years in a large, service delivery organisation. Analysis of the data collected indicates that the supervisors' ratings were significantly related to subsequent trainee examination performance. From the individual scores however, it can be postulated that as a feedback aid to learning, its usefulness may have been limited by the narrow range of ratings given.

**Self-study program on drug information for staff pharmacists.**  
Poirier TI; Lech JG  
Am J Hosp Pharm ,Aug 1982, 39 (8) p1313-5, ISSN  
0002-9289 Journal Code: 3IO  
Languages: ENGLISH

A self-study inservice educational program on drug information resources was designed to improve staff pharmacist competence in responding to drug information requests. Pharmacists attended two introductory sessions in the drug information center (DIC) that focused on available resources

and the systematic search process. Each pharmacist also spent an eight-hour work period in the DIC. Twenty-four hours of regular staff time was allowed for each pharmacist to complete a self-study manual. The manual consisted of three sections: (1) discussion of selected references; (2) assignments based on common types of drug information questions; and (3) assignments that required the use of indexing and abstracting sources. Each pharmacist had to complete 50 questions during a 12-week period. The pharmacists were evaluated through pre- and post-tests and by the accuracy of answers to assignments in the manual. Six pharmacists initially participated in the program; five of them attained an average grade of more than 70 on the post-test and assignments. Three new staff pharmacists now have also completed the program. The success of the program depended on the support of pharmacy administration, as well as the motivation of the participating pharmacists. This staff development program using a self-study manual has been an effective means for improving pharmacists' use of drug information resources. The manual is flexible to accommodate differences in the rate of staff development and it is a useful training tool for new pharmacists.

Two studies were conducted to assess the train clinical interviewing skills. In Experiment 1, eight university practicum students ("therapists") and either role played or volunteer "clients" were audiotaped during simulated interviews. Following the collection of baseline data on both therapist and client responses, training was provided by way of written materials, classroom instruction and practice, and quizzes. Results of a multiple baseline design across subjects showed improvements in therapists' interviewing skills and subsequent increases in client responding. Experiment 2 replicated and extended the research to a hospital outpatient clinic, in which therapists interviewed the parents of children with behavior problems. In addition, four months following the completion of Experiment 2, follow-up data collected during a maintenance condition showed continued high levels of therapist and client behavior. Finally, a panel of expert peers indicated that each response category was judged highly relevant to the behavioral assessment process.

Two nutrition education modules for inservice training of hospital food service personnel were evaluated in 16 hospitals. The modules, dealing with cardiovascular disease and diet, contained a leader's guide, a teaching package, audiovisual material, and suggested learning activities. Pretests and post-tests were used to assess knowledge gains resulting from learning sessions. Participants were divided so that one group took the post-tests before the sessions and one group after the sessions. When differences between groups were controlled, the sessions were shown to have a significant positive effect on post-test scores. Three-fourths of the participants rated the sessions as "very good" to "excellent."

Hundert J  
J Appl Behav Anal ,Spring 1982, 15 (1) p111-22, ISSN 0021-8855 Journal Code: HDR  
Languages: ENGLISH  
In contrast to previous studies where teachers were instructed how to implement behavior modification programs designed by an experimenter, teachers in the present experiment were taught how to write as well as implement

behavior modification programs. The generalized effects of two training conditions on teacher and pupil behaviors were assessed by a multiple baseline design where, following baseline, two teachers of multi-handicapped deaf children were taught to set objectives and measure pupil performance (measurement training). Later, through a training manual, they learned a general problem-solving approach to writing behavior modification programs (programming training). After both training conditions, experimenter feedback was given for teachers' application of training to a target behavior for one pupil and generalization was measured across target behaviors for the same pupil and across pupils. It was found that measurement training had little general effect on either teacher behavior or pupil behavior. However, after programming training, teachers increased their program writing and correct use of behavior modification procedures and generalized this training across pupils and target behaviors. Along with these effects, there was improvement in pupil behaviors. Possible explanation for generalized effects of teacher training were considered.

**An evaluation of Teaching-Family (Achievement Place) group homes for juvenile offenders.**

Kirigin KA; Braukmann CJ; Atwater JD; Wolf MM  
J Appl Behav Anal ,Spring 1982. 15 (1) p1-16, ISSN  
0021-8855 Journal Code: HDR  
Contract/Grant No.: MH20030; MH13644  
Languages: ENGLISH

Juvenile crime is a serious problem for which treatment approach has been found to be reliably effective. This outcome evaluation assessed during and posttreatment effectiveness of Teaching-Family group home treatment programs for juvenile offenders. The evaluation included the original Achievement Place program, which was the prototype for the development of the Teaching-Family treatment approach, 12 replications of Achievement Place, and 9 comparison group home programs. Primary dependent measures were retrieved from court and police files and included number of alleged offenses, percentage of youths involved in those alleged offenses, and percentage of youths institutionalized. Other dependent measures were subjective ratings of effectiveness obtained from the program consumers, including the group home residents. The results showed difference during treatment favoring the Teaching-Family programs on rate of alleged criminal offenses, percentage of youths involved in those offenses, and consumer ratings of the programs. The consumer ratings provided by the youths and their school teachers were found to be inversely and significantly correlated with the reduction of criminal offenses during treatment. There were no significant differences during treatment on measures of noncriminal offenses (e.g., truancy, runaway, and curfew violations). In the posttreatment year, none of the differences between the groups was significant on any of the outcome measures. The results are discussed in terms of measurement and design issues in the evaluation of delinquency treatment programs and in relation to the evaluation of Teaching-Family group homes by Richard Jones and his colleagues.

Languages: ENGLISH

Volunteers are essential to smaller hospice care programs. These volunteers must be selected and trained to provide these services. The training program has several goals: content acquisition, experiential learning, mutual screening and selection, team building, and public relations. Selection processes avoid persons who have rigid beliefs, unresolved grief, or negative personalities as well as those who talk too much. The training uses many teaching methods to emphasize hospice philosophy, team building, communication skills, death awareness, empathy skills, basic nursing skills, impact of death on family, cancer information, pain control, and physician-care factors. Concrete examples of how each of these themes is accomplished are included in the paper. This program has worked well in preparing a group of volunteers for a rural, home-based hospice program in northern Michigan and represents one example of an effective approach.

**A proposal: primary nursing for the mother-baby dyad.**  
Vestal KW  
Nurs Clin North Am ,Mar 1982, 17 (1) p3-9, ISSN 0029-6465 Journal Code: 092  
Languages: ENGLISH

Nurses who work in a maternity setting must define their role in terms of the families for whom they care. Care of the childbearing family includes the social, cultural, and economic environment in which the new baby and his family are a part. The postpartum period is an ideal time for the primary nurse to influence the care of the baby and family in a way that supports their unique family system. The nurse who utilizes this opportunity to care for the family can contribute positively to the start of a new member of society. The interactional system of the infant and family can be viewed as a mutually dependent dyad that is best supported by consistent and knowledgeable nursing care. It is no longer reasonable to deny such care to maternity clients. Family-centered care has been shown to be successful in a variety of hospital maternity settings, improving care for the mother-baby dyad and promoting cost-effective staffing. The process of proposing such a change is challenging. Obstacles to change can be overcome and, although painful, they often lead to clearer definition of the proposal. Nursing must provide the impetus to sound family-centered care. The alternatives are no longer acceptable to consumers, and fragmented nursing care is seldom satisfying to nurses. There is much to be gained by fulfilling the true sense of family-centered postpartum care.

The value of continuing education for nurses continues to be stressed by nursing educators and nursing administrators. An in-house program, similar to the one described above, could be useful for other acute-care health facilities. It seems highly probable that certification by a recognized credentials-granting agency, especially a specialty of nursing, such as obstetrics or neonatology, will become an important evaluation tool for those who employ nurses. It seems logical and cost-effective for nurses to take advantage of this opportunity to learn from resources in their own institution.

**The professional health educator in HMOs: implications for training and our future in medical care.**  
Squyres W  
Health Educ Q ,Spring 1982, 9 (1) p67-80, ISSN 0195-8402  
Journal Code: G20  
Languages: ENGLISH

Health Educators who work in HMOs face most of the problems and predicaments of their colleagues in medical care as well as some additional challenges. In keeping with the national interest in role definitions for health educators in various settings, this paper examines the role, functions, and skills of health educators in medical care, with special attention and case examples in HMOs. Several key issues, in role definition, are identified: 1) the lack of standards for training health educators in medical care; 2) the lack of agreement on health education roles and functions; and 3) the lack of reality-based training for health educators in medical care settings. The one hopeful note for the future is that current efforts at role definition are by and large efforts of the health education profession to set its own standards. Countering that note are directions that the profession is moving that jeopardize its effectiveness and future in medical care. This paper recommends that health educators from academia and practice work collaboratively on role definition, as well as standards for training.

Languages: ENGLISH

To develop strong health education programs, health educators working in complex medical care organizations must often secure professional cooperation across disciplines, coordination of services, and orientation of policies, procedures, and personnel toward patient preferences and needs. Frequently, they undertake these tasks against the tide, within a problematic organizational structure. The present case study illustrates the difficulties posed by introducing change in medical care organizations in the context of an education program to acquaint employees of a large HMO with a consumer bill of rights mandated by the consumer Board of Trustees. The underlying assumption was that in a bureaucratic institution, an employee-centered and modest system reform strategy would be effective in bringing about client-centered outcomes in this case, increased recognition of client rights. The case analysis and results of a post-intervention, cross-sectional survey suggest that in units where a threshold level of participation was reached, there were improvements in knowledge about the Bill and employee attitudes. The program was less successful with hospital nurses whose feelings about physicians were not taken into account fully, and with physicians whose relative lack of integration into the policy and managerial domains made them harder to reach.

The nature of Quality Assurance is outlined, as well as the range of activities encompassed in a Quality Assurance program. The need to provide occupational therapy personnel with an organizational framework within which to develop the skills to implement a Quality Assurance program is given as the rationale for utilizing a model that focuses on five key areas of professional practice. The model is described, and the way it has facilitated the Quality Assurance program in the Occupational Therapy Services Department of the University Hospital, London, Ontario is discussed. Reference material, useful when implementing a program, is included.

Twenty-seven projects for the development of interdisciplinary geriatric curricula were supported by the Health Resources Administration's Bureau of Health Professions in fiscal 1979. A variety of clinical training sites were used (e.g., university gerontology centers, VA medical centers, senior citizen facilities, adult health care centers), and innovative teaching approaches were developed. For example, a combined medical/dental/optometry clinic is conducted by students at the three professional schools; medical students accompany volunteers serving Meals on Wheels; and dental students treat patients in nursing homes in a mobile dental unit. Students have gained insights into the problems of the elderly and the roles of other health professionals through the interdisciplinary-team training courses. Nurse-practitioner programs to prepare nurses to provide primary health care to the elderly were also supported by the Bureau, as were special projects to develop short-term in-service basic training programs for nurses' aides and orderlies in nursing homes, to upgrade the skills of the paraprofessionals who care for the elderly. In other projects, the geriatric educational needs of pharmacy students were assessed, and dental schools promoted remote-site training to improve access to dental care for the elderly.

In 1978, the Panel on Health Services Research Training of the Committee on a Study of National Needs for Biomedical and Behavioral Research Personnel surveyed former health services research trainees and principal investigators to get information about the supply, employment, research, and teaching activities of people in these two groups. The survey shows that federal support for the training of health services research personnel has generated a cadre of investigators who

remain active in health services research. Former trainees represent a cohort of largely younger investigators who are doing research of a type once done by older principal investigators who today engage in more administration and do less research. Most health services researchers are employed in academic settings and do research in their field.

In accordance with the requirements of the Privacy Act, the Public Health Service (PHS) is publishing a notice proposing major alterations in the Privacy Act system of records entitled "Grants Act system of records entitled "Grants: Research, Research Training, Research Scientist Development, Education, Demonstration, Fellowships, Clinical Training, Community Services, Cooperation Agreements, "HHS/ADAMHA/OA, 09-03-0027. The system contains the official documentation of the grant programs of the Alcohol, Drug Abuse, and Mental Health Administration (ADAMHA). The proposed alterations are necessary to ensure compliance with recently added provisions in the Public Health Service Act (PHSA). Section 303 (42 U.S.C 242a), concerning clinical training awardees' payback obligations.

Languages: ENGLISH

The purpose of this study was to examine the extent to which hospital pharmacists in Wisconsin received compensation for continuing education (CE) from their institutions and to compare this with their participation in CE activities. The study was conducted by a mail questionnaire sent to all pharmacists practicing in a hospital setting in Wisconsin. The usable response rate was greater than 45%. Persons in administrative positions received greater support for CE activities than staff in the areas of registration fees (P less than 0.005), travel expenses (P less than 0.0005), dues for professional organizations (P less than 0.0005), and compensatory time (P less than 0.0005). Pharmacists in the sample participated in an average of 123.8 hours of CE yearly, including 77.2 hours of journal reading. Staff size influenced the method of obtaining CE, with smaller staffs relying more heavily on journals and larger staffs on in-house programs. The amount of compensation did not influence total CE participation, suggesting that other factors might influence CE participation.

**Financing graduate medical education: an update and a suggestion for reform.**

Hadley J; Tighe P  
Health Policy Educ ,Jul 1982, 3 (2) p157-71, ISSN  
0165-2281 Journal Code: G2I  
Contract/Grant No.: HCFA 95-P-97176/3-02  
Languages: ENGLISH

This article reports data pertinent to three issues in the financing of graduate medical education: sources of funds for house staff support, the financing of faculty salaries for educational activities, and reimbursement bias in favor of care provided in inpatient settings. Using data from a 1979 hospital survey, we estimate that total expenditures for house-staff stipends and fringe benefits were almost \$1.6 billion. Eighty-seven percent of these funds were derived from patient care revenues. Faculty salaries for educational activities added another \$376 million to the cost of graduate medical education. Teaching hospitals collected 81 percent of their charges for inpatient care, but only 72.8 percent of charges for outpatient care. However, Medicare and Medicaid reimbursed approximately the same proportion of charges in both settings. The article concludes by arguing that a unified-charge system for paying teaching hospitals would eliminate most of the issues currently associated with the financing of graduate medical education as matters of public policy.

**Service-conditional medical student aid programs: The experience of the states.**

Strosberg MA; Mullan F; Winsberg GR  
J Med Educ ,Aug 1982, 57 (8) p586-92, ISSN 0022-2577  
Journal Code: J13  
Languages: ENGLISH

Medical student aid programs tied to a service commitment are in operation in 31 states. The programs provide various options for students to pay back the financial support given by the state, the most popular form being cancellation of the financial obligation to the state if a service commitment is fulfilled. Although the statutory language and program literature claim a major objective of the programs to be the provision of manpower to underserved areas, lenient "buy-out" provisions and small awards relative to the total tuition have caused these programs to be used as sources of low-interest loans. Moreover, states do not provide subsidies to promote service in unattractive areas; thus, there is little reason for physician graduates to locate in low-income areas. State cooperation with the federal National Health Service Corps Scholarship Program, which does provide subsidies to physicians practicing in underserved areas, may provide the states a strategy for meeting their legislative objectives of providing physicians for the underserved.

Graduate medical education in the setting of a large health maintenance organization (HMO) is a challenging enterprise with surmountable problems and tangible rewards. Ten years ago an independent residency program in internal medicine was begun at one of the largest medical centers in the Kaiser-Permanente Medical Care Program in Northern California. The residency program, at the Kaiser-Permanente Medical Center in Santa Clara, is described and compared with other graduate medical programs. Included are discussions of curriculum development, faculty, funding, medical school affiliation, and the role of HMOs in graduate training.

**Self-study program on drug information for staff pharmacists.**  
Poirier TI; Lech JG  
Am J Hosp Pharm ,Aug 1982, 39 (8) p1313-5, ISSN 0002-9289  
Journal Code: 3IO  
Languages: ENGLISH

A self-study inservice educational program on drug information resources was designed to improve staff pharmacist competence in responding to drug information requests. Pharmacists attended two introductory sessions in the drug information center (DIC) that focused on available resources and the systematic search process. Each pharmacist also spent an eight-hour work period in the DIC. Twenty-four hours of regular staff time was allowed for each pharmacist to complete a self-study manual. The manual consisted of three sections: (1) discussion of selected references; (2) assignments based on common types of drug information questions; and (3) assignments that required the use of indexing and abstracting sources. Each pharmacist had to complete 50 questions during a

12-week period. The pharmacists were evaluated through pre- and post-tests and by the accuracy of answers to assignments in the manual. Six pharmacists initially participated in the program; five of them attained an average grade of more than 70 on the post-test and assignments. Three new staff pharmacists now have also completed the program. The success of the program depended on the support of pharmacy administration, as well as the motivation of the participating pharmacists. This staff development program using a self-study manual has been an effective means for improving pharmacists' use of drug information resources. The manual is flexible to accommodate differences in the rate of staff development and it is a useful training tool for new pharmacists.

 Languages: ENGLISH

This article is intended to introduce the reader to the concepts of CEA/CBA for purposes of evaluating innovative pharmacy services. Furthermore, sensitization to the issues surrounding CEA/CBA studies should allow the reader to be more discriminating in reviewing such reports in the literature. Rising costs for health care and the existence of limited resources are forcing policy makers to allocate resources in ways that maximize return-on-investment. It is felt by some that in the 1980s, researchers will be expected to answer the questions, "How much better is the innovation?" and "How do the expected benefits of an innovation compare with the benefits that could be obtained if the resources were used in some alternative way?" Part of the solution will require changes in the training and practice of health professionals. Future physicians, pharmacists, and others will need to acquire skills from the behavioral, social, and decision sciences (e.g., epidemiology, statistics, economics, decision analysis). The notion of cost-effective clinical decision making needs to be taught at all levels. Health practitioners involved with decision making at the level of the patient need to become more knowledgeable of the overall impact (regarding costs and benefits) of their decisions. Finally, evaluation of innovative pharmacy services is but one element of a management program for clinical services. Our attempt is not to deemphasize the need for studies documenting the value of clinical services, but rather to put evaluation in perspective with an equally important need, the need for development of an overall pharmacy program that is not only cost effective but efficient as well. The means to this end is a total management program integrating all pharmacy services.

Am J Hosp Pharm ,Oct 1981, 38 (10) p1463-6, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

The managerial position held by men and women pharmacists in three primary practice settings were examined and compared. A nationwide survey, using a pretested 12-page questionnaire, was sent to 2100 pharmacists in hospitals, independently owned pharmacies, and chain-store pharmacies. The variables examined by discriminant analysis were sex, age, years with employer, the number of times a pharmacist left practice, and educational level. A total of 767 completed questionnaires were used in the analysis for a 39.6% response rate, and 57.6% of the sample was women. Women were found to be significantly under represented in managerial positions in all three practice settings; however, there were a greater percentage of women in managerial positions in hospital pharmacies than in independently owned or chain-store pharmacies (p less than or equal to 0.001). When age was controlled in the analysis, there were more women at the staff level than men in all the age categories above 25. The discriminant analysis showed that advanced education was a significant factor in a pharmacist's position in hospital pharmacies but not in community pharmacies. The sex of the pharmacist showed the highest discriminating power in classifying the position of community pharmacists. Women pharmacists were under represented in managerial positions in all three practice environments. However, hospital pharmacy had a greater percentage of women in managerial positions than community pharmacy.

Languages: ENGLISH

A competency-based advancement program for practicing pharmacists is presented. The criteria for selecting this method of providing incentives for pharmacists are outlined. Procedures for developing and implementing this competency-based program are described. Five competency levels for pharmacists were developed based on the pharmacist's educational background, training, and experience. Differentiated position titles and competency expectations for each level are summarized. Criteria for pharmacist placement and promotion from one completely level to another are outlined. The administration of the program is described, including budget considerations and methods for evaluating its effectiveness. This system recognizes and rewards accomplishments of staff pharmacists without removing them from patient care roles.

**Administrative audits of professional services: effective residency training experience.**

Schneider PJ; Brier KL; Caryer KE; Lemay AP; Rogers KR; Salzer LB; Witkowski PL

Am J Hosp Pharm .Mar 1981, 38 (3) p339-42, ISSN 0002-9289 Journal Code: 3IO

Languages: ENGLISH

The development of a structured method of providing administrative experience for hospital pharmacy residents, using internal audit techniques, is described. Residents were assigned topics to investigate in the administrative area of hospital pharmacy early during their two-year, academically affiliated residency. They were expected to review and evaluate the topic critically using internal audit techniques; written and oral reports were presented to the administrative staff. Residents were able to complete the audits while attending classes as part of their academic experience. As a result of performing the audits, residents have learned administrative skills in problem identification, assessed their personal competency by reviewing major components of contemporary practice, learned accepted standards of pharmacy practice, and developed skills in making improvements in conformity with quality assurance standards. This program has been incorporated as an integral part of the residency program.

The types of problems that can be analyzed with regression analysis, and interpretation of the resulting summary statistics, are discussed. Linear and multiple regression models, regression coefficients are described. Regression analysis can answer questions about the existence and strength of relationships and the relative importance of independent variables, and can forecast the outcome from changes in the values of independent variables. Multivariate regression analysis can detect the contribution of each of several independent variables on the dependent variable.

**Medicare program; access to books, documents and records of subcontractors--Health Care Financing Administration. Proposed rule.**  
Fed Regist ,Oct 12 1982, 47 (197) p44750-6, ISSN 0097-6326 Journal Code: B58  
Languages: ENGLISH

This proposal would implement section 952 of the Omnibus Reconciliation Act of 1980 (Pub. Law 96-499), which conditions Medicare reimbursement for the cost of services performed under certain contracts upon compliance with prescribed criteria. If a contract between a provider and a subcontractor covers services valued at or costing \$10,000 or more over a 12-month period, Medicare reimbursement cannot be made for the services unless the contract includes a clause allowing the Secretary of Health and Human Services and the Comptroller General and access to the contract and to the subcontractor's books, documents and records necessary to verify the costs of the contract. The clause in the contract must also permit similar access to any subcontract between the subcontractor and a related organization of the subcontractor when the subcontract is worth or costs \$10,000 or more over a 12-month period. This proposal specifies the criteria and procedures that the Department would use to obtain access to affected books, documents and records. The purpose of the legislation and these proposed regulations is to permit the Secretary and Comptroller General to make an accurate determination of the reasonable costs under these contracts.

A decentralized nursing structure allows the head nurse to become actively involved in the planning and budgeting process. In Nursing Decentralization: The El Camino Experience (published in November 1981 by Nursing Resources) the authors describe the development of a budgeting system that supports autonomy, accountability, and authority at the practitioner level. For JONA readers, we present, in two parts, an abridged version of the chapter "Budgeting: Holding the Purse Strings." Part 1, which follows, outlines important steps for the development of a successful and efficient budgeting program that can be adapted to meet the needs of other decentralized organizations. Part 2, which details a typical budget session, will appear in the next issue of JONA.

Declining budget conditions in many social service settings suggest that education must provide future graduates with very different managerial skills. When human service organizations are perceived as evolving political structures, populated with a variety of individuals who represent diverse values and claims, resource scarcity often results in growing conflict and a preoccupation with individual and subunit survival. This changing organizational context will require increasing political skill on the part of managers as well as an ability to harmonize new approaches with prior service values in achieving consensus around solutions to service delivery problems.

**Operational budgeting and budgetary control in diagnostic radiology.**

Evert H

Radiol Manage ,Sep 1982, 4 (4) p21-3, ISSN 0198-7097

Journal Code: Q5J

Languages: ENGLISH

This article is concerned with establishing a revenue and expense budget for a diagnostic radiology department. It deals with setting up a breakout of examinations into specific categories and projecting the volume in each category. The volume should be expressed in RVUs rather than examinations. The volume predictions for the upcoming year would then be decided by factoring in such things as new procedures, new technology, patient day projections, ER projections, and any known outside influences. Once the volume is projected, expenses should be matched to these increases or decreases. These expenses would be prior to adding inflationary impacts. Finally, a follow-up should be performed on a monthly basis to ensure that the percentage change in volume is being matched by the same percentage change in expenses.

**The politics of fund raising through grantsmanship in the human services.**

Lorenz PH

Public Adm Rev ,May-Jun 1982, 42 (3) p244-51, ISSN 0033-3352 Journal Code: QIN

Languages: ENGLISH

Funds for human service programs and services are declining, and selection criteria for funds are becoming more objective. These conditions are creating an imbalance in the system which will result in a significant change in human service funding and delivery. The climate is ripe for increased competition among those who obtain funds for human services. This article attempts to define how that competition will ultimately generate a spirit of cooperation among the survivors. To reach that point, however, grantsmen/providers, to be competitive, will need to sharpen their technical writing skills and their political skills, that is, they need to become more shrewd, prudent, and diplomatic. This article suggests some methods for improving technical grant-writing skills and developing political skills among grant writers.

**Simultaneous financial evaluation of a complex set of capital budgeting alternatives: a mathematical model.**  
Duncan CS  
Am J Clin Pathol ,Jan 1983. 79 (1) p87-97. ISSN  
0002-9173 Journal Code: 3FK  
Languages: ENGLISH

Capital budgeting technics provide for financial evaluation of planned purchases of equipment or other major investments. In capital budgeting, the laboratorian often is faced with a complex set of alternatives, including leasing, installment purchasing, contracting work to another laboratory, and outright purchasing. This paper presents a mathematical model useful for simultaneously evaluating the financial worth of all such alternatives under the same set of assumptions. Armed with the results of financial evaluation and evaluations of quality, turnaround time, and other patient-care factors, the laboratorian can make better decisions regarding the choice of method which, in turn, will affect the productivity of the laboratory. The model is tended for application to mutually exclusive alternatives and includes three useful capital budgeting technics: (1) payback period, (2) net present value, and (3) profitability index. The technics are demonstrated as well as a method of programming the model in financial planning software for solution by microcomputer.

The historical approach to planning community hospitals fails to recognize the substantial impact of finance on program decisions. A fundamentally different approach, an approach that involves the chief financial officer in the planning effort, is proposed here. By integrating financial planning within the overall planning effort, a hospital can develop a truly strategic plan based on the best information from everyone on the hospital management team.

**New California strategy for medical assistance favors public health and organized plans.**  
Cole CA  
Urban Health ,Aug 1982, 11 (7) p36-9, Journal Code: X6C  
Languages: ENGLISH

In coming months, county governments in California will begin implementing regulations enacted by State Assembly that will change the settings for treatment of Medi-Cal (Medicaid) patients. The change will be dramatic, channeling medical assistance patients out of the offices of individual private practice physicians and into the offices of salaried doctors in public health settings or offices of doctors participating in organized health plans. Negotiated contracts with counties, institutions and non-institutional providers, patients, and fixed rates of reimbursement will become the parameters of medical service for providers of health care in the state's medical assistance program. For urban private solo practitioners in California whose practices rely heavily on publicly-supported patients, these changes hold a major threat, and for physicians throughout the nation it is a situation which should be watched carefully, because California is well known as a state which gives birth to changes that later appear in other states.

**The hospital capital crisis: issues for trustees.**

Bradford C; Caldwell G; Goldsmith J

Harv Bus Rev ,Sep-Oct 1982, 60 (5) p56-68, ISSN

0017-8012 Journal Code: GBE

Languages: ENGLISH

The erosion of the capital position in the hospital industry--one of the most complex and overregulated industries in the United States--is a major challenge to trustees. Hospital trustees have often neglected to examine their hospitals' capital needs on more than a project-by-project basis. In dealing with their hospitals' capital needs, trustees, most of whom are successful business people, too often take off their "business" hats and put on their "social worker" hats. In doing so they not only neglect to subject their hospitals' capital and operating programs to searching cost-benefit review, but they also overlook much useful knowledge about how to use corporate organization to shelter new ventures and strengthen their hospitals' market position and solvency. In this article, the authors discuss how hospitals can adopt successful corporate restructurings and strategies to respond to the adverse financial developments they will have to face in the coming years.

Languages: ENGLISH

Approximately 1.3 million of our nation's elderly live in nursing homes. Despite the increasingly important role of Medicare and Medicaid, many must bear the costs of their care. This Note examines one means of financing nursing home care--the life care contract. These require residents to pay an entrance fee and transfer to the nursing home all or part of their property in return for the home's promise to provide care for the remainder of the resident's life. The Note discusses the potential problem a life care resident may face, such as substandard living conditions or a home's financial instability. It concludes by delineating steps that potential residents can take in constructing life care contracts to ensure protection of their rights and needs.

The definition of the fiscal unit/family structure has enabled users of the FMIS, or family practices in Colorado and Wyoming, to maintain accurate, ongoing financial information on their patients. In turn, this structure has been a major incentive for maintaining accurate family information, and a distinct benefit to FMIS users. This article has presented the rationale, design, and method of implementation of the fiscal unit structure, with the intention of presenting this concept to others for use in other information systems used in maintaining family-oriented financial and medical information for medical practices.

**Antitrust law implications of exclusive contracts, closed staffs, and denials of hospital privileges.**

Costilo LB  
Ann Intern Med ,Oct 1982, 97 (4) p599-601. ISSN  
0003-4819 Journal Code: 5A6  
Languages: ENGLISH

Reports of an impending surplus of physicians have intensified economic incentives to exclude competing professionals from the hospital workplace. These conditions have led to a substantial increase in the number of private lawsuits instituted by the excluded physicians. Denials of hospital privileges can be essential to the maintenance of high standards of quality and efficiency at a hospital. However, unreasonable denials of staff privileges, staff closures, and exclusive contracts can raise antitrust implications depending on the facts. The relevant factual and economic questions that should be asked about such conduct in order to determine the degree of antitrust risk are discussed.

0033-3549 Journal Code: QJA  
Languages: ENGLISH

A computer-based financial planning model was formulated to measure the impact of a major capital improvement project on the fiscal health of Stanford University Hospital. The model had to be responsive to many variables and easy to use, so as to allow for the testing of numerous alternatives. Special efforts were made to identify the key variables that needed to be presented in the model and to include all known links between capital investment, debt, and hospital operating expenses. Growth in the number of patient days of care was singled out as a major source of uncertainty that would have profound effects on the hospital's finances. Therefore this variable was subjected to special scrutiny in terms of efforts to gauge expected demographic trends and market forces. In addition, alternative base runs of the model were made under three distinct patient-demand assumptions. Use of the model enabled planners at the Stanford University Hospital (a) to determine that a proposed modernization plan was financially feasible under a reasonable (that is, not unduly optimistic) set of assumptions and (b) to examine the major sources of risk. Other than patient demand, these sources were found to be gross revenues per patient, operating costs, and future limitations on government reimbursement programs. When the

likely financial consequences of these risks were estimated, both separately and in combination, it was determined that even if two or more assumptions took a somewhat more negative turn than was expected, the hospital would be able to offset adverse consequences by a relatively minor reduction in operating costs.

**Variable billing for services: new fiscal direction for nursing.**

Higgerson NJ; Van Slyck A  
J Nurs Adm ,Jun 1982, 12 (6) p20-7, ISSN 0002-0443  
Journal Code: JEL  
Languages: ENGLISH

The advantages of variable billing for nursing care that: It identifies revenue nursing cost centers. It facilitates systematic control of revenue and expenses, improving budget planning and management. It generates a tremendous amount of data that can be used in administrative planning and decision making. It is more equitable than past billing practices for the patient, the third-party payer, and the hospital, making it a public relations asset. The disadvantages of variable billing are that: Charges at one hospital are not easily compared with those at another. The mix of patients at varying classification levels has a significant effect on revenue, thus increasing the possibility of lower revenue. More accountability and in some cases more work is required of nursing administrators. In this article, the practical application of variable billing in acute care settings has been discussed. It is hoped that the information provided here will stimulate nursing administrators to assess the feasibility of implementing variable billing for nursing services as a fiscal practice in their own institutions.

**On the political economy of risk: farmworkers, pesticides, and dollars.**

Strigini P  
Int J Health Serv ,1982, 12 (2) p263-92, ISSN 0020-7314  
Journal Code: GRJ  
Languages: ENGLISH

The rapid industrialization of world agriculture has been one of the most eventful social and economic transformations taking place in the second half of the 20th century. Today two agricultures coexist in most countries: capital-intensive agri-business and labor-intensive subsistence farming. In the U.S., the former exploits largely nonwhite immigrant labor and the latter female unpaid labor, surviving as a "second job." The striking increase of production in industrial agriculture has been accompanied by uneven and irrational development and by a tragic upsurge of mechanical accidents and chemical hazards. Current pesticide use poses a threat to workers and their families, the general public, the environment, and future generations. Acute risks begin to be known largely through farmworkers' exposure, while chronic risks are often inferred from experimental studies but generally are disregarded. Because of industry's historic neglect of health and environmental hazards, regulation has evolved under pressure from workers and citizens. Regulation is at present the best tool available to shape technological development according to society's needs and goals. Its basic requirements are information, reorientation of public resources, and democratic control. A major obstacle to its implementation is

the inequitable social distribution of risks and benefits, within and among nations.

**Declining reimbursement will demand innovative delivery methods.**

Mannisto M  
Hospitals ,Jul 16 1982, 56 (14) p92, 94, ISSN 0018-5973  
Journal Code: GDL  
Languages: ENGLISH

In summary, hospitals will have to find innovative ways to secure market share as federal reimbursement continues to decline and the commercial insurance industry rebels against the cost shifting burden that is being placed on it. Hospitals can also expect increasing pressure to control costs if inflation rates continue to moderate but hospital expenses exceed the current inflation rates. All in all, the reimbursement system will undergo severe "belt tightening," which will force hospitals to change their product mix; accept new payment systems, such as capitation; and reduce expenses in order to achieve profitable operating margins.

There are many hazards in the clinical laboratory that could result in injury, illness, or loss of property. Many of these hazards are common to the home and a wide variety of working environments; others are unique to the laboratory. Since control and prevention of occupational illness and injury depends on recognizing their causes and taking timely and appropriate corrective action, this article presents a basic program for protecting the health and safety of clinical laboratorians. It consists of three parts: hazard identification, control measures, and accountability.

**Managing medical malpractice risk via system science.**

Grose VL  
J Med Syst ,Feb 1982, 6 (1) p89-103, ISSN 0148-5598  
Journal Code: IZM  
Languages: ENGLISH

The complexity of health care is increasing at an alarming rate. Medical malpractice risks, which are inherent elements of this complexity, threaten the survival of both physicians and hospitals. Technological advances, social concerns, legal ramifications, economic values, and political pressures all amplify risk for health care professionals. Federal government warnings to control health care costs compound the dilemma. System science provides a framework for identifying, analyzing, and ranking all types of risk so that they can be balanced against the more easily recognized benefits of health care. Rather than limiting the concept of risk management to the traditional concern for financial loss, this paper stresses a much broader scope of risk assessment and control. All medical activities that can lead to injury or death of any person, or damage to or loss of property, material, or reputation must be systematically managed regarding risk. A strong theoretical foundation is combined with the successful application of system science to managing risk at the Saint Joseph Medical Center in Burbank, California.

Gronbjerg KA

Soc Serv Rev ,Mar 1982, 56 (1) p1-26, ISSN 0037-7961

Journal Code: UTV

Languages: ENGLISH

This paper examines recent trends in American philanthropy and relates these to changes in the composition and size of both the private and public welfare sectors in the United

States. The findings reveal that private welfare has been overwhelmed - but not replaced - by the growth in public welfare. Although private welfare maintains some of its traditional functions, it has become more closely linked to and in some cases dependent on, public welfare. Consequently, there have been significant changes in the institutional character and organizational format and operations of private welfare. These transformations of the American welfare system are interpreted within the mass-society perspective. (63 Refs.)

Small and rural hospitals that have financed capital projects successfully have built a strong base of public support among the local community and regulators, and they have been willing to risk failure to achieve their goals. An open mind, community involvement, and participation of experienced professionals are essential to a successful financing.

Despite predictions that the Economic Recovery Tax Act of 1981, by diminishing the tax benefits of charitable giving, will have a serious adverse effect on philanthropy to hospitals, many hospital development officers remain optimistic. They recommend that hospitals respond by improving their marketing efforts to their giving publics.

The major debt financing options available to hospitals may be evaluated according to two categories of factors: those involving the financing itself and those involving its subsequent operational impact. Structural considerations include the likely trend in interest rates, the time commitment necessary to complete multiple financings, the institutional operating climate, and the likelihood that a preferable vehicle will be available at a later date.

With traditional sources of capital threatened, hospitals are going to have to turn to new sources of capital and new methods of raising capital if they are to meet their facilities and equipment needs during the 1980s. New capital will come primarily from two sources: net income from new health services and health-related ventures operating in less regulated markets, and equity offerings.

The Economic Recovery Tax Act of 1981 left tax-exempt hospitals at a significant disadvantage in the competition for capital. Although the new law's accelerated depreciation schedules and liberalized investment tax credits contain some marginal benefits for tax-exempt hospitals, these benefits are probably more than offset by the impact of the law on charitable giving.

**Medical practice, case mix, and cost containment. A new role for the attending physician.**

Young DW; Saltman RB

JAMA ,Feb 12 1982, 247 (6) p801-5, ISSN 0098-7484  
Journal Code: KFR  
Languages: ENGLISH

Present political pressures for hospital cost containment appear to make some form of case-specific reimbursement system inevitable. For such a system to be able to control hospital costs effectively, however, its design must reflect the fundamental and traditional principles of management control systems. Although the diagnostic-related group (DRG) approach is the most frequently discussed form of case-mix-sensitive reimbursement, DRGs do not satisfy basic management control principles. Under a more appropriate hospital control system, however, physicians would be incorporated directly into the hospital's management structure. Consequently, to ensure that this new control system is medically as well as financially appropriate, physicians should seize the initiative in determining the standards against which their performance will be measured.

To weather the stormy malpractice environment that lies ahead, hospital medical staffs will need to cooperate more actively with risk management and quality assurance programs than they have in the past. One barrier to more active physician cooperation has been fear that the confidentiality of medical staff committee findings will be breached. This article describes how the California Medical Association and the California Hospital Association worked to promote an organized approach to quality assurance built around legislation that removes quality assurance data and records from legal discovery.

**'Nonprofits' need surplus too.**  
Young DW  
Hary Bus Rev ,Jan-Feb 1982, 60 (1) p124-31, ISSN  
0017-8012 Journal Code: GBE  
Languages: ENGLISH

By definition profit refers to the difference between revenue and expenses. In for-profit organizations profit or surplus gives a return to the owners of the company and serves as a source of financing for capital acquisitions and working capital. Nonprofit organizations, which are not allowed a surplus, don't suffer on the first count because they have no owners. But they do suffer on the second count because, if expected to grow, they need to finance asset replacement and growth. In these days when funds for long-term debt are becoming scarcer, this author asserts, the need for regulators to allow 'nonprofits' to keep a surplus is increasing. In this article, he argues for a surplus and then discusses how managers and regulators can determine how much a nonprofit organization should be allowed. He presents a combination of a modified version of the return-on-asset pricing model used in for-profit organizations and a model for assessing working capital needs associated with growth.

Journal Code: 5A6

Contract/Grant No.: HS-02577

Languages: ENGLISH

The literature on economic efficiency in providing hospital services has been growing recently. Often such literature examines the costs of providing services at varying volumes of treatments per location per year. However, instead of measuring cost directly, these studies use patient bills (charges) as a proxy for cost. Charges may bear little resemblance to economic cost, and use of charges as a proxy for economic cost may lead researchers to draw unwarranted conclusions about economic efficiency. Because of the differences between economic cost, accounting cost, and charges to the patient, actual resource consumption should be used as a measure of cost.

A study of standard-setting efforts in accounting and auditing is reported. The study reveals four major areas of concern in a professional standard-setting effort: (1) issues related to the rationale for setting standards, (2) issues related to the standard-setting board and its support structure, (3) issues related to the content of standards and rules for generating them, and (4) issues that deal with how standards are put to use. Principles derived from the study of accounting and auditing are provided to illuminate and assess standard-setting efforts in evaluation.

**Accountability, efficiency, and the "bottom line" in non-profit organizations.**

Cutt J

Can Public Adm ,Fall 1982, 25 (3) p311-31, Journal

Code: CK7

Languages: ENGLISH

Financial reporting by non-profit organizations deals only with accountability for propriety and regularity, and ignores output measurement. The development of output measures of a physical or index nature offers a means of relating dollar costs to output in the form of cost-efficiency or cost-effectiveness measures, but does not provide any measure of the absolute value or worthwhileness of such programs. This fundamental absolute value question should be asked of all non-profit programs and documented to the greatest possible extent in budgetary submissions, and subsequent control and audit. In public sector non-profit programs, the posing of this question requires information on consumer demand other than in aggregative and imprecise form through the political process, and much improved information on the cost side. Eliciting demand information is feasible in the case of public programs with separable benefits by the use of a variety of pricing techniques, direct or imputed, whether or not the service in question is ultimately financed on a user-pay basis. The problem of eliciting demand is more difficult in the case of public goods, but improved demand information can be obtained, ideally by an approach such as the use of a Clarke tax. The argument can be extended to encompass questions of income distribution, stabilization, regulation and tax policy. Recent developments in program evaluation in the federal government are important, but remain deficient in failing to address the question of absolute value.

**Subjecting hospitals to truth in lending disclosure requirements: Bright V. Ball Memorial Hospital.**

Galler L

Am J Law Med ,Spring 1982, 8 (1) p69-86, ISSN 0098-8588

Journal Code: 3IP

Languages: ENGLISH

The federal Truth in Lending Act requires creditors to comply with complex disclosure requirements whenever they engage in consumer credit transactions. In light of procedures adopted by hospitals and health care professionals which permit payment for services over time, there is some question as to whether these groups may be considered creditors within the meaning of the Act and therefore subject to the Act's disclosure requirements. In Bright v. Ball Memorial Hospital, the Court of Appeals for the Seventh Circuit concluded that a hospital can be a creditor with respect to certain hospital-patient transactions. However, the court found that the defendant had not consummated consumer credit transactions with the plaintiffs and consequently had not violated the Act by failing to make disclosures. This Case Comment contends that although the court correctly determined that a hospital, in certain circumstances, may be subject to the Act, it incorrectly held that Ball Memorial failed to consummate consumer credit transactions with the plaintiffs. This Case Comment also discusses the circumstances under which a hospital should be considered a creditor for purposes of the Truth in Lending Act and recommends that hospitals offering installment payment plans routinely comply with disclosure requirements of the Act.

**Improved cost allocation in case-mix accounting.**

Williams SV; Finkler SA; Murphy CM; Eisenberg JM  
Med Care ,May 1982, 20 (5) p450-9, ISSN 0025-7079  
Journal Code: LSM  
Contract/Grant No.: HS-02577  
Languages: ENGLISH

Traditionally, many hospital costs have been allocated to patients using indirect measures that do not always reflect the value of the resources used to provide care. When, for example, costs are allocated by multiplying the patient's charges by the hospital's ratio of costs to charges, the allocated cost does not reflect actual cost because the hospital does not uniformly charge for services in proportion to their cost. The choice of method for cost allocation will be as important for the newly developed case-mix cost-accounting systems as it has been for traditional cost-accounting systems. To illustrate how the use of an indirect cost-allocation method might affect the output of a case-mix cost-accounting system, operating room, radiology and clinical laboratory costs were assigned to 106 hospitalized inguinal hernia patients in two diagnosis-related groups (DRGs) using both the hospital's existing cost-allocation method and a method that measures costs directly. Total costs and the costs in each department were significantly lower in each DRG using the direct method. It was concluded that patients in these two DRGs were being assigned more than the actual cost of their care with the existing cost-allocation method and, therefore, that the existing method prevented the case-mix accounting system from providing accurate management information.

**Improving revenue collection for ambulatory pharmaceutical services.**

Boucher BA; Metzler DM; Baxter H; Cipolle RJ; Zaske DE  
Am J Hosp Pharm ,Apr 1982, 39 (4) p610-2, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

A method of improving revenue collection for ambulatory pharmaceutical services was studied. Data were collected and compared from two phases. In Phase 1, all charges for outpatient pharmaceutical services were billed by the business office. During Phase 2, a pharmacy-based cash-and-carry policy was initiated; patients were encouraged to pay for their prescriptions by cash, check, or credit card, and third-party agencies were billed directly for prescriptions when patients had such coverage. Samples of 1000 prescriptions were randomly selected in each phase to determine the amount of charges collected. Criteria for inclusion of prescriptions were the same in each phase. For the 831 prescriptions meeting the study criteria in Phase 1, 46% of the total \$895,812 in charges was collected. For the 767 prescriptions meeting the same criteria in Phase 2, 85% of the total \$892,185 charges was collected. It required an additional 1.5 minutes for the pharmacy to process a prescription in Phase 2. Patients receiving emergency medical services and those covered by Medicare had the poorest collection rates. The highest rates occurred for patients covered by Medicaid and those receiving maintenance medication. The cash-and-carry policy notably improved revenue collection and the efficiency of the collection process for outpatient pharmaceutical services.

**Accounting for station connections, optional payment in revenues and related capital costs, customer provided equipment and sale of terminal equipment--Federal Communications Commission. Order on reconsideration and clarification of first report and order.**

Fed Regist ,May 5 1982. 47 (87) p19361-7, ISSN 0097-6326 Journal Code: B58

Languages: ENGLISH

This document sets for the Commissions response to a petition for clarification and a petition for reconsideration of its First Report and Order, Commonly known as "Expensing of Station Connections". The First Report and Order, published in the Federal Register at 456 FR 18481, March 31, 1981, adopted changes to the Commissions Rules in Part 31 on uniform system of accounts for Class A and B telephone companies. Both petitioners raised the question of whether, and to what extent the adoption of th First Report and Order limits the discretion of the State commissions to follow different accounting and depreciation procedures for purposes of computing revenue requirements for intrastate telecommunications services.

0017-8012 Journal Code: GBE  
Languages: ENGLISH  
Despite their constantly rising charges that provoke government regulators and insurance companies to impose "caps," hospitals and other health care institutions continue to use antiquated cost control systems. This author describes a new accounting system, based on the amount of care each patient needs, that has been in use at Massachusetts Eye and Ear Infirmary for six years. In this system, basic "clinical care units" (determined by a peer review process and in collaboration with third-party payers) establish the acceptable standard for a given diagnosis. With charges and reimbursement based more directly on the labor and services involved, hospitals can plan more efficient use of nursing staff and other personnel and services. Use of established norms for each diagnosis also helps staff and third-party insurers determine when hospital resources are being used most productively.

**National health expenditure growth in the 1980's: an aging population, new technologies, and increasing competition.**

Freeland MS; Schendler CE

Health Care Financ Rev ,Mar 1983, 4 (3) p1-58, Journal Code: GHX

Languages: ENGLISH

Health care spending in the United States more than tripled between 1971 and 1981, increasing from \$83 billion to \$287 billion. This growth in health sector spending substantially

outpaced overall growth in the economy, averaging 13.2 percent per year compared to 10.5 percent for the gross national product (GNP). By 1981, one out of every ten dollars of GNP was spent on health care, compared to one out of every thirteen dollars of GNP in 1971. If current trends continue and if present health care financing arrangements remain basically unchanged, national health expenditures are projected to reach approximately \$756 billion in 1990 and consume roughly 12 percent of GNP. The focal issue in health care today is cost and cost increases. The outlook for the 1980's is for continued rapid growth but at a diminished rate.

The primary force behind this moderating growth is projected lower inflation. However, real growth rates are also expected to moderate slightly. The chief factors influencing the growth of health expenditures in the eighties are expected to be aging of the population, new medical technologies, increasing competition, restrained public funding, growth in real income, increased health manpower, and a deceleration in economy-wide inflation. Managers, policy makers and providers in the health sector, as in all sectors, must include in today's decisions unanticipated outcomes of policies over the last decade have intensified the need for periodic assessments of individual industries and their relationship to the macro economy. This article provides such an assessment for the health care industry. Baseline current-law projections of national health expenditures are made to 1990. (148 Refs.)

**Nutrition services in State and local public health agencies. Special supplement: revision of the 1955 guide by the Nutrition Services Project Committee.**  
Public Health Rep ,Jan-Feb 1983, 98 (1) p7-20, ISSN 0033-3549  
Journal Code: QJA  
Languages: ENGLISH

The contribution of nutrition in preventing disease, prolonging life, and promoting health through organized community effort is well recognized. While many gains have been made in public health nutrition, it is clear that the American population continues to exhibit nutrition problems. Rene Dubos has said that no community will find it possible to deal simultaneously with all of the health problems inherited from the past and with those brought about by modernization and change. The challenge lies in determining priorities and making difficult choices in the face of shifting responsibilities among levels of government, reduced resources, and increased competition. The purpose of this guide is to help public health officials appreciate the important role nutrition services play in meeting the health needs of their communities. The recommendations for nutrition programs are sensitive to the social, economic, and political forces that are shaping the future of public health. How well public health officials meet the challenge of providing nutrition services in their communities will be a significant factor influencing the health status of the American population in the 1980s and beyond.

**Integrating primary health care and mental health services--a successful rural linkage.**  
Prindaville GM; Sidwell LH; Milner DE  
Public Health Rep ,Jan-Feb 1983, 98 (1) p67-72, ISSN 0033-3549  
Journal Code: QJA  
Languages: ENGLISH

The local delivery of human services is currently receiving national emphasis. The expectation is that community-based services shall be provided with a minimum of duplication and with maximum efficiency, achieved partly by interdisciplinary and interorganizational cooperation. This emphasis was appropriately facilitated in the mid-1970s through the availability of the Mental Health Initiative grants. The grants, initiated by the Bureau of Community Health Services in conjunction with the National Institute of Mental Health, Public Health Service, promoted the increased availability of mental health services through formal linkages between

community mental health centers and primary health care programs. One such successful linkage was between a small primary health care center and a nonfederally funded, multicounty, mental health center in northwest Illinois. Initiated in September 1980, the services of the linkage project included direct clinical mental health services delivered at the primary health care center site, consultation and education activities, and the coordination of interagency services. The project patients differed from the general clients of the mental health center in demographic characteristics, source of referral, and diagnoses. The key elements in successful linkages and the achievement of goals are analyzed. The experience of the linkage project is relevant to the 1980s. The project was prematurely ended after 14 months. Reduction in Federal funds severely cut support for the primary health care center, and the depressed local economy could not match the withdrawn Federal funds.

As the federal government's role in health policy has grown, its involvement in the development, adoption, and use of medical technology has grown concomitantly. The government now makes a wide variety of decisions concerning technology. Many of these decisions involve randomized clinical trials (RCTs). The federal government probably funds or requires a majority of the RCTs carried out in the United States. The federal government also uses the results of RCTs increasingly as an important basis for its decisions, especially within the Medicare program. As the scientific basis for medical practice has improved through use of the RCT, policy decisions have been put on a firmer base.

**The politics of fund raising through grantsmanship in the human services.**

Lorenz PH

Public Adm Rev ,May-Jun 1982, 42 (3) p244-51, ISSN  
0033-3352 Journal Code: QIN

Languages: ENGLISH

Funds for human service programs and services are declining, and selection criteria for funds are becoming more objective. These conditions are creating an imbalance in the system which will result in a significant change in human service funding and delivery. The climate is ripe for increased competition among those who obtain funds for human services. This article attempts to define how that competition will ultimately generate a spirit of cooperation among the survivors. To reach that point, however, grantsmen/providers, to be competitive, will need to sharpen their technical writing skills and their political skills, that is, they need to become more shrewd, prudent, and diplomatic. This article suggests some methods for improving technical grant-writing skills and developing political skills among grant writers.

In a national survey of family medicine university units and

residencies, 549 MD and 135 PhD faculty pursuing family medicine research were identified. Resources available for research were assessed, as were practice data system characteristics. The practice base nationally of programs pursuing research included 2.6 million patients from 1 million families, making 5.1 million visits per year. Common major impediments to research reported by programs included lack of faculty time (78%), lack of funding for faculty (61%) or staff, equipment and supplies (48%), and lack of research skill (45%) and role models (43%). The annual amount of all research grants received for calendar year 1979 was \$3.4 million, of which \$2.6 million was from federal government sources. This represented 0.06% of the federal health research effort. Continued development of family medicine research will require increased funding support both for research and research training.

As in most cases of natural disasters, relief needs arising out of the Mount St. Helens volcanic eruptions in May 1980 were greatly overestimated. Technical, bureaucratic, and political considerations all contribute to the upward bias in such cases. The errors in early estimates of relief needs can be reduced by systematic means. But more important than obtaining good early estimates is maintaining an effective control over actual disaster relief expenditures. As it turns out, the more effective systems of control usually go hand in hand with poorer early estimates, creating a dilemma for the management for disaster relief.

**Health care accommodation in Scotland.**  
MacIachlan J  
Scott Med J ,Oct 1982, 27 (4) p325-30, ISSN 0036-9330  
Journal Code: UJK  
Languages: ENGLISH  
The Medical and Nursing Advisers of the Scottish Health Service, Common Services Agency, Building Division, advise upon the planning of health care accommodation. The overall spread of beds by function is given in a review of existing health care buildings in the year 1981. The numbers of hospital beds and of various groups of staff in the hospital and community services are calculated per 100,000 population so that any unusual disparity can be ascertained. One of the parameters for health building planning is fiscal control and so the cost per hospital in-patient week is tabulated for eight groups of specialities. The appropriate responsibilities of the Regional Councils in Scotland in 1979 are considered along with the responsibilities of Health Boards because part of each Social Work Department's work is the provision of accommodation and social care for those in need as opposed to the National Health Service responsibility for the health care of those in hospital and in the community. An overall view of residential accommodation for those requiring medical treatment or social care is presented in tabular form. The views expressed are not necessarily those of the Common Services Agency.

This paper presents a critical examination of the past and future direction of social policies for the aged in the United States. The definitions of the social problem of old age and of the appropriate policy solutions for this problem have reflected the ups and downs of the U.S. economy and the shifting bases of political power during the past thirty years. In the 1980s, three dominant definitions of reality are shaping public policy for the elderly: (a) the perception of fiscal crisis and the necessity for reduced federal expenditures; (b) the perception that national policies should give way to decentralization and block grants; and (c) the perception of old age as an individual problem. It is argued that old age policy in the United States reflects a two-class system of welfare in which benefits are distributed on the basis of legitimacy rather than on the basis of need.

Community mental health centers are subject to a number of pressures that will affect the way centers operate in the years ahead. These influences include a reduction in federal appropriations, the use of block grants to the states, the administration's efforts at deregulation, and the continuing impact of deinstitutionalization. Because of these pressures, changes can be expected in the staffing patterns, catchment-area philosophy, numbers of service mergers and consolidations, degree of competition with the private sector the role of the states, use of state hospitals, consumer and citizen involvement, and kind and degree of professional advocacy. The author cautions that these trends may lead to decisions harmful to patient care unless careful planning is carried out. Centers of the future may well have to serve

fewer clients while maintaining a highly professional staff, a wide range of services, and an increased responsibility for caring for the chronic mentally ill.

According to the United States Supreme Court in 1973, a pregnant woman does not have an absolute right to an abortion. The Supreme Court stated that a pregnant woman's right to an abortion, based in part upon her constitutional right of privacy, is limited by a state's interest in the protection of potential human life. A wave of state legislative activity has ensued, most of which has been attempts by states to flex their "police power" muscles. The consequence of such activity has been state statutes which are vague, overly broad, inconsistent with the approaches taken with respect to the area of prenatal negligence, and which often leave the physician and surgeon without proper standards of conduct.

In fiscal years 1979 and 1980, the Genetic Diseases Service Branch of the Health Services Administration funded 34 state genetic service programs in the United States through monies

from the National Genetic Diseases Act (PL 94-278) of 1976. During the two-year period, 131,818 at-risk individuals were provided with genetic counseling. Analyses of amniotic fluid were performed on 42,003 specimens, with 436 abnormal fetuses (1%) detected. Utilization ratios of amniocentesis for advanced maternal age ranged from a low of 5% to a high of 49%. Screening programs for inborn errors of metabolism reported testing 3, 158,521 specimens. The numbers of affected children detected nationally were 195 with phenylketonuria (1:16,000), 536 with hypothyroidism (1:5,900), 25 with galactosemia (1:39,685), eight with maple syrup urine disease (1:86,984), and eight with homocystinuria (1:139,008).

Languages: ENGLISH  
The program directors of obstetrics-gynecology residencies in the United States were questioned regarding their perceptions of benign gynecologic surgical volume change at their institutions. Most responding departments had experienced a decline volume during the 5 years prior to the study. This volume decrease tended to be more frequent and more pronounced in those programs involving care of a high percentage of indigent patients. Conversely, programs with a predominantly nonindigent patient population tended to experience increases in volume. Many factors are responsible for this redistribution, including a change in gynecology, itself, which has become increasingly occupied with noninvasive ambulatory techniques.

**Effect of Reaganomics on the U.S. health-care system.**

Enright SM

Am J Hosp Pharm ,Jul 1982, 39 (7) p1169-75, ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

Health care under President Ronald Reagan is discussed as it relates to consumers, third-party carriers, hospitals, and hospital pharmacists. The Reagan Administration's goals are to: (1) promote cost containment and quality control through competition, and (2) shift the major elements of program control to the state and local governments and the competitive private sector. Described are the regulatory and legislative initiatives of the Administration, such as the Omnibus Reconciliation Budget Act, Block Grant Programs, Medicare and Medicaid cuts, and procompetition legislation. Under increased competition in the health insurance system, the locus of responsibility for costs will shift from employers and unions to employees. Incentives for greater cost sharing will force hospitals to restrain costs. Multihospital systems are likely to proliferate. Proposed ancillary service caps will increase competition for resources among hospital departments. Pharmacy departments must implement strategic long-range planning to withstand the pressures for reductions in staff and services. Clinical pharmacy services will become increasingly difficult to implement without full documentation. As a result of all these changes, consumer demand for health-care services may decrease, and the way such services are delivered will probably shift.

**A spatial analysis of voting on health care issues. United States House of Representatives, 86th Congress, First Session.**

Mullner R; Andes S; Tatalovich R; Bardes B

Soc Sci Med ,1982, 16 (11) p1147-56, ISSN 0277-9536

Journal Code: UT9

Languages: ENGLISH

This study examines the spatial patterns of congressional voting on health issues. Thirteen roll call votes on health care issues occurring during the 1st Session of the 96th Congress are factor analyzed. This analysis shows that health care questions cluster around two major issues: health care regulation and health care spending. The factor scores for each Representative are mapped, and a regression model is developed relating health care voting to characteristics of the Representative, the Congressional district, and the hospitals in that district. The most important findings were:

(1) support for both health care spending and regulation is strongest in the Northeast and upper Midwest. (2) Although Representatives from most of the Southern states are opposed to health care regulation, they generally favor health care spending. (3) Representatives from a few of the Southern states, however, do not fit this generalization. (4) Although Representatives from the Pacific Coast states are the strongest proponents of regulation, they are opposed to spending. (5) Opposition to health care spending is particularly strong among Representatives from suburban districts.

Public policy controversies about the cost-containing potential of HMOs and the failures of many plans should not overshadow the fact that HMOs will be forces in the health care sector in the 1980s, largely as the result of increasing private investment. There is a large, stable segment of the prepaid industry that developed as a result of private sector and community concern long before the federal HMO Act of 1973, and it is their initiatives along with increasing investment activity by insurance companies and management companies in particular, that will serve as a base for consolidation and growth of HMO plans. HMOs have not proved to be the miraculous cost-containing mechanism of the future, but their impact will be felt even more for the changes they stimulate in the customary organizational forms, in financing, and in the role of business in health care.

Reilly BJ; Legge JS Jr  
J Health Polit Policy Law ,Spring 1982, 7 (1) p254-70,  
ISSN 0361-6878 Journal Code: IBC  
Languages: ENGLISH

As the costs of the American health care system escalate, there is a tendency to identify the biggest cost item and attempt to reduce it to a manageable size. However, since that biggest cost item, the hospital, is a creation of uncontrolled forces within the system as a whole, attempts to manage costs will be limited in effectiveness. The hospital is the end product of an uncontrolled system, a product that displays little understanding of the economic principles of trade-off,

efficiency, and productivity. To limit spending in the hospital care system, controls must be rooted in an analysis of the forces that have shaped the hospital's present form and structure. Factors to be considered are those that have defined what a "good" hospital is, who its real consumers are, and what economic and quality control factors must be part of the entire health system. This article suggests modification of public policies relative to medical manpower an insurance, and recommends adoption of reimbursement by Diagnostic Related Groups.

The Canadian health care system is like the leaning tower of Pisa--a fine structure which everyone wants to preserve and improve. The officials in charge are caught between demands from those who want a new escalator for the visitors, and those who say the main priority is to find ways to prevent the tower from falling over. Our system has evolved in a sound and orderly way and few would wish to dismantle it. It has become caught up in conflict between pressures for growth and problems of how to pay for that growth. The challenge is to keep the system as a whole viable, while adding improvements in a fair and rational manner. No specific solutions are suggested, but rather a positive approach to finding them. While there will be no easy victories, this suggestion should be considered seriously by any who have an interest in getting the most out of more for Canadians.

These proposed rules would reaffirm the Department's policy ordinarily to use notice and comment procedures in the development of rules relating to public property, loans, grants, benefits, and contracts, even though such action is not required by the Administrative Procedure Act, and would set forth the circumstances for such use. The Secretary believes that public comment serves an important purpose in bringing the expertise and views of interested parties to the attention of the Department.

**Maternal and child health: use of health status indicators in coordinating and targeting federal programs.**

Omenn GS

J Community Health ,Spring 1982, 7 (3) p194-210, ISSN 0094-5145 Journal Code: HUT

Languages: ENGLISH

The United States has achieved dramatic improvements in overall maternal and child health status, yet faces disturbingly wide variations in the health status of many population subgroups. The Surgeon General in 1980 published specific quantitative objectives to stimulate further improvements in the health of the American people by 1990. A critical step in meeting relevant objectives is the more effective use at national, state, and local levels of available data, particularly infant, perinatal, neonatal, and maternal mortality rates and the incidence of low weight births. This paper reviews variations in infant mortality rates and five current federal "categorical" programs that aim to improve maternal and child health: Supplemental Feeding Program for Women, Infants and Children; Head Start; Maternal and Child Health; Family Planning; and Community Health Centers. Several examples are cited of effective use of data in the coordination and targeting of resources from these large public programs. Recommendations are made for enhancement of federal maternal and child health programs within current funding levels. These recommendations will be all the more relevant if the Congress enacts block grants to the states with lower total funding.

McNamara JJ

Clin Pediatr (Phila) ,May 1982, 21 (5) p275-8, ISSN 0009-9228 Journal Code: DHE

Languages: ENGLISH

Health Systems Agencies (HSA) are the official national health planning and regulatory agencies in the United States. This case study examines three HSA activities: determination of need, review and approval of federal grants, and appropriateness review. The article raises questions about planning assumptions and suggests the need to simplify regulatory process and strengthen standards of pediatric care in community hospitals.

**Medicaid cutbacks and block grants: crisis or opportunity for community mental health?**  
Sharfstein SS  
Am J Psychiatry ,Apr 1982, 139 (4) p466-70, ISSN  
0002-953X Journal Code: 3VG  
Languages: ENGLISH

The fourfold growth in the mental health service system since 1955 has been largely financed by federal monies and by federal and state funding through Medicaid. This growth represents expansion of both institutional and outpatient settings, even though there has been a total reversal of the proportion of inpatient to outpatient care over the last 22 years. Current proposals to cap Medicaid costs and to issue block grants challenge the delivery system to attempt alternatives, such as financing similar to what is done in a health maintenance organization (HMO). The author describes a model of a "mental health HMO" that would be appropriate from professional consumer, and economic perspectives.

Information about comprehensive rehabilitation for patients with cancer is limited. Only a few descriptions of existing models are found in the literature. A survey questionnaire concerning the description and operation of cancer rehabilitation programs was developed and mailed to identified programs in 95 facilities throughout the country. Thirty-six facilities responded with data appropriate for analysis of their method of organization, treatment approaches, team composition, program emphasis, evaluation procedures, and program results. A literature and survey analysis provide support for an interdisciplinary team approach for rehabilitation of cancer patients disabled by the disease or its treatment. In addition, the survey shows favorable acceptance and success of cancer rehabilitation programs, especially in community hospital settings.

Considering the major challenges that face hospitals during the 1980s--reimbursement shortfalls, capital acquisition, replacement of obsolete facilities, and more--it seems most likely that investor-owned and not-for-profit multihospital systems will begin to replace freestanding hospitals as the dominant organizational form in the health care industry.

**National health expenditure growth in the 1980's: an aging population, new technologies, and increasing competition.**  
Freeland MS; Schendler CE  
Health Care Financ Rev ,Mar 1983, 4 (3) p1-58, Journal  
Code: GHX  
Languages: ENGLISH  
Health care spending in the United States more than tripled between 1971 and 1981, increasing from \$83 billion to \$287 billion. This growth in health sector spending substantially outpaced overall growth in the economy, averaging 13.2 percent per year compared to 10.5 percent for the gross national product (GNP). By 1981, one out of every ten dollars of GNP was spent on health care, compared to one out of every

thirteen dollars of GNP in 1971. If current trends continue and if present health care financing arrangements remain basically unchanged, national health expenditures are projected to reach approximately \$756 billion in 1990 and consume roughly 12 percent of GNP. The focal issue in health care today is cost and cost increases. The outlook for the 1980's is for continued rapid growth but at a diminished rate. The primary force behind this moderating growth is projected lower inflation. However, real growth rates are also expected to moderate slightly. The chief factors influencing the growth of health expenditures in the eighties are expected to be aging of the population, new medical technologies, increasing competition, restrained public funding, growth in real income, increased health manpower, and a deceleration in economy-wide inflation. Managers, policy makers and providers in the health sector, as in all sectors, must include in today's decisions probable future trends. Inflation, economic shocks, and unanticipated outcomes of policies over the last decade have intensified the need for periodic assessments of individual industries and their relationship to the macro economy. This article provides such an assessment for the health care industry. Baseline current-law projections of national health expenditures are made to 1990. (148 Refs.)

More doctors: what will they cost? Physician income as  
supply expands.  
Sloan FA; Schwartz WB  
JAMA ,Feb 11 1983, 249 (6) p766-9, ISSN 0098-7484  
Journal Code: KFR  
Languages: ENGLISH

During the 1970s, expenditure for physicians' services rose by \$12.7 billion (in 1979 dollars), but only about one fifty of this amount could be attributed to an increase in number of physicians relative to population. Other factors, chiefly demographic changes and greater insurance coverage, were responsible for the bulk of higher expenditures. Despite the growth in number of physicians, real income of individual physicians remained virtually constant. Maintenance of real income was not, however, appreciably dependent on physicians inducing an unwarranted demand for their services. We predict that as the physician supply expands by 25% to 35% during the 1980s, real payments to physicians will increase by some \$14 to \$20 billion (1979) dollars. As in the past decade, however, only about one fifth of the amount will be attributable to an increase in physician supply. Gross income of individual physicians is likely to rise by 10% to 15% (in 1979 dollars) over the decade, but net income probably will show little increase or may even fall slightly.

Health promotion: what's in it for business and industry?  
Brennan AJ  
Health Educ Q ,Fall 1982, 9 Spec Suppl p9-19, ISSN  
0195-8402 Journal Code: G20  
Languages: ENGLISH

Health promotion has been linked to improved morale, increased productivity, reduced absenteeism and turnover, more appropriate utilization of medical services and decreased disability and premature death claims due to unhealthy lifestyles. Preliminary data in favor of HPPs are being accumulated. Final proof is not available to "sell" myopic bottom line managers on the concept, however, as Immanuel Kant stated, "It is often necessary to make a decision on the basis of knowledge sufficient for action but insufficient to satisfy the intellect." If techniques can be developed to quantify in economic terms the impact of health promotion in these areas, business and industry will have a profound, hard line reason beyond their genuine interest in the health of their employees, for providing health promotion to employee populations--MONEY.

The catastrophic health insurance bills introduced during the 96th U.S. Congress failed to consider the current role that Health Maintenance Organizations (HMO's) play in providing catastrophic protection and the potential negative impact such legislation may have on their competitive position. This article demonstrates that HMO's are providing this coverage by using the simulated health care expenditures for families in one HMO. The estimated proportion of families that incur catastrophic expenditures varies from 0.3 to 14.4% depending on the definition used for catastrophic. The paper closes with a discussion of the potential adverse impact that the legislation would have had on HMO's.

Medical expenditure within the National Health Service (NHS) is based upon an arrangement whereby doctors share in common resources provided by the Health Authority. This arrangement is unsatisfactory when resources are contracting and leads to social regulation of medical activity. If doctors within the district work-group do not respond to the challenge of cost-containment by internal organisation, more and more externally imposed regulations will result to the detriment of patients and doctors. The continual redevelopment of organisation to permit the optimal mix of internal and external regulation should be a subject of long-term enquiry and action for doctors in each district.

The challenge facing national policymakers is to provide health care that is comprehensive and cost-effective to our nation's growing population of elderly people. A solution worthy of consideration is the use of health maintenance organizations (HMOs) in this capacity. An analysis of the services provided by a multidisciplinary health care system to 150 inner-city elderly, many of whom were "homebound," reversal 1) this population is not homogeneous with respect to severity of disease and service utilization, and 2) a total mean cost per individual per year of \$2,021.34 covers: physician, nursing, and social service home visits; visiting nurse, homemakers, home health aide, occupational therapy and physical therapy services; outpatient, laboratory and medication costs. These findings suggest that while costs for those over 65 are many times the per capita costs of younger enrollees, these costs may be significantly less than the costs of institutional care. Further investigation of the costs of maintaining low-income inner-city old, as well as

other elderly populations, at home is vital to planning for future long-term care.

**An analysis of alternative imputation strategies for individuals with partial data in the National Medical Care Expenditure Survey.**

Cohen SB

Rev Public Data Use ,Oct 1982, 10 (3) p153-65, ISSN

0092-2846 Journal Code: RWM

Languages: ENGLISH

Data collection in the National Medical Care Expenditure Survey was applied to the same panel of sample households in six rounds of interviewing, with 1977 as the reference period.

Approximately 11 percent of all survey participants provided data for only part of the time they were eligible to respond. To allow for national estimates of relevant health parameters, the data for the partial participants must be adjusted for the entire time frame for which they were eligible. Consequently, three alternative imputation strategies were considered for implementation: a weighted adjustment to the partial data, a substitution of data from complete participants who matched the partial respondents on relevant demographic characteristics, and use of only the data from participants with complete information to characterize the nation. To determine the optimal strategy, a controlled experiment was conducted by artificially creating partial data for participants with complete information, then adjusting the synthetically produced partial data by the three imputation strategies.

Should the cost of insurance reflect the cost of use in local hospital markets?

Wennberg JE

Languages: ENGLISH

Local hospital markets have been shown to vary extensively in per capita expenditures for hospital services and in the reimbursements paid per Medicare enrollee and per Blue Cross subscriber. Insurance premiums do not reflect these differences among local markets, resulting in intermarket subsidies (transfer payments) and distortion of competition between health-maintenance organizations and the fee-for-service system. Regulatory strategies to "cap" hospital costs have ignored these market variations and thus perpetuated the established pattern of expenditures and transfer payments. The plans for implementing a voucher system for the Medicare program set the value of the voucher according to average reimbursements at the county or state level. Since several markets can exist within one county's boundaries, the cash value established for the voucher in some low-cost markets will substantially exceed current per capita rates of reimbursement, permitting large profits and an increase in total costs to the Medicare program. If the price of health insurance were adjusted to correspond more closely to local market conditions, transfer payments would be reduced, and more effective regulation, competition, and consumer involvement might result.

This article presents an integrative model of the relations among health status, quality of care, and resource expenditure. It defines medical care quality in terms of outcomes, measured as the expected improvements in health status attributable to care. The consideration of how quality so defined is affected by the unconstrained, efficient use of resources for care leads to the specification of the absolutist definition of quality. Consideration of the incidence of individual and external costs and benefits of care provides the basis for distinguishing further between the individualized definition of quality, which depends upon individual preferences and ability to pay, and the social definition of quality, which includes consideration of external benefits, full social definition of quality, which includes consideration of external benefits, full social costs, and preferences for the distribution of welfare. An additional distinction is made between clinical efficiency and production efficiency. This article examines in detail the implications, for the selection of optimal strategies of care, of the three definitions of quality (absolutist, individualized, and social) and the two types of efficiency (clinical and production).

The United States spent an estimated \$287 billion for health care in 1981 (Figure 1), an amount equal to 9.8 percent of the Gross National Product (GNP). Highlights of the figures that underly this estimate include the following: Health care expenditures continued to grow at a rapid rate in 1981, at a time when the economy as a whole exhibited sluggish growth. The 9.8 percent share of the GNP was a dramatic increase from the 8.9 percent share seen just two years earlier. Health care expenditures amounted to \$1,225 per person in 1981 (Table 1). Of that amount, \$524, or 42.7 percent, came from public funds. Hospital care accounted for 41.2 percent of total health care spending in 1981 (Table 2). These expenditures increased 17.5 percent from 1980, to a level of \$118 billion. Spending for the services of physicians increased 16.9 percent to \$55 billion--19.1 percent of all health care spending. Public sources provided 42.7 percent of the money spent on health in 1981, including Federal payments of \$84 billion and \$39 billion in State and local government funds (Table 3). All third parties combined--private health insurers, governments, private charities, and industry--financed 67.9 percent of the \$255 billion in personal health care in 1981 (Table 4), covering 89.2 percent of hospital care services, 62.1 percent of physicians' services, and 41.3 percent of the remainder (Table 5). Direct patient payments for health care reached \$82 billion in 1981, accounting for 32.1 percent of all personal health care expenses (Table 6). Consumers and their employers paid another \$73 billion in premiums to private health insurers, \$67 billion of which was returned in the form of benefits. Outlays for health care benefits by the Medicare and Medicaid programs totaled \$73 billion, including \$42 billion for hospital care. The two programs combined paid for 28.6 percent of all personal health care in the nation (Table 7).

To economically evaluate a new drug or other medical innovation one must assess both the changes in costs and in benefits. Safety and efficacy matter, but so do resources costs and social benefits. This paper evaluates the effects on expenditures of the recent introduction of cimetidine, a drug used in the prevention and treatment of duodenal ulcers. This evaluation is of interest in its own right and also as a "guide" for studying similar effects of other innovations. State Medicaid records are used to test the effects on hospitalization and aggregate medical care expenditures of this new medical innovation. After controlling to the extent possible for potential selection bias, we find that: 1) usage of cimetidine is associated with a lower level of medical care

expenditures and fewer days of hospitalization per patient for those duodenal ulcer patients who had zero health care expenditures and zero days of hospitalization during the presample period; an annual cost saving of some \$320.00 (20 per cent) per patient is indicated. Further analysis disclosed, however, that this saving was lower for patients with somewhat higher levels of health care expenditures and hospitalization in the presample period, and to some extent was reversed for the patients whose prior year's medical care expenditures and hospitalization were highest.

This study examines the specialty background, relative activity, role, and cost of care among physicians treating high school football injuries in six western states. There were 1,000 injuries (in 1,000 players) in the 1980 football season. Among the players, 30.7 and 17.9% were treated solely by general practitioners and emergency room physicians, respectively. Orthopedic surgeons exclusively managed 17.1% of players, and 6.8% were seen initially by the emergency room physician and referred to an orthopedic surgeon. Osteopaths solely treated 6.4% of players. Chiropractic was the exclusive care for 6.4%. Four and nine-tenths per cent of players were seen initially by general practitioners and referred to an orthopedic surgeon. Emergency room physicians referred 3% of their injured high school football players to general practitioners. The remaining 6.8% of players were cared for by

dentists, pediatricians, general surgeons, naturopaths, neurosurgeons, urologists, otolaryngologists, and ophthalmologists. General practitioners referred 14% of their patients, and emergency room physicians referred 73.6% of their patients. The most common referral was to an orthopedic surgeon. Two hundred ninety-eight players ultimately received care from an orthopedist, including 82% of all patients with fractures. For patients with the same diagnosis, costs for care by orthopedic surgeons were 54% higher than the fees charged by a general practitioner.

The degree to which Medicare and Medicaid programs provide health coverage for the elderly still leaves a large financial burden on this population. Although the sale of supplementary health insurance to the elderly has been fraught with abuse, a policy purchased from a reputable organization can be advantageous. Knowledge of the large amount spent on personal health care will hopefully stimulate the search for alternative, less expensive ways to provide health care.

Br Med J [Clin Res] ,Mar 13 1982, 284 (6318) p799-802,  
Journal Code: B4X  
Languages: ENGLISH

The rapid increase in the number of very aged people has not been accompanied by appropriate expansion of local authority residential facilities. The rate of provision in 1976 was already acknowledged to be inadequate, but data are now presented to show that since then there has been an effective fall in the rate of provision of some 9000 places equivalent to, say, 180 old people's homes of 50 places each. The

prospects for the future are even gloomier: public spending cuts and local authority priorities suggest a continuing fall in the rate of provision that can be expected to have a profound effect on the National Health Service, on the burden on families, and on the condition in which old people are obliged to remain "in the community" (where support services have likewise failed to keep pace with demographic change).

This paper examines recent trends in American philanthropy and relates these to changes in the composition and size of both the private and public welfare sectors in the United States. The findings reveal that private welfare has been overwhelmed - but not replaced - by the growth in public welfare. Although private welfare maintains some of its traditional functions, it has become more closely linked to and in some cases dependent on, public welfare. Consequently, there have been significant changes in the institutional character and organizational format and operations of private welfare. These transformations of the American welfare system are interpreted within the mass-society perspective. (63 Refs.)

The "Omnibus Budget Reconciliation Act of 1981" included a number of provisions designed to reduce federal spending for health care and to increase state authority over health programs. Evidence concerning the financial condition and health care needs of children served by federally-financed health programs, and recent trends in coverage and eligibility, make it possible to assess the likely impact of the new legislation. One conclusion seems clear: extensive federal funding reductions cannot be accommodated by eliminating excesses. While reforms of the Medicaid program may be advisable for a number of reasons, a simple reduction to funding will have serious, adverse consequences for poor children.

**Effects of fluoride and regular dental care on personal dental expenditures of young adults in Finland.**

Alvesalo I; Reisine S; Hay J; Bailit HL  
Community Dent Oral Epidemiol ,Feb 1982, 10 (1) p15-22.  
ISSN 0301-5661 Journal Code: DNF

Languages: ENGLISH

This paper analyzes the relationship among presence of fluoride in the drinking water, oral health and dental expenditures in four towns in Finland. A two-stage least-squares model is used to determine the effect of fluoridated water and other independent variables on the number of missing teeth and per capita annual dental service expenditures for 555 adults. The results show that regularity of dental visits is the only significant factor explaining per capita expenditures. In contrast, many factors affect the number of missing teeth; most importantly, the number of dentists per capita, level of fluoride, age, education, use of services and smoking habits. These findings suggest that fluoride significantly improves oral health status but does not reduce adult per capita dental expenditures.

**Type A and B behavior patterns and self-reported health symptoms and stress: examining individual and organizational fit.**

Matteson MT; Ivancevich JM  
J Occup Med ,Aug 1982, 24 (8) p585-9, ISSN 0022-3212  
Journal Code: JFR

Languages: ENGLISH

This article describes a preliminary investigation of the proposition that organizations, as well as people, can be classified along a Type A and B behavior pattern dimension and that the resulting match or lack thereof between individual and organizational behavior patterns is related to various health indices. A sample of 315 medical technologists were classified as either Type As or Bs and as working in either Type A or B environments. Results supported the hypotheses that (1) Type Bs in B organizations report the fewest negative health symptoms; (2) Type As in A organizations report the most; and (3) Type Bs in A organizations and Type As in B organizations report an intermediate level of symptoms. The results are treated within the framework of a person-environment fit model and the implications of the findings are discussed.

**Organizational change techniques: their present, their future.**

Michael SR  
Organ Dyn ,Summer 1982, 11 (1) p67-79, ISSN 0090-2616  
Journal Code: NQ2

Languages: ENGLISH

To help carry out their responsibility of managing rapid and often unexpected change, managers have an available set of techniques: organizational behavior modification, management by objectives, management development, organization development, management auditing, and a control cycle of planning, implementation, and control. Each of these has a format that specifies the procedures to be followed to bring about organizational change. Michael emphasizes that such formats are preferable to a haphazard, trial-and-error approach that may produce unanticipated results. In part because some techniques are newer than others, data from a research project of planning and control that Michael conducted show different rates of usage by a sample of Fortune 500 companies. The control cycle is the most widely used; organizational behavior modification the least widely used. The use of these techniques of organizational change is likely to vary in some ways and experience may bring about changes in the techniques. Michael concludes that the newer breed of managers who are versed in the social sciences, mathematics, and the computer are likely to spread new techniques in the organizational world.

**The fantasy residue: an antitherapeutic force on the psychiatric inpatient service.**

Levine HB  
Psychiatry ,Aug 1982, 45 (3) p262-9, ISSN 0033-2747  
Journal Code: QCS

Languages: ENGLISH

This paper will attempt a model of organizational behavior to the study of the origin, perpetuation, and rectification of certain antitherapeutic forces (Sacks and Carpenter 1974) on inpatient services, which I shall call the ward's "fantasy residue." The fantasy residue consists of the enduring antitherapeutic patterns of dealing with patients that have become normative for a given ward and evolve from irrational staff responses to a variety of stresses in the absence of appropriate corrective administrative actions. Because they originate in irrational responses to complicated situations of patient management or staff relations, these forces can be called "fantastical." Because they tend to flourish and remain active long after the specific conditions which gave rise to them changed or cease to exist, they are "residual." Hence, the name "fantasy residue." Once established, the fantasy residue can persist either as unacknowledged maladaptive responses in the ward's milieu or as openly espoused, presumably valid "methods of treatment." In either case, the ward staff and its leaders lose sight of both the irrational base and antitherapeutic consequences of these attitudes and actions. In this sense, a ward's fantasy residue is analogous to a person's ego syntonic character resistances and correction requires a process of confrontation, recognition, and facilitation of objective self-scrutiny among staff and patients.

**Managing for success: assessing the balanced MIS environment.**

Bellerby LJ; Goslin LN  
 Adm Soc Work ,Fall-Winter 1981, 5 (3-4) p69-81,  
 Journal Code: 2H3  
 Contract/Grant No.: NIMH5T24; MH15446-01  
 Languages: ENGLISH

The authors provide guidelines which permit mental health managers to determine the current stage of growth of the macro dimensions of their MIS environment. These macro dimensions are representative of the technical, managerial, and organizational behavior aspects of system development. A profile of MIS attributes for each macro dimension is presented. These attributes, derived from an empirical study of community mental health centers, distinguish among information systems at different stages of growth. The attributes allow managers to conduct a comparative assessment of the degree of balance in their MIS environment relative to experiences of other centers.

**Coordination and citizen participation.**

Tucker DJ  
 Soc Serv Rev ,Mar 1980, 54 (1) p13-30, ISSN 0037-7961  
 Journal Code: UTV  
 Languages: ENGLISH

This study investigates the validity of the assumption that coordination and citizen participation are related inversely and, thus, are incompatible as features in the same social service reform strategy. Seventeen social service organizations situated in the same urban area were studied. Data were obtained by structured interview. The concepts of coordination and citizen participation were operationalized by means of scales. The findings support the validity of the assumption noted above. Although interpretations of the findings can be provided, they are post-factum. This implies a need for explanatory research which might be guided by theories of community power structure and of organizational behavior.

**Urgent care in the HMO: evolution of a system in Washington, D.C.**

Turner RW  
 Med Care ,May 1978, 16 (5) p361-71, ISSN 0025-7079  
 Journal Code: LSM  
 Languages: ENGLISH

In 1961, Group Health Association, a large, non-hospital based, prepaid group practice in Washington, D.C. established an after-hours walk-in clinic on its premises for the care of medical problems requiring prompt attention. Within a year, this clinic's operation was extended to daytime hours for the use of the consumer-member at his own discretion. After 10

years, in the plan's main health center, the volume of adult visits to the acute care/walk-in center exceeded the number seen in the Department of Internal Medicine; most were of a routine rather than urgent nature. More visits to the acute care service were made during the day, when the full range of ambulatory services were available by appointment, than were made after hours. The choice of immediate first-come, first-served care over the conventional care-by-appointment by so many members was felt to have resulted in discontinuous suboptimal care, segregation of the membership along socioeconomic lines, as well as unnecessary and very costly duplications of service. The background of organizational behavior and community medical practices contributing to this pattern of utilization are explored. Compared to traditional fee-for-service medicine, demands for outpatient services in the HMO tend to be greater. Acceptable alternatives to off-line channeling of patients with unexpected or acute conditions can be designed. In the general community today, utilization of medical services is strongly influenced by imbalances in available resources and by financial factors which are under no central control. In the HMO, all costs are prepaid and services are planned for a membership of known size. Even so, consumers' use of services in prepaid plans tends to follow the patterns seen in the community. More appropriate distribution of demands requires an active and ongoing system of patient education. A commitment by the HMO's providers and managers toward this goal is indispensable.

**Implementing family planning in a Ministry of Health: organizational barriers at the state and district levels.**

Simmons RS; Ashraf A

Stud Fam Plann ,Feb-Mar 1978, 9 (2-3) p22-34, ISSN 0039-3665 Journal Code: V52

Languages: ENGLISH

1. Family planning occupied a subordinate position in the medical and health bureaucracy almost two decades after its introduction. Senior Ministry officials accorded low priority to formal program objectives, while the State Family Planning Officer, the highest state official concerned solely with the family planning program, suffered from a relatively subordinate position in the Directorate and a lack of authority and support. Within the medical profession, family planning was held in low esteem, and the medical and health bureaucracies did not have a mechanism for selecting personnel on the basis of interest and commitment. 2. Organizational adjustment to family planning in the Ministry of Health was a slow and painful process, absorbing the energy and attention of Ministry officials for almost a decade. The repeated reorganizations of the district setup revolving around the division of labor between medical, health, and family planning activities and between the rural and urban program, led to months of almost total inertia and detracted substantially from the supervisory capacity of the officials involved. 3. Decision making and guidance suffered from the quick turnover of the Secretary, the most powerful administrator in the Ministry. In Uttar Pradesh Secretaries stayed barely long enough to begin to understand the complex organizational setup of the program. 4. Multiple and often conflicting lines of authority characterized the relationships between the higher and lower echelons within the Ministry. This was accentuated when the District Family Planning Officer was placed under the administrative control of the District Magistrate. While intended to "energize" family planning through the association of the most prestigious and powerful district official with the program, this organizational arrangement resulted in conflicting instructions to the staffs of the primary health centers. 5. The organizational behavior of the Ministry of Health was shaped by the interplay of the various "professional cultures" of its key actors. The generalist administrators' short time horizon and eagerness to produce quantitative results clashed with the specialists' emphasis upon long-term goals and technical constraints; the politician's defense of the interest of his constituents clashed with the administrator's desire to defend his autonomy. The calculus of political survival made support for family planning goals a costly burden that few politicians have been willi

Mahoney FX

Personnel ,Jul-Aug 1982, 59 (4) p64-9, ISSN 0031-5702

Journal Code: PAP

Languages: ENGLISH

In the last issue of Personnel, Part 5 of our series on team development covered basic procedure meetings. In this issue, Part 6 goes into the team interaction variation and the critique variation of procedure meetings. Author Francis X. Mahoney, personnel development advisor for Exxon Company, U.S.A., notes that in the interaction variation the team looks at its own practices for the purpose of improving them. The session usually begins by identifying the five or six high-scoring items and the five or six low-scoring items in an opinion survey on team effectiveness that is taken before the session is held. The team then spends one session discussing the high-scoring items and at least one on the low-scoring items. During the latter discussion, the team aims to come up with suggestions for changes in techniques and ways to implement these changes.

This paper examines an experiment in an unusual method of accounting and budgeting, and discusses its implications to clinicians. Clinical teams were made responsible for their own expenditure. They were supplied with a breakdown of their expenditure and a budget based on previous expenditure. Each team, at its own discretion, could use savings made from reducing expenditure in one sphere to provide unrelated services. Reduced expenditure was achieved and new projects started.

In this windup of his series on team development (TD), Francis X. Mahoney, personnel development advisor for Exxon Company, U.S.A., sums up TD's advantages, shows how it can be used to meet organizational objectives, and indicates other ways of applying TD methods. Mahoney maintains that TD is truly "organization development (OD) at the front line" because they share the same objectives. For example, employee involvement and encouragement of initiative are OD goals and, as we have seen, TD gets people involved and encourages even those at the lowest level of the organization to contribute ideas and work together to solve work problems and implement the solutions. Mahoney hopes that this series will encourage internal and external OD experts to apply OD at levels not normally reached during regular assignments. TD activities can provide the basis for continuing activities between or after consultants' visits and after training programs. It can become a tool, particularly for first-time supervisors and middle managers, to improve productivity and teamwork. That, in essence, is what this series is all about--getting people to work together productively, effectively, and cohesively.

A field study was conducted to examine the relative control of provider and consumer members of HSA Project Review Committee. Three project review committees chosen at random during a single HSA review cycle were observed throughout the decision-making process using Interaction Process Analysis. Results indicated that there were no significant differences in control between the provider and consumer members when considered as subgroups of the review committees. Findings also confirm the critical role of the chairperson in the organization and function of the group. It can be concluded that the occupational prestige of provider or consumer members is not imported into the planning situation to a sufficient degree to allow either the provider or consumer subgroup to dominate the planning process. Innovations in health care planning such as long-term education in health planning, group processes, and related issues should be attempted to enhance the effectiveness of these groups.

When asked how he has been able to effectively stay in one job for so long, the man who has been at the head of one of the nation's largest banking organizations for 16 years, Richard Cooley, chairman, Wells-Fargo Bank, said that he "learned very early that board relations was the most important key to his continuity." Cooley said his strategy over the years has been to meet for dinner about once a year with each member of this board to allow the board member to get to know him, to personally hear the issues that the board member considers most important, and to solicit input on proposed management plans.

**Results of one-year antismoking campaign conducted within the framework of multifactorial prevention of ischaemic heart disease.**

Oleynikov SP; Glasunov IS; Chazova LV  
Cor Vasa ,1982, 24 (5) p318-28, ISSN 0010-8650  
Journal Code: DR5

Languages: ENGLISH

Among 593 smokers examined within the framework of the programme of multifactorial prevention of ischaemic heart disease [IHD], various smoking control measures were taken for combating smoking (lecture with discussion, group and individual sessions). Smokers with arterial hypertension and/or IHD were given antismoking advice by their physicians. After one year 20.7% persons of the whole group stopped smoking, and 25.3% reduced the number of daily consumed cigarettes by at least one quarter. The total number of smokers decreased by 8.1% ( $p = 0.0005$ ). In the control group, the smoking habit changed only insignificantly. The greatest success (50% of persons who gave up smoking) was obtained at group discussions, using positive motivation to stop smoking; the smallest effect (12.2%) was reached among patients where the antismoking campaign was entrusted to their physicians. Persons who were given greatest attention in the antismoking campaign (patients participating in group discussions) showed the lowest percentage of those who reported for annual examination within the framework of the programme of multifactorial prevention of IHD.

Self-esteem was hypothesized to moderate relationships between peer group interaction and two work-related variables, job performance and job strain. The study found support for the general hypothesis. Peer group interaction had a greater impact on the two work-related variables for low than for high self-esteem individuals. (35 Refs.)

Psychiatr Prax ,Sep 1982, 9 (5) p138-44, ISSN 0303-4259  
Journal Code: QCK

Languages: GERMAN Summary Languages: ENGLISH

Structure and functioning of a group therapy comprising all patients of a psychiatric ward is described in terms of psychoanalytic and group dynamics, behaviour therapy and cognitive psychology. 34 acutely-ill patients with heterogenic diagnoses reported their experiences with this group technique at day of discharge. Aims of therapy are discussed in respect of desired effects and risks for delusional patients. This psychotherapeutic procedure with inpatients is conceived as part of "psychiatric psychotherapy".

Languages: ENGLISH

This study compared Cognitive Self-Modeling [CSM(N = 39)]--a new treatment using a highly structured, cognitively oriented approach to increasing interpersonal skills among adolescents--with Conventional Group Counselling [CGC(N = 40)]--a widely accepted nondirective approach. A no-treatment group of which about half were pretested, served as a control [NTC(N = 18)]. Students (N = 97, mean age = 16.5) in a school setting were administered self-report trait and behavior indices at pretest, posttest (six weeks), follow-up-1 (10 weeks) and follow-up-2 (52 weeks). In addition, a measure of participation in clubs and organizations was administered at pre and posttest. Scheffe post hoc analyses revealed significant results for both treatment groups: CSM changes occurred early (posttest) and generally remained stable over time (follow-up-1 and 2), whereas CGC changes emerged slowly with significant findings on all measures at follow-up-2. NTC volunteers made no significant changes. Also, no differences were obtained between students who were pretested and those who were not, indicating that pretesting made no contribution to outcome.

Languages: ENGLISH

The authors report on a five-year experience with process-oriented discussion groups at annual four-day, off-campus retreats attended by students, faculty members, and "significant others." Group sessions comprised 17 hours of each retreat, which also included community activities and recreation time. Group leaders represented a diversity of professional backgrounds. In response to questionnaires sent from one to two months after the retreats, participants rated group experiences highly, although they also considered a significant amount of time for unstructured interpersonal interaction and recreation important. Participants enjoyed meeting students and faculty members in a relatively "role-free" setting, and students derived an enhanced sense of self-awareness from group discussions. The most highly valued group leader behaviors were participation as a group member, facilitation of interpersonal communication, and attention to group members' needs. Guidance and direction by the leaders were also considered valuable, provided that they did not impose inappropriate expectations on their groups.

**Self-help and mental health.**

Gartner AJ; Riessman F

Hosp Community Psychiatry ,Aug 1982, 33 (8) p631-5,

ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Over the past decade self-help groups have become an important way of helping people cope with various life crises.

Groups have organized to help individual members deal with a wide range of health-related and other problems. The authors define the meaning of self-help in such groups and describe the range of groups now available, including a number of mental-health-related groups. The part self-help groups play in providing social support, preventing illness and death, and reducing the need for hospitalization is discussed. The authors also examine the role of professionals in initiating and working with such groups. They point to self-help groups as one means of meeting the increasing demands placed on health and mental health service systems during the 1980s.

**Mutual-help groups: members' views of their benefits and of roles for professionals.**

Gottlieb BH

Prev Hum Serv ,Spring 1982, 1 (3) p55-67, ISSN

0270-3114 Journal Code: PAB

Languages: ENGLISH

Members of 18 self-help groups in Canada were surveyed as to the benefits of participation in mutual help groups and the roles for professionals in such groups. Three distinctions are made among mutual help groups: (1) those dealing with loss-transition (L-T), (2) those with members one step removed (OSR) from the problem, and (3) groups for stress, coping and support (SC&S). Members in OSR groups feel they benefit significantly more from participation than SC&S group members, while many L-T members feel they could get along well without the group if they had to. Members of SC&S groups tend to favor indirect involvement of professionals and see professional help and mutual help as complementary, more than do members of L-T and OSR groups. The traditional health care system is found to ignore the needs of L-T and OSR group members; mutual help thus provides a critical source of support and education for these people.

**Dilemmas of managing participation.**

Kanter RM

Organ Dyn ,Summer 1982, 11 (1) p5-27, ISSN 0090-2616

Journal Code: NQ2

Languages: ENGLISH

There are two reasons that current corporate efforts to achieve employee "participation" often seem fragile and temporary: unrealistic expectations about the appropriate use of participation and a failure to manage participation efforts

for maximum success. Participation is most appropriate when, for example, expertise is diffused, issues are controversial, problems cut across existing roles, or the development of people is desired; autonomy and individual responsibility may be more appropriate under the opposite conditions. Kanter discusses six sets of dilemmas that must be resolved to ensure that participating teams work effectively for the organization: dilemmas around initiation, structure, issue choice, teamwork, links between teams and their environment, and evaluation/continuation. Kanter concludes that participation works best when it is well managed. Participation is best viewed not as a permanent "program" or a "formula" but as temporary episodes of high involvement alternating with a more routine everyday structure.

**Quality circles and medical staffs.**

Orlikoff JE

Hosp Med Staff ,Sep 1982, 11 (9) p23-7, ISSN 0090-0710

Journal Code: G93

Languages: ENGLISH

Quality circles are a new phenomenon in American industry. Can the touted virtues of quality circles-improved morale, productivity, and product quality-be translated into the health care setting? In some departments, probably. But it remains to be seen if medical staff members will become major supporters of the quality circles movement. A future article will take a case study approach to show how the hospital medical staff of one hospital became involved with quality circles.

**Support and education groups for the families of the mentally ill** have been in existence for at least 20 years. The authors describe a group treatment program established in 1979 for parents of chronically mentally ill individuals living in the community. The goal was to help parents become less overprotective, critical, and hostile so that clients would relapse less frequently and improve their social functioning during their time in the community. The groups provided parents with information and support. Some of the results of the groups include the implementation of new hospital procedures, more effective parenting, and a parent-initiated alliance on behalf of the mentally ill in the locality.

Multiple family groups have been used for some time as a treatment for hospitalized psychiatric patients. However, there is no indication that they have been used in orienting patients and their families during the traumatic initial period on the inpatient ward. The authors describe the use of family orientation group meetings on the psychiatric inpatient ward of a university hospital. The theoretical bases of the group format are explained and the kinds of information relayed to parents and patients are outlined. The authors believe that use of one-time orientation meetings can help turn the crucial initial period into a therapeutic gain for the patient.

Arons BS  
Hosp Community Psychiatry ,Jun 1982, 33 (6) p480-3,  
ISSN 0022-1597 Journal Code: GCJ  
Languages: ENGLISH  
The community meeting is often established as a part of the program on a psychiatric treatment unit to enhance the therapeutic atmosphere and advance the unit's goals. Such meetings usually consist of at least 30 or more individuals, including patients, staff, and trainees, and therefore incorporate small-group dynamics as well as phenomena more typical of large groups. Leaders should try to ensure the effectiveness of their meetings by assessing tasks and boundaries, as well as the extent to which small-group dynamics and techniques used in large groups apply.

**Type A behavior, need for control, and reactions to group participation.**

Sanders GS; Malkis FS  
Organ Behav Hum Perform ,Aug 1982, 30 (1) p71-86. ISSN  
0030-5073 Journal Code: OK6  
Languages: ENGLISH

The present study examines the behavior of Type A coronary-prone subjects in group problem-solving sessions. Subjects discuss possible solutions to two problems in same-sex groups containing both Type As and Bs. As are much more likely than Bs to be seen as leaders and are rarely nominated as the least helpful member. Although A and B leaders are both seen as moderately likeable, A leaders' problem solutions are rated as lower in quality. Manipulations of problem importance and incentive for good solutions have similar effects on As and Bs. The results are discussed as being generally consistent with the proposal that Type As are primarily motivated by a need for control. Some indirect support is obtained for the idea that As are more susceptible than Bs to learned helplessness.

0001-8449 Journal Code: 2H8  
Languages: ENGLISH

This report describes the development, functioning, content, and usefulness of patient group meetings on an adolescent medical ward. The meetings prove to be a useful technique in furthering the objectives of psychiatric consultation in such a setting. The meetings convinced the author that the threat to developing autonomy is the major focus of emotional conflict for the hospitalized adolescent. The meetings prove beneficial in helping the patients adjust to the experience of hospitalization. A diagnostic and educational function is also

served.

**Three models of group choice.**

Ozar DT

J Med Philos ,Feb 1982, 7 (1) p23-34, ISSN 0360-5310

Journal Code: IZD

Languages: ENGLISH

The notion of group responsibility has received some very fruitful examination in recent years. But there still remains an important commonsense objection to this notion. Moral responsibility for an action is ordinarily linked to and held to depend upon the action's being the product of an act of choice on the part of the agent. The thrust of the objection here is that it is extremely difficult to understand how intentional acts like acts of choice can be properly attributed to a group. The notion of a group "consciousness" does not seem a very satisfactory resolution of this problem. In this paper I shall propose that there are actually three distinct processes, as well as many hybrid combinations of them there, by which groups "make choices." That is, when we look at the activities of groups, we discover three different kinds of analogues to the act of choice of the individual person. I shall be illustrating each of these models with examples of health care decisions. In addition, I shall also try to illustrate how the level of personal moral responsibility of each of the individuals making up the group, i.e., each one's responsibility for the group's action, can be seen to flow from the particular role that an individual plays within the process of "group choice" that is involved. In this way, I hope to shed light not only on the topics of group choice, group responsibility, and the interplay of personal and group responsibility, but also to show concretely the valuable role that these themes can play in our understanding of the moral elements of the health care setting.

Languages: ENGLISH  
Environmental disasters cause deaths, injuries, and destruction of familiar surroundings. Social networks and routines that structure daily life are often left in disarray. To surmount subsequent crises, survivors must master painful feelings, solve problems, and accomplish important tasks, even while they are confused, bereaved, and displaced. Otherwise, coping failure leads to a vicious spiral of loss of self-esteem, distrust of the environment, and abandonment of social roles. Both crisis intervention and disaster literature advocate concrete and practical treatment measures. Activity intervention can prevent and reverse the destructive downward spiral by facilitating victims' most effective coping responses. This paper reviews the pertinent literature and sets forth a theoretical model of occupational therapy in post-disaster settings.

Languages: ENGLISH  
Task delegations among different nursing skill levels (RNs, LPNs, NAs) are empirically measured in this study by performing a nursing activity analysis. Instead of relying on conventional techniques of time study and work sampling, this study incorporates Nominal Group Process and specially designed questionnaires for analyzing nursing activities. Approximately 100 nurses from a 193-bed short-term general hospital participated in the study. The resulting task

delegation rates are compared with hospital policy, and a comparison is also made between different nursing units.

**Presidential address: normal in psychoanalysis.**  
Joseph ED  
Int J Psychoanal ,1982, 63 (1) p3-13, ISSN 0020-7578  
Journal Code: GSL  
Languages: ENGLISH  
This paper is an attempt to spell out some of the usages of 'normal' in psychoanalysis in respect to the concepts lying behind such usage, and to attempt to see how various of these usages and concepts have been and can be employed in present day psychoanalysis. This started out as a seemingly simple exploration of the meaning of a term but turned into a puzzling exposition, the dimensions of which were not anticipated, and perhaps, were not fulfilled in the course of this presentation. In the final section, the author returns to the concept of normality as progressing over time and links this with the concept of average and expectable. This concept, as defined by research and experience, is the most operationally useful one when applied to the individual. From this point of view, the same seems to apply to psychoanalytic societies and groups.

A group's aim is to make well-conceived, well-understood, well-accepted and realistic decisions to reach their agreed-upon goals. This aim applies equally to their own goals and those occasionally imposed by outsiders such as hospital administration, accreditation committees and the federal government. Effective groupwork requires group cohesion with its components of trust, risk taking, mutual support, and group esteem. With constant vigilance the group can maintain its positive dynamics, so that the unhealthy state of groupthink does not undermine its existence.

Staff meetings are essential to good staff communication. Meetings help keep the grapevine from growing so big that it strangles the group with its rumors. By holding regular meetings with your staff, you create a consistency in your communications that helps prevent problems that you don't even suspect from cropping up. All personnel should attend the meetings. This way everyone hears news at the same time. Be consistent in your use of meetings. Meetings are more effective if you have a planned agenda and a firm time schedule. Encourage your staff to use meetings to talk out problems that affect the group. Once the meeting is over, encourage them to leave their feelings in the room. Many leaders are reluctant, for a variety of reasons, to hold meetings with their staffs. But it's like dieting and exercise; the more you do it, the easier it becomes. This type of meeting will pay rich dividends in staff personal and professional growth and in improved communication. The sense of participation that can be gained by the effective use of staff meetings can lead to high morale and effective staff performance. As you begin to see the results of a cohesive staff functioning together well, you will realize the routine staff meeting is a management tool that should not be overlooked or underused.

**The professional support group: a model for psychiatric clinical nurse specialists.**

Johnson RM; Richardson JI; Von Endt LL; Lindgren KS  
J Psychosoc Nurs Ment Health Serv ,Feb 1982, 20 (2)  
p9-13, ISSN 0279-3695 Journal Code: JUW  
Languages: ENGLISH

In addition to the frustrations experienced by any CNS, the psychiatric CNS in the general hospital setting experiences additional pressures which are inherent to his/her role. The major additional pressure is the great demand for the provision of support to patients, families, and staff. This necessitates a source of support for the psychiatric CNS. In response to this need, a group of psychiatric CNSs from general hospital settings developed and implemented a model for a professional support group. The formation and developmental process of this professional support group was consistent with literature descriptions of both small group and professional support group development. Informal evaluation demonstrated that this professional support group is achieving its purposes, and continues to function as an ongoing group.

**Measuring functional outcomes in chronic disease: a comparison of traditional scales and a self-administered health status questionnaire in patients with rheumatoid arthritis.**

Deyo RA; Inui TS; Leininger JD; Overman SS  
Med Care ,Feb 1983, 21 (2) p180-92, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

A new "health-status" questionnaire, the Sickness Impact Profile (SIP), was examined to determine whether it offered measurement advantages over the traditional American Rheumatism Association (ARA) functional scale or patient self-ratings of function. Seventy-nine outpatients with rheumatoid arthritis (RA) administered the SIP to themselves and provided self-ratings on a 7-point functional scale. Clinicians independently rated patients on the ARA functional scale, and repeated measures were obtained over a 6-month period. Scores on the SIP or its subscales showed stronger correlations than the other scales with hematocrit, sedimentation rate, grip strength, morning stiffness, duration of RA, anatomic stage, work status, and psychiatric status. Validity of the SIP appeared to be maintained with repeated administrations, and the SIP was more reliable than either of the other scales. These findings, as well as the comprehensiveness and feasibility of the self-administered SIP, suggest that this (and perhaps similar health status instruments) may be a useful supplement to more traditional measures of chronic disease outcome.

One hospital's personalized admitting system is staffed by business representatives who perform a variety of liaison activities to ease patients' nonmedical experience in the hospital. For example, they expedite admissions, discharges, and transfers; make bed assignments; arrange patient

transportation; supervise room cleaning on their units; verify patients' insurance coverage; provide financial counseling; and collect payment on bills.

This paper presents hypotheses and conceptualizations regarding the job-role definition of admissions clerks and managers in the Admissions Department of a general hospital. Our sample represents a segment of the administrative staff. The findings show that the malfunctioning of the department in question is not due to a lack of consensus among the workers regarding the perception or definition of role, but to their lack of identification and to inadequate recognition from their peers and superiors.

**The admissions process in two state psychiatric hospitals.**  
Solomon P  
Hosp Community Psychiatry ,Jun 1981, 32 (6) p405-8,  
ISSN 0022-1597 Journal Code: GCJ  
Languages: ENGLISH  
In this study, a conceptual model of the factors influencing the admissions process was tested in two state psychiatric hospitals. The factors included in the model fell into four categories: characteristics of patients, characteristics of admitting personnel, system factors, and patient assessment. The attitudes of individuals accompanying an applicant were found to be most important. Patients referred by police, courts, family, friends, or agency personnel were more likely to be admitted than self-referrals. Pathological behaviors that had a significant impact on the admissions process were those that indicated the presence of mental disorder or danger to self or others. The availability of alternatives to hospitalization was not found to be significant, a finding that suggests that admitting personnel, particularly psychiatrists, should be educated about community alternatives if spiraling rates of psychiatric admission are to be reduced.

**On the therapeutic aspects of psychiatric admission.**  
Vera MI  
Soc Work Health Care ,Summer 1980, 5 (4) p361-71, ISSN  
0098-1389 Journal Code: U95  
Languages: ENGLISH

Notwithstanding the current interest in different aspects of admission to psychiatric facilities, the actual procedures for admission have been neglected. Their therapeutic importance is here emphasized using the notion of a therapeutic contract that incorporates patients, families and professionals. Clarification of expectations and roles among the parties to this contract is essential to achieving an understanding of the patient-clinician relationship. An admission conference is proposed as conducive to reaching these goals.

Care of geriatric patients is a significant, comprehensive and at the same time difficult task facing the psychiatric hospitals run by the Land government. In this field of psychiatry too, new approaches and concepts are beginning to materialise, which, however, are rendered even more difficult by many obstacles which have to be overcome. The present article reports from the practice of a Land hospital, and describes the new accents which have to be placed on diagnostic and therapeutic aspects as a result of the opening of a new ward for gerontopsychiatric patients, and explains how these new aspects influence prognosis. The article is based on the data of 200 patients whose treatment has been completed after this study was taken up. The purpose of this article is to provide a first critical reflection on the work done by the hospital and its staff, including the stimulation of discussions with other institutes and the outpatients field of activities.

The author deals with the results from the interviewing of  
oral surgery patients on their problems concerning the sending  
and the admission to the hospital, with special attention to  
the problems of waiting for admission, the familiarization  
with the clinical environment and the improvement suggestions  
of the patients. The conclusions concern tasks arising from  
the medical and dental care for inpatients as well as for  
outpatients.

To be accepted as an inpatient in the Geneva Hospital one  
must proceed through a registration post. Data collecting  
sessions were set up there to study its working. Since many  
random components enter the registration procedure a  
stochastic queuing process is the appropriate model. The  
process main characteristics are determined by rather involved  
statistical and mathematical means. The values reckoned for  
the most relevant parameters (to both medical staff and  
general public) are found quite plausible.

Many hospital admissions scheduling or admissions control systems reported in the literature rely on estimates of future discharges to help control the variance in daily patient census. One of the two most frequently reported methods of estimating discharges attempts to explain the variance in historical length of stay (LPS) data. This paper explores the relationship between LOS variance explanation and the ability to predict discharges and concludes that even a large improvement in the ability to explain LOS variance will only marginally reduce the errors in the associated discharge predictions. In drawing this conclusion, a general discharge prediction model is developed and a more relevant statistic than per cent variance explained is introduced.

Simulation is used to investigate the effects on hospital occupancy of the number of beds in the facility, the percentage of patients who are emergencies, the percentage of elective patients who are scheduled, and the average lengths of stay of emergency and elective patients. A practical method is presented for estimating the optimum size of a short-term hospital on the basis of expected demand, and use of the results in planning is discussed.

Lawton MP; Lipton MB; Fulcomer MC; Kleban MH

Am J Psychiatry ,Dec 1977, 134 (12) p1386-90, ISSN

0002-953X Journal Code: 3VG

Languages: ENGLISH

The authors studied the patients and community facilities in an area for which a mental hospital phasedown was contemplated. They found that patients who were continuously hospitalized during a 9-month period were highly dependent and judged unlikely to be candidates for community placement. By contrast, the patients who had been discharged during this 9-month period were judged relocatable by staff and constituted a select group in terms of independence. The authors' survey of community facilities indicated few placement possibilities for the majority of the continuously hospitalized patients.

**The blocked bed. Definition of a problem.**

Hall D; Bytheway B

Soc Sci Med ,1982, 16 (22) p1985-91, ISSN 0277-9536  
Journal Code: UT9  
Languages: ENGLISH

The 'blocked bed' is a term familiar to doctors and hospital administrators, but has no conventional definition. Estimates

of the prevalence of bed blockage vary and are largely subjective. A survey of Area and Regional Health Authorities in the U.K. was used to collect information on the nature and extent of bed blockage. The definitions offered focus on the match between patient characteristics and services provided, and refer in the main to elderly patients in acute hospital beds. It is argued that the emergence of blockage as a problem is related to a dominant model of acute care in hospitals, which does not accurately reflect the situation of elderly patients or their needs for treatment.

**Hospital performance in multihospital systems: a comparative study of system and independent hospitals.**

Coyne JS

Health Serv Res ,Winter 1982, 17 (4) p303-29, ISSN 0017-9124  
Journal Code: G2L

Languages: ENGLISH

Hospital costs and productivity in multihospital systems versus those of independent hospitals are a major source of debate among health care providers and researchers. Previous studies have shown system hospitals perform better than independent hospitals. The evidence, however, has been limited to only a few nonprofit systems. To help fill this research gap, approximately 100 system hospitals from 14 systems and 4 ownership types are compared with approximately 50 independent hospitals using cost and productivity data from one year. The results show that system hospitals realize both significantly higher cost and higher productivity levels, except for county-owned facilities which have lower costs and insignificantly different productivity levels. Factors that help explain these results are discussed and directions for further research are suggested.

**Bacterial colonization of newborn infants in a neonatal intensive care unit.**

Eriksson M; Melen B; Myrback KE; Winbladh B; Zetterstrom R  
Acta Paediatr Scand ,Sep 1982, 71 (5) p779-83, ISSN  
0001-656X Journal Code: 1LV

Languages: ENGLISH

The bacterial colonization of the nose, umbilicus, perineum and faeces in 85 newborns was studied during one period of high and one of low occupancy in a neonatal intensive care unit. Cultures were taken on admission, at three days, at one week of age, and then weekly during the stay in the unit. Colonization took place early and potential pathogens were responsible for a significant part of the spectrum. At one week of age, more than 50% of the infants had Staphylococcus aureus in the nose and umbilicus, 25% had E. coli and/or Klebsiella enterobacter in the umbilicus, and 60% had Klebsiella enterobacter in the perineum. Neither the occupancy rate in the unit nor the clinical state of the infant seemed to influence the colonization pattern significantly. Changes in flora were frequent in the individual infant. However, the bacterial spectrum remained essentially the same with increasing age during the stay in the unit and during the two periods. Only on two occasions was the same phage type of Staphylococcus aureus found in two infants at the same time. Two cases of septicemia occurred in the 85 infants during the three months of the study. Both infants were colonized beforehand with the causative organism. The results may indicate that the clinical state of the infant is of greater importance for risk of septicemia than the pattern of the bacterial colonization.

**An econometric analysis of the major determinants of nursing home costs in the United States.**

Meiners MR

Soc Sci Med ,1982, 16 (8) p887-98, ISSN 0277-9536  
Journal Code: UT9

Languages: ENGLISH

This study presents statistical cost function estimates based on data from the 1973-74 National Nursing Home Survey. Using multiple regression techniques, multiplicative and additive models of both total cost and operating cost are presented. Findings from the analysis contribute to the growing literature on nursing home costs and provide added insight to a number of important topics. Economies to scale are indicated with an optimum size in the 300-400 bed range. Flat-rate reimbursement systems and other systems which set rates prospectively are shown to be associated with significantly lower nursing home costs when compared to the incentives of cost based systems with or without limits and the incentives of private financing. Increases in both the admission rate and the occupancy rate are associated with higher costs though only the latter relationship proves of much practical significance, with the cost savings more pronounced for facilities starting with low occupancy rates. The profit motive is confirmed as an important incentive for containing costs. Holding several important level or scope of service indicators constant, proprietary nursing homes were found to have total costs 7% lower and operating costs 11% lower than in the voluntary non-profit nursing homes. The range of therapeutic services available and the type of staff coverage of the daily shifts provided in the nursing homes are confirmed as key cost determinants. Evidence is also provided which suggests that residents with mid-level dependency are relatively more costly to treat than those who are completely dependent or independent. The usefulness of other facility descriptions and quality proxy measures as cost determinants is also explored. The results are compared to those from other recent nursing home cost function studies.

**Elderly patients in a general surgical unit: do they block beds?**

Seymour DG; Pringle R

Br Med J [Clin Res] ,Jun 26 1982, 284 (6333) p1921-3,  
Journal Code: B4X

Languages: ENGLISH

In a prospective study of patients aged 65 years and over admitted to a general surgical unit only one patient in 10 remained in hospital for more than a month and fewer than one patient in a hundred became a "bed-blocker." While the over-65s had mean and median durations of stay which were longer than those of younger patients, in almost all cases a prolonged stay in hospital resulted from postoperative morbidity and was not related to social or administrative factors. Only a reduction in the incidence of postoperative morbidity could achieve a significant saving in the number of

bed-days occupied by elderly people.

**The impact of an expanding community mental health service on patterns of bed usage: evaluation of a four-year period of implementation.**

Hafner H; Klug J

Psychol Med ,Feb 1982, 12 (1) p177-90, ISSN 0033-2917  
Journal Code: QER

Languages: ENGLISH

In the city of Mannheim the introduction of an extensive community mental health service has been shown, by means of case-register data over 4 1/2 years, to have led to a considerable increase in utilization, mainly at the out-patient level of care. The rates of admission to hospital increased very little. Due to the simultaneous decline in long-term bed occupancy, the overall need for psychiatric beds remained stable at a rate of about 1.2/1000, a rate which is very low by international standards. The sharp decline in the "old" long-stay population was followed by a smaller increase in "new" long-stay patients which it has not been possible to prevent. These patients are, however, admitted for a long-term stay significantly later than formerly, and their diagnostic composition has changed significantly. The increase in the bed requirements for short- and medium-term stay patients resulted from different sources: an increasing morbidity in some groups of disorders, the rising utilization in case of emergencies and severe crises, and the transfer of long-stay patients to alternative care services. The level of these needs was very similar in Mannheim, Salford, Samsø and Camberwell, whereas the rates for long-term beds still show clear national differences.

Journal Code: LSM  
Contract/Grant No.: #18-P-97038/1-03  
Languages: ENGLISH

There is growing concern over the inappropriate utilization of health care facilities. The high cost of hospital care and the apparent shortage of nursing home beds have focused attention on one aspect of this problem: the clinically unnecessary days (sometimes called "administrative days" or "ADs") spent in hospitals by patients who are awaiting placement in long-term care facilities. In this study, data from a 1976 Massachusetts Department of Public Health survey of patients backed up in hospitals were analyzed to determine the magnitude of the problem and to examine the influence of several major factors that had been hypothesized in previous studies to contribute to the backup. We demonstrate that the average delay of a patient found waiting in a "snapshot" survey (which is often used to estimate the magnitude of the problem) is significantly greater than the average delay experienced by a typical discharged patient. We show that there are at least two major factors that influence the delay time: nursing home preferences in accepting certain types of patients and nursing home occupancy rates in the hospital service area. Neither medical-surgical occupancy rate nor the number of AD patients waiting in the hospital was significantly correlated with the delay time.

**Changing patterns in mental illness in the elderly.**

Christie AB  
Br J Psychiatry ,Feb 1982, 140 p154-9, ISSN 0007-1250  
Journal Code: B1K  
Languages: ENGLISH

The study of Graylingwell Hospital conducted by Roth (1955) has in part been replicated in order to study the changing patterns of mental illness in the elderly over a 25-year period. Important changes in the diagnostic distribution and outcome of cases admitted have occurred. Functional illness has given way to dementia, not as a proportion of patients admitted but in the number of beds employed for their care 6 and 24 months after their index admission. Discharge rates for all diagnostic groups except acute confusional states, have undergone considerable change and death rates have fallen. The study has concentrated on the residual in-patient population, paying particular attention to increasing demand for beds for the dementing group. These changes have been quantified and reflect a four-year increase in bed requirements for cases of dementia at two years. Despite a striking reduction in requirement for functional cases, there is an overall increase in bed requirement of 38 per cent at the two-year mark.

Friedman B  
J Hum Resour ,Winter 1982, 17 (1) p59-71, ISSN  
0022-166X Journal Code: IE9  
Languages: ENGLISH

State governments, with federal subsidies under the Medicaid program, are the source of the largest share of expenditures to support patients in the long-term institutional nursing care. A major state policy tool that has been evolving is the authority to approve or deny expansions in bed capacity. This paper is an analysis of how the behavior of physicians and nursing homes operates, given present reimbursement policies, could determine the allocation of beds among patients. Both general evidence of inefficient allocation and the detailed experience in the State of Rhode Island before and after a period of rapid expansion of bed capacity lend support to the conceptual model of home-operator behavior. Some alternative structural reforms in Medicaid and in the rationing of beds are suggested in the final section.

**Contracting state mental hospital systems.**

Frank RG; Welch WP

J Health Polit Policy Law ,Winter 1982, 6 (4) p676-83,

ISSN 0361-6878 Journal Code: IBC

Languages: ENGLISH

The predominant approach to contracting state mental hospital systems has been to close individual hospitals. Such a policy creates conflict between state government and the affected workers and communities. Closing of hospitals has been motivated by an implicit assumption on the part of state policy-makers that there are increasing returns to scale in mental hospitals. The bulk of empirical evidence suggests that returns to scale are constant. Thus, in many cases one may forego the political conflict inherent in closing hospitals by shrinking them with no loss in economic efficiency.

Predicting that in an environment of limited resources, the hospital's competitive strategy will assume greater importance, the author reviews the relationship of positioning to market success. He also discussed how such strategies as differentiation, overall cost leadership, and market focus can be applied to hospitals.

This paper reports on the findings of a longitudinal study of a mental subnormality hospital in the North of England. The focus is upon how nurses have experienced a major change in care and treatment of residents from 1978 to 1980. We explore, through the eyes of nurses, the change in their role from a predominantly nurturing/custodial one to a mainly educational/community orientated role. The research findings demonstrate that this change has increased nurses' self-esteem and their satisfaction with important areas of their work. There is some evidence also that nurses/resident relationships have improved in spite of reservations felt about new forms of treatment and community care. We suggest that such reservations may be linked to critical views expressed by nurses, particularly sisters and charge nurses, that decisions were taken about residents by other more senior personnel who had little contact with residents. One important conclusion of this study is that the traditional processes of decision making in the hospital appears to impede the full implementation of a major change which requires nurses to be involved in a potentially threatening process of altering their perceptions of themselves and residents.

Information is an increasingly important resource in an academic hospital. Effective planning and control of this resource are essential in order to maximize its usefulness. The Hospital Information Planning Study (HIPS) undertaken at Groote Schuur Hospital, and based on the Business Systems Planning (BSP) methodology, is outlined, as are the results of the study. The recommendations arising from the study, which are of considerable significance to the hospital, are mentioned briefly.

This paper examines organizational adaptations to an environmental jolt--a sudden and unprecedented event (in this case, a doctors' strike)-- that created a natural experiment

within a group of hospitals. Although adaptations were diverse and appeared anomalous, they are elucidated by considering the hospitals' antecedent strategies, structures, ideologies, and stockpiles of slack resources. Assessments of the primacy of the antecedents suggest that ideological and strategic variables are better predictors of adaptations to jolts than are structural variables or measures of organizational slack. Although abrupt changes in environments are commonly thought to jeopardize organizations, environmental jolts are found to be ambiguous events that offer propitious opportunities for organizational learning, administrative drama, and introducing unrelated changes.

Harv Bus Rev ,Sep-Oct 1982, 60 (5) p56-68, ISSN 0017-8012  
Journal Code: GBE  
Languages: ENGLISH  
The erosion of the capital position in the hospital industry--one of the most complex and overregulated industries in the United States--is a major challenge to trustees. Hospital trustees have often neglected to examine their hospitals' capital needs on more than a project-by-project basis. In dealing with their hospitals' capital needs, trustees, most of whom are successful business people, too often take off their "business" hats and put on their "social worker" hats. In doing so they not only neglect to subject their hospitals' capital and operating programs to searching cost-benefit review, but they also overlook much useful knowledge about how to use corporate organization to shelter new ventures and strengthen their hospitals' market position and solvency. In this article, the authors discuss how hospitals can adopt successful corporate restructurings and strategies to respond to the adverse financial developments they will have to face in the coming years.

A description of a comprehensive multidisciplinary education and training program in geriatrics in an acute care hospital is presented. A brief review of the history of medical education in geriatrics is examined, and the need for and potential of a hospital-based training program is discussed. The methods used in implementing an education program that attracts house staff physicians and other health professionals are described. The program incorporates the application of a multidisciplinary team model of patient assessment and treatment, which is augmented by clinical bedside teaching and a broad-based educational program. Using hospital-wide faculty, the program includes a geriatrics/gerontology lecture series incorporating presentations on the biopsychosocial aspects of aging and a diversity of subjects relevant to aging. Other programs such as weekly house staff topic sessions on aging, interdisciplinary research seminars, orientations, and special symposia are all part of the education program.

Three arrangements for structuring the work of professional participants in professional organizations are described, contrasted and evaluated. Arguments are illustrated by application to the organization of physicians within hospitals. The primary rationale, the support structures that have fostered its development, the key structural features and the advantages and disadvantages of each arrangement are described. The effect on these arrangements of structures and forces external to any particular professional organization is emphasized. (80 Refs.)

This paper delineates the necessary steps to provide hospital administrators with the information needed to evaluate an automated system, OCLC, for addition to the medical library. Based on experience at the Norton-Children's Hospitals, included are: (1) cost analyses of present technical processing systems and cost comparisons with OCLC; (2) delineation of start-up costs for installing OCLC; (3) budgetary requirements for 1981; (4) the impact of automation on library systems, personnel, and services; (5) potential as a shared service; and (6) preparation of the proposal for administrative review.

Lajer M  
Scand J Soc Med ,1982, 10 (1) p3-10, ISSN 0300-8037  
Journal Code: UDS  
Languages: ENGLISH  
677 active members of the bricklayers' trade union in Aarhus have been investigated with regard to unemployment and hospitalization during the period April 1, 1972-March 31, 1978. Information concerning unemployment was obtained through the bricklayers' trade union, and information about hospitalization from the hospital administration registry of three counties of Northern Jutland and from the Danish Central Psychiatric Register. Using logit analysis it was found that admission to a hospital increased the risk of unemployment, and that unemployment increased the risk of hospitalization. Admission to a psychiatric department appeared within a latency period of 0-1 years. A latency period of 1/2-11/2 years was observed before admission to a medical department. Admission to a surgical department occurred 1/2-21/2 years after accumulated unemployment. The risk of admission to a psychiatric department was seven times as high for bricklayers who have been unemployed more than 50% of the time compared with those who have been unemployed less of the time, although the calculation was based on relatively few individuals. The risk of admission to medical wards was twice as high, and the risk of admission to surgical wards was almost twice as high among those with much unemployment.

**Development of a model practice for pediatric residents.  
Economic and administrative considerations.**

Mankad VN; Shell RT  
Clin Pediatr (Phila) ,Sep 1982, 21 (9) p519-24. ISSN  
0009-9228 Journal Code: DHE  
Contract/Grant No.: 5528 PE 14236-04  
Languages: ENGLISH

A model pediatric residents' group practice which functions independently of the hospital administration and, to a large extent, of the university administration was developed for the specific purpose of training pediatric residents. During the second year of operation (1981), the residents' group practice met 91 per cent of all expenses, including faculty and resident salaries. The residents' group practice shares many characteristics of private practice (e.g., continuity of physician-patient relationship, appointment keeping, efficient patient flow, and physician participation in practice management). Through their involvement in the management of the practice, residents learn about socioeconomic aspects of pediatric practice and learn how to provide affordable primary care of high quality. Suggestions for developing similar models elsewhere are described.

**A metropolitan airport disaster plan--coordination of a multihospital response to provide on-site resuscitation and stabilization before evacuation.**

Dove DB; Del Guercio LR; Stahl WM; Star LD; Abelson LC  
J Trauma ,Jul 1982, 22 (7) p550-9, ISSN 0022-5282

Journal Code: KAF

Languages: ENGLISH

At the John F. Kennedy International Airport in New York City, disaster planning has been an integral part of the airport operations for the past 20 years. The medical component of this disaster planning has focused around the Medical Office at JFK. Through this office, on-site emergency medical teams have been established and trained from all ranks of airport personnel. Following the crash of a Boeing 727 aircraft in 1975, a new concept was added to disaster planning for JFK, which involves bringing the hospital, its facilities, and its personnel to the scene. A new piece of equipment, known as Emergency Mobile Hospital, was developed with the cooperation of the airlines, the operating authority of the airport, and other interested parties. Two such vehicles are now in constant readiness at the airport, and together provide two operating rooms, 12 monitored ICU beds, a 16-bed burn unit, and 72 other beds to be used for on-site stabilization of critically ill patients, before transfer to a definitive care facility. Under the auspices of a single area medical school (New York Medical College) and its affiliated departments of surgery, trauma teams are made available to be airlifted to the scene within 30 minutes of notification. Additional medical teams from other medical school hospitals serve as backup support. The principle of bringing the hospital to the emergency, and of assembling trauma teams for the initial phase, remains the same for Kennedy Airport as for that of any other metropolitan airport.

**Quality assurance and organizational effectiveness in hospitals.**

Hetherington RW  
Health Serv Res ,Summer 1982, 17 (2) p185-201, ISSN  
0017-9124 Journal Code: G2L

Languages: ENGLISH

The purpose of this paper is to explore some aspects of a general theoretical model within which research on the organizational impacts of quality assurance programs in hospitals may be examined. Quality assurance is conceptualized as an organizational control mechanism, operating primarily through increased formalization of structures and specification of procedures. Organizational effectiveness is discussed from the perspective of the problem-solving theory of organizations, wherein effective organizations are those which maintain at least average performance in all four system problem areas simultaneously (goal-attainment, integration, adaptation and pattern-maintenance). It is proposed that through the realization of mutual benefits for both professionals and the bureaucracy, quality assurance programs

can maximize such effective performance in hospitals.

Adolescent clients of a Teen Health Clinic were surveyed to determine those aspects of the service that were considered crucial to patient acceptance and program continuance. A simple one-page questionnaire enabled the clients to express their feelings about personnel, services, environment, and educational materials used in the clinic. Eighty-five percent of the clients expressed positive reactions to the clinic, while only 25.5% offered negative statements. Most respondents indicated clinic staff as the feature they liked most about the service and mentioned routine clinical activities as the part they liked least. Of the topics on which teenage clients wanted more information, 68% indicated that they wanted

Alternative methods for rapidly producing accurate medical records, usually dictation-transcription systems or nurse-scribe methods, have been used in emergency departments.

We now have more than five years of experience with a non-nurse scribe system. This system has proven effective in generating accurate and complete medical records while enhancing patient flow. We describe the system and its implementation.

Critical Path Method (CPM) and Program Evaluation and Review Technique (PERT) are quantitative network planning strategies that facilitate management of projects with many interrelated activities. They determine the minimum time necessary to complete a project and identify which activities are critical to achieving the minimum. PERT also incorporates probabilistic estimates of activity durations. This statistical approach is useful when planning a project entailing some uncertainty and allows one to calculate chances of finishing on time. CPM and PERT encourage participation of all key personnel in the planning process, effective fit between project variables and organizational structure, and optimization of resource allocation. Availability of several levels of sophistication make network planning flexible enough to be applied easily in laboratory research and development. Iterative refinement of network plans and time estimates in progressive steps of involvement with clinical colleagues augments the effectiveness of these technics in hospital settings.

**The role of parents and medical auxiliaries in oral rehydration in Thailand.**

Varavithya W; Pavabutara P; Pichaipat V; Thanomsingh P; Putthipongsiriporn S; Mahothorn K; Ratanapanich P

Southeast Asian J Trop Med Public Health .Sep 1982, 13 (3) p451-4, ISSN 0038-3619 Journal Code: UVN

Languages: ENGLISH

Parents and medical auxiliaries should participate in the oral rehydration programme to reduce diarrhoeal diseases mortality. Integration of this programme into the national health programme will require a system of education and training that can reach everyone involved in the delivery of health care. A pilot study carried out at a province in northeast of Thailand showed that only 0.6% of diarrhoeal cases had to be referred for treatment to the provincial hospital. The benefit of oral rehydration at periphery by local health officers could be appreciated by the reduction in admission of diarrhoeal cases to the provincial hospital and significant reduction of mortality rate. The role of parents and medical auxiliaries in practice and promotion of oral rehydration is the key to the success of control of diarrhoeal diseases in the context of primary health care.

**[6 years of psychiatry in a general hospital]**

Sechs Jahre Psychiatrie an einem Allgemeinkrankenhaus.

Michaelis R; Crome B; Kulenkampff M; Schwartz RB

Psychiatr Prax .Nov 1982, 9 (6) p197-202, ISSN 0303-4259 Journal Code: QCK

Languages: GERMAN Summary Languages: ENGLISH

Six years of experience in the psychiatric and neurologic department of the General Hospital at Itzehoe (122 beds, including 78 psychiatric patients and 44 neurological patients; 5 assistant physicians, 1 psychologist, 2 senior physicians, 1 Medical Director [Head]; 38 nurses, 1 social worker, 2 occupational therapists) allow us to summarize initially the efficiency of such an institution: A department like this is basically able to take over full responsibility for the psychiatric care of a community district including the town and adjacent areas of other districts (totalling 120,000 inhabitants). The prerequisites--as is the case in the Steinburg district--are that a hospital is available for patients with chronic mental diseases; close cooperation with an established sociopsychiatric service; and, last but not least, a possibility of transferring patients for the purpose

of long-term rehabilitation and withdrawal treatment in relevant institutions. Hence, it is absolutely out of place to label such work performed by "small" departments as "gilded" or "miniature psychiatry". Such departments are increasingly becoming the representatives of a type of psychiatry which definitely has a future because it operates near the patients' domiciles. However, it will be necessary to revise the job schedules, since the number of personnel employed in this type of work is by no means sufficient for conducting a type of psychiatry which is in line with modern concepts and requirements.

**[Nurses in the psychiatric department of a community hospital]**

Krankenschwestern in der psychiatrischen Abteilung eines Gemeindekrankenhauses.

Mayer D; Driburg B  
Psychiatr Prax .Nov 1982, 9 (6) p190-2, ISSN 0303-4259 Journal Code: QCK

Languages: GERMAN Summary Languages: ENGLISH

Anyone who tries to convert a Psychiatric Department into a hospitable home for the benefit on the inmates and their environment, has quite often not reckoned with, the "host", that is to say, with the doctors, nurses and the hospital staff in general. Hence, it seems that a fundamental change in the attitude and consciousness of those who are engaged in psychiatry, is just as important as a new treatment concept or a new building. The author quotes the Bad Driburg Community Hospital as an example: here, planning and construction were not the only important factors. The nurses have taken and accepted advice with regard to their supervisory functions, and in the course of a protracted process they have changed their attitude in favour of a psychiatric practice which follows a treatment pattern based on a "open-minded" approach to community members.

The authors describe a training program on prevention and management of violent behavior for the staff of a Veterans Administration hospital. The one-day workshop focuses on

preventive identification of potentially violent situations and on methods of verbal and physical management of violent behavior. A study of workshop participants showed that trainees had improved knowledge about and performance in handling violent behavior after completing the program. Future developments in training in prevention and management of violent behavior should include greater availability of educational resource materials and incorporation of the subject in undergraduate and graduate health care training.

**Work sampling: a means of determining physiotherapy activities and reviewing caseloads.**

Allen JM  
Physiother Can ,Jan-Feb 1983, 35 (1) p31-5, ISSN  
0300-0508 Journal Code: PCP  
Languages: ENGLISH

Work sampling is a tool used to examine the activities involved in performing a job. A work sampling study was designed to examine the components of physiotherapy care in a 350-bed teaching hospital. The components were related to a physiotherapist's activities and included an examination of the time related to patient treatment, attendance at meetings, record-keeping and preparation, travel, teaching, continuing education (in-service), talking to colleagues (doctors, occupational therapists), and other activities. The purpose of the study was to quantify a therapist's nontreatment activities, and to compare observations concerning treatment with the work sampling data obtained in compliance with the Canadian Schedule of Unit Values and, in particular, its weighted units. The study showed that there was no difference between the "observed" time (sampling time in percentage of total time) spent in direct patient contact, and the weighted units, when the latter was converted to a percentage of time. The Nova Scotia government's standard of 50 000 work units per year was found to be useful in justifying staffing levels; a useful indicator of productivity was also developed using weighted units expressed as a percentage of worked or paid hours. Work sampling would thus appear to be a useful tool for

physiotherapy department managers.

We have suggested that improving the productivity of an individual or of one group of workers is not the same thing as improving the productivity of the organization overall. Further, because work units in hospitals are interdependent, attempts to improve productivity ultimately involve a reexamination of the organization's values and culture. Until this fundamental realization occurs, little can be done to improve the organization's productivity. As such, productivity is not simply a day-to-day managerial issue as a long-term leadership issue. Thus, we ought to begin mapping out productivity strategies for the long run. Some of the elements of such a strategy have been highlighted.

This is a report on a community seminar, jointly sponsored by Toronto East General and Orthopaedic Hospital and the Borough of East York. The object was to provide information, support and a milieu for discussion for those caring for an elderly person at home. The planning committee included health-care professionals and agencies from both the hospital and the community. Two questionnaires were distributed and results indicated that the objectives had been met.

**Medicare and Medicaid programs; rural hospitals: provision of long-term care services (swing-bed provision); flexibility in application of standards--Health Care Financing Administration. Interim final rule with comment period.**  
Fed Regist ,Jul 20 1982, 47 (139) p31518-33, ISSN  
0097-6326 Journal Code: B58  
Languages: ENGLISH

These regulations implement sections 904 and 949 of Pub. L. 96-499, the Omnibus Reconciliation Act of 1980. Under section 904 (the swing-bed provision), certain small, rural hospitals may use their inpatient facilities to furnish skilled nursing facility (SNF) services to Medicare and Medicaid beneficiaries, and intermediate care facility (ICF) services to Medicaid beneficiaries. These hospitals will be reimbursed at rates appropriate for those services, which are generally lower than hospital rates. This statutory provision is intended to encourage the most efficient and effective use of inpatient hospital beds for delivery of either hospital or SNF and ICF services. Under section 949, rural hospitals of 50 or fewer beds may be exempted from certain personnel standards in the conditions of participation for hospitals. This exemption applies only to the extent that it does not jeopardize or adversely affect the health and safety of patients.

Microcomputer applications in anesthesiology are increasing rapidly. All areas are affected: research, education, administration and clinical care. In research, microcomputers are accomplishing both process control and analysis, as well as storage of large data banks. In education, computer-aided instruction permits the student to progress at his own speed, while freeing instructor time for individual tutoring. Administrative applications produce more useful information and cost-control with reduced clerical effort. clinical applications offer the possibility of truly integrated monitoring systems that will make automated anesthesia records possible; eventually this will lead to computer-controlled anesthesia. This paper examines the "state of the art" in applications of microcomputers in anesthesia.

**Patient classification systems: the ideal vs. reality.**  
Alward RR  
J Nurs Adm ,Feb 1983, 13 (2) p14-9, ISSN 0002-0443  
Journal Code: JEL  
Languages: ENGLISH

This author identifies a critical problem in the wholesale adoption of patient classification systems (PCSs) in nursing departments. She suggests that without attention to their reliability and validity for the specific institution's standards and practice, PCSs may frustrate, rather than assist, the nursing administrator's efforts to predict staffing needs. Here she describes an "ideal" PCS and compares it with the reality of today's systems. She then suggests ways that nursing administrators can move closer to this ideal system and make PCSs more useful management tools.

As the practice of research increasingly becomes a part of the nursing profession, nurses must develop their ability to evaluate and incorporate the findings gained through the research process. This article reports the results of a survey aimed at determining problem areas existing among nursing staffs in understanding, accepting, and incorporating research findings. The report will help nursing administrators identify specific factors that inhibit the use of research findings and improve the conditions for incorporating research in their facilities.

Journal Code: JEL

Languages: ENGLISH

Nursing administrators and nurse recruiters coping with staffing shortages can profit from some recent studies of the causes of nursing turnover. Research reveals that the problem lies not in the motivations or characteristics of individual nurses but the nature of hospital nursing jobs and incentive structures. Using the research findings as a basis for discussion, Weisman suggests target areas for administrative intervention in the design of hospital nursing jobs. Her insightful commentary provides stimulus for some basic rethinking of the nature of nursing jobs and the traditional employer-employee relationship between hospitals and nurses--as well as some specific suggestions for "recruiting from within" to retain those productive nurses in whom the hospital has already invested time and money.

**Applying management information systems to staffing.**

Hanson RL  
J Nurs Adm ,Oct 1982, 12 (10) p5-9, ISSN 0002-0443  
Journal Code: JEL

Languages: ENGLISH

A management information system (MIS) is a tool for managing resources effectively. After reviewing some concepts and principles for effective data management, Hanson clearly applies the concepts to nurse staffing systems, which manage human resources. He defines a seven-step process for establishing an MIS, from defining the management objective to implementing the system. Pointing out that an MIS need not be computerized to be effective, Hanson presents a positive perspective and clarifies some often-misconceived notions

about management information systems and the paper printouts they generate. In the next issue of JONA, a second article by Hanson will take a more detailed look at the variety, use, and usefulness of staffing statistics available from an MIS for staffing. These articles are based on material in a forthcoming book, Management Systems for Nursing Service Staffing, to be published by Aspen Systems Corporation, Rockville, Maryland.

Sheridan DR; Bronstein JE; Walker DD  
J Nurs Adm ,Oct 1982, 12 (10) p26-34, ISSN 0002-0443  
Journal Code: JEL

Languages: ENGLISH

If a nursing service uses agency nurses to help cope with staff shortages, the nursing administrator must manage the cost and quality of care delivered by these nurses. The authors describe their hospital's system for using agency nurses. The components of their system--an orientation program, contracts with the agencies, and systematic performance evaluation--can be used or adapted in other institutions.

**The 12-hour weekend plan--does the nursing staff really like it?**

Metcalf ML  
J Nurs Adm ,Oct 1982, 12 (10) p16-9, ISSN 0002-0443  
Journal Code: JEL

Languages: ENGLISH

After nursing administrators at one Boston hospital implemented a new system for weekend coverage, they surveyed the staff's response to the trial plan. Here the author explains their system, what they learned when they measured its effects, and how they used staff responses to improve it. They proceed to examine the new system's effects on recruitment and absenteeism. The experiences shared here should assist other nursing administrators who are looking at new scheduling approaches and their viability in resolving staffing problems.

**Mental health in the Third World.**

Lin TY

J Nerv Ment Dis ,Feb 1983, 171 (2) p71-8. ISSN  
0022-3018 Journal Code: JAF

Languages: ENGLISH

In spite of great national and international efforts and relative success in achieving technological and economic progress, the underlying situation in the Third World offers little cause for optimism. Some notable exceptions notwithstanding, in most countries poverty is increasing at an alarming rate, with its accompanying misery, poor health, and social unrest. Unequal distribution of material wealth, political instability, and the crumbling of traditional and cultural values are also increasingly prevalent. Critical assessment of the philosophy, goals, and methodology of development is an urgent requirement in many nations. Mental health endeavors in the Third World need similar reformulation of both immediate and long range objectives and methods, if ever-increasing mental health demands fostered by such rapid and sweeping changes are to be met. Four major models--the hospital-based model, the medical school-based model, the community-based model, and the voluntary organization model--have so far been the basis for mental health development in Third World nations and, to a certain extent, have produced the needed personnel and services. A fifth model--the primary health care model--seems to hold more promise for the future. By virtue of its integration with general health and other administrative social networks, it can more easily reach out to the community, providing both curative and preventive mental health. Whichever model or combination of models any one nation or region adopts, future mental health endeavors in the Third World should be an integral part of overall social policy and health planning. Taking children, family, and school as major foci, such efforts are indispensable and should constitute a positive force in shaping the continuing process of social evolution.

**Changes in patterns of care of the mentally handicapped: implications for nurses' perceptions of their roles and hospital decision making processes.**

Shaw M; Heyman B

J Adv Nurs ,Nov 1982, 7 (6) p555-63. ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH

This paper reports on the findings of a longitudinal study of a mental subnormality hospital in the North of England. The focus is upon how nurses have experienced a major change in care and treatment of residents from 1978 to 1980. We explore, through the eyes of nurses, the change in their role from a predominantly nurturing/custodial one to a mainly educational/community orientated role. The research findings demonstrate that this change has increased nurses' self-esteem and their satisfaction with important areas of their work. There is some evidence also that nurses/resident relationships

have improved in spite of reservations felt about new forms of treatment and community care. We suggest that such reservations may be linked to critical views expressed by nurses, particularly sisters and charge nurses, that decisions were taken about residents by other more senior personnel who had little contact with residents. One important conclusion of this study is that the traditional processes of decision making in the hospital appears to impede the full implementation of a major change which requires nurses to be involved in a potentially threatening process of altering their perceptions of themselves and residents.

**Attitudes of patients, housestaff, and nurses toward postoperative analgesic care.**

Weis DF; Sriwatanakul K; Alloza JL; Weintraub M; Lasagna L  
Anesth Analg ,Jan 1983, 62 (1) p70-4, ISSN 0003-2999  
Journal Code: 4R8  
Languages: ENGLISH

A survey was carried out among housestaff and nurses involved with postoperative patient care to assess their knowledge of analgesics and their attitudes toward postoperative analgesic care. Only one-fifth of the respondents prescribed for complete pain relief. There were some misconceptions about adding other drugs to narcotic analgesics as well as fear of the addictive properties of these narcotics. The respondents lacked confidence about their knowledge of narcotic analgesics. Fear of respiratory depression was less prominent. Nine percent of the physicians and 31% of the nurses believed that response to a placebo indicates factitious pain. Fifty-four percent of the physicians and 74% of the nurses believed that patients receive adequate pain relief. Eighty-one patients were questioned on their beliefs about pain and its relief. Sixty-six of these were monitored postoperatively to assess the effectiveness of pain relief, which was judged by the authors to be ineffective (i.e., moderate to severe pain at the peak of analgesia) in 41%. Seventy-five percent of the patients reported that their overall postoperative pain relief had been adequate. There was no correlation between the amount of analgesic required postoperatively and either the degree to which patients believed pain builds character or the degree to which they rated themselves sensitive to pain. This study emphasizes the need for better and more comprehensive training of housestaff and nurses in analgesic care.

In this final installment of a 12-article series on managing computer systems for the hospital pharmacy department, contemporary issues related to the topic of the series are discussed. Assessment of institutional strategy for acquiring systems and determining the departmental direction is reviewed. The far-reaching impact of computerization on personnel staffing and job functions is discussed. The results of a telephone survey of 23 pharmacy computer system vendors that had at least one installation of a unit dose and i.v. admixture system are also presented. Because of the current and future widespread use of computers, pharmacists must acquire knowledge of computer systems.

**[Recent experiences with kidney explantation outside transplantation centers]**

Neue Erfahrungen mit der Nierenexplantation ausserhalb von Transplantationszentren.  
Geister H; Simon S  
Urologe [Auszg A] ,Sep 1982, 21 (5) p254-5, ISSN  
0042-1103 Journal Code: WSJ

Languages: GERMAN Summary Languages: ENGLISH

The ever-increasing negative balance between the offer of a demand for organs with regard to transplantation surgery is very problematic. The transplantation centres are confronted with an insolvable problem and for this reason the co-operation of hospitals, other than the transplantation centres, is of vital importance where the explantation of kidneys, under specified conditions, is concerned. There are reports of new experiences in the removal of organs through in-situ-perfusion and en-bloc-removals as well as combined consignments of organs and typing material. The favourable results personally achieved during the past 6 years have given cause to believe that other clinics or hospitals, other than the transplantation centres, will participate in the explantation or organs for the purpose of transplantation.

**Doctors' roles in primary health care.**

Piyaratn P

Trop Doct ,Oct 1982, 12 (4 Pt 2) p196-202, ISSN  
0049-4755 Journal Code: WGC

Languages: ENGLISH

Doctors in developing countries where the majority of the population live in rural areas are facing difficult adjustments of their roles to attain health for all of the rural population. In Thailand, doctors directing remote district hospitals act as the focal points of other health care facilities serving the entire population of the districts. To supplement the existing governmental health service network and in accordance with principles of primary health care, community primary health care volunteers are being developed to expand service coverage to rural communities. These lead to changes in doctors' roles. Doctors are required to be not only competent clinicians but also good managers of health promotive and preventive programmes, effective hospital administrators, competent trainers and qualified researchers. They must not only work within the hospital but also support the health personnel and activities of the entire district, and in particular the community primary health care workers. However, as it is now, they are graduates of traditional medical schools, whose educational programmes do not equip them adequately for their emerging new roles in rural hospitals. Reorientation of the existing health system, including its health personnel, is needed. The critical factor in such a process is the development of appropriate attitudes at all levels of health services. This is a difficult but challenging task, as it involves long established medical institutions which hold firmly to old traditions and values.

**A study of emergency unit waiting time.**

DiGiacomo EV; Kramer LD

QRB ,Nov 1982, 8 (11) p10-3, ISSN 0097-5990 Journal  
Code: OKP

Languages: ENGLISH

Administrators at Mercy Hospital in Springfield, Massachusetts, studied the effects of daily patient number and arrival rate on waiting time in the Emergency Unit. These two factors were found to have a smaller impact on waiting times than might be expected. Several issues relating to staffing and to patients' illnesses were addressed to reduce visit

lengths (ie, inadequate number of admitting registrars, inefficient use of staff, insufficient locations for the rapid treatment of patients requiring suturing, and large numbers of ancillary services requested on a stat basis). Subsequent studies showed that changes instituted as a result of the initial study had reduced overall emergency waiting time by 12%, even though average daily census had increased by 17%.

The Dietary Order Entry System is a computerized system which instantaneously communicates orders/messages from the patient care units to the floor diet offices. The system also produces up-to-date management reports such as diet lists and diet census at pre-determined times and on demand. Dietary and nursing personnel believe it is an extremely beneficial system in terms of both increased accuracy of data and time savings in transmission of information. We believe that improved patient care will result from this improved method of diet ordering.

A contract of employment is based on implied terms (a nurse can be expected to work shifts while the same does not apply to a secretary in the purchasing department), on conduct (unacceptable tardiness or laxity can become an accepted term of the contract if it is not corrected by the employer), and on agreements either express (a signed contract) or implied (the acceptance of personnel manual terms during a probationary period). An employee's service can not be terminated without reasonable notice except for cause. To determine if summary dismissal (cause) is warranted, apply the test described in Stilwell v. Audio Pictures Ltd.

**Superior hospital formularies: a critical analysis.**  
Rucker TD  
Hosp Pharm ,Sep 1982, 17 (9) p465-71, 474-5, 477-9  
passim, ISSN 0018-5787 Journal Code: G98  
Languages: ENGLISH  
The drug monograph section of eight superior hospital formularies was examined to (1) determine the type of pharmaceuticals, including dosage forms, listed, (2) delineate patterns of concurrence and divergence in drug acceptance, and (3) ascertain quantitative benchmarks by therapeutic category that may suggest optimum formulary size. The survey also undertook a comparative analysis of marginal drugs and reviewed the role of pharmacy personnel in supporting formulary administration. The critique of pharmaceutical preparations revealed significant patterns of similarity, heterogeneity, perplexity, and redundancy. The investigation also documented problems in dosage form selection and formulary publication. The report concludes that there is a need for more comprehensive studies that incorporate alternative quality assurance methods and focus on the more intangible factors of professional leadership and integrity.

The procedures required for software and hardware maintenance of a pharmacy computer system, and methods of dealing with operational and administrative problems of such systems, are described. Maintenance of software and hardware purchased from a vendor is usually provided by the vendor under contract. Repair maintenance is required for programs that do not run, produce incorrect results, or run too slowly. Update and revision maintenance is required when user requirements exceed the limits and design of the original program. Typical problems encountered with computer systems include slow computer response time, performance of maintenance personnel, turnover in user personnel, legal liabilities and restrictions, reliability of hardware and software, downtime, security, and changing configuration of equipment. Successful management of predictable and unpredictable problems with computer systems is accomplished through systematic review of the potential problem area and prospective planning.

**Qualifications required in advertisements for hospital pharmacy management positions.**

Shepherd MD; Pink LA

Am J Hosp Pharm ,Nov 1982, 39 (11) p1940-3, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

Advertisements for pharmacy management positions were analyzed to determine the extent to which advanced degrees or experience were required. Advertisements were collected from three professional journals for 1971-1981 for the following positions: director and assistant director of pharmacy services, director and assistant director of clinical services, director and assistant director of drug information, and clinical coordinator. The following information was obtained from each advertisement: position title, educational degree required or preferred, number of beds in institution, type of ownership of institution, residency required or preferred, and experience required or preferred. Of 224 advertisements analyzed, 124 were for directors of pharmacy, 59 for assistant directors of pharmacy, and 41 for clinical management positions. No degree was required or preferred in 85 of the advertisements. A degree qualification was specified for all the clinical management positions; 37 out of 41 required a Pharm.D. or advanced degree. Advertisements for directors and assistant directors requiring an advanced degree were evenly divided between Pharm.D. and M.S. degrees. Since 1979, the number of advertisements not specifying a degree appears to have decreased and the number specifying M.S. or Pharm.D. to have increased. Managerial experience was mentioned in 51 of 183 advertisements for directors and assistant directors. For clinical management positions, only 6 specified managerial experience and 22 required clinical experience. Many employers specified residencies as qualifications. Advanced degrees are increasingly in demand for management positions. Advancement opportunities in the future may not be as promising as in the past for pharmacists who hold only B.S. degrees.

**Regional disaster planning for hospital pharmacies.**

Bragdon RL; Gousse GC; Piwarzyk P; Szweczyk T

Am J Hosp Pharm ,Nov 1982, 39 (11) p1913-5, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

The development of a disaster plan for hospital pharmacy services in Hartford, CT, is described. In June 1978, directors of pharmacy from 12 hospitals in the Hartford, CT, area began a project designed to ensure an uninterrupted supply of drugs and an adequate supply of pharmacy personnel during and after any natural disaster. The project initially involved standardization of components of the individual hospital pharmacies' disaster plans. A questionnaire was then completed by each director of pharmacy regarding hours of operation, telephone numbers, and pharmaceutical products usually stocked (including blood derivatives, radiologic-cont-

rast media, and intravenous solutions). Information on inventory levels was collected later. Pharmaceutical manufacturers and wholesalers in the region were contacted, and a list of routine and emergency telephone numbers was compiled. The disaster plan was completed in July 1979. The plan has been tested in a mock catastrophe drill and one natural disaster that caused relatively few injuries.

**Role of the director of pharmacy: the first four months.**

Nold EG

Am J Hosp Pharm ,Oct 1982, 39 (10) p1702-6, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

Specific goals and tasks that should be addressed during a pharmacy director's first four months of employment are reviewed. Individuals must prepare themselves for the director's role, find the right job, and negotiate an acceptable benefits package. During the first two months as director of pharmacy, an individual should primarily work on gathering facts and assessing the department's operations without making many changes. Interrelationships within the hospital should be studied, and many pharmacy and hospital documents should be reviewed so that the director has an understanding of past history. The director should interview all employees of the department and work as a staff pharmacist for one to two days in each area. During the third and fourth months, the new director will need to determine the extent of authority, develop working relationships with key individuals, assess the pharmacy-management team, develop a data-collection system, learn the processes for making changes, and consolidate authority. A major document, containing a departmental-operations analysis, statement of philosophy, goals, and approach to goal completion, should be the culmination of the four months. The director of pharmacy must meld professional, administrative, and financial activities; the final determinant of success will be the director's ability to implement and follow through with proposed changes.

**Managing the implementation of a pharmacy computer system.**

Mildenberger J; Gouveia WA

Am J Hosp Pharm ,Oct 1982, 39 (10) p1692-701, ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

The process of managing the implementation of a pharmacy computer system is described. The three major phases of an implementation plan are (1) orientation and testing, (2) training of personnel, and (3) operation and expansion. Testing procedures described include those for entering new medication orders, profile maintenance, printouts for unit dose cart dispensing, label and report generation, I.V. system orders, back-up system, special edit features, charge generation, and admission, discharge, and transfer status. Personnel training components described are orientation, formal and practical sessions, program development, and training manual development. Implementation programs described include parallel operations of manual and computer systems, limited independent operation, and expansion. Successful implementation of a pharmacy computer system depends on careful planning and coordination.

**Operating room practices for the control of infection in U. S. hospitals, October 1976 to July 1977.**

Garner JS; Emori TG; Haley RW

Surg Gynecol Obstet ,Dec 1982, 155 (6) p873-80, ISSN

0039-6087 Journal Code: VBD

Languages: ENGLISH

We estimated the frequency of selected infection control practices in the operating room from a nationwide survey of hospitals. Our survey confirmed that, in many hospitals, practices which have not received scientific or budgetary scrutiny have become part of the perioperative routine. Almost half of the hospitals reported using nonrecommended tacky, or disinfectant, mats at the entrance to operating rooms, and more than three-fourths were performing nonrecommended environmental cultures in the operating room at a cost ranging from \$2,000 to \$20,000 per year. When routine nose and throat cultures were taken of operating room personnel, we found an obvious pecking order, rather than a scientific rationale for culturing. In almost all instances, we found wide variations in practice among hospitals. This nonuniformity may be due to such factors as lack of a convincing scientific basis for evaluating the relative efficacy of alternative practices, the strong influence of industry marketing, the individual preferences of surgeons and operating room supervisors and the lack of completeness and agreement of statements from various scientific and professional organizations.

J Am Geriatr Soc ,Dec 1982, 30 (12) p774-80, ISSN  
0002-8614 Journal Code: H6V  
Languages: ENGLISH

A description of a comprehensive multidisciplinary education and training program in geriatrics in an acute care hospital is presented. A brief review of the history of medical education in geriatrics is examined, and the need for and potential of a hospital-based training program is discussed. The methods used in implementing an education program that attracts house staff physicians and other health professionals are described. The program incorporates the application of a multidisciplinary team model of patient assessment and treatment, which is augmented by clinical bedside teaching and a broad-based educational program. Using hospital-wide faculty, the program includes a geriatrics/gerontology lecture series incorporating presentations on the biopsychosocial aspects of aging and a diversity of subjects relevant to aging. Other programs such as weekly house staff topic sessions on aging, interdisciplinary research seminars, orientations, and special symposia are all part of the education program.

**Interdisciplinary consultation on the care of the critically ill and dying: the role of one hospital ethics committee.**

Cohen CB  
Crit Care Med ,Nov 1982, 10 (11) p776-84, ISSN  
0090-3493 Journal Code: DTF  
Languages: ENGLISH

Little is known about the structure and objectives of various hospital ethics committees due to their need to preserve confidentiality, their reluctance to reveal internal hospital problems, and their concern about becoming involved in the developing debate about the appropriate role and value of such committees. The evolution, functions, and goals of one distinctive hospital committee concerned with the care of the critically ill and dying are explained. Its membership and proceedings are described, and the medico-moral issues with which it has grappled are presented and discussed. An assessment is provided of the positive and negative impact of this committee within the Medical Center with which it is affiliated. The experience of this particular group illustrates that hospital ethics committees can play advisory and educational roles within a large medical center. They can provide support for patients, medical professionals, and families who face difficult dilemmas about terminal illness. They can function as forces to sensitize medical personnel to the challenges presented by medicine's growing power over death. They can serve as catalysts for interdisciplinary communication. Finally, they can promote the development of new programs for informed and humane care of the terminally ill.

Languages: ENGLISH

This paper examines the task and functioning of a contemporary mental institution. The author, drawing from his experience, explores the world within such an institution whose purpose often contradicts the officially stated one. This world with its own assumptions is a creation in response to needs and anxieties of its participants. In the face of rapid shifts and increasing complexity in institutional environments, the capability to change become critical. Real change is impossible unless the underlying assumptions of an institution are recognized, understood and dealt with.

**A comprehensive program to increase job satisfaction among pharmacy technicians.**

Mahoney CD; Gallina JN; Jeffrey LP

Hosp Pharm .Oct 1982, 17 (10) p547-50, ISSN 0018-5787  
Journal Code: G98

Languages: ENGLISH

A multifaceted personnel management and continuing education program specifically designed to provide job satisfaction for the pharmacy technician is described. Turnover among technicians is often higher than for other personnel categories. One interpretation of a high turnover rate is that it is a direct indication of job dissatisfaction and disillusionment on the part of technicians towards their career potential. Several approaches were initiated at the Rhode Island Hospital to increase job satisfaction among pharmacy technicians and to assist the pharmacy department in stabilizing this category to reflect a more satisfactory turnover rate. These were: (1) initiating a comprehensive continuing education program; (2) establishing a "career

ladder" by developing an advanced level of pharmacy technicians; (3) incorporating technicians in a concept of participative management within the department; (4) increasing job responsibilities as new programs are developed; (5) rotating assignments and responsibilities to foster flexibility and interest. The programs enumerated have made a significant contribution toward increasing the stability and job satisfaction of the technician category. The success of the measures described is reflected in the average tenure of an individual in the technician category, which is 41.9 months.

Arch Pathol Lab Med ,Dec 1982, 106 (13) p666-9, ISSN  
0363-0153 Journal Code: 79Z  
Languages: ENGLISH

A microcomputer reporting system for gross and microscopic surgical pathology is simple and inexpensive, reduces the need for clerical personnel, and saves the pathologist's time in the preparation of reports. Gross descriptions are performatted. A dictionary of microscopic diagnoses is constructed and stored on disks. The diagnosis to be used for a case is selected by a pathologist by number. It is called to

a video screen from disk storage by entering the number on the microcomputer keyboard. The diagnosis is edited or expanded for an individual patient while it is on the screen and is printed after changes are made. Each diagnosis contains preentered classification, coding, and filing information, as well as format, medical terminology, and spelling. The system has rapid retrieval and search capability and may be used for patients awaiting frozen-section diagnosis. The system requires fewer clerical personnel in surgical pathology than with free-form reporting.

The steps involved in preparing to implement a pharmacy computer system are described. Although the order in which the various steps have to be completed varies according to the hospital specifics, important elements of the preparation process include preparation of the site, organization of personnel, development of policies and procedures, developing and ordering forms, preparation of the implementation schedule, file development, and preparation of other departments. A well-designed plan and a realistic time schedule for the preparation process facilitates the actual implementation of a pharmacy computer system.

**Changing an automated drug inventory control system to a data base design.**

Bradish RA

Am J Hosp Pharm ,Sep 1982, 39 (9) p1502-5, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

A pharmacy department's change from indexed sequential access files to a data base management system (DBMS) for purposes of automated inventory control is described. The DBMS has three main functional areas: (1) inventory ordering and accountability, (2) charging of interdepartmental and intradepartmental orders, and (3) data manipulation with report design for management control. There are seven files directly related to the inventory ordering and accountability area. Each record can be accessed directly or through another file. Information on the quantity of a drug on hand, drug(s) supplied by a specific vendor, status of a purchase order, or calculation of an estimated order quantity can be retrieved quickly. In the drug master file, two records contain a reorder point and safety-stock level that are determined by searching the entries in the order history file and vendor master file. The intradepartmental and interdepartmental orders section contains five files assigned to record and store information on drug distribution. All items removed from the stockroom and distributed are recorded, and reports can be generated for itemized bills, total cost by area, and as formatted files for the accounts payable department. The design, development, and implementation of the DBMS took approximately a year using a part-time pharmacist and minimal outside help, while the previous system required constant expensive help of a programmer/analyst. The DBMS has given the pharmacy department a flexible inventory management system with increased drug control, decreased operating expenses, increased use of department personnel, and the ability to develop and enhance other systems.

**Emergence of occupational medical services outside the workplace.**

Rosenstock L; Heyer NH

Am J Industr Med ,1982, 3 (2) p217-23, ISSN 0271-3586  
Journal Code: 31N

Languages: ENGLISH

A new type of occupational medicine clinic has recently emerged in the United States. These clinics are multispecialty in staffing, are located in hospital outpatient departments, and are affiliated with academic medical centers. Their primary goal is to provide personal health and medical services including diagnosis, treatment, and follow-through of occupationally related diseases. Approximately 15 such clinics have been established in the last several years. A review of the medical, economic, and social forces that have historically shaped the content and scope of occupational medical and health services for workers explains in large part the reasons why many of these clinics have now come into

being. Characteristics of eight of these clinics are reviewed in detail. These clinics provide a setting for interdisciplinary and interspecialty education of personnel and offer the medical community a demonstration of a means for better recognition and treatment of occupationally related illnesses.

**Administrative decision making: staff-patient ratios (a patient classification system for a psychiatric setting).**

Schroder PJ; Washington WP

Perspect Psychiatr Care ,Jul-Sep 1982, 20 (3) p111-23,

ISSN 0031-5990 Journal Code: 0ZT

Languages: ENGLISH

In this article, we have described a patient classification system in use at the C.F. Menninger Memorial Hospital. It is a type of factor evaluation, in which we use critical indicators or descriptors of care as units of measurement. Each critical indicator represents a grouping of nursing activities rather than concrete time measurement of each activity. The ten critical indicators of patient care needs and nursing activities which were identified were divided into two major categories: routine and extra. Each category was then subdivided to reflect a range or variation of care levels. This type of patient classification appears to have an advantage over other classification systems when applied to psychiatric nursing. The factor evaluations are broad enough in scope to allow inclusion of patient assessment, documentation, and use of the nursing process, while providing a measurement of psychological and psychosocial needs of the patient which are frequently absent in other classification systems that rely on task measurements or acuity levels alone.

Because of its practicality it has been readily accepted by nurses working on psychiatric units, and the nurse administrator's effort to put a classification system in place has been made easier.

**Developing a system of comprehensive care for the spinal cord injured patient in Houston, Texas, U.S.A.**

Donovan WH; Clifton G; Carter RE

Paraplegia ,Jun 1982, 20 (3) p174-9, ISSN 0031-1758

Journal Code: 0QT

Languages: ENGLISH

The authors agree with the principle, widely accepted, that spinal cord injured (SCI) individuals should receive all their acute, rehabilitative and follow-up care in a spinal cord injury centre. The evolution of rehabilitation medicine and services in the United States, however, has favoured the separation of acute and rehabilitation care for spinal cord injured patients, as well as other disabilities. This has resulted partly from specialisation of medical and allied health personnel, physical separation of acute and

rehabilitation facilities, and reluctance of some funders of health care to see rehabilitation as a natural extension of medical care in these patients. In Houston the proximity of a rehabilitation facility to three acute care university hospitals, representing three medical schools, provided an opportunity to improve communication among the medical personnel. These individuals have recognised the value of early rehabilitation even while the patient is acutely ill; they agreed to institute a system of care wherein the rehabilitation physician partakes in the early management in a designated area of the acute hospitals for spinal cord injured patients and works toward early transfer to the rehabilitation hospital in as ideal a condition as possible. Surgeons, who have initial primary responsibility, also visit the rehabilitation hospital, following their patient's progress at selected conferences and at the bedside. This paper describes how, a spinal cord injury service was established, how the major barriers to early transfer were confronted, and the results of the first 6 months of operation.

A real-time nursing computer system operational on six medical wards allows the automatic data capture of all nursing procedures carried out for all patients. Each nursing procedure has been graded by an experienced nurse on a 5-point scale (Ninewells Index I), with grade 5 representing the greatest workload. A Delphi type survey was carried out by a questionnaire involving 115 medical charge nurses in Scotland who graded the same procedures on a 5-point scale (Delphi Index I). Good agreement with the two indices was found. The Delphi Index I was transferred from the original scale to an interval scale (Delphi Index II) to facilitate statistical handling of data and conversion to timings. The conversion of

Delphi Index II to timings (Ninewells Index II) was achieved by using data from three extensive work studies. It is suggested that Ninewells Index II is a practical problem of staff allocation in medical wards.

**Motivational management: coping with burnout.**

Richardson M; West P

Hosp Community Psychiatry ,Oct 1982, 33 (10) p837-40, ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Burnout, the emotional state that accompanies an overload of stress, generally has been ascribed to organizational or personal causes. Motivational management is an approach to identifying the causes of burnout among workers and determining ways to effectively intercede. The authors conducted workshops to help staff combat burnout at a public health agency, a small community hospital, and a preschool for handicapped children. During the first phase of the workshop participants generated a list of problems that contributed to their sense of burnout. They then assigned each problem a personal, organizational, or environmental cause. During the second phase participants decided who should accept responsibility for developing and executing strategies for change. The authors believe motivational management techniques can also be used to explore burnout in other roles such as those of parent, child, friend, or community member.

Languages: ENGLISH

The Salmonella reversion test was used to measure the mutagenic activities of urine concentrates from individuals preparing cancer chemotherapy agents for i.v. administration. Longitudinal studies were performed in which the total urine produced in 24-hr periods was collected, starting on a Sunday at 7 p.m. after a duty-free weekend and extending over an 8-day period. There was no detectable increase in mutagenic activity in the urine concentrates of three pharmacy administrators who had no contact with these drugs. All six individuals admixing drugs in open-faced, horizontal laminar flow hoods displayed a 2-fold increase in mutagenesis by the fourth day with peak values of 2.7- to 24-fold occurring on Days 5 and 6, reduced values by Day 7, and a return to the spontaneous level by Day 8. When four of the six positive individuals in the preceding experiment admixed comparable amounts of chemotherapeutic drugs in a closed-face, vertical laminar flow hood, no increase in mutagenic activity was detected in their urine concentrates over the 8-day period.

**New baccalaureate graduates' perceptions of organizational conflict.**

Snyder DJ

Nurs Res ,Sep-Oct 1982, 31 (5) p300-5, ISSN 0029-6562  
Journal Code: 09K

Languages: ENGLISH

This study explores the process of professional socialization in a sample of newly graduated baccalaureate nurses whose first experience as practicing professionals was in a hospital organizational system. Professional socialization was defined in terms of concept of identity reassessment as proposed by Strauss and in terms of the new graduates' descriptions of their own behavior during conflictual situations in the work setting. These descriptions were identified as conflict-reporting behavior and analyzed from two aspects: the source of the conflict and the level reached by the behavior of the respondent, as defined by a model for organizational conflict proposed by Pondy. Although changes in conflict-reporting behavior with increasing experience in the hospital bureaucracy were noted, the study findings showed no significant relationships between this behavior and ideas about the nursing role and the value of organizational inducements. Some trends in conflict-reporting behavior were noted in relation to three other variables: the size of the unit on which the new graduate was working, the identity of the other persons in the conflict, and the new graduates' work experience in a hospital system while in school.

**Determinants of staff nurses' perceptions of autonomy within different clinical contexts.**

Alexander CS; Weisman CS; Chase GA

Nurs Res ,Jan-Feb 1982, 31 (1) p48-52, ISSN 0029-6562  
Journal Code: 09K

Contract/Grant No.: NU00568

Languages: ENGLISH

Studies of nurses and other health professionals indicate that autonomy is an important determinant of job satisfaction and turnover. This study analyzed selected characteristics of hospital nursing units to identify those features of the work setting that influence staff nurses' perceptions of autonomy: comparisons among nurses who work in different clinical areas were made. Data were collected by interviewing 789 nonsupervisory registered nurses who were employed full time at one large university-affiliated hospital. Personal and job-related information was obtained for each nurse. Structural features of units, such as workload, were gathered from head nurse reports and hospital records. Findings indicated that nurses' perceptions of autonomy are influenced by both personal characteristics of the nurse and structural features of the units. The nurse's sense of personal efficacy and the relationship she has with her head nurse are two important determinants of autonomy across all units. Workload, primary nursing, and staffing patterns are influential factors

in predicting autonomy for nurses who work in critical care areas. Implications of these findings for nursing administrators are discussed.

Seelye A

J Adv Nurs ,May 1982, 7 (3) p195-201, ISSN 0309-2402

Journal Code: H3L

Languages: ENGLISH

This literature review discusses the evidence that modern wards divided into small bedrooms or bays, require higher nurse staffing levels. Aspects of ward design and operation such as patient privacy, nursing efficiency, patient dependency and ward organization are outlined and methods for establishing staffing levels which take ward design into account are described. The majority of ward evaluation studies concerned with nurse staffing concentrate on two areas, the use of the nurses' time (particularly in travel) and user opinion of wards. The conclusions drawn suggest that the two main measures of ward layout which relate to effective and efficient nursing care are short travel distances and features which facilitate the maximum contact between nurses and patients. Further, how these two principles are incorporated effectively into a ward will depend upon a number of other factors which effect nursing work viz, the number and characteristics of the patients and ward staff and the policies and practices of the nurses themselves. Three arrangements for structuring the work of professional participants in professional organizations are described, contrasted and evaluated. Arguments are illustrated by application to the organization of physicians within hospitals. The primary rationale, the support structures that have fostered its development, the key structural features and the advantages and disadvantages of each arrangement are described. The effect on these arrangements of structures and forces external to any particular professional organization is emphasized. (80 Refs.)

Languages: ENGLISH

When asked how he has been able to effectively stay in one job for so long, the man who has been at the head of one of the nation's largest banking organizations for 16 years, Richard Cooley, chairman, Wells-Fargo Bank, said that he "learned very early that board relations was the most important key to his continuity." Cooley said his strategy over the years has been to meet for dinner about once a year with each member of this board to allow the board member to get to know him, to personally hear the issues that the board member considers most important, and to solicit input on proposed management plans.

Browdy JD  
Trustee ,Dec 1982, 35 (12) p45-8, ISSN 0041-3674  
Journal Code: WG9

Languages: ENGLISH  
Because executive and managerial talent is a hospital's most valuable asset in a highly competitive climate, boards should be concerned with matters of executive compensation. The major responsibilities of an executive compensation committee are outlined here, including evaluation of the CEO's performance, determination of his compensation level, and establishment of the institution's basic compensation philosophy.

Foremost among the serious issues surrounding long-term care is the question of appropriate staffing for quality patient care. The philosophy of personnel management in controlling the key factors of the institution's objectives will enhance the employee's capability and understanding. The approach in personnel management techniques should then be designed to involve management, supervisory personnel, and the employee. Employee efficiency, quality performance, and advancement of the overall goals are the desired end results. Employees should be constantly challenged to allow them to contribute their best efforts and achieve their potential. While both methods and the workforce are undergoing constant and dramatic changes, people continue to be management's greatest asset.

**Health services administrator role delineation methodology: an institutional long-term care example.**  
Cyr AB  
Eval Health Prof ,Jun 1982, 5 (2) p170-99, ISSN 0163-2787  
Journal Code: ENK  
Languages: ENGLISH  
Health services administrators (HSA) are the cynosure of much current research because of their pivotal positions vis-a-vis quality of care and cost-effective policies. Role delineation methods used to date are too simple and/or too subjective to reflect the actual complexities of these roles. Dimensional analysis, as used to delineate complex organizational processes, more succinctly and accurately reflects these complexities and is more objective. The inherent weakness of dimensional analysis in devising the initial list of tasks can be counteracted by the use of facet analysis. A set of LTC administrator tasks from a national study is dimensionally analyzed to produce a role delineation and the subroles are validated through criterion analyses and amplified through reference to the literature. A similar strategy could usefully and readily be applied to extant data sets for other HSAs. (49 Refs.)

There has been little previous research on the determinants of the effectiveness of health care administrators. This research gap pertains to virtually all health care areas but is especially germane to the long-term care field, which has only recently witnessed professional growth in nursing home associations and administrator licensing, education, and ethical behavior. The present study examines the effectiveness of nursing home administrators according to economic criteria (costs and profits per patient per day). Multiple regression analysis was used to determine structure and process variables related to those effectiveness measures. Results indicate that process variable which are controllable by administrators themselves account for the bulk of the variability in nursing home administrator effectiveness.

Governance of academic medical centers is in a process of change. This essay reviews some of the historical factors that have affected the present status of academic medical center governance and describes the functions of the four individuals who are most involved in the operation of academic medical centers: vice-presidents for health affairs, deans of relationships between these four individuals are analyzed, and points of conflict are identified. Some suggestion about how these individuals can work together more effectively are made.

Stimulated by a variety of external pressures, managerial innovation is likely to become more common in health care organizations. Relatively little is known, however, about the phenomenon. This paper develops a framework for the analysis of managerial innovation in health care organizations, based on the premise that control is at the heart of effective managerial practice. Physician control over the production process in health care is likely to be increasingly challenged, partially as a consequence of the ascendancy of managerial ideology. Opportunities for managerial innovation will be created, but are likely to be successful only to the extent that physician expertise is incorporated into rather than excluded from the resulting changes.

A well-designed executive compensation program can help to motivate and retain key executives. An executive compensation program should be linked to the hospital's objectives, should be competitive in the marketplace, should minimize the executive's taxes, and should meet executive expectations.

This study documents a high prevalence of medical disorders,  
especially head and face injury, seizures, and other  
neurological problems in violent incarcerated adolescent  
delinquents. It documents the failure of three different  
medical specialties--pediatrics, psychiatry, and  
neurology--to consistently elicit significant potentially  
treatable disorders during routine evaluations. It explores  
possible causes for overlooking significant medical factors in  
these youngsters and proposes ways to improve the health  
evaluations of delinquent adolescents.

PERT is becoming a necessary approach for controlling the  
many events that contribute to the success or failure of  
initiating new diagnostic imaging services. This article first  
describes the development of a PERT program and offers advice  
on how to optimize the chance for successful results. It then  
describes the one single event that is the most critical one  
that impacts on the total results which are obtained.

0002-953X Journal Code: 3VG  
Contract/Grant No.: MH-30906  
Languages: ENGLISH

The authors conducted quality review of outpatient psychopharmacological practice in 180 cases with the screening criteria of the APA Task Force on Psychopharmacological Criteria Development and a subset of 12 criteria involving higher-risk practices. Excessive duration of drug treatment was the most common questionable practice, and no relationship was found between frequency of questionable practices and patients' sex, age, social class, or Global Assessment Scale score. An educational exercise based on the audit resulted in a nonsignificant decrease in the higher-risk practices.

**Problems in health data analysis: the Maryland permanent pacemaker experience in 1979 and 1980.**  
Scherlis L; Dembo DH  
Am J Cardiol ,Jan 1 1983, 51 (1) p131-6. ISSN 0002-9149  
Journal Code: 3DQ  
Languages: ENGLISH

In a recent report the Maryland statewide health data base, which is derived from "face sheet" data, was used to determine the appropriateness of permanent pacemaker insertion. In the present study the same indications were utilized and both the complete medical records and the face sheet were reviewed for those patients who had been classified as having permanent pacemakers inserted for inappropriate or questionable reasons. In 32 hospitals, 75% of the records were reviewed (610 of 817 patients). Although coded as having received permanent pacemakers, 16% had received temporary pacemakers, battery change, and the like. Diagnoses justifying permanent pacemaker insertion had been omitted in 53% of the face sheets, and coding errors were found in 39%. Although none of the 610 medical records reviewed had a valid indication for permanent pacemaker insertion listed on the face sheet, complete medical record review demonstrated valid indications in 95%. Inherent difficulties arise in attempting to list rigid indications for permanent pacemaker insertion. The face sheet does not provide adequate data for assessing the appropriateness of permanent pacemaker insertion.

A modified Phoenix data processing system has been introduced into the laboratories at the Manchester Royal Infirmary. Specifications for the design and installation of microcomputers to link automated instruments to this host computer are described. The operation and data manipulation facilities of the microcomputer are included. It is concluded that these devices aid the management of data within the department and improve the quality of service.

Languages: ENGLISH

In a sample of 19,210 adult inpatients discharged from Maryland community hospitals in 1978, 1 in 4 had either an elevated diastolic blood pressure greater than or equal to 100 mm Hg (3,338) or a diagnosis of hypertension (1,233). Among the patients with elevated blood pressure, hypertension was diagnosed in 44 percent, and 48 percent received advice concerning followup care. Likewise, of the patients with diagnosed hypertension, 72 percent were treated in the hospital, and 70 percent received advice concerning followup care. Age, race, and sex differences were significant. White male were least likely to have hypertension diagnosed, to be treated for it, or to receive instruction about it. The survey results were used to the Maryland State Department of Health and Mental Hygiene to formulate a statewide high blood pressure coordination plan and to construct modules for the education of professional in high blood pressure treatment and control. A followup survey is planned to evaluate the effect of these efforts.

 The hospital information system developed by Research Institute of Medical Bionics during 1976--1980 provides the means to enter and update files continually during a patient's stay in hospital. Particular external diagram provide the access the relationship for each user. Only data relevant to the user level is revealed by the system. For illustration, a detailed description of an external diagram of the First Neurological Clinic of Komensky's University Medical School is shown to inform the reader about the practicability of the system for nurses and physicians during daily routine.

**Increasing incidence of clefts in Finland: reliability of hospital records and central register of congenital malformations.**

Rintala A; Stegars T  
Scand J Plast Reconstr Surg ,1982, 16 (1) p35-40, ISSN  
0036-5556 Journal Code: UCZ  
Languages: ENGLISH

The treatment of cleft lip and/or palate [CL(P), CP] in Finland has been centralized to one unit since 1947. Since 1963 all congenital malformations are reported to a central register. Comparison of these two materials showed that altogether 3928 children with clefts, born from 1948 to 1975, were registered in a total of 2 258 850 live born children in Finland, corresponding an incidence of 1.74%. There was a constant registered rise in the incidence from 1.31% in 1948-52 to 2.16% in 1969-75, indicating a corrected "true" increase in the incidence by 33% in 28 years, or approximately by over one percent per year. Of all registered clefts born 1963-75 23.5% were lacking from the Register of Congenital Malformations, and 10.3% from the hospital records. In 1948-75 55.8% of the clefts belonged to the group CP and 44.2% to CL(P). The incidence of CP increased from 0.78% in 1948-52 to 1.21% in 1969-75, and that of CL(P) from 0.53 to 0.95%. An average of 13.8% of the CP-cases were submucous clefts. Their registered incidence in all live born children increased from 0.08% in 1948-52 to 0.19% in 1969-75.

**Validation of autopsy method for evaluating trauma care.**

West JG

Arch Surg ,Aug 1982, 117 (8) p1033-5, ISSN 0004-0010

Journal Code: 8IA

Languages: ENGLISH

A previous study on the simplified autopsy method evaluated autopsies from a series of motor vehicle deaths. The results were not generally accepted by the medical and political community because of reservations concerning the validity of the autopsy data. In response, I undertook a second study evaluating a similar series, using data from hospital records as well as autopsies. Results were evaluated by the autopsy method and compared with the results obtained by the hospital records method. Seventy-one percent of the deaths were judged preventable by the autopsy method as compared with 85% by the hospital records method. All deaths judged preventable by the autopsy method were also judged preventable by the method using hospital records. This confirms that the autopsy method accurately identifies and understates the problem it exposes.

**Mortality rate in strabismus surgery.**

Cooper J; Medow N; Dibble C

J Am Optom Assoc ,May 1982, 53 (5) p391-5, ISSN

0003-0244 Journal Code: H82

Languages: ENGLISH

Strabismus surgery has been viewed as being associated with a high degree of mortality. Many past studies have used small surgical samples and have stressed the various theoretical causes of the deaths rather than view the procedure from a statistical and scientific standpoint. We present here a large series of surgical cases collected nationwide showing that strabismus surgery is a relatively safe procedure associated with a mortality less than that of a tooth extraction.

**Computational and noncomputational clinical information processing by computer.**

Kleinmuntz B

Behav Sci ,Apr 1982, 27 (2) p164-75, ISSN 0005-7940

Journal Code: 9KW

Languages: ENGLISH

Computers have been used in their computational as well as noncomputational modes for the scientific study of the clinical decision making. As computational tools, computers

serve as storage devices for hospital file data so that these data can be analyzed statistically for a large variety of epidemiological and diagnostic purposes. As noncomputational devices, computers are functioning as knowledgeable medical teachers that interface with students who can query the system. In this mode, computers are sometimes used as consultants to clinicians who need information on technical topics. Noncomputational computers are also used to simulate the inferences of clinicians. Byproducts of these simulations are computer programs that become formal statements or theories of the decision processes under investigation.

**North West Thames registry of neurological disease.**

Haberman S; Benjamin B; Capildeo R; Rose FC

J R Soc Med ,Jun 1982, 75 (6) p443-9, Journal Code:

JX1

Languages: ENGLISH

A feasibility study has been carried out to determine whether a population-based registry of neurological disease can be established using the Hospital (Inpatient) Activity Analysis (HAA) records for England and Wales. The study provides a valuable opportunity to use and test the HAA system. The neurological disease chosen was the Guillain-Barre-Strohl syndrome (GBS), because it would be expected that most patients would be admitted to hospital, and recurrent attacks or chronicity are rare. In this study it has been demonstrated that, for GBS, a neurological registry, based on HAA records, provided an excellent source of data to measure the incidence of the disease and potentially any change of incidence over time. The proportion of coding errors was found to be under 5%.

Roos LL Jr; Roos NP; Cageorge SM; Nicol JP  
Med Care ,Mar 1982, 20 (3) p266-76, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH  
This study investigates the reliability of the Manitoba Health Services Commission data bank from a variety of perspectives. Emphasizing diagnostic and surgical procedures, the research focuses on those areas in which problems exist

and in which the data can be relied upon. Computerized comparisons are stressed, since they can provide cost-effective checks on data quality. One key to performing reliability studies inexpensively is finding information recorded independently: by separate individuals or organizations, at two different times, or in two or more data files. When a particular event has certain logical implications vis-a-vis another, inconsistencies can be located. Face sheet information and data on the performance of major surgical procedures were found to be reliably recorded in the Manitoba data bank. Collapsing ICD-8 diagnosis from medical claims into several categories proved much better than relying upon individual diagnoses. Problems in working with the data included difficulty in distinguishing between closely related surgical procedures and the underreporting of in-hospital consultations and nonsurgical procedures.

**The use of the differential leukocyte count for inpatient casefinding.**  
Connelly DP; McClain MP; Crowson TW; Benson ES  
Hum Pathol ,Apr 1982, 13 (4) p294-300, ISSN 0046-8177  
Journal Code: GEC  
Languages: ENGLISH  
The differential leukocyte count is a nonspecific, imprecise, error-prone, usually labor-intensive, and expensive test to perform. Although the differential count is frequently ordered in the absence of clinical suspicion in both inpatient and outpatient settings, its effectiveness as a screening test has been studied little. From a detailed chart review of 287 cases randomly drawn from a population of 2682 adult patients for whom a differential count was performed on admission, we found that 23 per cent of the cases met criteria for admission screening, that abnormal results were found in approximately one half of these screening differential examinations, and that one third of the abnormal examinations were acknowledged in the medical record by a physician. In no instance did a screening differential count appear to have had clinical significance. It may be medically prudent to consider discontinuing the differential leukocyte count as an inpatient screening test for adults.

**Controlled substances system change provides increased accountability.**  
Proksch RA; Riley AN  
Hosp Pharm ,Jan 1982, 17 (1) p6-7, 9-16, ISSN 0018-5787  
Journal Code: G98  
Languages: ENGLISH  
The distribution and control systems for controlled substances were evaluated. A mail survey of other hospitals was conducted to obtain samples of control substance systems and the associated procedures. From these samples of existing programs and previous experiences with the current program, a system was designed to meet the needs of an 800-bed hospital with a decentralized pharmacy distribution system. The new distribution and control system completely replaced the prior system. Therefore, new forms and procedures were generated. The total system was implemented in a stepwise procedure in two-week increments over approximately 14 weeks until the entire hospital was converted. The new system has increased control as well as identified workload, inventory utilization, and problem areas.

**A computer data bank system for otolaryngologic and audiologic data.**

Alberti PW; Hyde ML  
Arch Otolaryngol ,Apr 1983, 109 (4) p245-51, ISSN  
0003-9977 Journal Code: 860  
Languages: ENGLISH

A data bank system has been in routine clinical operation for more than two years in our department. It is used to record histories, physical findings, and audiometric data; to produce reports that are sent with short covering letters to referring physicians, and to establish a data bank for research. Although originally created for noise-induced hearing loss claimants referred by the Workmen's Compensation Board, the system was designed, from the start, to be applicable to a wide range of clinical conditions. This report describes the conceptual approach to the data bank and certain practical details involved. The system is quick and effective to use, and it can be run on a relatively small microcomputer.

**Improved emergency department patient flow: five years of experience with a scribe system.**

Allred RJ; Ewer S  
Ann Emerg Med ,Mar 1983, 12 (3) p162-3, ISSN 0196-0644  
Journal Code: 4Z7  
Languages: ENGLISH

Alternative methods for rapidly producing accurate medical records, usually dictation-transcription systems or nurse-scribe methods, have been used in emergency departments. We now have more than five years of experience with a non-nurse scribe system. This system has proven effective in generating accurate and complete medical records while enhancing patient flow. We describe the system and its implementation.

**An all-digital nuclear medicine department.**

Parker JA; Royal HD; Uren RF; Front D; Bliss JG; Rabuzzi M; Jansons D; Kolodny GM  
Radiology ,Apr 1983, 147 (1) p237-40, ISSN 0033-8419  
Journal Code: QSH  
Contract/Grant No.: 5 K04 HL00465  
Languages: ENGLISH

An all-digital nuclear medicine department is described. Nuclear medicine images are acquired by a separate computer interfaced to each camera. The digital images are viewed, manipulated, and interpreted from remote display stations in an interpretation area. The interpretation is dictated into a Rapid Telephone Access System (RTAS), where the voice is digitized and stored. By dialing the patient's identification number, the referring physician can hear the interpretation over any telephone. The images are filed on large storage discs. The digital scans can be rapidly and easily accessed for later review by the use of several directory programs. This system has brought not only efficiency and cost savings, but the ability for remote viewing elsewhere in the hospital and telephone transmission of nuclear cardiology studies from community hospitals for interpretation in the digital nuclear medicine department.

**Measuring functional outcomes in chronic disease: a comparison of traditional scales and a self-administered health status questionnaire in patients with rheumatoid arthritis.**

Deyo RA; Inui TS; Leininger JD; Overman SS  
Med Care .Feb 1983, 21 (2) p180-92, ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

A new "health-status" questionnaire, the Sickness Impact Profile (SIP), was examined to determine whether it offered measurement advantages over the traditional American Rheumatism Association (ARA) functional scale or patient self-ratings of function. Seventy-nine outpatients with rheumatoid arthritis (RA) administered the SIP to themselves and provided self-ratings on a 7-point functional scale. Clinicians independently rated patients on the ARA functional scale, and repeated measures were obtained over a 6-month period. Scores on the SIP or its subscales showed stronger correlations than the other scales with hematocrit, sedimentation rate, grip strength, morning stiffness, duration of RA, anatomic stage, work status, and psychiatric status. Validity of the SIP appeared to be maintained with repeated administrations, and the SIP was more reliable than either of the other scales. These findings, as well as the comprehensiveness and feasibility of the self-administered SIP, suggest that this (and perhaps similar health status instruments) may be a useful supplement to more traditional measures of chronic disease outcome.

**Why are radiologists in the UK not using computers in their departments?**

Sutherland GR  
Clin Radiol .Mar 1983, 34 (2) p215-20, ISSN 0009-9260  
Journal Code: DIU

Languages: ENGLISH

The value of administrative support computers in radiology departments has been evident, particularly in the United States, for more than a decade. It is difficult to understand why so little interest appears to have developed in this country; it is, perhaps, our inherent conservatism. The advent of the inexpensive microprocessor with a wide range of program packages has set the scene for an expansion of the use of computing in a wide range of clerical tasks. This article sets out to describe the various applications which we have demonstrated to be particularly suitable for incorporation into a computer system and suggests a number of additional applications which may be appropriate to particular radiology departments.

**Radiologic examination requisition procedures: a study of their effectiveness in a community hospital.**

Worrell J

South Med J .Feb 1983, 76 (2) p216-7, ISSN 0038-4348  
Journal Code: UVH  
Languages: ENGLISH

I reviewed 100 consecutive radiologic examinations with particular attention to the clinical information included. The referring physician originated this clinical information in only 33% of cases. Other personnel, including nurses and aides, added information on the requisitions 57% of the time. When nonphysician personnel completed the requisitions, 46% of the cases were completed with either inappropriate or misleading clinical information. In 9% of the cases, there was no clinical information. Because all of the cases originated by physicians were appropriately completed, a strong plea is made for requiring physicians to originate radiologic requisitions.

**Automated anesthesia data management and recordkeeping.**

Mitchell MM  
Med Instrum .Nov-Dec 1982, 16 (6) p279-82, ISSN 0004-5446  
Journal Code: M12  
Languages: ENGLISH

It is apparent that judicious application of computer technology to the design and implementation of an automated anesthesia recordkeeping system could afford increased ease of use to the anesthesiologist compared to a manually kept record. Although prototype systems have been developed at academic institutions, and commercially available operating room physiological monitoring systems show increasing capability for some recordkeeping functions, production of an effective AAD-MARKS will depend on the development of suitable display formats and capabilities, markedly improved user interfaces for data input and system control, intelligent graduated alarm systems, and demonstrated reliability, with provision for preservation of critical data and recordkeeping functions and basic physiological data monitoring despite system failure.

**Emergency department chart auditing in a family practice residency program.**

Grauer K

J Fam Pract .Jan 1983, 16 (1) p121-6, ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

A prospective audit of process on 1,200 consecutive patients seen in the emergency department by family practice residents was performed at the Family Practice Residency Program in Gainesville, Florida. The overall quality of care delivered conformed to the standards of "good medical care" as judged by the author in 85.6 percent of cases. Resident errors were detected in the remaining 14.4 percent of cases, and occurred most frequently among physicians in the earlier years of training (P less than .005). Ultimate patient management was changed by the audit in only 1 percent of cases but potentially had an important impact on the care of these patients. Errors of inadequate documentation were common among residents irrespective of their level of training. An ongoing audit of emergency department charts with regular feedback on medical process and recording appears to be useful both as an educational tool and as a method of improving emergency care.

**A study of lithium carbonate use in a health maintenance**

**organization.**

Feldman J; Wilner S; Winickoff R

QRB .Sep 1982, 8 (9) p8-14, ISSN 0097-5990 Journal  
Code: OKP

Languages: ENGLISH

The Harvard Community Health Plan, a Boston-based health maintenance organization, evaluated the use of lithium carbonate in its mental health department. Criteria were developed for four categories of care: prerequisite workup, initialization of therapy, maintenance of therapy, and management of side effects. Patient records were evaluated for a retrospective control period, an experimental period in which educational interventions (education seminars and reminder notices) were provided to practitioners, and a postexperimental period in which interventions were discontinued. Practitioners' performance improved during the experimental period but declined to control-period levels during the postexperimental period.

**Surgical pathology reports with a portable microcomputer.**

MacDonald RA; Pechet GS; Lovenbury P

Arch Pathol Lab Med .Dec 1982, 106 (13) p666-9, ISSN  
0363-0153 Journal Code: 79Z

Languages: ENGLISH

A microcomputer reporting system for gross and microscopic surgical pathology is simple and inexpensive, reduces the need for clerical personnel, and saves the pathologist's time in the preparation of reports. Gross descriptions are preformatted. A dictionary of microscopic diagnoses is constructed and stored on disks. The diagnosis to be used for a case is selected by a pathologist by number. It is called to a video screen from disk storage by entering the number on the microcomputer keyboard. The diagnosis is edited or expanded for an individual patient while it is on the screen and is printed after changes are made. Each diagnosis contains preentered classification, coding, and filing information, as well as format, medical terminology, and spelling. The system has rapid retrieval and search capability and may be used for patients awaiting frozen-section diagnosis. The system requires fewer clerical personnel in surgical pathology than with free-form reporting.

**Response strategies for chart requests from psychiatric inpatients.**

Bernstein RA; Andrews EM  
Hosp Community Psychiatry .Oct 1982. 33 (10) p841-3,  
ISSN 0022-1597 Journal Code: GCU

Languages: ENGLISH  
Of 452 patients seen during one year on a medical-school-affiliated general hospital psychiatric unit, 26 requested to see their charts. These patients tended to be younger, more likely to have character disorders, and less likely to have an affective disorder than patients who did not make chart requests. The apparent increase in the number of patients who ask to see their records may be linked to increasing medical consumerism. Rather than causing therapists to become defensive, record requests should provide an opportunity for education and treatment. The authors outline methods of interpreting and responding to chart requests.

**One year's evaluation of a system of on-line computerisation of anaesthetic records using a computer bureau.**

Roessler P; Lambert TF  
Anaesth Intensive Care .Aug 1982. 10 (3) p208-11,  
Journal Code: 4M5

Languages: ENGLISH  
A system for the on-line computerisation of anaesthetic records using a computer bureau is described. The requirements of the system are a keyboard and video display unit appropriately linked to the bureau's computer. The system was cheap and easy to install. It required no programming expertise from department members. Disadvantages included the need to change between two screens for data entry, a delay of over 8 months before satisfactory reports materialised for individuals or the department, congestion at peak times for data entry, excessive time spent on data entry, reluctance of the bureau to alter the format of the screens once they had been generated. The cost of the system is felt to be justified by the information provided for both accreditation requirements and for department management.

**A peripheralized digital image management system: prospectus.**

Templeton AW; Dwyer SJ 3d; Rosenthal SJ; Hensley KS; Martin NL; Anderson WH; Robinson RG; Levine E; Batnitzky S; Lee KR  
AJR .Nov 1982. 139 (5) p979-84, ISSN 0361-803X

Journal Code: 3AE  
Languages: ENGLISH  
The number of diagnostic radiology examinations being performed on digitally formatted imaging equipment is continually increasing. However, most digital data are recorded as analogue images and the films stored in a central file. The dynamic range of raw digital data is lost.

Currently, the space and cost requirements for storage of all digital data have discouraged most users from attempting it. This article presents the concepts and describes the requirements and initial fabrication of a system that will capture and retain all digital data using a network of peripheralized image acquisition, display, and storage devices. Any piece of digitally formatted equipment can be interfaced into the system. A real-time computer capability provides that any digital examination can be reviewed at any display station for up to 10 days.

**A computerized perinatal data system. The Arizona experience.**

Jennett RJ; Warford HS  
Acta Obstet Gynecol Scand [Suppl] .1982. 109 p11-6,  
ISSN 0300-8835 Journal Code: 1EC  
Languages: ENGLISH

The development of a regional data system was one of the major objectives of the Arizona Perinatal Program funded by the Robert Wood Johnson Foundation. To achieve this objective, a decision was made to adopt and expand a perinatal data system under development at St. Joseph's Hospital in Phoenix. This shift from what was planned as a highly sophisticated single hospital system, which would include real-time data storage as well as paper acquired data, required certain sacrifices and resulted in certain problems as well as significant gains for the region. The data system is made up of two major components - (1) a paper record system in which the documents completed by physician or nurse serve both as the official medical record and computer-input document and (2) a computer using the Meditech Interpretive Information System (MIS) version of the MUMPS operating system and language. Programs to achieve the goals and objectives established for the system are described. Lessons learned from this experience which may be helpful to others interested in similar developments are described.

**Psychiatric records: variations based on discipline and patient characteristics, with implications for quality of care.**  
Perlman BB; Schwartz AH; Paris M; Thornton JC; Smith H; Weber R  
Am J Psychiatry ,Sep 1982, 139 (9) p1154-7, ISSN 0002-953X  
Journal Code: 3VG  
Languages: ENGLISH  
In this study of the delivery of outpatient psychiatric care

to Medicaid patients at all 29 free-standing psychiatric clinics and at six hospital clinics in New York City, the authors found that nonphysician mental health workers provided much direct patient care: diagnosis and identifying data, necessary for reimbursement, were always included in records whereas mental status and medical history were poorly documented; and nonphysicians in hospitals generally surpassed physicians in the latter two areas. An additional observation was that attitudes of mental health workers toward certain diagnostic and ethnic groups may be inferred from the selective completeness of their psychiatric record keeping.

J Gynecol Obstet Biol Reprod (Paris) ,1982, 11 (2) p201-13, Journal Code: IAZ  
Languages: FRENCH Summary Languages: ENGLISH  
The University Centre for Gynaecology and Obstetrics in Toulouse have been using a computerised record system for obstetrics since 1974. This makes it possible for a review for a review to be undertaken each year of the work carried out in the Service and has made it possible to study over six years the evolution of the characteristics of the population who have been followed, as well as the changes in attitudes and techniques adopted during pregnancy and labour. A study has been carried out on the factors associated with perinatal mortality and prematurity. Computerisation of 13,500 records has made it possible to draw curves of birth weights, according to the duration of the pregnancy, and characterising the service given. Finally the adoption of a prospective record system used in common by several teams and checked by people specialised in this work has improved the quality and quantity of retrieval and has made it possible to foresee cooperative studies between different departments.

**[Use of a microcomputer for simplified data processing of ENT case-records employing a commercial program (author's transl)]**

Micro-informatique : gestion simplifiée des dossiers ORL sur programme commercial.

Garcin M; Brisac A; Ardaud B

Ann Otolaryngol Chir Cervicofac ,1982, 99 (3) p89-96,  
ISSN 0003-438X Journal Code: 500

Languages: FRENCH Summary Languages: ENGLISH

Combined use of a microcomputer of sufficient capacity and a commercial program for data processing permits simple storage and exploitation of hospital case-records in an ENT department of moderate size. The principal advantages of the system reside in its permanent availability, the ease of communication with the computer due to the clear language employed, its large storage capacity (650 case-records per diskette), and the moderate cost involved. Programming time is reduced by the use of a particular nomenclature for questions and possible replies. The system is not static, and can be adapted to individual needs or modifications in pathology.

**[The low consumption of outpatient medical care in the department of Ardennes (France) (author's transl)]**

La faible consommation de médecine de ville dans le département des Ardennes.

Lebrun T; Saily J

Rev Epidemiol Sante Publique ,1982, 30 (1) p99-118,  
ISSN 0398-7620 Journal Code: RST

Languages: FRENCH Summary Languages: ENGLISH

The purpose of the research explained in this article was to build up a methodology which allows to set up a map of low consumption of outpatient medical care and to find out to which extent the low recorded demand is attributable to the medical aids supply. French National Health Service files were the basic data for this research which was led into the department of Ardennes. First and foremost the investigation was to identify on a district level with low consumer families after having eliminated demands' factors. Thus one could set up maps of low consumption in comparison with maps of low prescription. The investigation showed that low consumer families live generally in the cantons of low medical care consumption concerned mainly with low medical aids suppliers.

Br Heart J ,Aug 1982, 48 (2) p169-76, ISSN 0007-0769  
Journal Code: ATS

Languages: ENGLISH

Optical Mark Reader forms have been used by the Cardiac Department at St Thomas's Hospital for six years to store

clinical and haemodynamic data by computer. Forms are completed by clinical staff in outpatients and also for those patients undergoing cardiac catheterisation. Three documents are used to record the symptoms and signs at the clinical consultation, the results of relevant investigations, and the important findings at cardiac catheterisation. These documents are fed into a computer and data from them, together with a limited quantity of types information, are used to produce full clinical reports for our colleagues and the case notes. These reports have saved much secretarial and medical time. A variety of analyses is available for research and management purposes.

**Epidemiological studies of radiation workers: preliminary communication.**

Schofield GB

J R Soc Med ,Jun 1982, 75 (6) p450-6, Journal Code: JXI

Languages: ENGLISH

British Nuclear Fuels Limited has embarked on a study of the mortality data among those of its workforce who were employed prior to 1 January 1976. The study covers a total population of about 41 000 current and ex-employees, but is initially concerned with a radiation worker cohort of 7500 at the Sellafield establishment where the highest radiation doses are received. Tracing of the health status of ex-employees has been undertaken using the services provided by the Office of Population Censuses and Surveys (OPCS) and the Department of Health and Social Security (DHSS) and it is expected that ultimately the level of trace will be better than 97%. Mortality data not specifically related to radiation workers are included and relate to male deaths among serving staff and pensioners during the years 1962-1978. Those observed deaths (O) are compared on an age standardized basis with those expected (E) from the general population, the ratio O/E being about 1 for all cancers and less than 1 for non-cancer deaths.

This pattern is consistent with the well known 'healthy worker' effect seen in industry.

**A micro-computerized anaesthetic record system.**

Zissos A; Strunin L  
Can Anaesth Soc J ,Mar 1982, 29 (2) p168-73, ISSN  
0008-2856 Journal Code: CG7  
Languages: ENGLISH

An anesthetic record system has been implemented using a micro-computer, rather than a larger computer system. The record system provides a wide range of functions, including record retrieval, random record processing, and the generation of graphical reports on the department's operating room performance. The steps taken in realizing this system are described, with emphasis on the preparatory decisions that must be made before computer programming can be undertaken. Adopting a modest straightforward design philosophy is shown to be an important pre-requisite to success.

**Problem-orientated categorisation of "other conditions" seen  
in a genitourinary medicine clinic.**

Pattman RS; Schofield CB

Br J Vener Dis ,Feb 1983, 59 (1) p63-5, ISSN 0007-134X  
Journal Code: B40

Languages: ENGLISH

The case sheets of patients coded as D2 (other conditions requiring treatment) and D3 (other conditions not requiring treatment) in 1981 were reclassified on a problem-orientated basis. Ten discreet categories were delineated with ease. Women with non-specific vaginitis and men with Gardnerella vaginalis urogenital infection, usually coded D2 or C4, should be reclassified under the C group of conditions as, for example, "Gardnerella or other bacterial genital infections." It is suggested that codes D2 and D3 be replaced by the following nine categories: genital skin lesions or rashes; genitourinary symptoms; enteric conditions; other sexually transmitted infections; normal genital architecture, congenital conditions, or unconfirmed genital discharges; asymptomatic patients attending for routine examination; uninfected contacts of patients with sexually transmitted diseases; psychosexual problems; and others.

With the rapid expansion of knowledge and techniques for the care of critically ill patients, the organization and recording of data have become increasingly complex and increasingly important for patient care. A flow sheet for the Neurosurgical Intensive Care Unit has been developed in a series of pilot studies with input from general and cardiovascular surgeons and nurses specializing in critical care medicine.

Languages: ENGLISH

Objective assessment of the delivery of care requires an unambiguous record of all related events and decisions in the care process. Both the handwritten Problem-Oriented Medical Record (POMR) and its computerized successor, the Problem Oriented Medical Information System (PROMIS) have been designed to facilitate audit of care delivery. In this study, a national sample of physicians was asked to determine which of these two record systems best serves the function of audit. The study involves assessment of a sample of 69 matched pairs of patient records drawn from two different ward settings, one of which used the manual POMR, the other, PROMIS. No difference was perceived between the two records with respect to the reliability of information or the analytical reasoning of providers. Information in PROMIS records was judged to be slightly more thorough. The format of the manual record was judged better on the basis of conciseness, accessibility, and organization of record information.

The application of information processing to the study of the evolution of the patient's state requires the constituting of a file which contains the values of different items as functions of time. There are many methods for doing this and most of them appeal to the construction of a complex database.

The technique presented in the paper paper tries at first to constitute, for each patient, some records, of which every one corresponds to a determined "operation" (the term "operation" is taken in the wide sense; example: consultation, surgical intervention,...) then to link them according to the chronological order. It has the advantage of being easy so that it may be used even on minicomputers. Furthermore, the exploitation of the resultant data file is very easy. This method is well suited to problems such as the examination of the longitudinal investigations, the treatment of records of the patients who went through several operations, etc. The application presented here is the checking of the functioning of pacemakers. We wrote on a minicomputer MITRA 15/125 transferable general program (using FORTRAN IV exclusively).

which allows one to carry out the linking and to exploit the resultant file. It is so designed that the addition of new procedures involved in new applications may be very easy.

**Team approach to the problem-oriented record in a long-term care facility.**

Beattie BL; Crawshaw ML  
J Am Geriatr Soc ,Feb 1982, 30 (2) p109-13, ISSN  
0002-8614 Journal Code: H6V  
Languages: ENGLISH

At the Extended Care Unit of the Health Sciences Centre Hospital at the University of British Columbia, team participation in the care of 300 elderly patients includes the team's ability to facilitate use of the problem-oriented record (POR). The key to making the POR a functional communication tool was the development of a useful Problem List. In establishing this system, many difficulties arose. It was imperative to recognize that many staff members had not been trained in problem-solving techniques, and that they had varying degrees of knowledge about the data base. Active physician involvement was mandatory. Employment of a half-time POR Coordinator working with a supporting interdisciplinary POR Committee was needed to make the system work. Guidelines for defining problems were developed, and Problem Lists gradually acquired significance for the entire health care team. Examples are included. Concurrent continuing education was started in pathophysiology, problem-solving, and use of the POR.

Hospitals are often faced with the problem of apparent inefficiency or ineffectiveness of operating room management. There can be many contributing factors, and a systematic approach is needed to solve this problem. The article delineates eight management components and suggests that implementation and continuous evaluation of these components will promote the efficient operation of surgical facilities.

This paper reviews the orthopaedic operations performed on patients from one consultant's waiting list using two short-stay wards. In a twelve-month period over 200 operations were performed with no major complication. The ultimate clinical result was not impaired by the short period of hospitalization. The advantages short-stay wards have over day wards in reducing orthopaedic waiting lists are discussed, as are the precautions necessary to make this a safe method of managing non-urgent orthopaedic problems.

**[Children hospitalized for surgery: a cognitive program for the prevention of behavioral disorders]**

Das chirurgisch kranke Kind im Krankenhaus: Ein kognitives Programm zur Reduktion von Verhaltensstörungen während des Aufenthaltes und nach der Entlassung.

Loschenkohl E; Brandesky G  
Z Kinderchir ,Oct 1982, 37 (2) p42-9, ISSN 0174-3082  
Journal Code: YF2

Languages: GERMAN Summary Languages: ENGLISH

To compare the conditions of behavioral disorders of hospitalized children in pediatric and surgical wards an investigation was made on 60 children aged 3 to 6 years who had to undergo surgery. The results were compared with earlier findings on children hospitalized in pediatric wards (Wanschura and Loschenkohl 1979, Schandl and Loschenkohl 1980). Most of the conditions of behavioral disorders could be confirmed. Conditions which inhibit behavioral disorders are: opportunity to play freely, contact to other children, positive contact to medical staff, play organized by parents who visited their children, higher frequency of visits, higher age of the child, active searching for contact by the child, confidence in the medical staff. Conditions which reinforce behavioral disorders are: Higher frequency of earlier hospitalizations, previous psychic traumas, anxiety of the mother related to illness. A psychological intervention program based on a cognitive theory of anxiety combined with the transfer of positive affects by a photographed model who had shown no fear in different situations of hospitalization and surgery significantly reduced behavioral disorders of hospitalized children in the hospital and after release from the hospital in the home environment.

In this research, we examine the relative importance of different structural units in a professional organization, the hospital, as they affect organizational effectiveness. The difficulties of measuring effectiveness in a complex professional organization are discussed, and an adjusted measure of surgical outcome is developed. Data are drawn from a prospective study of over 8,000 surgical patients treated by more than 500 surgeons in 15 hospitals throughout the nation. Two different types of analyses are presented, both indicating that hospital features have more impact on surgical outcomes than do surgeon characteristics. The second analysis assesses the relative importance of specific attributes of the hospital, surgical staff organization, and surgeon characteristics on surgical outcomes.

**Variations between and within countries in hospital care for peptic ulcer. A comparison between Denmark and Sweden.**

J:snsson B; Silverberg R

Scand J Soc Med ,1982, 10 (2) p63-9, ISSN 0300-8037  
Journal Code: UD5

Languages: ENGLISH

The present study tries to examine variations in utilization rates for hospital care for ulcer disease between and within Denmark and Sweden. The focus is on how utilization rates differ but an attempt is also made to explain why regional differences occur. Hospital patient statistics from both countries show that ulcer disease accounts for 35% more bed-days per 100000 inhabitants in Denmark than in Sweden. The main source for this difference is duodenal ulcer, where the number of bed-days is 63% higher in Denmark. The differences in length of stay are negligible and the numbers of surgical operations are about the same in the two countries. The greater utilization of hospital resources in Denmark is explained mainly by the fact that more medical cases are treated as in-patients in Denmark than in Sweden. Neither mortality rates nor other data support the hypothesis that the incidence of duodenal ulcer is higher in Denmark than in Sweden. The difference between Denmark and Sweden widens when utilization rates are adjusted for differences in the age structure of the population in the two countries. There are wide variations in utilization rates between regions within both countries. The findings support the hypothesis that the intertemporal change in the technology for management of ulcer disease is one of the main reasons for variations between and within countries.

Number of admissions, days of care and the average length of stay are presented by age, sex and other criteria for Swiss short stay hospital. Persons 60 and over consumed more than 50 percent of all days of care. On the average, females of all age groups, except from 5 to 54 years of age, were hospitalized longer than males. Principal factors influencing the length of stay are: age, diagnosis and mode of discharge. The increase in the number of persons 65 and over admitted to medical departments corresponds to the demographic development, while it exceeds the demographic increase for surgical departments.

**[Studies on bacteriologic contamination of potassium chloride solution 25% in multidose containers regularly used on hospital wards]**

Untersuchungen zur bakteriologischen Kontamination von Kaliumchloridlosung 25% in Mehrdosenbehaltern unter den Praxisbedingungen des Krankenhausbetriebes.

Schramm G; Bianchi S

Schweiz Med Wochenschr .Aug 3 1982. 112 (31-32)

p1099-100. ISSN 0036-7672 Journal Code: UEI

Languages: GERMAN Summary Languages: ENGLISH

The use of multidose containers poses the problem of in-use microbial contamination. In a clinical investigation sterility tests of 25% potassium chloride solution (w/v) in multidose containers have been performed in-use on two surgical wards. The contents of 80 vials used for 1, 3, 7 or 10 days (with registered withdrawals) were sterility tested with the aid of blood agar plates. None of the 80 bottles were contaminated. It has been shown that lege artis withdrawals of 25% potassium chloride solution (w/v) from multidose containers involves a very low risk of contamination. However, the theory that contaminants have been killed must not be excluded. In final laboratory tests, multidose containers of 25% sterile potassium chloride solution (w/v) were artificially contaminated. Test microorganisms were E. coli ATCC 25922, Pseudomonas aeruginosa ATCC 27853 and Staph. aureus ATCC 25923. Microbial control after 1 or 2 days storage showed absence or significant germ reduction with the experimental technique described.

The authors suggest that new surgical procedures be carried out initially in selected institutions and that complex procedures for which it has been or can be demonstrated that mortality is inversely related to the volume of experience also be regionalized. Regionalization in the latter instance can have a small overall impact on surgical practice but a large impact on the adverse consequences of high risk operations that are performed only occasionally.

**Unemployment and hospitalization among bricklayers.**

Lajer M  
Scand J Soc Med ,1982, 10 (1) p3-10, ISSN 0300-8037  
Journal Code: UD5  
Languages: ENGLISH

677 active members of the bricklayers' trade union in Aarhus have been investigated with regard to unemployment and hospitalization during the period April 1, 1972-March 31, 1978. Information concerning unemployment was obtained through the bricklayers' trade union, and information about hospitalization from the hospital administration registry of three counties of Northern Jutland and from the Danish Central Psychiatric Register. Using logit analysis it was found that admission to a hospital increased the risk of unemployment, and that unemployment increased the risk of hospitalization. Admission to a psychiatric department appeared within a latency period of 0-1 years. A latency period of 1/2-11/2 years was observed before admission to a medical department. Admission to a surgical department occurred 1/2-21/2 years after accumulated unemployment. The risk of admission to a psychiatric department was seven times as high for bricklayers who have been unemployed more than 50% of the time compared with those who have been unemployed less of the time, although the calculation was based on relatively few individuals. The risk of admission to medical wards was twice as high, and the risk of admission to surgical wards was almost twice as high among those with much unemployment.

Beresford T; Low D; Adduci R; Goggans F

J Bone Joint Surg [Am] ,Jun 1982, 64 (5) p730-3, ISSN

0021-9355 Journal Code: HJR

Languages: ENGLISH

We reviewed the initial history, obtained by the orthopaedic house staff, of each of eighty-seven patients who were consecutively admitted to an acute orthopaedic-surgery service. A diagnosis of alcoholism was made by the house staff in only one of every ten patients who had been identified as having symptoms of alcohol addiction in a previous study. Alcohol abuse was identified in only five of every ten such patients. Of the orthopaedic patients in this sample who had been shown to be abusing alcohol, 37 per cent were neither suspected nor diagnosed as abusers by the orthopaedic house staff. We recommend the use of a brief screening interview (CAGE) to increase diagnostic effectiveness in this area, and discuss the clinical usefulness of an early diagnosis of alcoholism among orthopaedic surgical patients.

**Treatment outcome and efficiency in surgery.**

Haig TH

Can J Surg ,May 1982, 25 (3) p293-6, ISSN 0008-428X  
Journal Code: CKJ

Languages: ENGLISH

Health gains for patients treated on the surgical service of the University Hospital in Saskatoon have been measured using an illness index matrix and these gains have been related to financial costs. Although many patients benefited, 46.5% did not, either because they suffered self-limiting complaints or because their diseases were beyond the surgeon's ability to help. This 60-bed surgical service generated costs of \$8 million in 1979, of which about \$3 million were for services from which there was little or no gain for the patient. Since 72% of expenditures were for basic bed, board and nursing costs, more exacting use of hospital beds holds the greatest potential for increasing efficiency. There is evidence, too, that our use of medical manpower may be improvident.

**Elderly patients in a general surgical unit: do they block beds?**

Seymour DG; Pringle R

Br Med J [Clin Res] ,Jun 26 1982, 284 (6333) p1921-3,

Journal Code: B4X

Languages: ENGLISH

In a prospective study of patients aged 65 years and over admitted to a general surgical unit only one patient in 10 remained in hospital for more than a month and fewer than one patient in a hundred became a "bed-blocker." While the over-65s had mean and median durations of stay which were longer than those of younger patients, in almost all cases a prolonged stay in hospital resulted from postoperative morbidity and was not related to social or administrative factors. Only a reduction in the incidence of postoperative morbidity could achieve a significant saving in the number of bed-days occupied by elderly people.

**A freestanding ambulatory surgical unit: a success or failure?**

Wolff J; Dunning DR

Am J Obstet Gynecol ,Jun 1 1982, 143 (3) p270-6, ISSN  
0002-9378 Journal Code: 3NI

Languages: ENGLISH

The concept of a freestanding ambulatory surgical center was to provide the patient with a more cost-effective, safe, and convenient service. A study of 5,369 surgical patients treated at the Northeast Louisiana Surgical Center, Inc., in Monroe, Louisiana, was carried out to determine whether these objectives had been met. The finding was that a freestanding ambulatory surgical center was more cost effective than either a hospital ambulatory unit or an in-hospital service. The infection rate was 0.06%, and the hospital transfer rate was 0.04%. The concept of freestanding ambulatory surgical center has fulfilled the expectations of safety, convenience, and cost effectiveness for the patients.

**Estimating the effects of nosocomial infections on the length of hospitalization.**

Green MS; Rubinstein E; Amit P

J Infect Dis ,May 1982, 145 (5) p667-72, ISSN 0022-1899

Journal Code: IH3

Languages: ENGLISH

Increased length of hospitalization due to nosocomial infections has generally been calculated from the arithmetic mean of the differences in hospital stay of persons with nosocomial infections and their matched control patients. This method may yield estimates inflated by a few extreme values. Data from a prospective study of nosocomial infections in patients hospitalized in surgical and orthopedic services in a large hospital in Israel are used to illustrate a modified statistical approach to this problem. The geometric mean of the ratio of length of hospitalization of 57 patients with nosocomial infections to matched control patients was determined. The increased mean hospital stay was estimated at 4.5 days for urinary tract infection, 11.9 days for surgical wound infection, and 25 days for "double infection." These figures were lower than those derived from calculation of the arithmetic mean of excess hospital stay and suggest that this modification should be incorporated in future studies of this nature.

**Psychologist in a plastic surgery service.**

Clifford E

Ann Plast Surg ,Jan 1982, 8 (1) p79-82, ISSN 0148-7043

Journal Code: 5VB

Languages: ENGLISH

Some of the roles of a psychologist on a plastic surgery service, particularly with patients undergoing cleft palate, craniofacial, and breast reconstruction, are explored. Psychological counseling with parents of infants with birth defects is described. For patients with craniofacial anomalies team management, extensive presurgical evaluations, and a psychological support system during hospitalization are required. Patients undergoing breast reconstruction need to work through preexisting feelings and attitudes about mastectomy as well as their anticipation of results of corrective surgery. For all patients, printed materials are used to augment the counseling. Research is emphasized, in keeping with the role of such a plastic surgery service in a university setting.

Liesegang J

Langenbecks Arch Chir ,1981, 355 p335-9, ISSN 0023-8236

Journal Code: LIM

Languages: GERMAN Summary Languages: ENGLISH

In the management of accident patients a physician must be able to recognize the life-threatening complications of craniocerebral trauma. Therefore, he must be well versed in the symptomatology of such complications and by a short neurological examination be able to find out the risk to the patient. Only in this way is it possible to decide whether the patient has to be merely observed or additional neuroradiological investigation is necessary, whether he has to be transferred to a neurosurgical department or in emergency cases be operated on immediately. In acute epidural hematoma, e.g., with signs of midbrain compression, an instantaneous trephination is imperative; therefore, a general surgeon, too, should have the ability to perform such an operation, the technique of which is described in the paper.

Möglichkeiten des Einsatzes von elektronischer Datenverarbeitung in chirurgischen Abteilungen.

Bokelmann D; Pfaff G

Langenbecks Arch Chir ,1981, 355 p311-5, ISSN 0023-8236

Journal Code: LIM

Languages: GERMAN Summary Languages: ENGLISH

The primary precondition for the application of electronic data processing (EDP) are organisational measures including adequate personnel who are needed for preparatory work. Special documentation and coding systems must be introduced for the purpose of data preparation, whereby the size of the EDP equipment (hardware) depends on the problem to be tackled.

The EDP programmes (software) should be designed in such a way that every doctor is able to operate the EDP equipment even with little knowledge of data processing. Equipment ranges from minicomputers and centralized computer systems to integrated information systems. Whereas today well-designed application models for minicomputers already exist, the integrated information system is still in a development stage.

The establishment of a clinical basis documentation has approved because of the co-operation with the service-computer-centre of the clinical administration by linking the administrative and clinical data of the patients. The most essential data like diagnosis, operation, complication, operating surgeon as well as the eventual case of death will be registered in a protocol by the ward physician. These data will be registered by a documentary assistant according to the international keys. The evaluation of the data is done by a SPSS-program. The present results demonstrate that this kind of computer assisted clinical documentation has been successful.

**Case mix complexity differences between teaching and nonteaching hospitals.**

Ament RP; Kobrinski EJ; Wood WR  
 J Med Educ ,Nov 1981, 56 (11) p894-903. ISSN 0022-2577  
 Journal Code: J13  
 Languages: ENGLISH

In the study reported here, the authors measured the differences between teaching and nonteaching hospitals in case mix complexity and provided some detail concerning the differences. They measured case complexity in a sample of 200 short-term general hospitals by the Resource Need Index (RNI) using a cross-classification of 3,490 case types with weights compiled from patient charges. Median RNI values were moderately higher for teaching than for nonteaching hospitals both for the hospital as a whole and for each clinical service except obstetrics-gynecology. The most resource-intensive case type were relatively more frequent in the teaching hospitals, but the least resource-intensive types were of about equal relative frequency in the two hospital groups. The results show that teaching hospitals could be expected to cost somewhat more per patient even if case mix were the only factor.

**Plastic surgery in a large hospital.**

Pers M; Davenport P  
 Br J Plast Surg ,Oct 1981, 34 (4) p373-8. ISSN  
 0007-1226 Journal Code: BOW  
 Languages: ENGLISH

It may be debated whether the interaction between plastic surgery and other specialties is important enough to justify the presence of a department of plastic surgery in a large teaching hospital. To provide some data on which to base such discussion we have analysed the interaction at the Rigshospitalet in Copenhagen over a ten year period (1970-1980). In the plastic surgery department almost 10% of all the operations were on patients from the wards of other departments. One tenth of these operations were combined operations carried out in collaboration with surgeons from other specialties. Otherwise intractable conditions may be cured by such combined activity and a properly organised "skin-grafting service" pays handsome dividends by shortening the healing time for ulcers within the hospital.

**Hospital privileges for family physicians: a national study of office based members of the American Academy of Family Physicians.**

Clinton C; Schmittling G; Stern TL; Black RR  
J Fam Pract ,Sep 1981, 13 (3) p361-71, ISSN 0094-3509  
Journal Code: I4L  
Languages: ENGLISH

In 1980 the American Academy of Family Physicians sampled those active members who were nonfederal, office based physicians in direct patient care to ascertain the characteristics of their hospital practices. The sample was stratified by the nine US census regions: 83.7 percent of the 5,216 active members in the sample responded. The vast majority of family physician/general practitioners in direct patient care in an office based setting have hospital admission privileges in one or more hospitals. A higher percentage of family physicians/general practitioners in census regions west of the Mississippi River were likely to have privileges in obstetrics and surgery than those in eastern regions. Moreover, family physicians/general practitioners in the nonmetropolitan areas of each census region were more likely to have hospital privileges at any level than were their colleagues in the metropolitan areas of the same region. Although there were disparities in the proportions of family physician/general practitioners with certain hospital privileges among regions, the vast majority in each region indicated that the privileges afforded them were appropriate.

**40 years' work of a paediatric surgical ward.**

Pilaszanovich I; Pinter A  
Acta Paediatr Acad Sci Hung ,1981, 22 (1-2) p83-8, ISSN 0001-6527 Journal Code: 1JQ  
Languages: ENGLISH

The overall activity of the Surgical Ward of the Children's Department, University Medical School of Pecs, was analysed in the 40-year period of 1940-1980 in order to illustrate the rapid development in the surgical care of infants and children. A scoring system, based on the magnitude of surgical interventions and patient age, was worked out to prove this progress. The most remarkable feature of the development of paediatric surgery is that more skillful and time-consuming surgery is required in much younger patients. In order to meet the higher demands, the conditions of such a service should further be improved.

**Pulmonary artery pressure monitoring in the surgical intensive care unit. Benefits vs difficulties.**

Quinn K; Quebbeman EJ

Arch Surg ,Jul 1981, 116 (7) p872-6, ISSN 0004-0010  
Journal Code: 81A

Languages: ENGLISH

The process of pulmonary artery pressure monitoring in 50 consecutive patients in the surgical intensive care unit was analyzed to determine the number and types of problems that occurred in relation to the benefit obtained. Twenty-six percent of the patients had a change in their cardiorespiratory therapy and their conditions were improved after the pressure data were obtained. Many technical and interpretative problems that tended to decrease the desirability of using pulmonary artery pressure monitoring were identified. Most problems could be avoided by carefully calibrating the monitor system, clearing the catheter system of air bubbles and blood clots, learning to properly interpret pulmonary artery pressure tracings despite large respiratory variations, and obtaining a hard-copy printout of the pressure tracing with the simultaneous ECG signal. A protocol for avoiding many difficulties was developed.

**A five-day ward as part of a comprehensive surgical service.**

Ruckley CV; Ferguson JB; Cuthbertson C

Br Med J [Clin Res] ,May 9 1981, 282 (6275) p1525-8,  
Journal Code: B4X

Languages: ENGLISH

The role of a five-day ward was examined as part of an audit of the work of a general surgical unit. The four levels of care for elective operations were main ward, five-day ward, major day care, and minor day care. In a prospective study 2000 consecutive patients were followed through their hospital courses from the first referral to the surgical clinic to the postoperative follow-up visit. The aim was to measure the surgical needs of this population and to determine the rates

of success or failure in carrying through the planned care. One thousand and forty-five (52%) of the referred patients were put on waiting lists, and of these, 975 (93%) completed their hospital course within the two years of the study. The surgeons chose five-day ward care for 28% of the patients, major and minor day care for 8% and 33% respectively, leaving only 30% who were judged to require care in the main ward. Selections were validated by postoperative interview, which showed that 82% had followed the expected hospital course, and by monitoring deviations from planned care. Four per cent of the five-day ward patients required transfer to the main ward and 3.3% required readmission. Patients managed in the five-day ward were on average younger and the conditions less urgent than those in the main ward. We conclude that a five-day ward can fulfil a large and important part of a general surgical service provided that its function is closely integrated with other parts of the service and that patients are accurately assessed in the outpatient clinic.

Med Care ,May 1981, 19 (5) p510-25, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

Cholecystectomy is one of the most frequently performed elective surgical procedures, and a major contributor to surgery-associated mortality. The well-documented variation in surgical rates across geographic areas has been attributed not simply to differences in disease prevalence but to factors such as varying rates of clinical and radiologic investigation and use of different indications for surgical treatment. The research uses a large claims-based data bank--the hospital and medical files maintained by the Manitoba Health Services Commission. The study focused first on the incidence of gallbladder operations in Manitoba's six rural and three urban areas. Age-adjusted surgical rates varied across regions from more than 50 operations per 10,000 persons aged 25 and over to less than 42. Such variation was considerably less than that noted earlier for the tonsillectomy/adenoidectomy (T&A) operation. Cholecystectomy and T&A rates were not significantly correlated across regions. Moreover, a region's cholecystectomy rate and its 'supply' of operating physicians (measured by a physician-to-population ratio) were not significantly associated. Because a large number of referrals to surgeons in urban centers take place, an analytical distinction between surgery done within the region and that done outside the region has been made. Some movement of rural patients with more serious conditions to urban hospitals is found. Questions of regionalization of surgery are discussed using 9 years of data on mortality following cholecystectomy and biliary tract surgery.

Helv Chir Acta ,Feb 1981, 47 (6) p823-30, ISSN 0018-0181  
Journal Code: G4P

Languages: FRENCH Summary Languages: ENGLISH  
Microsurgery in France is organized in a relatively large number of centers. More centers would compromise the results achieved especially in replantation. Teaching and training is given in specialised courses and at universities. Indications for microsurgery in orthopaedics and traumatology are widespread. Large replantations may give excellent results but frequent complications have to be kept in mind, which sometimes are life-threatening. Free or composite grafts of skin, toe, muscles, bone and joints with neurovascular peduncle may be taken into consideration.

**The impact of computer-age technology on respiratory therapy.**

McPeck M

Respir Care ,Jul 1982, 27 (7) p855-65, ISSN 0730-8418  
Journal Code: QZ3

Languages: ENGLISH

Computer-age technology is changing the face of respiratory therapy as it is that of nearly every other technical field. In some hospital respiratory therapy departments computers are presently being used for a wide range of functions such as blood gas result reporting, billing, budgeting, purchasing, hemodynamic calculations, and respiratory monitoring. Microprocessor-controlled ventilators and respiratory monitoring systems are becoming increasingly utilized. In the future the computer may actually operate the ventilator. But who is going to operate the computer? The new breed of intensivist will be trained in critical care medicine, respiratory therapy, biomedical engineering, and computer technology. Respiratory therapists must recognize and rise to the challenge that computer-age technology presents if they are to continue as intensivists. The worst possible development of the future for respiratory therapy would be for computer-age technology to be applied to respiratory therapy without the input and inclusion of respiratory therapists. The challenge then is to be adequately prepared to utilize and apply this inevitable new computer-age technology.

**Respiratory therapy as a component of an integrated hospital information system: the Parkland On-Line Information System (POIS).**

Mishelevich DJ; Robinson AL; Rogers C; DuPriest ME; Mize EI  
Respir Care ,Jul 1982, 27 (7) p846-54, ISSN 0730-8418

Journal Code: QZ3

Languages: ENGLISH

Information handling is an important part of the activities of health care professionals, and the Parkland On-line Information System (POIS)--a computerized hospital information system--was established to more efficiently handle the processing and storage of information in our institution. Computerization of a respiratory therapy department is more effective if done in the context of a comprehensive, integrated hospital information system. Information and requests for services flow into the respiratory therapy

departmental computer from other hospital terminals, and information, such as patient charges and statistical data, flow out of the departmental computer to those requesting such information. POIS is an implementation of the IBM Patient Care System. We have found that a computerized hospital information system can facilitate patient care by easing the burden of information processing.

**Computerized decision-making in the pulmonary function laboratory.**

Gardner RM; Crapo RO; Morris AH; Beus ML

Respir Care ,Jul 1982, 27 (7) p799-816, ISSN 0730-8418  
Journal Code: QZ3

Languages: ENGLISH

Computers are now in widespread use in pulmonary function laboratories, where they have made an important contribution by assisting with complex and repetitive tasks. They can be used to acquire data from testing instruments, make measurements and calculations, and prepare reports. At LDS Hospital in Salt Lake City, we use the HELP (Health Evaluation through Logical Processing) Computer System for medical decision-making. As a result of our experience with this system, we have found six definable steps between data acquisition and data interpretation: (1) establish quality instrumentation, (2) establish adequate procedures for test performance, (3) standardize measurement and computational techniques, (4) determine the adequacy and reproducibility of results and apply a test selection, (5) identify the measurements to be used for interpretation, and (6) apply strategies that lead to consistent interpretation of results. Because spirometry and blood gas tests account for the major activities of our pulmonary function laboratory, we have applied these six steps necessary for computer decision-making to these two tests; however, they are equally applicable to other tests in the pulmonary function laboratory.

**The occupational therapist in Papua New Guinea.**

Rodgers-Wilson M

Papua New Guinea Med J ,Jun 1982, 25 (2) p123-6. ISSN 0031-1480 Journal Code: YEU

Languages: ENGLISH

The Occupational Therapist (O.T.) is an indispensable member of all health teams in major general hospitals, rehabilitation centres, sheltered workshops, psychiatric clinics and special centres for children and elderly people, as well as contributing to many community health projects. The O.T. provides rehabilitation programmes for patients with spinal injuries, degenerative neurological disease, head injuries, blindness, amputations, and leprosy as well as many other disabling conditions. In addition occupational therapy is important in paediatric practice. Supervision of the sheltered workshop is a further responsibility of the O.T. It is recommended that the position for an O.T. in Port Moresby General Hospital be maintained, and that Papua New Guineans be trained overseas to meet future needs within the country.

**[Difficulties and possibilities of the integration of psychosomatic obstetric knowledge in labor and lying-in wards]**

Schwierigkeiten und Möglichkeiten bei der Integration psychosomatisch-geburtshilflichen Wissens im Kreissaal und auf den Wochenbettstationen.

Müller P

Z Geburtshilfe Perinatol ,Aug-Sep 1982, 186 (4) p208-11. ISSN 0300-967X Journal Code: XU4

Languages: GERMAN Summary Languages: ENGLISH

Results of research into early mother-child relations provoked by developments in depth psychology and pediatrics have had an extremely lasting influence on psychosomatic obstetrics. Their intensification depends on the patient's own, often subconscious, motivation, which is the decisive influence in the success of the therapy. In an investigation involving nurses engaged in obstetrical duties (n = 237) the question as to the extent in which the nurses' individual psychological characteristics and social attitudes differed from those of the "average population" and to what extent ward sisters, midwives and children's nurses differed in their psychic make-up was examined. The health of an individual depends on a healthy "relationship", on "his or her real, individual and social capacity as well as on the idealistic standards which the individual strives to live up to." Both with regard to their social position and the appreciation they receive, the nurses considered that they were not appreciated as much as they would like to have been. Their inhibited aggression exercises an influence on their basic mood which, in individual sub-groups, is tinged with depression. Vocational further-training sessions in their intellectualised form are, rather, a form of defence instead of a potential forum for discussing difficulties.

**Automated anesthesia data management and recordkeeping.**

Mitchell MM

Med Instrum ,Nov-Dec 1982, 16 (6) p279-82. ISSN 0004-5446 Journal Code: M12

Languages: ENGLISH

It is apparent that judicious application of computer technology to the design and implementation of an automated anesthesia recordkeeping system could afford increased ease of use to the anesthesiologist compared to a manually kept record. Although prototype systems have been developed at academic institutions, and commercially available operating room physiological monitoring systems show increasing capability for some recordkeeping functions, production of an effective AAD-MARKS will depend on the development of suitable display formats and capabilities, markedly improved user interfaces for data input and system control, intelligent graduated alarm systems, and demonstrated reliability, with provision for preservation of critical data and recordkeeping functions and basic physiological data monitoring despite system failure.

**Effectiveness in professional organizations: the impact of surgeons and surgical staff organizations on the quality of care in hospitals.**

Flood AB; Scott WR; Ewy W; Forrest WH Jr

Health Serv Res ,Winter 1982, 17 (4) p341-66, ISSN

0017-9124 Journal Code: G2L

Languages: ENGLISH

In this research, we examine the relative importance of different structural units in a professional organization, the hospital, as they affect organizational effectiveness. The difficulties of measuring effectiveness in a complex professional organization are discussed, and an adjusted measure of surgical outcome is developed. Data are drawn from a prospective study of over 8,000 surgical patients treated by more than 500 surgeons in 15 hospitals throughout the nation. Two different types of analyses are presented, both indicating that hospital features have more impact on surgical outcomes than do surgeon characteristics. The second analysis assesses the relative importance of specific attributes of the hospital, surgical staff organization, and surgeon characteristics on surgical outcomes.

**The clinical value and cost of a district hospital urodynamic unit.**

Miller RA; Barod RK; Chapman J; Fergus JN

Br J Urol ,Dec 1982, 54 (6) p635-7, ISSN 0007-1331

Journal Code: B3K

Languages: ENGLISH

A retrospective review has shown that urodynamic studies were useful in the diagnosis of 87% of our patients and were diagnostic in 43%. The cost per patient was 43 pounds, which compares favourably with urography (35 pounds) an in-patient cystoscopy (104 pounds). Provided that more than 200 patients a year are studied, the expense and effort of running the urodynamic unit are justified. We now perform urodynamic studies routinely in patients with complex lower urinary tract symptoms, prior to intravenous urography and cystoscopy.

**Operational budgeting and budgetary control in diagnostic radiology.**

Evert H

Radiol Manage ,Sep 1982, 4 (4) p21-3, ISSN 0198-7097  
Journal Code: Q5J

Languages: ENGLISH

This article is concerned with establishing a revenue and expense budget for a diagnostic radiology department. It deals with setting up a breakout of examinations into specific categories and projecting the volume in each category. The volume should be expressed in RVUs rather than examinations. The volume predictions for the upcoming year would then be decided by factoring in such things as new procedures, new technology, patient day projections, ER projections, and any known outside influences. Once the volume is projected, expenses should be matched to these increases or decreases. These expenses would be prior to adding inflationary impacts. Finally, a follow-up should be performed on a monthly basis to ensure that the percentage change in volume is being matched by the same percentage change in expenses.

**productivity.**

Hage SJ

Radiol Manage ,Sep 1982, 4 (4) p14-7, ISSN 0198-7097  
Journal Code: Q5J

Languages: ENGLISH

Productivity in radiology is a complex and elusive issue. The fact that radiology is the practice of medicine makes management of it very different from management in traditional "smokestack" industry. Management itself is very young, and more familiar with smokestacks and widgets than with radiology or any other service industry. Before management can hope to affect productivity in radiology, it must first come to understand what it (radiology) is, and how it works.

**Variations between and within countries in hospital care for peptic ulcer. A comparison between Denmark and Sweden.**

J:snsson B; Silverberg R

Scand J Soc Med ,1982, 10 (2) p63-9, ISSN 0300-8037

Journal Code: UD5

Languages: ENGLISH

The present study tries to examine variations in utilization rates for hospital care for ulcer disease between and within Denmark and Sweden. The focus is on how utilization rates differ but an attempt is also made to explain why regional differences occur. Hospital patient statistics from both countries show that ulcer disease accounts for 35% more

bed-days per 100000 inhabitants in Denmark than in Sweden. The main source for this difference is duodenal ulcer, where the number of bed-days is 63% higher in Denmark. The differences in length of stay are negligible and the numbers of surgical operations are about the same in the two countries. The greater utilization of hospital resources in Denmark is explained mainly by the fact that more medical cases are treated as in-patients in Denmark than in Sweden. Neither mortality rates nor other data support the hypothesis that the incidence of duodenal ulcer is higher in Denmark than in Sweden. The difference between Denmark and Sweden widens when utilization rates are adjusted for differences in the age structure of the population in the two countries. There are wide variations in utilization rates between regions within both countries. The findings support the hypothesis that the intertemporal change in the technology for management of ulcer disease is one of the main reasons for variations between and within countries.

Languages: ENGLISH

Instead of a technology-oriented approach of a hospital information system (HIS), the authors present a structure oriented approach built on three elements: objects, events and operations which allow one to model a static and dynamic schema of an information system (IS). Objects of the static schema lead to a relational model. Events expose various states of Information System; operations allow one to build a dynamic schema. Such a schema is interesting for IS description in order to enhance the analytical capability of the designer, to define IS solutions and to limit the risks of errors. It allows the clinician better management of information relative to patients, especially thanks to the dynamical schema which enables one at any moment to know the patient's state. Finally, it has to free clinicians from managing information and allow them to give an always more important consideration to human relationships in medicine.

**Trends in radiopharmaceutical dispensing in a regional nuclear pharmacy.**

Basmadjian GP; Johnston J; Barker K; Ice RD

Am J Hosp Pharm ,Nov 1982, 39 (11) p1933-6, ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

Dispensing trends for radiopharmaceuticals at a regional nuclear pharmacy over a 51-month period were studied. dispensing records of a regional nuclear pharmacy were analyzed with a forecasting procedure that uses univariate time data to produce time trends and autoregressive models. The overall number of prescriptions increased from 3500 to 5500 per quarter. Radiopharmaceuticals used in nuclear cardiology studies increased from less than 0.1% to 17.5% of total prescriptions dispensed, while radiopharmaceuticals used for brain imaging showed a steady decline from 29% to 11% of total prescriptions dispensed. The demand for other radiopharmaceuticals increased in areas such as renal studies, bone studies, lung studies, liver-function studies, and Ga-67 tumor-uptake studies, and declined slightly for static liver studies. Changes in dispensing trends for radiopharmaceuticals will continue as the practice of nuclear medicine concentrates more on functional studies and as newer imaging techniques become used for other purposes.

Ophthalmologische Tumorabteilung zur Betreuung von Patienten mit malignen intraokularen Tumoren.

Heine U; Fuhrmann M

Klin Monatsbl Augenheilkd ,Oct 1982, 181 (4) p240-5, ISSN 0023-2165 Journal Code: KWA

Languages: GERMAN Summary Languages: ENGLISH

The organization of treatment for patients with malignant intraocular tumors is described with reference to the oncology department of an eye clinic specializing in tumor problems. Since eye tumors are seldom encountered in day-to-day ophthalmological practice, and the costs of diagnosis and treatment are so high, centralized treatment facilities are advocated.

**Radiology workload system for diagnostic radiology. Productivity enhancement studies.**

MacEwan DW

J Can Assoc Radiol ,Sep 1982, 33 (3) p183-96, ISSN

0008-2902 Journal Code: HLZ

Languages: ENGLISH

A unit measurement system for diagnostic radiology has been prepared. The basic data were collected in fifteen small, medium and large sized Canadian hospitals. Detailed measurements were made of the technologists' time for performing radiographic examinations. Analysis of work activity established the time contribution for each category of support staff. The basic data were tested in a field trial of forty-two Canadian hospitals and found to be reliable. Comparisons with other systems, particularly in Finland and Scotland, revealed a great similarity of results. A method of productivity analysis was developed. The study will be likely to form the basis for national reporting of work in Canadian radiology departments.

Haupt BJ  
Advance Data ,Oct 8 1982. (83) p1-11. ISSN 0147-3956  
Journal Code: 2GY  
Languages: ENGLISH  
During 1980 3.8 million women with deliveries were discharged from short-stay non-Federal hospitals in the United States. These women made up a sizable portion--9.9 percent--of all the discharges (excluding newborn infants) during that year. Women with deliveries remained hospitalized an average of 3.8 days and used 14.2 million days of inpatient hospital

care. This was only 5.2 percent of the total days spent in hospitals by all patients discharged during the year. Most of the women who had a delivery were in their twenties, were white, and were married. The largest percent of deliveries occurred in the South Region, followed by the North Central, Northeast, and West Regions. The percent of women with deliveries was lowest in the smallest hospitals and highest in the largest hospitals. Most of the women with deliveries were discharged from nonprofit hospitals. About half of the women had a normal delivery and about half had some sort of complication. Women more likely to have a complicated delivery were older, were races other than white, had an unknown marital status, and had delivered in the South Region. These women also stayed in the hospital longer, on the average, than did women with normal delivery. The most frequently occurring complications were forceps or vacuum extraction without mention of indication and obstetrical trauma. Episiotomy was the most common procedure. Other frequently performed procedures were low forceps or vacuum extraction with or without episiotomy, cesarean section, repair of obstetric laceration, and bilateral destruction or occlusion of fallopian tubes.

Using data from a 1975 hospital wage survey conducted by the Industry Wage Division of the U.S. Bureau of Labor Statistics, the relationship between accreditation status and hourly wages of 590 female full-time medical record technicians (MRTs) in four metropolitan areas was examined. Through multiple regression analysis, the hourly wages of Accredited Record Technicians were found to be \$0.62 greater than those not accredited. Job location and hospital funding source also were related strongly to MRT hourly wages. Only 35 percent of the MRT's studied were accredited. These data reveal the willingness of employers to hire MRT's not accredited, while being willing to pay a premium for accreditation.

**Surgical pathology reports with a portable microcomputer.**  
MacDonald RA; Pechet GS; Lovenbury P  
Arch Pathol Lab Med ,Dec 1982, 106 (13) p666-9, ISSN 0363-0153 Journal Code: 79Z  
Languages: ENGLISH  
A microcomputer reporting system for gross and microscopic surgical pathology is simple and inexpensive, reduces the need for clerical personnel, and saves the pathologist's time in the preparation of reports. Gross descriptions are reformatted. A dictionary of microscopic diagnoses is constructed and stored on disks. The diagnosis to be used for a case is selected by a pathologist by number. It is called to a video screen from disk storage by entering the number on the microcomputer keyboard. The diagnosis is edited or expanded for an individual patient while it is on the screen and is printed after changes are made. Each diagnosis contains

preentered classification, coding, and filing information, as well as format, medical terminology, and spelling. The system has rapid retrieval and search capability and may be used for patients awaiting frozen-section diagnosis. The system requires fewer clerical personnel in surgical pathology than with free-form reporting.

**Research and development in obstetrics & gynaecology in the Department of Obstetrics & Gynaecology at the National University of Singapore.**

Ratnam SS; Karim SM; Ng CS; TambyRaja RL; Tsakok FH; McCarthy TG; Ng SC; Goh HH

Ann Acad Med Singapore, Jul 1982, 11 (3) p313-21, ISSN 0304-4602 Journal Code: 53F

Languages: ENGLISH

This is a review of the research and achievements of the Department of Obstetrics and Gynaecology, National University of Singapore since 1949. The research activities reviewed are Fertility Control, Subfertility, Reproductive Endocrinology, In-Vitro Fertilization, Trophoblastic Disease, Prostaglandins and Perinatal Medicine. The University Department has kept abreast with the Singapore norm of two-child families by providing the most sophisticated technology and expertise. The perinatal mortality and stillbirth rates have been reduced to 11 and 6 per thousand births. Prostaglandin research in the Department includes an investigation of the involvement of these substances in various physiological processes, pharmacological studies with different prostaglandins and development of clinical applications. Between 1974 and 1981 we had studied 12 intrauterine contraceptive devices, both on a departmental basis and in conjunction with international agencies. The newer medicated devices have proved to offer significant advantages over the original inert plastic configuration. Metabolic changes in Singapore women on the oral pill and injection Depoprovera were studied. Impaired glucose tolerance and raised fasting total lipids were found in women on the pill. Marginal changes in carbohydrate metabolism only were found in women on injection Depoprovera. Hypercoagulation changes in the blood occurring in Singapore women varied with the dose of the synthetic or natural oestrogen medication. Initially, the fibrinolytic activity was enough to compensate for these changes; however after two years there were signs of decompensation. Progestogens affect coagulation via their influence on the liver functions. Hypercoagulation changes also occurred in pregnancy and was of a greater magnitude than oestrogen or progestogen medication. In many obstetric disorders, including hydatidiform mole, there was evidence of intravascular coagulation. The introduction of endocrine function tests has greatly improved patient care in our Department, in particular those related to endocrine disorders. Application of the immunoassays to basic research has shown that physiological levels of oestradiol exert a negative feedback effect on both FSH and LH secretions in men. The greater suppression of LH than of FSH secretion by pharmacological doses of estradiol is possibly due to different control mechanisms in the pituitary for the synthesis and release of both gonadotrophins. Physiological lev

Languages: ENGLISH

An out-of-hours emergency biochemistry service, which allows access by all medical practitioners of varying experience within a hospital, can lead to overuse or even abuse of limited and costly facilities. When the workload increases, problems of staffing a voluntary (but paid) working rota may emerge. An industrial dispute involving medical laboratory scientific officers (MLSOs) caused the role of the emergency service to be examined and alternative regulating mechanisms to be tested. Experience at Glasgow Royal Infirmary between 1974 and 1981 has been reviewed. From 1977 to 1979, when clinicians (usually junior) arranged analyses directly with the MLSOs, test numbers increased by about 26% per annum. This was not associated with any concomitant increase in the range of analyses offered. During a five-week period in 1980, consultant clinicians had to contact a consultant clinical biochemist to arrange all emergency analyses, and test numbers were reduced to 13% of the previous levels. Subsequently, all requests for emergency analyses were made by clinicians to laboratory medical staff, and test numbers fell to approximately 60% of 1979 levels. This requesting system is now firmly established. Continued vigilance is required to maintain the reduced level of requesting, but too great a limitation on emergency requests may cause less efficient patient management. Senior clinical staff should be encouraged to take greater responsibility for the use of emergency laboratory services.

**A survey to evaluate parental consent as public policy for neonatal screening.**

Faden R; Chwalow AJ; Holtzman NA; Horn SD  
Am J Public Health ,Dec 1982, 72 (12) p1347-52, ISSN  
0090-0036 Journal Code: 3XW  
Contract/Grant No.: MC-R-240405  
Languages: ENGLISH

Most states currently have laws which result in compulsory neonatal screening practices, despite a widespread consensus that participation in genetic services and programs should be voluntary. In 1976, Maryland adopted a regulation designed to respect parents' rights to refuse neonatal screening by imposing a parental consent requirement. The results of a study designed to evaluate the effects of this regulation are reviewed here. Many health care providers were unaware of the parental consent regulation. However, hospitals were generally in compliance with the technical stipulations of the regulations. There was little evidence that the regulation resulted in additional costs to the health care system, either in terms of hospital staff time or in terms of loss of efficiency in the number of infants screened. Mothers affected by the regulation were largely in favor of being informed about neonatal screening and learned a significant amount of new information from the disclosure process. They were almost evenly divided on whether they favored parental consent.

**Survival of departments of obstetrics and gynecology: ten points for Association of Professors of Gynecology and Obstetrics action in the 1980s.**

Spellacy WN  
Am J Obstet Gynecol ,Nov 15 1982, 144 (6) p626-9, ISSN  
0002-9378 Journal Code: 3NI  
Languages: ENGLISH

Major changes have occurred in medicine during the past few years: the number of medical students who graduate per year has recently doubled, the federal government pays a significant portion of health care costs, and the body of scientific information is expanding logarithmically. The changes which will occur during the next 10 to 15 years will be equally dramatic, and in order for our specialty to increase its presence and position in medicine, it needs to begin to consider these changes and take actions to capitalize on them. Four areas of change were singled out and discussed in terms of their significance and possible plans of action to address them. The four include the increased numbers of women in obstetrics and gynecology, the demand for departments to generate more practice income, the reduced support for research, and the large numbers of physicians being trained in obstetrics and gynecology. Ten places for action by academic departments of obstetrics and gynecology were outlined, and these are listed in Table III. Continued review of the past and the present will allow us to be prepared for the future.

Barnhard HJ; Lane GB  
Radiology ,Nov 1982, 145 (2) p551-8, ISSN 0033-8419  
Journal Code: QSH  
Languages: ENGLISH

The small digital computer is becoming ever more powerful, reliable, and inexpensive. Diagnostic radiology and the computer are becoming more intertwined. During the past decade, computed tomography (CT) has achieved outstanding success. CT and other digital image systems that are capable of computer manipulation, storage, and viewing are becoming more numerous. Of increasing importance are the new and maturing reporting and operations/management systems. The many facets of newer computer and diagnostic radiology developments are discussed, and a model is presented here that integrates all applications into a single system. Many benefits in improved patient care and general operations of the department would result from its implementation. Some elements of this model exist now and can be installed with relatively little effort. Development of the entire model is within the state of current technology. A number of trends suggest that diagnostic radiology is becoming more ready to use such a model.

**A computer system to monitor radiology department activity: a management tool to improve patient care.**

Jost RG; Rodewald SS; Hill RL; Evens RG  
Radiology ,Nov 1982, 145 (2) p347-50, ISSN 0033-8419  
Journal Code: QSH

Languages: ENGLISH

A microcomputer system has been developed and installed at the Mallinckrodt Institute of Radiology to monitor the moment-to-moment activity in a radiology department. Data about department performances are collected, summarized, and displayed in graphs and tables on terminals at stations throughout the department. The system is currently used to monitor a wide variety of functions including patient waiting time, report production time, film-library operations, equipment maintenance, and room use. Since the displays are updated in real-time, it is possible to identify and address problems as they occur, thereby providing a method of evaluation that leads to improved performance as related to patient care.

The quality of services provided by respiratory therapists must be measured as part of a hospital's overall evaluation of patient care, as mandated by the Joint Commission on the Accreditation of Hospitals. An internal audit helps both the respiratory therapists and the attending physicians to know what kind of specific documentation is needed in the medical records to meet the desired standards. It also serves as a useful tool in identifying staff educational needs.

The number of diagnostic radiology examinations being performed on digitally formatted imaging equipment is continually increasing. However, most digital data are recorded as analogue images and the films stored in a central file. The dynamic range of raw digital data is lost. Currently, the space and cost requirements for storage of all digital data have discouraged most users from attempting it. This article presents the concepts and describes the requirements and initial fabrication of a system that will capture and retain all digital data using a network of peripheralized image acquisition, display, and storage devices. Any piece of digitally formatted equipment can be interfaced into the system. A real-time computer capability provides that any digital examination can be reviewed at any display station for up to 10 days.

**[Economic aspects of intensive care in obstetrics]**

Ökonomische Aspekte der Intensivgeburtshilfe.  
Koeppcke E; Seidenschnur G  
Zentralbl Gynakol ,1982, 104 (12) p719-30, ISSN  
0044-4197 Journal Code: Y5S  
Languages: GERMAN Summary Languages: ENGLISH

An intensive obstetric care unit has been established at investment costs of 646,167.--Mark which broke down into 220,248.--Mark for prepartum attention, 268,010.--Mark for intrapartum attention, and 157,909.--Mark for neonatal attention. Operational expenditures on equipment and services

were found to amount to 144,052.--Mark per annum.--Specific outlays resulted from intensive obstetrics, as compared to conventional procedures. They varied between 48.--Mark and 96.--Mark per delivery, depending on annual numbers of deliveries and on the use of equipment quantitatively adapted to requirements. Individual costs for intrapartum attention varied by bedside equipment combinations and turnover of patients (n/labour bed/d) and were between 12.--Mark and 36.10 Mark.--Something between 2000 and 3000 births per annum, with patient turnovers between 1.5 and 2.0 per bed and die, was considered optimum. The cost of intensive obstetrics went up under such optimum conditions to something between 48.--Mark and 58.--Mark, with something between 14.80 Mark (BMT 504 biomonitor, Lineomat, FTS 101 foetal-function recorder) and 21.60 Mark (BMT 9141 biomonitor, Lineomat) being required for intrapartum monitoring of one birth.--Reduction in perinatal mortality, as compared to figures of conventional obstetrics and to cost factor between 519,168.--Mark and 627,328.--Mark for equipment and other hardware, yielded a benefit for 10,816 births of something between 46.9 and 167.5 million Mark.

**A walk-in and telephone inquiry service: a function of a hospital social work department.**

Horn B; Manuele GM; Olvany BF  
Soc Work Health Care ,Spring 1982, 7 (3) p47-56, ISSN  
0098-1389 Journal Code: U95  
Languages: ENGLISH

This article describes a study undertaken to evaluate the Walk-In and Telephone Inquiry Service provided by a social work department in a general hospital division of a large, voluntary, metropolitan teaching hospital. The major social work function provided in such a service is information and referral; to provide this service, a psychosocial evaluation and counseling are essential. This service is valuable to and utilized by many individuals, professionals and community agencies. It can become the point where individuals enter the health care system. Issues related to policy making, institutional costs and cost benefits are discussed.

This article describes a modular quality assurance program that was designed for computer automation. The author explains how the quality assurance model not only meets this need but also satisfies other critical objectives, including integration with the hospital's multidisciplinary quality assurance program and minimal redundancy in developing standards and measurement criteria. Readers will benefit from ideas for refining or developing effective quality assurance programs that can also use computer technology to increase productivity.

This author identifies a critical problem in the wholesale adoption of patient classification systems (PCSs) in nursing departments. She suggests that without attention to their reliability and validity for the specific institution's standards and practice, PCSs may frustrate, rather than assist, the nursing administrator's efforts to predict staffing needs. Here she describes an "ideal" PCS and compares it with the reality of today's systems. She then suggests ways that nursing administrators can move closer to this ideal system and make PCSs more useful management tools.

This article demonstrates the usefulness of the Nursing Classification System (NCS) as an operational planning and control tool. Inherent in the NCS is sensitivity both to the quality of nursing care standards and to the variability in patient acuity levels. Consequently, the NCS provides a more effective basis for setting and monitoring productivity objectives in nursing service areas than cruder measures, such as full-time equivalents per patient day. Here the authors introduce and illustrate the concept of workload indexing, a means by which the NCS assists in defining staffing needs and monitoring workload and performance. The nursing administrator will gain insight into a simple and economical method of fiscal accountability for the personnel budget.

J Nurs Adm ,May 1982, 12 (5) p34-41, ISSN 0002-0443

Journal Code: JEL

Languages: ENGLISH

As the practice of research increasingly becomes a part of the nursing profession, nurses must develop their ability to evaluate and incorporate the findings gained through the research process. This article reports the results of a survey aimed at determining problem areas existing among nursing staffs in understanding, accepting, and incorporating research findings. The report will help nursing administrators identify specific factors that inhibit the use of research findings and improve the conditions for incorporating research in their facilities.

**Recruit from within: hospital nurse retention in the 1980s.**

Weisman CS

J Nurs Adm ,May 1982, 12 (5) p24-31, ISSN 0002-0443

Journal Code: JEL

Languages: ENGLISH

Nursing administrators and nurse recruiters coping with staffing shortages can profit from some recent studies of the causes of nursing turnover. Research reveals that the problem lies not in the motivations or characteristics of individual nurses but the nature of hospital nursing jobs and incentive structures. Using the research findings as a basis for discussion, Weisman suggests target areas for administrative intervention in the design of hospital nursing jobs. Her insightful commentary provides stimulus for some basic rethinking of the nature of nursing jobs and the traditional employer-employee relationship between hospitals and nurses--as well as some specific suggestions for "recruiting from within" to retain those productive nurses in whom the hospital has already invested time and money.

**Decentralized budgeting: holding the purse strings, part 1.**

Althaus JN; Hardyck NM; Pierce PB; Rodgers MS

J Nurs Adm ,May 1982, 12 (5) p15-20, ISSN 0002-0443

Journal Code: JEL

Languages: ENGLISH

A decentralized nursing structure allows the head nurse to become actively involved in the planning and budgeting process. In Nursing Decentralization: The El Camino Experience (published in November 1981 by Nursing Resources) the authors describe the development of a budgeting system that supports autonomy, accountability, and authority at the practitioner level. For JONA readers, we present, in two parts, an abridged version of the chapter "Budgeting: Holding the Purse Strings." Part 1, which follows, outlines important steps for the

development of a successful and efficient budgeting program that can be adapted to meet the needs of other decentralized organizations. Part 2, which details a typical budget session, will appear in the next issue of JONA.

**Applying management information systems to staffing.**

Hanson RL

J Nurs Adm ,Oct 1982, 12 (10) p5-9, ISSN 0002-0443

Journal Code: JEL

Languages: ENGLISH

A management information system (MIS) is a tool for managing resources effectively. After reviewing some concepts and principles for effective data management, Hanson clearly applies the concepts to nurse staffing systems, which manage human resources. He defines a seven-step process for establishing an MIS, from defining the management objective to implementing the system. Pointing out that an MIS need not be computerized to be effective, Hanson presents a positive perspective and clarifies some often-misconceived notions about management information systems and the paper printouts they generate. In the next issue of JONA, a second article by Hanson will take a more detailed look at the variety, use, and usefulness of staffing statistics available from an MIS for staffing. These articles are based on material in a forthcoming book, Management Systems for Nursing Service Staffing, to be published by Aspen Systems Corporation, Rockville, Maryland.

**Using registry nurses: coping with cost and quality issues.**

Sheridan DR; Bronstein JE; Walker DD

J Nurs Adm ,Oct 1982, 12 (10) p26-34, ISSN 0002-0443

Journal Code: JEL

Languages: ENGLISH

If a nursing service uses agency nurses to help cope with staff shortages, the nursing administrator must manage the cost and quality of care delivered by these nurses. The authors describe their hospital's system for using agency nurses. The components of their system--an orientation program, contracts with the agencies, and systematic performance evaluation--can be used or adapted in other institutions.

**The 12-hour weekend plan--does the nursing staff really like it?**

Metcalf ML  
J Nurs Adm ,Oct 1982, 12 (10) p16-9, ISSN 0002-0443  
Journal Code: JEL

Languages: ENGLISH

After nursing administrators at one Boston hospital implemented a new system for weekend coverage, they surveyed the staff's response to the trial plan. Here the author explains their system, what they learned when they measured its effects, and how they used staff responses to improve it. They proceed to examine the new system's effects on recruitment and absenteeism. The experiences shared here should assist other nursing administrators who are looking at new scheduling approaches and their viability in resolving staffing problems.

**Clarifying autonomy and accountability in nursing service: part 2.**

Lewis FM; Batey MV  
J Nurs Adm ,Oct 1982, 12 (10) p10-5, ISSN 0002-0443  
Journal Code: JEL

Languages: ENGLISH

How can a nursing service convincingly argue for autonomy and accountability without an understanding of the precise meanings of these terms? In this second of two articles exploring the meanings and implications of autonomy and accountability in nursing service, Lewis and Batey arrive at this and other provocative questions. They analyze the concept of accountability and provide selected definitions of the concept by directors of nursing. Their discussion provides insights into the presence or absence of true accountability in nursing organizations and presents issues for further study.

**Work environments of different types of nursing subunits.**

Leatt P; Schneck R  
J Adv Nurs ,Nov 1982, 7 (6) p581-94, ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH

Based upon organizational theory, the purpose of this research was to identify and describe similarities and differences in the work environments of nine different types of nursing subunits (intensive care, medical, surgical, psychiatric, auxiliary, rehabilitation, rural, paediatric and obstetrical) in hospitals. Six measures of nursing subunit environment were developed: these included measures of nursing subunit autonomy, and the complexity and pervasiveness of other medical and hospital groups interacting with the nursing subunit. Data were collected by questionnaire from headnurses in 157 nursing subunits located in 24 hospitals in Alberta,

Canada. The results indicated that the types of nursing subunits were similar in their degree of autonomy from both physicians and administration in the larger context in which they were located but were significantly different in terms of number and heterogeneity of groups outside nurses with which they interacted and the extent to which such groups pervaded the subunits. For example, intensive care units appeared as the type of nursing subunit with the greatest need for interaction with physicians, paramedics, hotel services and so on, whereas, psychiatric subunits appeared to be the least dependent on groups outside nursing in the hospital. These findings have implications for the management practices and educational programme for nursing.

J Nurs Adm ,Jan 1983, 13 (1) p5-9, ISSN 0002-0443

Journal Code: JEL  
Languages: ENGLISH  
A meaningful quality assurance program comes only with appropriate knowledge, communication, and accountability for all quality assurance functions among nurses at all levels. Describing the implementation of their quality assurance program, these authors tell of their eventual realization that, in fact, they had merely implemented a quality assurance tool that brought the nursing staff little benefit and a lot of grief. Highlighting the identified problems, the factors contributing to the program's failure, and the actions they took to develop and meet appropriate objectives, they detail their later, successful implementation of the concept and the process of quality assurance. Their experience provides readers with food for thought and stimulus for critical evaluations of their own quality assurance programs.

**Expanding the hospital nursing role: an administrative account.**

Garvey JL; Rottet S  
J Nurs Adm ,Dec 1982, 12 (12) p30-4. ISSN 0002-0443  
Journal Code: JEL  
Languages: ENGLISH

In reality, role change among staff RNs is a continuous phenomenon. As medical technology increases, patient care regimes follow suit, and the staff RN is constantly called upon to apply a knowledge base in different ways and to acquire new knowledge and behaviors. The nursing administrator who keeps pace with this growth can capitalize on the phenomenon, guiding the change to see that it is progressive, that it assists the nurse in developing a more advanced nursing (as opposed to mini-physician) identity and that it does improve extant nursing practice. Undertaking a new project of this sort on the unit is likely to create a number of beneficial by-products. For example, nurse-physician rapport and communication increase as each group opens professional boundaries in defining and planning the content of role expansion. The unit's traditional operation must also be examined in the course of building in new functions. System critiques stimulate the unit's nursing manager to weed out less than optimal features of the existing nursing care delivery system. The expanded role has favorably affected nursing care at Mercy Hospital. Physicians, nurses, and most important, the patient have reaped the benefits. The nurse is able to function in a more advanced capacity, and physicians see the benefits to their patients; fewer delays in specific aspects of care delivery with a more sophisticated, higher quality of nursing care. What is exciting about this concept is that the principles could apply to virtually any RN work group that gives direct care to a homogeneous patient population.

The steps involved in preparing to implement a pharmacy computer system are described. Although the order in which the various steps have to be completed varies according to the hospital specifics, important elements of the preparation process include preparation of the site, organization of personnel, development of policies and procedures, developing and ordering forms, preparation of the implementation schedule, file development, and preparation of other departments. A well-designed plan and a realistic time schedule for the preparation process facilitates the actual implementation of a pharmacy computer system.

The cost-benefit analysis of the primary nursing structure is contingent on the factors that affect the proper use of nursing skills. By reducing the problems of coordinating the work, primary nursing has the potential of greater professional nurse involvement with patients. However, in a unit with inefficient support systems, inappropriate use of professional skills in primary nursing render the primary nursing structure less cost-beneficial than the team nursing structure. We may postulate here that primary nursing will be more cost-beneficial than team nursing when the nursing support system requires very little of the RNs' time and the patients require highly skilled care. In a hospital that has inefficient nursing support systems and on nursing units that have mostly self-care to intermediate care patients, primary nursing will only diminish proper use of nursing skills without significant potential to improve the quality of care. On the contrary, with highly efficient nursing support systems and on nursing units that have mostly intermediate use to extensive care patients, primary nursing will have great potential to improve quality and to use nursing skills properly.

A real-time nursing computer system operational on six medical wards allows the automatic data capture of all nursing procedures carried out for all patients. Each nursing procedure has been graded by an experienced nurse on a 5-point scale (Ninewells Index I), with grade 5 representing the greatest workload. A Delphi type survey was carried out by a questionnaire involving 115 medical charge nurses in Scotland who graded the same procedures on a 5-point scale (Delphi Index I). Good agreement with the two indices was found. The Delphi Index I was transferred from the original scale to an interval scale (Delphi Index II) to facilitate statistical handling of data and conversion to timings. The conversion of

Delphi Index I] to timings (Ninewells Index II) was achieved by using data from three extensive work studies. It is suggested that Ninewells Index II is a practical problem of staff allocation in medical wards.

This study explores the process of professional socialization in a sample of newly graduated baccalaureate nurses whose first experience as practicing professionals was in a hospital organizational system. Professional socialization was defined in terms of concept of identity

reassessment as proposed by Strauss and in terms of the new graduates' descriptions of their own behavior during conflictual situations in the work setting. These descriptions were identified as conflict-reporting behavior and analyzed from two aspects: the source of the conflict and the level reached by the behavior of the respondent, as defined by a model for organizational conflict proposed by Pondy. Although changes in conflict-reporting behavior with increasing experience in the hospital bureaucracy were noted, the study findings showed no significant relationships between this behavior and ideas about the nursing role and the value of organizational inducements. Some trends in conflict-reporting behavior were noted in relation to three other variables: the size of the unit on which the new graduate was working, the identity of the other persons in the conflict, and the new graduates' work experience in a hospital system while in school.

Languages: ENGLISH

Studies of nurses and other health professionals indicate that autonomy is an important determinant of job satisfaction and turnover. This study analyzed selected characteristics of hospital nursing units to identify those features of the work setting that influence staff nurses' perceptions of autonomy: comparisons among nurses who work in different clinical areas were made. Data were collected by interviewing 789 nonsupervisory registered nurses who were employed full time at one large university-affiliated hospital. Personal and job-related information was obtained for each nurse. Structural features of units, such as workload, were gathered from head nurse reports and hospital records. Findings indicated that nurses' perceptions of autonomy are influenced by both personal characteristics of the nurse and structural features of the units. The nurse's sense of personal efficacy and the relationship she has with her head nurse are two important determinants of autonomy across all units. Workload, primary nursing, and staffing patterns are influential factors in predicting autonomy for nurses who work in critical care areas. Implications of these findings for nursing administrators are discussed.

**Asymptomatic gonorrhoea: selective screening and guidelines for identification of high risk patients.**

Ramaswami R; Martin A

Urban Health ,Oct 1982, 11 (9) p36-7, Journal Code:

X6C

Languages: ENGLISH

As recently as 1980, gonorrhoea ranked first among communicable diseases in the U.S.A. More alarming was the fact that 75 to 80 percent of infected females were reported to be asymptomatic. As more of these asymptomatic individuals were discovered, the tendency to do routine gonococcal screening in women increased. Of late, however, the trend to abstain from doing routine gonococcal screening has become more evident because of the low yield of positive cultures in the majority of the population screened. The St. Joseph's Medical Center is a single residency (Family Practice) teaching hospital serving the community of Yonkers, N.Y. The St. Joseph's Family Health Center serves as the model unit where our residents work and is also the main outpatient facility of the hospital. The objective of our study was to determine the incidence of asymptomatic gonorrhoea prospectively and randomly, in our female patients, to form guidelines to separate high from low risk patients, and to discuss the question of whether gonococcal screening should be performed routinely in females.

**Patterns in hospitals' use of a regional poison information center.**

Chafee-Bahamon C; Caplan DL; Lovejoy FH Jr  
Am J Public Health, Apr 1983, 73 (4) p396-400, ISSN  
0090-0036 Journal Code: 3XW  
Languages: ENGLISH

A statewide poison center undertook a study to identify types of hospitals which used its information services. Initial trends in calls from hospitals to the center over the center's first two years and percentages of hospitals' patient caseloads for which the center consulted were analyzed for 104 acute care hospitals by hospitals' location, size, and emergency room staffing. After the center's establishment as a regional resource, emergency room staff in urban teaching hospitals showed the greatest increase in calls within a year (88 per cent) and the highest consultation rates for poison patients seen (57 per cent). Private physician emergency room staff, and staff in distant and rural hospitals, showed lower or no increases in calls and lower consultation rates. Findings suggest that private physician emergency room staff and staff in distant and rural hospitals be considered for poison center outreach. Marketing of consultation services for non-pediatric overdoses is also indicated.

**Patients' priorities for medical care.**

Fletcher RH; O'Malley MS; Earp JA; Littleton TA; Fletcher SW  
; Greganti MA; Davidson RA; Taylor J  
Med Care ,Feb 1983, 21 (2) p234-42, ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

Relatively little research has been done on the importance patients attach to various aspects of their medical care when their options are constrained. We studied priorities for care among 225 patients attending the medical clinics of a university teaching hospital. Eight attributes of medical care were considered: continuity, coordination, comprehensiveness, availability, convenience, cost, expertise, and compassion. Priorities were established by the method of paired comparisons. Continuity of care was the highest priority for these patients, while cost and convenience were lowest. Priorities varied in subgroups of patients defined by demographic, illness, and utilization characteristics. Patients with acute problems preferred coordination and expertise, while those with chronic problems ranked continuity higher. Patients younger than 30 years old valued coordination most; older patients preferred continuity and comprehensiveness. Since all aspects of medical care cannot be provided to all people, and choices are necessary, patients' priorities should be considered when planning health services.

**Utilization of computers in clinical practice--role of physician networks: preliminary communication.**

Anderson JG; Jay SJ  
J R Soc Med ,Jan 1983, 76 (1) p45-52, ISSN 0141-0768  
Journal Code: JX1

Languages: ENGLISH

This study examines the influence of physician networks on the utilization of computers in clinical practice. Data on patient referrals, consultations, professional discussions, and on-call coverage were collected from 24 physicians who comprise a private group practice. Their utilization of a computerized hospital medical information system (HIS) in caring for patients admitted to a 1160-bed private, university affiliated, teaching hospital was determined. A matrix representing the professional relations among these physicians was subjected to smallest space analysis, a form of multidimensional scaling. Also, a number of indices that

describe structural and interactional properties of the network and individual physicians were computed. The three-dimensional representation of the network that resulted from the analysis suggests a two-step process of adoption and utilization of medical technology. Physicians who were engaged in outside professional activities and in the training of medical students and house staff were more likely to utilize the system in caring for patients. These physicians, who were more centrally located and dominant in the referral and consultation process, were more likely to influence the practice patterns of their colleagues. The use of network analysis to identify influential physicians whose involvement is essential to the success of efforts aimed at introducing computers into clinical practice is discussed.

**Success with an inpatient geriatric unit: a controlled study of outcome and follow-up.**

Lefton E; Bonstelle S; Frengley JD  
J Am Geriatr Soc ,Mar 1983, 31 (3) p149-55, ISSN  
0002-8614 Journal Code: H6V

Languages: ENGLISH

To assess the worth of a newly established geriatric unit, outcomes for 50 subject patients cared for on this unit were compared with outcomes for 50 control patients. Both groups of patients were hospitalized in Highland View Hospital, the chronic illness and rehabilitation section of a major teaching hospital in Cleveland, Ohio. Analysis of admission data showed the two groups to be closely comparable. All patients were managed by multidisciplinary teams, and the length of stay of both groups was comparable. The discharge data showed that the subject patients were more independent, with significantly greater numbers improving in ambulation and significantly more subject patients being discharged to a home setting. Although the patients in the control group were discharged at lower levels of function, they showed improvement at follow-up. Follow-up data also showed that both groups largely remained in their discharge environments. Explanations for these findings are discussed. The results of this study support the establishment of geriatric inpatient units.

**Planning high-carbohydrate, high-fiber diets with a microcomputer.**

Suitor CW; Suitor RF; Adelman MO  
J Am Diet Assoc ,Mar 1983, 82 (3) p279-82, ISSN  
0002-8223 Journal Code: H6F  
Languages: ENGLISH

Current research suggests that a diet high in carbohydrate and fiber (HCF) may be useful in the management of diabetes mellitus, hypercholesterolemia, and hypertriglyceridemia. To meet the needs of our clinic population, a microcomputer program has been developed that allows for individualization of HCF menu patterns that satisfy both the diet prescription and the patient's preferences. Educational materials were prepared to guide and augment the HCF diet instruction. It is hoped that this comprehensive approach to diet planning and teaching can be applied in similar settings to facilitate the delivery of quality patient care.

**A practicum for oral cancer teaching.**

Barr CE; Goldberg MD  
J Dent Educ ,Mar 1983, 47 (3) p160-2, ISSN 0022-0337  
Journal Code: HY7  
Languages: ENGLISH

This article describes a hospital-based method for teaching oral cancer to general practice residents, which involves the use of patients for whom the residents are responsible. The residents present prepared cases of patients of the hospital dental department according to a predetermined protocol. These conferences begin with a talk on a subject germane to the cases being presented and include complete documentation of clinical history and laboratory findings, photographs, projection of microscope slides of the lesion, and a thorough discussion of therapy and rehabilitation. The residents have had significant contact with the cancer patients from the time of initial patient complaint to completion of therapy. The practicum is based on thorough case review and builds on didactic information provided in the undergraduate dental school curriculum.

**An overview of patient satisfaction with psychiatric treatment.**

Kalman IP  
Hosp Community Psychiatry ,Jan 1983, 34 (1) p48-54, ISSN  
0022-1597 Journal Code: GCJ  
Languages: ENGLISH

Patient satisfaction with psychiatric treatment can strongly influence pursuit and use of mental health services as well as treatment compliance and treatment outcome. Although assessment of patient satisfaction is crucial to designing effective mental health programs, no standard methodology exists to measure satisfaction; thus it is difficult to

compare findings from different satisfaction studies. The author examines the studies in four areas of satisfaction research: patient satisfaction with treatment, with participation in research, with participation as subjects in psychiatric teaching, and with involuntary commitment. He notes the variance between mental health professionals' expectations of patient satisfaction and the higher satisfaction that patients themselves report. He also discusses the need for more study of the subjective experience of patients who participate in research projects, teaching conferences, and observed psychotherapy and who undergo involuntary commitment.

**Clinical causes and classification of perinatal mortality in Lagos.**

Abudu O; Akinkugbe A  
Int J Gynaecol Obstet ,Dec 1982, 20 (6) p443-7, ISSN  
0020-7292 Journal Code: E4T  
Languages: ENGLISH

Perinatal deaths in singleton births at the Lagos University Teaching Hospital during a 5-year period were reviewed. Causes of deaths were classified into eight groups using a modified form of the Aberdeen classification. Perinatal mortality was high (42.5/1000 total births). The stillbirth rate was 32.5/1000 total births. The major causes of perinatal mortality were trauma (30.5%), low birth weight (23.9%), hemorrhage (13.7%), toxemia of pregnancy (10.3%) and mature, cause unknown (10%). Congenital malformation (4.3%) was not a major cause of perinatal deaths in this study.

**The prenatal pediatric visit revisited.**

Berger LR; Rose E  
Clin Pediatr (Phila) ,Apr 1983, 22 (4) p287-9, ISSN  
0009-9228 Journal Code: DHE  
Languages: ENGLISH

The potential value of prenatal interviews with pediatricians was explored through interviews with 20 low-income women in their last trimester of pregnancy. Major areas of attention included prenatal concerns, psychosocial assessment, and anticipatory guidance. Important issues of relevance to pediatric care emerged, including gaps of parental knowledge, lack of financial and emotional support, and anxieties about the infant. Prenatal pediatric visits also served to encourage the involvement of fathers in pediatric care and to establish an ongoing professional relationship with the pediatrician. In health care settings where comprehensive, coordinated care is often lacking--such as teaching hospitals or county clinics--pediatric providers must take the initiative if families are to be reached prenatally.

**Design considerations for a medical school hospital cancer patient data system.**

Hokanson JA; Costanzi JJ; Smith MS; Richard P; Dugat PS  
Cancer ,Apr 15 1983, 51 (8) p1556-61, ISSN 0008-543X  
Journal Code: CLZ  
Contract/Grant No.: CA-17701  
Languages: ENGLISH

Tumor registries abound, but there are few that successfully incorporate information age data management resources. This article describes the evolutionary process of designing, implementing, and maintaining a computer-based cancer patient information system for a medical school hospital. The primary requirement was that accurate information about the cancer experience at University of Texas Medical Branch (UTMB) be readily available. Since the tumor registry staff were not data processing professionals, this system had to use commonly available, well documented, readily maintained, and easily used data management resources. The UTMB registry, as documented by the marked increase in frequency and scope of use, demonstrates that a quality information resource can have a significant impact on hospital cancer programs and could serve as a prototype for other institutions having similar needs.

0230348 83128196

**Colonoscopic polypectomy in a regional teaching hospital.**

Minopoulos GJ; McIntyre RL; Lee EC; Kettlewell MG  
Br J Surg ,Jan 1983, 70 (1) p51-3, ISSN 0007-1323  
Journal Code: B34  
Languages: ENGLISH

Five hundred and thirty-five polyps were found in 200 patients over 6 years at a regional teaching hospital. Eighty-five per cent of the patients were from the hospital area yet the presentation of the patients, the complications of polypectomy, the size, distribution and histological features of the polyps were similar to large series reported from metropolitan specialist centres of referral both in this country and the USA. However, a smaller proportion of our polyps were over 1 cm diameter. Between 25 and 53 per cent of patients had recurrent or residual polyps on the second and third colonoscopy. Patients with two or more polyps at the first endoscopy were significantly more likely (P less than 0.01) to have further polyps at follow-up. We therefore recommend that patients with colonic polyps are colonoscoped annually until free from polyps for 2 years, before being placed on colonoscopic review at 5-year intervals.

**Work sampling: a means of determining physiotherapy activities and reviewing caseloads.**

Allen JM

Physiother Can, Jan-Feb 1983, 35 (1) p31-5, ISSN 0300-0508 Journal Code: PCP

Languages: ENGLISH

Work sampling is a tool used to examine the activities involved in performing a job. A work sampling study was designed to examine the components of physiotherapy care in a 350-bed teaching hospital. The components were related to a physiotherapist's activities and included an examination of the time related to patient treatment, attendance at meetings, record-keeping and preparation, travel, teaching, continuing education (in-service), talking to colleagues (doctors, occupational therapists), and other activities. The purpose of the study was to quantify a therapist's nontreatment activities, and to compare observations concerning treatment with the work sampling data obtained in compliance with the Canadian Schedule of Unit Values and, in particular, its weighted units. The study showed that there was no difference between the "observed" time (sampling time in percentage of total time) spent in direct patient contact, and the weighted units, when the latter was converted to a percentage of time. The Nova Scotia government's standard of 50 000 work units per year was found to be useful in justifying staffing levels; a useful indicator of productivity was also developed using weighted units expressed as a percentage of worked or paid hours. Work sampling would thus appear to be a useful tool for physiotherapy department managers.

**Comparison of two teaching methods for self-care training for patients with chronic obstructive pulmonary disease.**

Brough FK; Schmidt CD; Rasmussen T; Boyer M

Patient Couns Health Educ, 1982, 4 (2) p111-6, ISSN 0190-2040 Journal Code: PAL

Languages: ENGLISH

Group instruction in self care is a widely used adjunct to the medical management of chronic obstructive pulmonary disease (COPD). Such classes are neither convenient nor accessible to all COPD patients, however, especially those in rural areas. A self-teaching module could be a practical means of serving hard-to-reach patients. This study compares the results of a self-teaching module with those of an established group method in teaching 13 self-care skills to COPD patients.

On referral from their physicians, patients in eight rural locations were randomly assigned to receive training through a group or a self-teaching process. Knowledge gain, skill attainment, skill implementation, and beneficial results were measured at the end of instruction and again six months later.

The two teaching methods were compared by analyzing the data on 34 patients matched for the variables of smoking, diagnosis, and severity of disease. No statistically significant difference was observed between the two educational methods in any of the parameters measured. The

fact that approximately three out of four patients benefited through either process suggests that the self-teaching module is as effective as group instruction.

**Women refused second-trimester abortion: correlates of pregnancy outcome.**

Binkin N; Mhango C; Cates W Jr; Slovis B; Freeman M  
Am J Obstet Gynecol ,Feb 1 1983, 145 (3) p279-84, ISSN  
0002-9378 Journal Code: JN1

Languages: ENGLISH

Little is known of the outcome of pregnancy in women denied abortions in the United States. To address this question, we studied the pregnancy outcomes in 316 low-income women who were denied second-trimester abortion at a large, metropolitan teaching hospital in the Southeast between August, 1978, and July, 1979. Follow-up information was available on 82%. One in five women denied an abortion managed to obtain one elsewhere.

Earlier gestational age at the initial abortion request, higher education level, and higher income were the best predictors of whether a woman subsequently obtained an abortion. For the women who continued their pregnancies, neither the rate of serious maternal complications nor the neonatal death rate was increased when compared with that of the rest of the hospital's population.

**Pedestrian traffic in a paediatric ward.**

Grant VJ

NZ Med J ,Feb 9 1983, 96 (725) p91-3, ISSN 0028-8446  
Journal Code: OBG

Languages: ENGLISH

On three separate occasions, between May 1980 and May 1982, observations were made of the number of people entering a six cot room in a paediatric ward between 6 am and 6 pm. The number of different people interacting with one unaccompanied child was also counted and in the 1982 study, the child's responses were described in detail. Results showed that more than 300 entrances by 100 different people occurred each day. It is suggested that such social demands on an unaccompanied child in the psychologically vulnerable age group may add to the stress of a hospital stay.

A large, continuing outbreak of infection and colonisation with a Staphylococcus aureus which is resistant to methicillin and gentamicin is reported. Affected patients and staff members seen between September, 1980, and August, 1981, are reviewed in detail. Methods of management of such persons and their treatment, if required, are discussed. The antibiotic-resistant Staph. aureus is readily disseminated in hospitals and may cause outbreaks of infection in wards, which require isolation of affected patients in the attempt to control the problem. It is suggested that a special isolation unit is needed. Use of the few effective antibiotic agents should be restricted. Despite these measures, the spread of this organism may not be contained.

A computer-assisted learning program in respiratory intensive care was introduced into the undergraduate curriculum at University College Hospital. Educational effectiveness was assessed. This method of learning was found to be highly acceptable to students. The improvement in students knowledge of the subject was up to three times greater in those who used the computer program, than a control group of students who received only teaching by conventional means, (P = 0.016). The results of a questionnaire designed to elicit students' attitudes to this learning experience are discussed.

**Dermatologic practice: implications for a primary care residency curriculum.**

Branch WT Jr; Collins M; Wintroub BU

J Med Educ ,Feb 1983, 58 (2) p136-42, ISSN 0022-2577

Journal Code: J13

Languages: ENGLISH

The problems encountered, diagnostic procedures performed, and treatments prescribed in dermatology were studied in a primary care practice and in a dermatology clinic. Referrals from a primary care practice to a dermatology practice were analyzed. It was determined that nine disease categories accounted for more than 75 percent of the problems encountered in both settings. Only one diagnostic procedure was performed commonly in both the primary care and dermatology practices--skin scraping for fungal infection. Approximately 90 percent of the treatments prescribed in both settings fell within 13 categories. It is proposed that these findings be the basis for designing the curriculum in dermatology for residents in primary care medicine. The curriculum also should provide practical experience in dermatology and familiarity with selected, rarely encountered dermatologic conditions that have important therapeutic implications.

**Attitudes of nonpsychiatric physicians toward psychiatric consultation.**

Cohen-Cole SA; Friedman CP  
Hosp Community Psychiatry ,Dec 1982, 33 (12) p1002-5,  
ISSN 0022-1597 Journal Code: GCJ  
Languages: ENGLISH

The authors report on an opinion survey of 200 nonpsychiatric attending physicians at a university teaching hospital about the process and outcome of consultation psychiatry. Over-all, physicians felt that 37 per cent of their patients had problems with significant psychological components, but that consultation was indicated for only 11 per cent. Physicians reported a high level of global satisfaction with consultations; 68 per cent were satisfied frequently or almost always. Factor analysis reduced consultees' evaluations of 18 different consultation activities to five dimensions, with patient disposition considered the most important and services to medical and ward staff the least important. Analysis of differences by specialty revealed that family medicine physicians seemed the most oriented to psychological issues and surgeons the least.

**Clinical pharmacy services in a pediatric ambulatory care clinic.**

Edwards R; Adams DW  
Drug Intell Clin Pharm ,Dec 1982, 16 (12) p939-44, ISSN  
0012-6578 Journal Code: EBU  
Languages: ENGLISH

The implementation of pharmacy services in an ambulatory pediatric clinic has met with initial success in acceptance by the medical and nursing staffs, the administrator, and the patient population. Errors in medication dispensing and prescription labeling have decreased, and patient understanding of prescribed therapy has improved. The number of ER visits by clinic patients has been reduced since the implementation of our service. The importance of patients' understanding directions for use and of dispensing medications in childproof containers for the pediatric population cannot be overstressed. A future goal of our service is to expand the pharmacist's clinical role to allow further participation in pharmacokinetics, specialty clinics, teaching, and patient education. Further documentation of the value of such services is essential to the expansion of the pharmacist's role in patient care.

surgical residents could evaluate their residency program. It was answered anonymously by 344 residents, four times during a 2-year period, at different stages of training. The answers were analysed, comparing individual hospitals and individual programs within the department. The weaknesses and strengths of the department could be identified by the residents. This identification of problems has brought about major changes in the attitudes of staff surgeons towards teaching. The authors believe that the residents' opinions are essential to amend and improve the quality of postgraduate education.

An annual survey of emergency medicine (EM) graduate physicians from 31 programs was conducted from 1977 through 1979. Results of the 1979 data are presented. Practice patterns show that 96% of the EM graduates are providing patient care, and almost half are working in the states in which they trained. Of those caring for patients, 38.8% practice in an urban location and only 7% work in rural hospitals. Learning new skills and procedures and retaining skills are major problems faced by physicians in rural locations. Other activities of EM graduates include teaching medical students and residents, administration, research, and community emergency medical services. Data are analyzed with attention to long-term commitment to emergency medicine. Implications for manpower needs are suggested.

Languages: ENGLISH

During the course of a 7-day voluntary rubella vaccination program conducted at a large community-teaching hospital, 718 hospital workers were vaccinated, an overall vaccination rate of 29%. During and after the vaccination campaign, physicians, employees, and students were surveyed as to their reasons for accepting or rejecting rubella vaccine. Prior to the campaign few hospital workers realized that rubella vaccination was of importance in their case. Although paycheck notices, newsletters, and poster displays were all effective in publicizing the campaign, hospital workers most frequently cited discussions with other workers as the major factor leading to their acceptance of vaccination. The belief that a history of rubella, diagnosed clinically, was adequate assurance of immunity was common among physicians and employees and was the major obstacle to greater success in the campaign. Vaccine reactions were infrequent and mild and did not lead to excessive employee absenteeism.

**Customizing infection control educational programs within the health care facility. Meeting a challenge vs. just satisfying a requirement.**

Christel LP

Am J Infect Control .Nov 1982. 10 (4) p138-46. ISSN 0196-6553 Journal Code: 4T6

Languages: ENGLISH

Infection control practitioners working within health care facilities are charged with the providing of in-service education programs for all new employees and volunteers as well as for all hospital departments, at least annually. To be effective, each program should be customized to meet the needs of the group for which it is given. Such a charge may be viewed as simply a "requirement that must be satisfied," or it may be approached as a challenge to be met with a measure of ingenuity and inventiveness. Academic preparation in the principles and skills germane to teaching are traditionally lacking in the training of health care professionals, and the ICP is thus left accountable for a job function for which she/he may have little proficiency. Customized education programs may be achieved with thoughtful planning and through the use of a few innovative ideas and resource materials available to most practitioners.

**Contractual relationships between colleges of pharmacy and university hospitals.**

Gourley DR; Fine DJ  
Am J Hosp Pharm ,Dec 1982, 39 (12) p2102-4, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

The relationships that exist between colleges of pharmacy and university hospitals located in academic medical centers were investigated, and the types of pharmaceutical services that are being offered by these institutions were profiled. Questionnaires were mailed to 35 directors of pharmaceutical services located in academic medical centers. Of the 30 institutions represented by respondents, 27 had a college of pharmacy on the same campus, and 13 had a formal agreement between the hospital and the college. Ninety-seven percent of the hospitals surveyed had unit-dose or partial unit-dose programs, and all of the hospitals had i.v. admixture services. Nine of the 13 hospitals with formal agreements and 13 of the 17 hospitals without formal agreements had decentralized pharmaceutical services. The staffing patterns in these institutions showed that only 10.3% of the pharmacist FTE positions were funded by the college of pharmacy. There was no difference in trends as related to faculty appointment, title, or tenure between directors in hospitals with and without affiliation agreements. Seven of the directors of pharmacy were in tenure-track positions, and the director's reporting mechanism in the college was either to the dean or the chairman of pharmacy practice. No differences were found between the pharmaceutical services offered, staffing patterns, or status of the director of pharmacy in hospitals with or without formal agreements with colleges of pharmacy. These authors believe that a firm relationship between the college and hospital might prove advantageous to both parties.

**The practice of hospital epidemiology.**

Hierholzer WJ Jr  
Yale J Biol Med ,May-Aug 1982, 55 (3-4) p225-30, ISSN  
0044-0086 Journal Code: XR7  
Languages: ENGLISH

The practice and methodology of hospital epidemiology in infection control have begun to mature. At the same time, there is need for an institutionally based clinical epidemiologist to assist in several other mandatory patient care-related programs in the hospital. Hospital epidemiology programs should recognize this need, the parallels in other programs, and the unique opportunity to bring to hospital in-service, teaching, and research, epidemiologic methodology as a natural extension of its present role.

Languages: GERMAN Summary Languages: ENGLISH

During the years 1974-1980, 19 of 17,285 inpatients of the divisions of internal medicine of two teaching hospitals showed a probable or definite adverse drug reaction (ADR) which was considered to be a major cause of death. In 7 patients the decisive ADR occurred during the hospital stay. The overall mortality from ADR is 0.040%. For each therapeutic group of drugs the following rate of drug-related death was calculated: for anticoagulants 0.047% (3/6378 inpatients), for cardiac glycosides 0.016% (1/6368), for analgesic/antirheumatic drugs 0.014% (1/7112) and for cytostatic drugs 0.38% (2/531). In 12 patients the ADR was already present on hospital admission.

In a survey conducted by the authors, volunteer faculty members were found to be generally satisfied with their role in medical education, despite their acknowledgement of problems involving respect and responsibility when working with academic colleagues. These problems and the indifference of the volunteers to them are delineated. The structural reasons for simultaneous recognition of an indifference to problems are discussed in relation to the erosion of the utilization and authority of volunteer faculty members.

**Pharmacist involvement in a diabetic education centre.**

Kanitz J; Birken B; Ward V  
Can J Hosp Pharm ,Jul-Aug 1982, 35 (4) p114-5, ISSN  
0008-4123 Journal Code: D2K  
Languages: ENGLISH

During the past two years, a multi-discipline health team has been meeting with selected diabetic "problem" patients on a regular basis at the North York General Hospital (NYGH). The patients are referred to the programme by their physicians when they appear to be having difficulty handling or coping with their diabetes. The participants in the programme attend the Diabetic Education Centre (DEC) for one week as day patients in the hospital and are exposed to various types of counselling from members of the Diabetic Education Centre Team (DECT), one of which is the pharmacist. Follow-up from this week of intensive education is made at annual intervals. The main purpose of the pharmacist in the clinic is to provide information for the patients regarding their prescriptions and over the counter (OTC) medication. This is achieved by means of individual patient interviews and informal group discussions, as well as rounds with other team members and contact with patients' families. This programme provides a forum for the patient and the patient's family to obtain valid information about diabetes, as well as problems associated with the disease, and aids in coping with these problems. The team concept enables the patient to be analyzed by all disciplines in order to assess his teaching needs and fulfill them. The pharmacist is continually involved in this information system and plays a valuable role on the team.

**Analyzing the factors contributing to rising laboratory costs.**

Tydeman J; Morrison JI; Cassidy PA; Hardwick DF  
Arch Pathol Lab Med ,Jan 1983, 107 (1) p7-12, ISSN  
0363-0153 Journal Code: 79Z  
Languages: ENGLISH

A new method for analyzing factors that contribute to the rising costs of hospital laboratories was used to analyze data from a Canadian teaching hospital for the period of 1971 to 1981. Results indicated that real cost per acute care admission has doubled, primarily because more tests are performed and the factors of production in laboratories are costlier. Increasingly sophisticated technology in the laboratory has increased productivity, and thus reduced cost per test; however, increased intensity of testing apparently has not been accompanied by reduced length of stay.

**Extended care in nursing homes: a program for a county teaching medical center.**

Breitenbacher RB; Schultz AL  
Ann Intern Med ,Jan 1983, 98 (1) p96-100, ISSN

0003-4819 Journal Code: 5A6

Languages: ENGLISH

A continuity care program for patients in nursing homes using internal medicine residents in training has been developed in a county teaching hospital. Resident physicians on a paid basis assume primary care responsibility for 1000 patients in 29 private community nursing homes. A faculty internist coordinates the activities of the residents and monitors patient care through an extended care office in the county hospital. The program has produced a significant upgrading of the continuity and quality of care of patients in these nursing homes as well as providing medical residents with geriatric and nursing home experience. The increased sensitivity and concern for the needs of nursing home patients developed by the medical residents seems to continue after they complete their training.

**Workload, space, and personnel of clinical chemistry laboratories in teaching hospitals.**

Elin RJ; Robertson EA; Sever G  
Am J Clin Pathol ,Dec 1982, 78 (6) p839-46, ISSN  
0002-9173 Journal Code: 3FK  
Languages: ENGLISH

The resources needed to operate a clinical chemistry laboratory are known only as rough approximations. In order to gather more information about these resources, a 13-page questionnaire was completed by 50 pathology departments of which 38 departments provided adequate information about their clinical chemistry section to permit adequate data analysis. This study provides the results for resource and workload factors, and significant regression analyses among these factors for the whole clinical chemistry section and the subsections of general chemistry, urinalysis, endocrinology, enzymology, lipid analysis, and toxicology. These data provide a basis for evaluating the current needs of clinical chemistry and for making projections for the future.

**Carcinoma of the uterine cervix: results of radiation therapy at a regional community teaching hospital.**

Boulware RJ; Rogers JD; Neglia WJ

South Med J ,Nov 1982, 75 (11) p1339-41, 1344, ISSN 0038-4348 Journal Code: UVH

Languages: ENGLISH

We analyzed the results of radiation therapy for carcinoma of the uterine cervix in 144 patients treated at a regional referral hospital. The local control was good in early stage disease, with only two pelvic failures in 92 stages I and II patients. Survival at 40 months was 86%, 83%, 48%, and 75% for stages I, IIA, IIB, and IIB (barrel-shaped lesions), respectively. Many IIB lesions could have been staged as IIB (barrel-shaped lesions). Control and survival in late disease was poor. The complications were minimal.

**[Consultation and liaison psychiatry--a contribution to the holistic thinking in medicine]**

Konsiliar- und Liaisonpsychiatrie--ein Beitrag zum ganzheitlichen Denken in der Medizin?

Wildbolz A

Schweiz Arch Neurol Neurochir Psychiatr ,1982, 131 (1) p81-8, ISSN 0036-7273 Journal Code: UDS

Languages: GERMAN Summary Languages: ENGLISH

After some introductory remarks about consultation and liaison psychiatry, the psychiatric consultation and liaison service in the general university hospital of Bern is presented. It has a statistically expressible exterior activity and an interior activity. It gives its contribution to holistic medical thinking in the fields of patient care, teaching, research, expertising and public relations. Problems of integration of consultation and liaison psychiatry and their possible overcoming are discussed on the base of two other studies of this author. The importance of creating psychiatric services in general hospitals is emphasized.

**Management of imperforate anus at the Lagos University Teaching Hospital, Nigeria: a review of ten years' experience.**

Adeyemi SD; de Rocha-Afodu JT

Prog Pediatr Surg ,1982, 15 p187-94, ISSN 0079-6654 Journal Code: Q50

Languages: ENGLISH

Sixty cases of imperforate anus treated at the Lagos University Teaching Hospital, Nigeria between 1969 and 1979 are reviewed. Late presentation at our hospital was a remarkable feature. Although there were only 18 attempts at Wangenstein-Rice (Wangenstein and Rice 1930) inversion radiograms using all the information available, it was possible to categorize 27 children as having high and 17 as having a low-type imperforate anus. Only 16 of the children with high lesions have had abdominoperineal pull-through procedures with an operative mortality of 31%. Eleven definite procedures for low lesions were carried out in newborn infants. The rest were decompressed either by a colostomy or a congenital fistula and are waiting for definite surgery. One child died before any surgical treatment. Some of the problems related to the outcome of treatment of this disease in our hospital are late presentation, inadequate facilities and shortage of specialized personnel, problems peculiar to a developing country. We suggest an urgent colostomy performed under local anaesthesia as a safe and expedient treatment for babies with obstruction and in whom the presence of a translevator anomaly cannot be immediately verified.

**The influence of obstetricians on the utilization of amniocentesis.**

Bernhardt BA; Bannerman RM

Prenatal Diagn ,Apr 1982, 2 (2) p115-21, ISSN 0197-3851 Journal Code: PJ7

Languages: ENGLISH

A study of 173 Western New York State obstetricians was undertaken to study referral patterns for second-trimester amniocentesis in 1974-1978. Referral patterns were analysed in relation to obstetrician age, religion, board certification, hospital affiliation and practice location. Forty-seven per cent of the obstetricians had never referred a patient for amniocentesis. Those referring were overall younger than those not referring and were significantly more often board certified. Obstetrician religion was significantly related to referral with fewer Catholic obstetricians referring. Hospital affiliation (teaching versus non-teaching) and obstetrician practice location (urban versus rural) were not important factors after controlling for religion and board certification. Obstetrician factors account for a small but important part of the variability in referral, and other factors, such as cost and access to laboratory and obstetric care need further investigation.

**The effect of structured and unstructured pre-operative teaching: a replication.**

King I; Tarsitano B

Nurs Res ,Nov-Dec 1982, 31 (6) p324-9, ISSN 0029-6562  
Journal Code: O9K

Languages: ENGLISH

This study conducted an approximate replication of the Lindeman and Van Aernam study (1971) on a sample of 49 patients from a large metropolitan hospital. Factors controlled in this study that were not present in the original study included sample restrictions to patients of three surgeons with similar techniques and to patients having lower or upper abdominal surgery. Structured pre-operative teaching was conducted primarily by the principle investigator and associate and a check list was used to indicate that the patients could perform the deep breathing, coughing, and exercises. For this sample, using  $p = .05$ , structured pre-operative instruction improved significantly the ability of the patients to deep breathe and cough post-operatively as measured by pulmonary function tests. Hypothesis I was supported. Structured pre-operative instruction did not reduce significantly the mean length of hospital stay and hypothesis II was not supported.

**The teaching of crisis counseling skills to pediatric residents: a one-year study.**

Jewett LS; Greenberg LW; Champion LA; Gluck RS; Leikin SL; Altieri MF; Lipnick RN

Pediatrics ,Dec 1982, 70 (6) p907-11, ISSN 0031-4005  
Journal Code: OXV

Contract/Grant No.: CA 21241

Languages: ENGLISH

Pediatric residents should learn to manage family crises such as informing parents that their child has a potentially life-threatening illness. Unfortunately, few training programs prepare residents to counsel parents of a child with cancer. An experiential parent crisis counseling program has been developed at the Children's Hospital National Medical Center in Washington, DC; this program has demonstrated that pediatric residents, with limited instruction, can be taught to give bad news to parents using effective information-giving and interpersonal skills.

**Therapeutic drug monitoring: a survey of sub- and supra-therapeutic serum drug levels in a large teaching hospital.**

Frewin DB; Shaw DR; Bochner F

NZ Med J ,Nov 10 1982, 95 (719) p774-6, ISSN 0028-8446  
Journal Code: OBQ

Languages: ENGLISH

One thousand five hundred serum drug levels lying outside

the defined therapeutic range have been followed up by the clinical pharmacology service at the Royal Adelaide Hospital over a thirteen month period. It was found that digoxin, phenytoin and theophylline were the most frequently monitored drugs. Blood levels outside the therapeutic range tended to be on the high side with digoxin, but were usually sub-therapeutic for the other two. Drug related toxicity was observed in 11.2 percent of those with a high serum level. Several potential drug interacting situations were also noted during the study. The value of therapeutic drug monitoring, to maximise efficacy of therapy and minimise side effects, is stressed. However, correct blood sampling, based on a knowledge of the clinical pharmacology and pharmacokinetics of the drug, must be performed in order to obtain optimal benefit from this exercise.

**League tables of biochemical laboratory costs. An attempt to modify requesting patterns.**

Grivell AR; Forgie HJ; Fraser CG; Berry MN

Med J Aust ,Oct 2 1982, 2 (7) p326-8, ISSN 0025-729X  
Journal Code: M26

Languages: ENGLISH

"League tables", ordered by potential cost of biochemical laboratory tests requested, were distributed at four-week intervals to all medical specialists of a 500-bed tertiary care teaching hospital, Flinders Medical Centre, Adelaide, in an attempt to reduce the workload of the laboratory. This information feedback did not appear to have any effect on over-all laboratory utilisation or on any individual requesting pattern. However, much useful information on laboratory use was collated and summarised. It appears that more active intervention is required to eliminate unnecessary requesting of laboratory tests.

**Geriatric medicine: a multidisciplinary training and education model in an acute care medical center.**

Crooks V; Lee P; Yoshikawa TT  
J Am Geriatr Soc ,Dec 1982, 30 (12) p774-80, ISSN  
0002-8614 Journal Code: H6V  
Languages: ENGLISH

A description of a comprehensive multidisciplinary education and training program in geriatrics in an acute care hospital is presented. A brief review of the history of medical education in geriatrics is examined, and the need for and potential of a hospital-based training program is discussed. The methods used in implementing an education program that attracts house staff physicians and other health professionals are described. The program incorporates the application of a multidisciplinary team model of patient assessment and treatment, which is augmented by clinical bedside teaching and a broad-based educational program. Using hospital-wide faculty, the program includes a geriatrics/gerontology lecture series incorporating presentations on the biopsychosocial aspects of aging and a diversity of subjects relevant to aging. Other programs such as weekly house staff topic sessions on aging, interdisciplinary research seminars, orientations, and special symposia are all part of the education program.

**Medical care in a geriatric psychiatry unit: impact on psychiatric outcome.**

Weingarten CH; Rosoff LG; Eisen SV; Grob MC  
J Am Geriatr Soc ,Dec 1982, 30 (12) p738-43, ISSN  
0002-8614 Journal Code: H6V  
Languages: ENGLISH

The medical care of 49 randomly selected patients admitted to a geriatric psychiatry evaluation unit was assessed to determine the impact on psychiatric care and outcome. Medical factors were identified as directly causing psychiatric symptoms in 12 of the 49 cases, whereas psychiatric

decompensation was precipitated by medical illness in 25. Previously undiagnosed significant medical problems were found in ten patients. In 25 cases concomitant medical illness had a major effect on psychiatric treatment, and in 23 the course of the medical illness affected psychiatric outcome. Seventy-nine per cent of the patients had at least moderately improved at the time of discharge, and most were able to return to their homes. Improvement in medical condition was correlated significantly with psychiatric improvement. Implications for the care of geriatric psychiatry patients are discussed.

**Pyramidal training: a large-scale application with institutional staff.**

Page TJ; Iwata BA; Reid DH  
J Appl Behav Anal ,Fall 1982, 15 (3) p335-51, ISSN  
0021-8855 Journal Code: HDR  
Languages: ENGLISH

This study evaluated an indirect method of training 45 institutional direct care staff to conduct behavioral programs. Three supervisors were trained to improve teaching behaviors (instructions, prompts, and consequence) used by the direct care staff while working with severely and profoundly handicapped residents. In addition to training, daily feedback was provided to supervisors regarding performance of their staff. Results of a multiple baseline analysis across teaching behaviors (instructions, prompts, and consequences) and content areas (communication and gross motor skills) showed that providing training and feedback to supervisors resulted in increases in correct teaching behavior by direct care staff. However, teaching behavior newly learned in one content area (communication) did not generalize to the other area (gross motor skills). Data collected on resident behavior showed small but noticeable improvement in terms of correct responses and attending behavior during programming. Results are discussed in terms of the benefits of a pyramidal approach to training institutional staff.

**Contributions in teaching consultation-liaison psychiatry. The use of the medical team model on a consultation-liaison teaching service.**

Guggenheim FG

Gen Hosp Psychiatry .Sep 1982, 4 (3) p219-24, ISSN

0163-8343 Journal Code: FNK

Languages: ENGLISH

This paper describes a consultation-liaison (C/L) teaching service that uses a medical team rounding model; four teams cover distinct geographic areas of the hospital, each team consisting of an attending psychiatrist, a resident, two medical students, and a psychology graduate student. Daily attending rounds on the medical/surgical wards provide prompt and direct patient care supervision for the team members, allowing for coordination of their activities and communication with the attending physician, who serves as a role model. Psychological testing can be readily integrated into the clinical setting; neurology and family practice residents can also get their psychiatric training in this setting. The medical team model of rounding is different from other models used on C/L services; its pros and cons are discussed.

0222890 83054595

**Evaluative research in consultation-liaison psychiatry. Review of the literature: 1970-1981.**

McKegney FP; Beckhardt RM

Gen Hosp Psychiatry .Sep 1982, 4 (3) p197-218, ISSN

0163-8343 Journal Code: FNK

Languages: ENGLISH

In the last decade, the biopsychosocial concept of medicine had flourished clinically in the form of consultation-liaison (C-L) psychiatry. However, full acceptance by the medical profession will depend, in part, upon scientific demonstration that psychological and social factors influence biological medical illness, and that C-L psychiatric teaching and patient intervention can improve the medical treatment of patients. This review surveys the literature over the last 10 years that describes and evaluates C-L activities as they impact upon clinical medicine and medical education. A conceptual grid for organizing research in the field is presented that distinguishes decision-oriented, or descriptive studies, from conclusion-oriented, or outcome studies. Further, this grid specifies the focus of the C-L activity, either the patient or health care professional. It seems clear that the very recent shift from descriptive studies to more outcome-oriented research, particularly regarding patient outcomes, should be the direction of the future. A greater emphasis on defining the exact components of C-L work that are most useful is also indicated. Several other specific recommendations for evaluative research in C-L psychiatry conclude this review. (182 Refs.)

**General internal medicine reappears in the teaching hospital: the experience of the Royal Victoria Hospital.**

Kong HH; Flegel KM; Coke W; Hoey JR

Can Med Assoc J .Nov 1 1982, 127 (9) p837-40, ISSN  
0008-4409 Journal Code: CKW

Languages: ENGLISH

The internal medicine unit of the Royal Victoria Hospital in Montreal was created in 1979 to improve the training of residents and the care of patients. The practices of four internists were brought together in one part of the institution, and within 2 years there were 10 attending staff and 6 residents. The unit now provides continuing care for 2500 patients, many of whom have multisystem or potentially lethal problems. Residents and attending staff share the responsibility of providing 24-hour coverage. The group handles 5000 outpatient visits per year (20% of them being consultations) and provides a general medical consulting service for other hospital departments, with about 300 consultations per year. The creation of the unit, with highly visible role models, appears to have given new prestige to general internists in the hospital. The unit has served as a model for the reorganization of the other medical clinics and provides a base for research in health care delivery.

**Subspecialty consultations in a teaching hospital.**

Rosansky SJ; Hoey JR; Seely JF

Can Med Assoc J .Oct 15 1982. 127 (8) p711-3. ISSN

0008-4409 Journal Code: CKW

Languages: ENGLISH

A chart review of 60 consultations by the nephrology service of a teaching hospital was carried out to determine their diagnostic and therapeutic utility. General medicine residents on elective rotations in nephrology performed 72% of the consultations, only 26% being written by residents in the subspecialty. Consultants made an average of 2.2 diagnoses per patient, of which 57% confirmed the working diagnosis already in the medical record. They made an average of 3.0 recommendations for further investigation per patient, but referring physicians implemented only 58% of these. An average of 1.6 recommendations for therapy were made per patient, of which 64% were implemented. The apparent neglect of the consultant's advice for investigation and therapy suggests that the written consultation to some extent fails to convey information useful for the referring physician and the patient. Further study is needed to determine if this failure reflects inadequate training of house officers as consultants.

**Telemedicine in northern Quebec.**

Roberge FA; Page G; Sylvestre J; Chahlaoui J

Can Med Assoc J .Oct 15 1982. 127 (8) p707-9. ISSN

0008-4409 Journal Code: CKW

Languages: ENGLISH

Television transmission of diagnostic and educational information can help to improve specialized medical care in remote and underserved areas. This paper describes a pilot study in which the Canadian satellite Anik-B was used to link the James Bay area in northern Quebec with two large Montreal teaching hospitals. Broad-band real-time television was well suited for tele-education and teleconsultation activities. A much less costly method, using narrow-band slow-scan television, was also examined, but it requires improvements. The technology of telemedicine is in place, but its future use is impeded by the prohibitive costs of operating an efficient two-way broad-band television system for several remote health care sites. A solution to this problem may be an intermediate-band system combining some of the low-cost features of narrowband slow-scan television with the interactive high-resolution advantages of broad-band real-time television.

**The characteristics of stat laboratory tests.**

Chu RC; Williams SV; Eisenberg JM

Arch Pathol Lab Med .Dec 1982. 106 (13) p662-5. ISSN

0363-0153 Journal Code: 79Z

Contract/Grant No.: HS 02577

Languages: ENGLISH

We studied the use of stat (ie, statim--as soon as possible) laboratory tests at a university teaching hospital. For the 20 most frequently performed tests, 35.7% of the determinations were performed on a stat basis. The frequency with which a test was ordered on a stat basis ranged from 6.0% (for ESR) to 61.5% (amylase level). The proportion of laboratory test requests from a hospital service that were ordered stat ranged from 3.8% (orthopedic surgery) to 100% (emergency services). The daily number of regular laboratory test requests decreased significantly over the weekend, but the daily number of stat requests fell less sharply. The number of requests for routine tests decreased after 6 pm, but the number of requests for stat tests remained relatively constant until about midnight.

**Supervising intake diagnosis. A psychiatric 'Rashomon'.**

Spitzer RL; Skodol AE; Williams JB; Gibbon M; Kass F  
Arch Gen Psychiatry ,Nov 1982, 39 (11) p1299-1305, ISSN  
0003-990X Journal Code: 72C

Languages: ENGLISH

Psychiatric diagnoses based on data collected during routine clinical intake evaluations done by trainees are often later used in research studies and in program evaluation. It is commonly assumed that the supervisory process can effectively overcome errors that trainees make in diagnosis. We designed a study to assess the adequacy of patient-in-absentia supervision for ensuring accurate psychiatric diagnoses. In 30% of the cases there were major diagnostic disagreements between the supervised diagnoses and consensus diagnoses based on information provided by both the trainee and an experienced clinician who sat in on the trainee's initial interview. These findings have implications for clinical care, training, and research.

**Emergence of occupational medical services outside the workplace.**

Rosenstock L; Heyer NH  
Am J Industr Med ,1982, 3 (2) p217-23, ISSN 0271-3586  
Journal Code: 3IN

Languages: ENGLISH

A new type of occupational medicine clinic has recently emerged in the United States. These clinics are multispecialty in staffing, are located in hospital outpatient departments, and are affiliated with academic medical centers. Their primary goal is to provide personal health and medical services including diagnosis, treatment, and follow-through of occupationally related diseases. Approximately 15 such clinics have been established in the last several years. A review of the medical, economic, and social forces that have historically shaped the content and scope of occupational medical and health services for workers explains in large part the reasons why many of these clinics have now come into being. Characteristics of eight of these clinics are reviewed in detail. These clinics provide a setting for interdisciplinary and interspecialty education of personnel and offer the medical community a demonstration of a means for better recognition and treatment of occupationally related illnesses.

**Computed tomographic studies of the head in a teaching hospital and a community hospital: a comparison.**

McNeil BJ; Kirkwood JR; Hanley JA; Polak J; Wilkinson R; Funkenstein HH

Radiology ,Nov 1982, 145 (2) p367-70, ISSN 0033-8419  
Journal Code: QSH

Languages: ENGLISH

This investigation compared the use of computed tomography (CT) of the head at a large primary medical-school-affiliated hospital and at a large community hospital. There were two aims: first, to study the intrinsic characteristics of the patients in an attempt to determine the potential for developing accurate discrimination algorithms; and second, to study the patterns of neurodiagnostic tests used at these facilities. The results indicated that separability of patients into normal and abnormal categories at both institutions was extremely small. In addition, there was no significant difference in the numbers of types of ancillary tests used at both institutions. Overall, these data once more confirm the difficulty of altering CT usage patterns in primary or secondary hospitals without significantly affecting the number of abnormal patients identified.

**Interdisciplinary teaching of community paediatrics.**

Wallgren-Pettersson C; Donner M; Holmberg C; Wasz-Hockert O  
Med Educ ,Sep 1982, 16 (5) p290-5, ISSN 0308-0110

Journal Code: MZ3

Languages: ENGLISH

An experiment of combining decentralized and interdisciplinary teaching is described. Seminars were arranged at a district hospital for medical, nursing and social work students to discuss families with a chronically ill child. The purpose of these seminars was to teach co-operation between different health care workers, and to stress the importance of becoming acquainted with the family situation, and learn what a child's illness means to the whole family. An evaluation of the first three seminars shows that this type of teaching was very well received by the students, professionals and families concerned. The students considered house calls an important part of their education and felt that more interdisciplinary teaching should be included in their curriculum. In addition to the teaching aspect, the families involved also considered the seminars a positive experience as they receive more information about their child's disease, and deficiencies in treatment could be corrected.

**A description of a means of improving ambulatory care in a large municipal teaching hospital: a new role for nurse practitioners.**

Becker DM; Fournier AM; Gardner LB  
Med Care ,Oct 1982, 20 (10) p1046-50, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

We describe a nurse practitioner program that has improved ambulatory care in a large municipal teaching hospital. The significant feature of this program is an expanded role for nurse practitioners in the follow-up of patients with complicated illnesses. Benefits of this program include improved continuity of care and an easing of the house staff's service burden. Similar use of nurse practitioners at other municipal teaching hospitals would be a useful approach to problems in quality of care and continuity of care.

**Ward sister--teacher or facilitator? An investigation into the behavioural characteristics of effective ward teachers.**

Marson SN  
J Adv Nurs ,Jul 1982, 7 (4) p347-57, ISSN 0309-2402  
Journal Code: H3L  
Languages: ENGLISH

The ward sister role is increasingly coming under study. This paper summarizes research into learning in the ward environment. The study being one of several on a similar theme, to have been published in the past 2 years. The research concentrated in particular on the behavioural characteristics of trained nurses perceived as good teachers. Attitudes and perceptions of teaching and learning were investigated by interviewing trained and trainee nurses. The data concerning good teachers collected at interviews were developed into a questionnaire and the results factor analysed. In the third phase of the study trained

nurse-trainee verbal communications were observed and analysed to determine any relationship between verbal behaviours and effective teaching. The findings of the study led to the conclusion that on the job teaching of nurses is a complex global act in which the role model presented to the learner has a powerful influence while it could not be said conclusively that a link between effective teaching and verbal behaviour was identified, a trend towards a more participative mode of communication was noted in two identified good teachers.

**Increasing occurrence of methicillin-resistant Staphylococcus aureus in the United States.**

Boyce JM; Causey WA  
Infect Control ,Sep-Oct 1982, 3 (5) p377-83, ISSN 0195-9417  
Journal Code: GTM  
Languages: ENGLISH

Although several outbreaks of methicillin-resistant Staphylococcus aureus (MRSA) infections have been reported in recent years, the geographic distribution and frequency of MRSA infections in American hospitals is unknown. We conducted a questionnaire survey to determine the magnitude of the problem. Data from 261 hospitals were included in the survey. MRSA were reported by 145 hospitals located in 36 states. Large hospitals reported these organisms significantly more often than small hospitals (p less than .001). University hospitals reported MRSA more often than community or community-teaching hospitals (p less than .001 and p less than .005, respectively). The number of hospitals reporting MRSA increased from 24 in 1975 to 112 in 1980 (p less than .001. Our data suggest that MRSA are widely distributed geographically and that the number of hospitals with these organisms has increased dramatically since 1975. (68 Refs.)

**Results of highly selective vagotomy in a non-university teaching hospital.**

Busman DC; Munting JD  
Br J Surg ,Oct 1982, 69 (10) p620-4, ISSN 0007-1323  
Journal Code: B34

Languages: ENGLISH

Clinical and laboratory results are presented of 229 patients treated by highly selective vagotomy for duodenal ulcer in a non-university teaching hospital. Sixty-two per cent of the operations were performed by residents as part of their training. After 1-8 years follow-up (97 per cent complete) there were 22 recurrences (9.6 per cent). The residents had fewer recurrences than the consultants, but their patients follow-up was shorter. The usual Visick grading is presented (1, 2: 83.5 per cent; 3, 4: 16.5 per cent) as well as an additional way of grading described by Visick in 1948 which suggests that 4 per cent appear to be permanent failures. Mortality rate was 0.4 per cent, complications rate was low and side effects were in general of minor importance. Laboratory results are presented showing that the basal acid output (BAO) was reduced permanently by 65 per cent, and the PAO by 50 per cent. In patients with recurrences BAO was not reduced and the PAO was less reduced than in the non-recurrence group. Metabolic parameters did not deteriorate. Basal serum gastrin rose after operation while serum vitamin B12 remained constant with a minimal tendency to decrease.

**The clinical pharmacist as a member of the burn team.**

Anderson PD; Wachtel TL; Frank HA; Trubo BG  
Contemp Pharm Pract ,Spring 1982, 5 (2) p120-3, ISSN  
0162-3761 Journal Code: D09

Languages: ENGLISH

Pharmacists are becoming involved increasingly in a patient care. At the University of California, San Diego Medical Center, a pharmacist has become a member of the multidisciplinary burn team. Through participation in work rounds and team conferences, the pharmacist has had a considerable beneficial impact on drug therapy, drug dosing, monitoring adverse drug reactions, and total parenteral nutrition. Specific benefits to patient care that the pharmacist provides are discussed and also the benefits derived in using a burn unit as a clinical teaching rotation for pharmacy students. The pharmacist has found his association with the burn unit to be professionally rewarding and the attending surgeons and surgical house staff have found his input to be valuable. The authors encourage other burn units to enlist a pharmacist as part of their burn team.

**Prenatal drugs: patient information and its source.**

Doering PL; Brackbill Y; McManus K; Woodward L; McClave JT

Contemp Pharm Pract ,Spring 1982, 5 (2) p112-9, ISSN  
0162-3761 Journal Code: D09

Languages: ENGLISH

Pregnant women consume numerous medications, some of which are potentially harmful to the fetus. It is especially important that these women are provided with information about these drugs. This study was undertaken, in part, to document the amount of information pregnant women have about the drugs they consume and the sources of their information. Study participants were 304 women selected at random from the postpartum inpatients at a teaching hospital. Mothers were interviewed to obtain drug exposure data and to determine what, if any, information they had about the drugs. The source of information for each drug consumed was also determined. Results show that pregnant women have little information for each drug they consume. Mothers most often cited primary medical personnel (physicians and nurses) as sources of information about specific drugs. In contrast, only six patients cited the pharmacist as a source of information about specific drugs. However, patients ranked the pharmacist high as a source of general drug information. This report emphasizes the need for more drug information for pregnant women and highlights the role of the pharmacist in providing such information.

**Pediatric cardiac catheterization with same-day discharge.**

Waldman JD; Young TS; Pappelbaum SJ; Turner SW; Kirkpatrick SE; George LM

Am J Cardiol .Oct 1982. 50 (4) p800-3. ISSN 0002-9149  
Journal Code: 3DQ

Languages: ENGLISH

A system was developed for cardiac catheterization in children without overnight hospital stay (called same-day discharge). Over a 4 year period, 233 children (aged 5 weeks to 20 years) had catheterization with same-day discharge staying an average of 11.8 hours in the hospital. In all but 1, no problems occurred after hospital discharge; 1 child required readmission for psoas tendinitis after retrograde aortography. Same-day discharge was safely applied regardless of the patient's age, diagnosis, and use of systemic heparinization, large-bore sheaths, retrograde arterial catheterization, or cineangiography. The hospital-related cost of pediatric cardiac catheterization was reduced 29% compared with that of the standard 42 hour hospital stay. Same-day discharge provides attractive elements to the physician and institution involved in cardiac catheterizations, for example: (1) improved medical care by a decrease in the length of hospitalization, (2) a significant reduction in medical costs, and (3) elimination of time pressure in training and teaching as well as therapeutic decision-making. Critical factors for the successful application of same-day discharge are coordination of multiple health care professionals and physician judgment of the patient's clinical status. We speculate that reassessment of other hospital-oriented procedures may foster the development of methods for improving medical care or reducing cost, or both.

Languages: ENGLISH

This article describes a study undertaken to evaluate the Walk-In and Telephone Inquiry Service provided by a social work department in a general hospital division of a large, voluntary, metropolitan teaching hospital. The major social work function provided in such a service is information and referral; to provide this service, a psychosocial evaluation and counseling are essential. This service is valuable to and utilized by many individuals, professionals and community agencies. It can become the point where individuals enter the health care system. Issues related to policy making, institutional costs and cost benefits are discussed.

**Reimbursement for residency training: how many times?**

Garg ML; Elkhatab M; Kleinberg WM; Mulligan JL  
Med Care ,Jul 1982, 20 (7) p719-26, ISSN 0025-7079

Journal Code: LSM

Languages: ENGLISH

Through an investigation of charges generated for 105 patients treated for congestive heart failure, three issues of reimbursement policy for graduate medical education are examined: 1) reimbursement policy by third parties for resident salaries and for the portion of teaching physicians' time devoted to graduate medical education; 2) the level of involvement for physicians in dual roles as attending physicians for private patients when simultaneously engaged in graduate medical education and supervising patient care delivered by residents; and 3) the greater utilization of hospital resources in teaching units. The results demonstrate that the reimbursement policy, as presently practiced, ignores the basic differences in the level of involvement between teaching and nonteaching physicians. The data also show for the first time the incremental effect of graduate medical education in a teaching hospital. Several alternatives are suggested to eliminate the deficiencies.

**Closure among U.S. community hospitals, 1976-1980: a description and a predictive model.**

Mullner RM; Byre CS; Levy PS; Kubal JD  
Med Care ,Jul 1982, 20 (7) p699-709, ISSN 0025-7079

Journal Code: LSM

Languages: ENGLISH

Closure of U.S. community hospitals during the years 1976-1980 is analyzed by describing the distributional patterns of closings among hospitals classified by certain institutional characteristics: bed size, number of facilities and services, ownership, teaching status, location in a Standard Metropolitan Statistical Area (SMSA) or in a non-SMSA, and location in one of the nine United States Census Divisions. The method of Cox regression analysis is used to show that each of these institutional characteristics is independently, and significantly, associated with closure, and to estimate the strength of the association. On the basis of this analysis, a theoretic model is constructed for estimating the relative probability of closure for any community hospital with a given set of these institutional characteristics.

**An education program which prepares nurses to teach breast self-examination.**

Kochanczyk ML  
JOGN Nurs ,Jul-Aug 1982, 11 (4) p222-4, ISSN 0090-0311

Journal Code: KS2

Languages: ENGLISH

The importance of competent and regular breast

self-examination in the early detection and improved outcome of breast cancer cannot be emphasized enough. In their contacts with women, nurses are in an opportune position to promote BSE through education and demonstration. Breast self-examination is an area where many nurses are not comfortable. However, with planned and organized instruction, professional nurses can assume the role of teaching this important skill. Breast self-examination can then be incorporated into any clinical setting where professional nursing is practiced.

**The operation of a radiology consultation service in an acute care hospital.**

Baker SR  
JAMA ,Nov 5 1982, 248 (17) p2152-4, ISSN 0098-7484

Journal Code: KFR

Languages: ENGLISH

The operation of a radiology consultation service in an acute care teaching hospital is described. The radiologist acts as an active advisor in the structuring of diagnostic evaluations in three disease categories; biliary tract disease, nonemergency gastrointestinal tract bleeding, and abdominal mass. There was a 64% reduction in the time needed to establish a diagnosis and a 32% decrease in the number of studies for each patient on the consultation ward compared with a control group, which consisted of patients with similar clinical presentations. A formal partnership between clinician and radiologist serves two important functions in teaching hospitals. It can simultaneously expedite diagnostic evaluations and teach the best utilization of imaging examinations.

**The effects of psychological factors on recovery from surgery.**

George JM; Scott DS  
J Am Dent Assoc ,Aug 1982, 105 (2) p251-8, ISSN  
0002-8177 Journal Code: H5J  
Languages: ENGLISH

This paper has reviewed correlational studies from both inpatient hospital settings and outpatient oral surgery that demonstrate that several psychological factors are related to postsurgical recovery. Examination of these factors indicates that dentists might improve patients' recovery by giving the surgery a more positive meaning (making the outcome seem desirable), improving patients' acceptance of their condition, making patients' expectations more positive and, reducing anxiety about recovery. Other psychological factors may be helpful in identifying patients who need more support, for example, those with higher trait anxiety, vigilant coping behavior, or an internal locus of control. The review of intervention studies indicates that the best preparation techniques include giving positive suggestions and teaching coping techniques. The value of giving increased amounts of information has not been demonstrated. Also, the literature is not conclusive on varying the type of preparation to fit the personality traits of patients. (46 Refs.)

**Self-detection of a breast mass in adolescent females.**

Hein K; Dell R; Cohen MI  
J Adolesc Health Care ,Aug 1982, 3 (1) p15-7, ISSN  
0197-0070 Journal Code: HAM  
Contract/Grant No.: RR05-393-19  
Languages: ENGLISH

The frequency of self-discovered breast masses in adolescent females has not previously been described. The histologic diagnosis rather than the means of detection has been the focus of previous surveys. Seven characteristics of 95 patients admitted from 1968-1979 for the evaluation of a

breast mass were delineated. The mean age at hospitalization was 15.9 years (range 12-20). The delay from detection to hospitalization was 7.2 months (range 0.5-72). In 77 cases the mass was detected by the patient; 11 were found during a physician examination, 4 by a family member, and 3 by an unrecorded source. Diagnoses were fibroadenoma (71), abscess (11), cyst (9), lipoma (2), and cystosarcoma phyllodes (2). The median length of the masses was 2.6 cm, width 2.3 cm, with a median mass area (diameter x length) of 6 cm<sup>2</sup>. When patients were compared for age, delay in hospitalization, means of detection, family history, and mass size, the girls with abscesses were younger and had a shorter time delay before hospitalization. Self-discovery was the means of detection in 77 of 95 (81%). The means of detection is an important factor to consider in weighing the merits of teaching breast self-examination procedures to adolescent females.

**Financing graduate medical education: an update and a suggestion for reform.**

Hadley J; Tigue P

Health Policy Educ ,Jul 1982, 3 (2) p157-71, ISSN

0165-2281 Journal Code: G2I

Contract/Grant No.: HCFA 95-P-97176/3-02

Languages: ENGLISH

This article reports data pertinent to three issues in the financing of graduate medical education: sources of funds for house staff support, the financing of faculty salaries for educational activities, and reimbursement bias in favor of care provided in inpatient settings. Using data from a 1979 hospital survey, we estimate that total expenditures for house-staff stipends and fringe benefits were almost \$1.6 billion. Eighty-seven percent of these funds were derived from patient care revenues. Faculty salaries for educational activities added another \$376 million to the cost of graduate medical education. Teaching hospitals collected 81 percent of their charges for inpatient care, but only 72.8 percent of charges for outpatient care. However, Medicare and Medicaid reimbursed approximately the same proportion of charges in both settings. The article concludes by arguing that a unified-charge system for paying teaching hospitals would eliminate most of the issues currently associated with the financing of graduate medical education as matters of public policy.

**An analysis of hospital costs by cost center, 1971 through 1978.**

Ashby JL Jr

Health Care Financ Rev ,Sep 1982, 4 (1) p37-53, ISSN

Journal Code: GHX

Languages: ENGLISH

Hospital cost analyses generally have not used costs broken down by hospital department or function due to the unavailability of appropriate data. The Medicare Cost Reports display direct cost by cost center, and the Health Care Financing Administration (HCFA) funded a project to abstract, edit, and categorize these data from a sample of 457 hospitals into meaningful groups. The author used the resulting data base to analyze trends in hospital costs, with cross tabulations by a hospital's teaching status, type of control, and bed size class, from 1971 through 1978. The author also used this data base to preliminarily assess whether

introduction of the Medicare Section 223 reimbursement limits altered cost center growth trends. The study found that the largest cost increases occurred among Ancillary Services. It also found slightly higher than average increases in Inpatient Services (concentrated in Special Care Units), and General Services increased at a below average rate. Outpatient Service costs escalated rapidly in absolute terms but rose much more slowly in per unit terms. The fastest growing cost quantity in the study was Other Ancillary Services, a miscellaneous group encompassing many of the new advanced technology services, which increased at a rate of 24 percent per year between 1973 and 1978. The study found costs per unit of output to be positively associated and bed size across all cost center categories, including General Services, where some evidence of economics of scale might have been expected. The study found no evidence that the Section 223 limits affected cost growth longitudinally, but an understanding of the impact of these limits will require considerably more study.

**Alternative to the traditional discount method of wholesaler purchasing.**

Lee GF; Bair JN; Piz JW

Am J Hosp Pharm ,Jul 1982, 39 (7) p1192-4, ISSN

0002-9289 Journal Code: 3IO

Languages: ENGLISH

A program of purchasing drugs from wholesalers at the wholesaler's exact invoice cost plus a percentage is described and compared with the traditional method of average wholesale price (AWP) less a discount. The comparison was conducted by the pharmacy department of a 310-bed, teaching hospital that awarded a one-year contract to a wholesaler offering its items at the exact cost plus a pre-established percentage. Data collected from monthly wholesaler computer printouts gave the following information on each product: (1) list price per item, (2) actual cost to pharmacy per item, (3) percentage discount from AWP, and (4) quantity ordered. The net percentage discount from AWP for 12 months was calculated and compared to the former (traditional) discount rate. The net discount from AWP was 15.6% for purchases made by the hospital during the first 12 months of the program. When compared with the smaller discount the hospital traditionally received, the new program saved the hospital \$5758 on annual purchases of \$136,419. The actual dollar savings to an institution that changes from a traditional discount program to a cost-plus-percentage program depends on: (1) the negotiated percentage added to wholesaler cost, (2) the discount from AWP that the institution was previously receiving, and (3) the volume of wholesale purchases.

**Team approach in providing clinical pharmacokinetic services.**

Maddox RR; Lampasona V  
Am J Hosp Pharm ,Jul 1982, 39 (7) p1186-9, ISSN  
0002-9289 Journal Code: JIO  
Languages: ENGLISH

A team approach to clinical pharmacokinetic services at a university hospital is described. The clinical pharmacokinetics team (CPT) developed as an outgrowth of a clinical pharmacokinetic service (CPS) as the workload of the service expanded. The CPT serves to: (1) maximize the quality and continuity of clinical pharmacokinetic care; (2) provide a teaching medium for students at the baccalaureate and graduate level; and (3) stimulate the development of clinical pharmacokinetic research. The CPT is responsible for patients in those medical services that are not regularly served by a clinical pharmacist. The structure of the CPT includes an attending clinical pharmacist with a hierarchy of subordinate practitioners ranked by their individual didactic and clinical experience in pharmacokinetics. Students participate in (1) work rounds, where collective discussions of patient evaluations occur, and (2) one-to-one student-preceptor clinical assessments of patients' drug therapy. The attending clinical pharmacist conducts CPT rounds daily, and the students and residents must convey information to the team on: (1) the drug therapy prescribed and the appropriate monitoring methods, (2) the working diagnosis and plan of treatment, (3) results of laboratory and clinical assessments, and (4) details of patient interviews. The CPT is also responsible for ongoing clinical pharmacokinetic research. The team approach to clinical pharmacokinetic services has provided a framework for the education of clinical pharmacists while stimulating research and providing direct patient care.

**Outcome-based doctor-patient interaction analysis: II. Identifying effective provider and patient behavior.**

Carter WB; Inui TS; Kukul WA; Haigh VH  
Med Care Jun 1982, 20 (6) p550-66, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

Three interactional analysis (IA) systems (Bales', Roter's modified Bales and Stiles' "Verbal response modes") were used to characterize behavioral elements of provider-patient dialogues of 101 new-patient visits in a general medical clinic. In a previous article, the explanatory power of these IA systems was compared. In this article, specific provider and patient behaviors within segments of the encounter (introduction-history, physical examination and conclusion), which were shown to be related to encounter outcomes of knowledge, compliance and satisfaction, were examined. Review of interactional behaviors entering regression analysis with a significant F-to-enter ( $p$  less than or equal to 0.05) and supplementary contextual analyses suggested the importance of several categories of physician and patient behavior. Behaviors manifesting tension bear important and complex relationships to encounter outcomes. For example, patient and physician expressions of tension generally bear strong negative relationships to patient satisfaction, while patient expressions interpreted as tension release are positively related to both satisfaction and compliance. The timing of other behaviors appears to be critical to subsequent outcomes.

If patient requests for medication occur early in the encounter, this behavior is positively related to subsequent patient satisfaction. However, if they occur in the concluding segment, a negative relationship results. Finally, several relationships taken together indicate that physician teaching in the concluding segment may be important. While useful observations may emerge from application of currently available IA techniques, the resulting information is best characterized as hypothesis-generating. These IA systems have many limitations, and research is needed to derive more clinically oriented systems that may permit more consistent demonstrations of critical process-outcome relationships.

**Outcome-based doctor-patient interaction analysis: I. Comparison of techniques.**

Inui TS; Carter WB; Kukul WA; Haigh VH  
Med Care Jun 1982, 20 (6) p535-49, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

Interactional analysis (IA) systems have been devised and applied to doctor-patient dialogues to describe encounters and to relate process to outcomes. Prior work in this area has been typified by the use of a single taxonomy for classifying verbal behaviors and limited outcomes (compliance and/or satisfaction). We applied three different IA systems (Bales, Roter's modified Bales with affective ratings, and Stiles' "Verbal Response Modes") to 101 new-patient visits to a

general medical clinic for which multiple outcomes had been determined: several measures of patient knowledge of problems at conclusion of visit; patient compliance with drugs (over the ensuing three months); and patient satisfaction with the visit (perceived technical, interpersonal and communication quality). Within IA systems, cross tabulations and multiple regressions were performed to relate encounter events to outcomes. Across IA systems, multiple regression R2 and R2 adjusted (R2a) for the number of independent variables entering were used to characterize strength of relationships. Roter's IA system showed stronger relationships to outcomes of knowledge (41% R2, 27% R2a) and compliance (44% R2, 28% R2a) than did Bales' or Stiles' systems. R2 for patient satisfaction was identical for Bales and Roter (35%), and greater than R2 for Stiles (14%). We conclude that choice of IA system for research or teaching purposes should be based on behaviors and outcomes of particular interest and importance to the user. Based on audiotape review of tapes, Roter's approach is less time-consuming and may perform as well as more complex systems requiring transcript analysis.

**Evaluation of two nutrition education modules for hospital staff members.**

Looker A; Walker S; Hamilton L; Shannon B  
J Am Diet Assoc ,Aug 1982, 81 (2) p158-63, ISSN  
0002-8223 Journal Code: H6F  
Languages: ENGLISH

Two nutrition education modules for inservice training of hospital food service personnel were evaluated in 16 hospitals. The modules, dealing with cardiovascular disease and diet, contained a leader's guide, a teaching package, audiovisual material, and suggested learning activities. Pretests and post-tests were used to assess knowledge gains resulting from learning sessions. Participants were divided so that one group took the post-tests before the sessions and one group after the sessions. When differences between groups were controlled, the sessions were shown to have a significant positive effect on post-test scores. Three-fourths of the participants rated the sessions as "very good" to "excellent."

Ometer JL; Oberfell MS  
J Am Diet Assoc ,Aug 1982, 81 (2) p129-32, ISSN  
0002-8223 Journal Code: H6F  
Languages: ENGLISH

A model used to identify patients requiring increased nutritional support and to determine priorities and delineate the degree of care required and role responsibilities is described. The model includes three levels of care; Level I is the most basic care and Level III the most intense. Assignment to a level of care is based on the presence, absence, or anticipated development of nutritional problems and/or the degree of dietary teaching required. Within each level of care, practitioner responsibilities have been defined by frequency and by position.

A three-day workshop was designed for practicing oral and maxillofacial surgeons to review the clinical skills needed for preoperative assessment. The intent of the workshop was to prepare participants for broader hospital privileges under the new recommendations of the Joint Commission on Accreditation of Hospitals. The course was characterized by small group interaction and team-teaching involving physicians and oral and maxillofacial surgeons. Instruction included observation of simulated cases, a review of the documentation of such encounters, lecture-discussions, and examination of patients

with positive physical findings.

An antibiotic utilization review was performed for the purpose of determining the frequency and types of infectious diseases presenting to a large, teaching hospital emergency department, and the appropriateness of the use of antibiotics in this setting. In 27% of the visits a diagnosis of an infectious disease was made or an antibiotic was prescribed. The most common presenting diagnoses (comprising more than 75% of cases) were infections of the respiratory tract, skin, urogenital system, and gastrointestinal tract. Penicillins and sulfonamides were frequently prescribed in nearly two-thirds of cases. Antibiotic prescribing was determined to be appropriate in 78% of cases. Inappropriate use most often involved the use of prophylactic antibiotics in clean lacerations and the use of prophylactic antibiotic combination products following trauma to the eye.

Contract/Grant No.: MH-12306; MH-13694  
Languages: ENGLISH

A 12-month postdoctoral specialized residency program in mental-health pharmacy practice with a psychopharmacology research component is described. The resident spent approximately four hours a day in clinical practice and in research activities in the inpatient setting; 10 hours per week in clinical research activities in an ambulatory patient setting; and 10 hours per week in teaching and scholarly activities. The resident was a member of a psychopharmacology research team that also included a research psychiatrist, a nurse, and two psychiatric medical residents at an adult acute-care site. The resident prepared a review of the preclinical evaluations of each investigational drug and participated in the initial screening of study patients. The resident was responsible for patient consent procedures, coordinating clinical evaluations, and scheduling necessary laboratory tests. As a member of the clinical team, she was also responsible for obtaining medication histories, monitoring and reporting adverse drug reactions, maintaining accurate dosage records, and completing the appropriate rating scales in the clinical evaluation of patients. In the ambulatory setting, the resident participated in the outpatient management of study patients. The resident learned to assess patient's clinical progress, maintain progress notes, write medication orders and administer medications in acute situations, maintain individual treatment plans, follow approved drug research protocols, and provide a program of education for patients and families when necessary. In addition, the resident was involved in educational programs for pharmacy students. This training program enables the pharmacist to gain experience in drug research studies, clinical practice, and pharmaceutical education, while contributing to psychopharmacology research.

**Ward environment and disturbed behaviour.**

Bouras N; Trauer I; Watson JP

Psychol Med ,May 1982, 12 (2) p309-19, ISSN 0033-2917

Journal Code: QER

Languages: ENGLISH

Disturbed behaviour and dissatisfaction were studied in relation to two contrasting ward environments, one representing the 'medical model' of psychiatry and the other being a modified form of 'therapeutic community'. Specially designed forms were used for 18 months to obtain daily and weekly measures of behavioural disturbance from the nurses and of dissatisfaction with various aspects of the ward environment from the patients. The results suggested that the 'therapeutic community' ward was significantly more disturbed, and that disturbance on that ward varied according to the day of the week, something which did not happen on the 'medical model' ward. Differences in disturbance between diagnoses were also found. Disturbance was significantly correlated with, and tended to precede, dissatisfaction only in the 'therapeutic community' ward.

Gilbert GL; Asche V; Hewstone AS; Mathiesen JL

Med J Aust ,May 29 1982, 1 (11) p455-9, ISSN 0025-729X

Journal Code: M26

Languages: ENGLISH

Methicillin-resistant Staphylococcus aureus has become an important nosocomial pathogen in the four special-care nurseries in Melbourne during the past two years. Once introduced into a nursery, it can spread rapidly unless specific precautions are taken to prevent it. It has been responsible for a number of serious infections in susceptible infants who have required treatment with the potentially toxic antibiotic agent, vancomycin. Because of the interdependence of the four special-care nurseries, a coordinated approach to infection control is required to minimise the spread of the organism and the associated increased morbidity.

**Epidemic of hospital-acquired infection due to methicillin-resistant Staphylococcus aureus in major Victorian hospitals.**

Pavillard R; Harvey K; Douglas D; Hewstone A; Andrew J; Collopy B; Asche V; Carson P; Davidson A; Gilbert G; Spicer J; Tosolini F

Med J Aust ,May 29 1982, 1 (11) p451-4, ISSN 0025-729X  
Journal Code: M26

Languages: ENGLISH

During 1979, the Victorian Health Commission received reports of a rising proportion of methicillin-resistant Staphylococcus aureus (MRSA) isolates from an increasing number of institutions. At least 31 metropolitan hospitals were involved, and six of these reported MRSA totaling between 20% and 40% of all Staph. aureus isolates. Since that time, the problem has continued. In some university teaching hospitals, strains of MRSA now cause from 200 to 300 new cases of hospital-acquired infection each year. Sepsis occurs mainly in patients who underwent surgery, premature neonates and in the immunocompromised or debilitated patients. The organism involved is multiresistant. Recent isolates show increasing resistance, particularly against gentamicin, chloramphenicol and, more lately, fusidic acid and rifampicin. Only vancomycin can be relied upon for empirical treatment. There is concern that increasing use of vancomycin will select vancomycin-resistant strains of MRSA, so that, in the near future, there may no longer be any effective antibiotic therapy against hospital staphylococci.

**A comparative trial of home and hospital psychiatric treatment: financial costs.**

Fenton FR; Tessier L; Contandriopoulos AP; Nguyen H; Struening EL

Can J Psychiatry ,Apr 1982, 27 (3) p177-87, ISSN 0706-7437  
Journal Code: CLR

Languages: ENGLISH

The financial costs of community-based treatment, stressing home treatment, were compared with the cost of hospital-based treatment during one year. Of 155 patients destined to receive inpatient treatment, 76 were randomly assigned to home treatment, 79 to hospital treatment; the two groups were similar as to important social, demographic, and clinical characteristics. The principal differences between the two treatments concerned the focus of treatment, the locale of

treatment, the degree to which continuity of treatment was maintained, and the roles of the respective treatment staffs. Manpower and operating costs, measured in dollars, were estimated in two ways. Either way, hospital-based treatment was more expensive during the year: 64.1% more expensive (+3,250 vs. +1,980 per patient) in the first instance, 108.9% more expensive (+6,750 vs. +3,230 per patient) in the second. With two exceptions during the first month of treatment, the proportions of patients and families receiving either treatment who incurred other costs of treatment were low, and the differences between groups were not significantly different. A higher proportion of patients and families receiving home-based treatment defrayed the cost of the patient's psychotropic drugs; second, a higher proportion of families of patients receiving hospital-based treatment defrayed transportation costs. The proportions of patients and families incurring costs of the consequences of illness were low, and the differences between treatment groups were not significant. We compared this study with similar studies, discussed the generalizability of the results of this study and similar studies, and identified issues for future research.

**Failure to thrive: diagnostic yield of hospitalisation.**

Berwick DM; Levy JC; Kleinerman R

Arch Dis Child .May 1982, 57 (5) p347-51. ISSN  
0003-9888 Journal Code: 6XG

Languages: ENGLISH

Review of hospital records of 122 infants, aged between 1 and 25 months, admitted to a teaching hospital with the diagnosis of failure to thrive but without an underlying disease apparent at admission, showed that about one-third of them had no diagnosis after evaluation. Thirty-two per cent were thought to have a social or environmental explanation for poor growth, and 31% were given a specific organic or physiological diagnosis. Of the last group, 2 out of 3 were diagnosed as having either gastro-oesophageal reflux or non-specific chronic diarrhoea. Vomiting was often associated with organic or structural disease. On average about 40 laboratory tests and x-ray films were performed per infant, but only 0.8% of all tests showed an abnormality which contributed to the diagnosis of the cause of failure to thrive. Our results stress the importance of social and environmental factors as basic causes of failure to thrive, and suggest that admission to hospital and laboratory testing is unlikely to lead to a specific organic diagnosis in a child whose failure to thrive is unexplained after careful history taking and a physical examination.

**The impact of an educational program on gentamicin use in a teaching hospital.**

Johnson MW; Mitch WE; Heller AH; Spector R

Am J Med .Jul 1982, 73 (1) p9-14. ISSN 0002-9343  
Journal Code: 3JU

Contract/Grant No.: AM 00750; K07NS00623

Languages: ENGLISH

We evaluated the effectiveness of a structured educational program in improving the gentamicin prescribing pattern of physicians in the hospital. Predetermined criteria for acceptable use were based upon the specific indications for initiating the drug therapy, the dosage regimen, and the precautions taken to avoid toxicity. In the preeducation review period, 57 of 109 courses of gentamicin (52 percent) were found acceptable. Following the educational program, 93 of 120 courses (78 percent;  $p$  less than 0.001) were acceptable; indications for gentamicin use that were found unacceptable decreased from 11 percent to 5 percent ( $p$  less than 0.005) and the incidence of excessive doses declined from

21 to 7 percent ( $p$  less than 0.005). We conclude that a structured educational program may improve the prescribing pattern of physicians.

**Teaching home monitoring of blood pressure to adolescents.**

Buckley K; Plaut SM; Ruley EJ

Adolescence .Spring 1982, 17 (65) p189-97. ISSN  
0001-8449 Journal Code: 2H8

Languages: ENGLISH

A videotape and lecture method for teaching the self-measurement of blood pressure were compared in twenty, 13-18-year-old adolescents. The time of instruction and evaluation were monitored in order to assess acquisition of skills and cost-effectiveness. Both methods of instruction were equal in respect to acquisition of skills. The videotape method of instruction was more cost-effective than the lecture method in populations of more than 23.9 patients per year, as long as videotape equipment was already available. If the equipment needed to be purchased, the videotape method became more cost-effective with populations of greater than 93.6 patients per year. It was concluded that health care teams should consider the videotape method as a cost-effective means of instruction when videotape equipment is available. In addition, a health care team which evaluates and follows a substantial number of patients per year for hypertension could realize considerable savings in the use of the newer media.

In 1975, the African Regional Health Education Centre (ARHEC) inaugurated two training programmes in health education: a two-year postgraduate course leading to a master's degree, and a one-year course preparing for a non-graduate diploma. The purpose of the latter was to give advanced training and updating to experienced health personnel who had either received a diploma in health education some years before or had been functioning as health educators. This was intended to be a temporary course, to phase out in three years. However, due to its popularity, it was extended in spite of certain negative aspects, mainly the fact that new graduates often return to their former positions with little opportunity to utilize fully their new skills. Those who succeeded best tried to merge health education with their basic professional practice (for example, nursing with patient education). ARHEC decided therefore to modify the programme of its advanced diploma course, which now provides for the teaching of a basic core of health education subjects to all students, and includes three modules to which students are assigned according to their previous training and their future professional activities: community health education and primary health care; hospital-based patient and family health education; and school health education. The practical field work, which is an essential aspect of the course, is tailored to the interests of students in each module. Preliminary evaluation indicates that this programme provides a better response to the needs of students and their employers and eliminates the problem of two categories of health educators (diploma and masters level). It is intended to create other modules dealing with the media, occupational health, and so on.

**Tracheobronchial foreign bodies: the impact of a postgraduate educational program on diagnosis, morbidity, and treatment.**

Puterman M; Gorodischer R; Leiberman A  
Pediatrics ,Jul 1982, 70 (1) p96-8, ISSN 0031-4005  
Journal Code: OXV  
Languages: ENGLISH

Aspirated foreign bodies (FBs) may remain undetected and cause serious complications. As part of a postgraduate educational program, results of a local survey were presented to the local medical staff in order to increase its awareness of this diagnostic possibility. The present study was carried out in order to evaluate the management of children with tracheobronchial FBs during two 2-year periods, before and after teaching sessions held in December 1976. In comparison with the previous two years during the 1977-1978 period, the percentage of cases in which a positive history of aspiration

was obtained increased from 47.6% to 84.0%; the mean number of hospitalizations due to tracheobronchial FBs decreased from 1.9 to 1.04 per infant, and the mean number of hospital days required for final diagnosis decreased from 17.6 to 5.3. The postgraduate educational program had a positive effect on physician performance and patient care.

Journal Code: M26

Languages: ENGLISH

Annual expenditure on medical research in Australia exceeds 70 million dollars. The scientific community has lobbied the government strongly for an increase in this sum. There has been much less discussion about how the available funds should be distributed. The National Health & Medical Research Council, which provides about one-third of the total support for medical research in Australia has, since 1973, attempted to foster research in various areas of need, while maintaining its traditional support of individual projects. These initiatives are seen as important moves towards a national research policy. The complexities of Australian medical research suggest that increased funding of strong research groups as "centres of excellence" is an important objective, but this must be accompanied by steady encouragement of the whole fabric of research in medical schools and teaching hospitals which are the nurseries of the researchers of the future.

Languages: GERMAN Summary Languages: ENGLISH

After two years' work as lecturers in ophthalmology at the University of Nairobi we report on our experiences in both teaching as well as outpatient and inpatient-care at the Kenyatta National Hospital. Special emphasis is given to the socio-economical background of the public health service in Kenya, to point out the special aspects of day-to-day medical work as well as the different needs of a postgraduate program in ophthalmology in this country. The main purpose of our work, supported by the Federal German Ministry of Economic Cooperation, Munich University Eye Clinic and many other

organizations, was to train ophthalmologists in their own country. Finally, medical research programs currently in progress and concerning special aspects of tropical ophthalmology are reported on. These studies are designed to help find a solution of the problem of blindness, which is briefly analysed, and which is much more urgent in Kenya than in Western Europe.

**After-hours calls: a five-year longitudinal study in a family practice group.**

Bergman JJ; Rosenblatt RA  
J Fam Pract ,Jul 1982, 15 (1) p101-6, ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

The provision of health care outside of regular hours is one of the major challenges in any primary care practice and an important focus of residency teaching in family medicine. In this study were studied the volume and pattern of after-hours calls in a residency based group family practice at the end of the first and fifth year of the practice's existence. During the five-year study interval, the number of registered patients in the practice tripled, whereas the number of scheduled patient visits doubled. After-hours phone calls increased 40 percent, visits 70 percent, and hospitalizations 50 percent. The distribution of calls during the week remained stable over the five-year period, and the problems prompting the calls changed little except for an increase in traumatic injuries and obstetrics, paralleling changes in the services offered by the practice. After-hours utilization decreased as a function of practice volume, suggesting that practice maturation decreases unscheduled demand for medical care. The burden of after-hours calls increased, however, because of the absolute growth in practice size. Residents handled the vast majority of the calls without consultation in both time periods. The rates and patterns of after-hours utilization are strikingly similar to those reported in other studies.

**A long-term geriatric teaching ward in an acute-care hospital: a three-year experience.**

Clarfield AM  
J Am Geriatr Soc .Jul 1982. 30 (7) p457-65. ISSN  
0002-8614 Journal Code: H6V  
Languages: ENGLISH

The development and management of a long-term geriatric ward in an acute-care teaching hospital are described. Structure, function, and costs are discussed, and issues of service and medical education are emphasized. A full geriatric team (physician, nurse, social worker, physiotherapist, and occupational therapist) assessed 165 long-term patients in the general wards of the hospital and accepted 98 for admission to the new long-term geriatric ward. Of these, 31 were discharged; 29 per cent went to a facility that encouraged more independent living. Eighteen patients died during their stay in the geriatric ward; autopsies were obtained in 33 per cent--a higher autopsy rate than the average for general hospitals. General hospitals may continue to have large populations of chronically ill patients. This model for a geriatric ward may offer a way of dealing with a difficult situation.

**Self-instruction and assessment in techniques of intensive care using a computer model of the respiratory system.**

Hinds CJ; Ingram D; Dickinson CJ  
Intensive Care Med .1982. 8 (3) p115-23. ISSN 0342-4642  
Journal Code: H2J  
Languages: ENGLISH

There are considerable logistical difficulties involved in providing an adequate training programme for each new doctor when starting intensive care. One solution is to use an interactive computer terminal and provide programmes for self-instruction and assessment. Using a computer model of the respiratory system linked to a computer-assisted instructional driver we have developed instructional exercises on the management of artificial ventilation and the treatment of respiratory failure. Each teaching session contains explanatory text, multiple choice questions and model simulations. The student can interact with the simulations, appropriate assistance being provided when required, while his answers are marked and assessed with further explanation when necessary. The use of computer models adds a new dimension to computer-assisted learning techniques and is particularly

applicable to intensive care medicine.

**Streptococcal pharyngitis: evaluation of diagnosis by gram stain in a pediatric acute care clinic.**

Funamura JL; Berkowitz CD  
Clin Pediatr (Phila) .Aug 1982. 21 (8) p468-71. ISSN  
0009-9228 Journal Code: DHE  
Languages: ENGLISH

Clinical prediction of streptococcal pharyngitis at the initial visit is often difficult. The applicability of the gram stain in the initial assessment of streptococcal pharyngitis was evaluated by comparing gram stain with ultimate culture results. Positive gram stains showed polymorphonuclear cells and typical gram-positive cocci. Thirty-one physicians rotating through the Acute Care Clinic of a county teaching hospital participated in the evaluation. The sensitivity, specificity, and predictive value of a positive test (PVP) were 62 per cent, 70 per cent, and 47 per cent, respectively. These results were compared to a clinical algorithm and to the results of a group with more expertise in the technique. It is concluded that the gram-stained smear of pharyngeal secretions does not appear to be a practical tool for the diagnosis of streptococcal pharyngitis in a busy pediatric emergency unit of a teaching hospital.

**Expanding the nurse's role to improve preventive service in an outpatient clinic.**

Hoey JR; McCallum HP; Lepage EM  
Can Med Assoc J ,Jul 1 1982, 127 (1) p27-8, ISSN  
0008-4409 Journal Code: CKW

Languages: ENGLISH

To help resolve the conflicting demands of primary and secondary care in hospital medical clinics, a program was developed whereby, with the physicians' agreement, nurses would select and vaccinate clinic patients eligible for influenza vaccination. In a controlled trial the nurses offered vaccination to half of the eligible patients attending morning sessions and vaccinated 35% of them. In contrast, physicians in the afternoon sessions, who were unaware of the program, vaccinated only 2% of similar patients. These results show that, although these physicians agree with guidelines for influenza vaccination, they are not currently providing the service. The use of nursing personnel to provide this and other types of primary medical care for clinic patients is a reasonable alternative.

**Evaluation of a self-teaching program.**

Roberts CR; Hosokawa MC; Walts B; Mueller R  
Patient Couns Health Educ ,4th Quarter 1982, 3 (4)  
p161-5, ISSN 0190-2040 Journal Code: PAL

Languages: ENGLISH

A self-teaching booklet on hypertension was evaluated in two populations: clients attending public health screening clinics and inpatients at a Veterans Administration hospital. Participants were randomized into an education or a control group. Evaluation consisted of measuring knowledge gained from the booklet immediately after reading it and retention of key concepts two weeks later. Men did better than women, and VA

education participants did better than VA controls. No differences were detected between the public health education and control groups or the combined VA and public health education and control groups. The self-teaching booklet alone did not appear to yield a measurable amount of new knowledge. Health professionals, when educating patients and evaluating programs, should consider combinations of educational methods when using self-teaching programs.

**Drug recognition by nurses and anaesthetists.**

Smellie GD; Lees NW; Smith EM

Anaesthesia ,Feb 1982. 37 (2) p206-8. ISSN 0003-2409

Journal Code: 4MC

Languages: ENGLISH

A survey of nurses and anaesthetists in a 500-bed teaching hospital set out to discover how they located a drug container in order to read its label and verify its contents. Members of each group assessed the value of seven factors thought to help in this location and answered questions on personal errors in drug administration. The nurses found the expected position of the drug container in the trolley or cupboard to be the most important factor, followed by the size of the container. The anaesthetists placed the colour of the container as most important, followed by the manufacturer's distinctive container as their second best guide to drug location. This preference for colour and a distinctive container can be used to reduce the chance of confusing drugs locally. A scheme for colour-coding ampoules in broad groups to reduce gross mistakes in the future is presented.

Am J Obstet Gynecol ,Jun 1 1982. 143 (3) p325-39. ISSN

0002-9378 Journal Code: 3NI

Languages: ENGLISH

This review describes the changes in the causes of maternal deaths in a major referral hospital over a span of 55 years. There has been a significant decline in direct maternal deaths from infection, hemorrhage, and toxemia. Continued vigilance is needed since 58% of direct obstetric deaths in our hospital during the last 30 years were considered to have been preventable. Heart disease and nonobstetric infection as indirect causes of maternal deaths have decreased also. Greater effort is necessary to identify those patients with conditions that predispose to indirect deaths and to provide appropriate contraception, sterilization, early pregnancy termination, or optimal multidisciplinary care in a referral hospital.

Mayer D; Driburg B  
Psychiatr Prax ,Nov 1982, 9 (6) p190-2, ISSN 0303-4259  
Journal Code: QCK  
Languages: GERMAN Summary Languages: ENGLISH  
Anyone who tries to convert a Psychiatric Department into a  
hospitable home for the benefit on the inmates and their  
environment, has quite often not reckoned with, the "host",  
that is to say, with the doctors, nurses and the hospital  
staff in general. Hence, it seems that a fundamental change in  
the attitude and consciousness of those who are engaged in  
psychiatry, is just as important as a new treatment concept or  
a new building. The author quotes the Bad Driburg Community  
Hospital as an example: here, planning and construction were  
not the only important factors. The nurses have taken and  
accepted advice with regard to their supervisory functions,  
and in the course of a protracted process they have changed  
their attitude in favour of a psychiatric practice which  
follows a treatment pattern based on a "open-minded" approach  
to community members.

**Five years' experience of a gastroenterology day-case unit.**

Northfield TC; Kirkham JS  
Lancet ,Feb 12 1983, 1 (8320) p342-5, ISSN 0023-7507  
Journal Code: LOS  
Languages: ENGLISH

An inpatient ward has been converted, at low cost, to a gastroenterology day-case unit, which includes a purpose-built endoscopy room and a day-case area. The presence of a day-case ward permits the nursing establishment to be sufficiently flexible to cover the endoscopy room fully, and the hours are suitable for married nurses with families. Patients remain on the same trolley throughout the procedure so that portering delays are avoided, and a good flow system operated by the unit's staff enables endoscopies to be carried out at the rate of one every ten to fifteen minutes. Admissions rose from 1900 to 2700 per year (an average of 12 X 5 admissions per working day, theoretical bed occupancy = 140%). Cost per patient is about half the estimated cost without a day-case unit. The increasing numbers of routine upper gastrointestinal endoscopies are mirrored by a halving of barium-meal examinations.

Quantitative noise analysis of a general surgical ward in a modern hospital showed that the level of noise was in excess of recommended levels and of sufficient intensity to disturb sleep. Individual noises in excess of 50 dB(A) were recorded in every area at all times of the day. Internal hospital sounds were responsible for most noise; staff and audible warning devices were the main sources of noise over 70 dB(A). Octave waveband analysis showed that both the general ward noise and the noise of the air conditioning were in excess of recommended levels.

**Hospital ward layout and nurse staffing.**

Seelye A

J Adv Nurs ,May 1982, 7 (3) p195-201, ISSN 0309-2402

Journal Code: H3L

Languages: ENGLISH

This literature review discusses the evidence that modern wards divided into small bedrooms or bays, require higher nurse staffing levels. Aspects of ward design and operation such as patient privacy, nursing efficiency, patient dependency and ward organization are outlined and methods for establishing staffing levels which take ward design into account are described. The majority of ward evaluation studies concerned with nurse staffing concentrate on two areas, the use of the nurses' time (particularly in travel) and user opinion of wards. The conclusions drawn suggest that the two main measures of ward layout which relate to effective and efficient nursing care are short travel distances and features which facilitate the maximum contact between nurses and patients. Further, how these two principles are incorporated effectively into a ward will depend upon a number of other factors which effect nursing work viz, the number and characteristics of the patients and ward staff and the policies and practices of the nurses themselves. (61 Refs.)

competing successfully in the market and functioning efficiently often depend on a reassessment of the environment. Accordingly, upgraded convenience, comfort, and atmosphere have become major marketing mechanisms for hospitals. This article presents several examples of how hospitals have used design to provide marketing advantages.

Is the deregulatory thrust of this administration having an effect on hospital design and construction? does it threaten to create an expansion and construction free-for-all in the industry? A number of architects and construction industry professionals comment on what effect, if any, they expect deregulation to have on health care construction, as well as the expected effect of financing and management in an increasingly competitive environment.

**A financial planning model for estimating hospital debt capacity.**

Hopkins DS; Heath D; Levin PJ  
Public Health Rep ,Jul-Aug 1982. 97 (4) p363-72. ISSN  
0033-3549 Journal Code: QJA  
Languages: ENGLISH

A computer-based financial planning model was formulated to measure the impact of a major capital improvement project on the fiscal health of Stanford University Hospital. The model had to be responsive to many variables and easy to use, so as to allow for the testing of numerous alternatives. Special efforts were made to identify the key variables that needed to be presented in the model and to include all known links between capital investment, debt, and hospital operating expenses. Growth in the number of patient days of care was singled out as a major source of uncertainty that would have profound effects on the hospital's finances. Therefore this variable was subjected to special scrutiny in terms of efforts to gauge expected demographic trends and market forces. In addition, alternative base runs of the model were made under three distinct patient-demand assumptions. Use of the model enabled planners at the Stanford University Hospital (a) to determine that a proposed modernization plan was financially feasible under a reasonable (that is, not unduly optimistic) set of assumptions and (b) to examine the major sources of risk. Other than patient demand, these sources were found to be gross revenues per patient, operating costs, and future limitations on government reimbursement programs. When the likely financial consequences of these risks were estimated, both separately and in combination, it was determined that even if two or more assumptions took a somewhat more negative turn than was expected, the hospital would be able to offset adverse consequences by a relatively minor reduction in operating costs.

An important decision in planning for a new laboratory is the physical location in relation to other departments. In this article, the author examines the specimen flow, patient and information flow, and the surgical pathology and frozen section services, and explains how consideration of these areas in the planning stages determines the future efficiency of the department.

**Increased recovery of Aspergillus flavus from respiratory  
specimens during hospital construction.**  
Sarubbi FA Jr; Kopf HB; Wilson MB; McGinnis MR; Rutala WA  
Am Rev Respir Dis ,Jan 1982, 125 (1) p33-8, ISSN

0003-0805 Journal Code: 426  
Languages: ENGLISH

An increase in the recovery of *Aspergillus flavus* from respiratory specimens occurred among hospitalized patients during a several-month period in 1977. Notably, 86% of the patients with positive culture results were located in an older hospital section adjacent to a building construction site that created great amounts of dust in the hospital's vicinity. Airborne contamination was suspected and results of air sampling showed *A. flavus* in 80% of old wing patient rooms (average, 8 *A. flavus*/positive room) compared with only 23% of the contiguous newer wing patient rooms (average, 1 *A. flavus*/positive room). Inspection of the main mechanical ventilation units in the two hospital sections disclosed numerous defects in the unit in the old wing and a properly functioning unit in the new wing. After repairing the defective unit, a significant reduction in the recovery of *A. flavus* from clinical and environmental specimens was noted.

Patients at Sheltering Arms Hospital in Richmond, Virginia, receive instruction about their medication by pharmacists and may progress through three levels of teaching, including monitored self-medication. Pre- and posttests are administered to determine the effectiveness of the program and the percentage of patient improvement in recall as a result. Patients who completed the program demonstrated a significant improvement in scores in four out of five testing categories.

**Computer applications in hospital pharmacy practice. II. Manual backup/support system.**

Colaluca DM; Cornelis WA

Hosp Pharm ,Feb 1983, 18 (2) p81-3, ISSN 0018-5787

Journal Code: G98

Languages: ENGLISH

The planning phase of a hospital pharmacy computer system usually does not address the issue of a suitable backup should the computer fail. This article describes a backup system centered around a hard-copy patient medication profile. This profile is built through use of computer-generated duplicate labels and exists for both the unit dose and intravenous admixture services. With this approach, the computer initiates its own support system and thereby eliminates the need for a separate, manually maintained backup system.

0233178 83135216

**Computer applications in hospital pharmacy practice. I. Computer expectations/applications.**

Colaluca DM; Cornelis WA

Hosp Pharm ,Feb 1983, 18 (2) p68-9, 74-6, ISSN 0018-5787 Journal Code: G98

Languages: ENGLISH

Following vendor selection of a pharmacy computer system, attention must be directed toward which computerized functions to include. Although most features are uniform among the various systems, a discussion is presented listing those applications considered the minimum acceptable for any hospital pharmacy computer system. The descriptions focus on computerization of those labor-intensive activities necessary to support drug distribution services. Computerized support of an intravenous (I.V.) admixture and unit dose program centers around label production and charging/crediting functions. Label production is used to generate a manual backup profile and unit dose cart fill list. The scope of information to include on I.V. and unit dose labels is described.

Charging/crediting functions via computer are also discussed, with mention of free-form capabilities. Other computer applications mentioned include: medication profiling, drug interaction flagging, data confidentiality, census support, and hard copy reports. Feature selection depends on the aspects and unique needs that benefit most from computerization.

**Experiences in utilizing the quality circle concept.**

Louie C

Hosp Pharm ,Feb 1983, 18 (2) p63-4, 67, ISSN 0018-5787

Journal Code: G98

Languages: ENGLISH

This article describes an experience with using the quality circle concept in a hospital pharmacy environment. The initial experience was positive in that the staff defined productivity standards for themselves. The staff used their productivity standards to evaluate the perceived problem of understaffing in the department.

The relationship of drug price and purchasing group size was evaluated. Thirty drug line items were studied in 26 private hospital purchasing groups of various sizes. Prices were analyzed relative to purchasing group size, age, and location. Drug prices were negatively correlated to group size in a linear relationship. Prices were significantly lower in groups representing greater than 10,000 beds. No significant relationship was found between group age or location and drug prices. The theory that increasing purchasing group size will result in better contract prices was supported.

**Pharmacy department costs and patient charges associated with a home parenteral nutrition program.**

Brakebill JI; Robb RA; Ivey MF; Christensen DB; Young JH;  
Scribner BH  
Am J Hosp Pharm ,Feb 1983, 40 (2) p260-3, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

The pharmacy department costs of a home parenteral nutrition (HPN) program were identified, and the patient charges for HPN were compared with the charges for hospitalization for parenteral nutrition. Ten patients were randomly selected from 55 patients active in the HPN program at the University of Washington Hospital. Cost identification included quantification of supplies, personnel, equipment, freight, miscellaneous, and indirect costs. Patient charges were identified through billing documents. Charges included clinic visits and laboratory tests. Inpatient charges were identified in a similar manner and included a standard daily hospital charge. Average yearly costs to the pharmacy department were nearly +9000 per HPN patient. Patient charges for HPN were +48.19 per infusion day compared with +205.68 per infusion day for the hospitalized patient. The cost savings of HPN to the patient and the hospital were clearly demonstrated.

The relationships between demographic variables, such as income, age, education, sex, marital status, job categories (nurses, medical technologists, pharmacists, and administrators) and general job satisfaction were studied in a community general hospital. Analysis showed that females were more satisfied than males when income, age, and education were controlled through covariance. Income and age positively affected job satisfaction when sex, marital status, and job categories were controlled through covariance.

**Self-directed learning of hospital pharmacy residents in western Canada.**

Levchuk JW  
Am J Hosp Pharm ,Jan 1983, 40 (1) p78-83, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

The extent of self-directed learning among hospital pharmacy residents in western Canada was studied. A preresidency questionnaire and a postresidency group interview with a set of questionnaires were used. The residents were asked to list learning projects conducted in their residency programs; these learning projects were categorized as self-directed, mutual-agreement, and preceptor-directed. A postinterview questionnaire was used to obtain postresidency measurements of self-directedness and resident autonomy. Twenty-four residents provided data on 164 learning projects. Projects with the most meaningfulness, high achievement contribution, positive motivation, and relevance corresponded with the self-directed approach. Residents who had more meaningful learning entered their residencies with no more self-directedness than other residents, but they did have more autonomy in their residencies. No particular type of project, with respect to learner autonomy, was found to be more problematic than the others. Facilitation of learner autonomy in a hospital pharmacy residency may increase the value of self-directed learning projects in general and improve the resident's self-directedness. Self-directed learning should continue to be part of residency programs.

**Pharmacy-based controlled substances distribution for a university campus.**

Hibbard FJ; Bair JN; Sylvester KL  
Am J Hosp Pharm ,Jan 1983, 40 (1) p74-7, ISSN 0002-9289  
Journal Code: 310  
Languages: ENGLISH

A university-wide pharmacy-based controlled substances distribution system is described. The purchasing and control of controlled substances for the entire university campus is centralized in the hospital pharmacy department. The distribution system uses the concept of restricted versus nonrestricted drugs, where restricted drugs are all Schedule II controlled substances and other drugs needing restrictive control. The restricted or nonrestricted status of a drug is based upon suspected or observed abuse potential. After receipt by the pharmacy, all controlled substances and restricted drugs are stored in a vault. A 24-hour audit-disposition record system is used to control the inpatient distribution of restricted drugs, which are stored in locked cabinets on each nursing unit. In the outpatient pharmacy, a small supply of restricted drugs is stored in a locked cabinet; the inventory is reconciled weekly. Nonrestricted controlled substances, such as phenobarbital and chloral hydrate, are distributed to the inpatient satellite pharmacies and the outpatient pharmacy in the same manner as other prescription drugs. Campus practitioners and researchers order all controlled substances from the pharmacy using the appropriate order forms; each individual is responsible for maintaining a record and control system. A quality assurance program was established to review and improve the quality of service. The centralized pharmacy-based system improved the control, monitoring, and efficiency of controlled substances distribution for the entire university campus.

**System to maximize inventory performance in a small hospital.**

VanDerLinde LP

Am J Hosp Pharm ,Jan 1983, 40 (1) p70-3, ISSN 0002-9289

Journal Code: 310

Languages: ENGLISH

A computerized system to maximize inventory performance in a small hospital is described. An inventory control system, which integrates economic order quantity (EOQ) and ABC inventory models was implemented in a 146-bed hospital. The perpetual inventory control data base, supported by the hospital's mainframe computer, generates monthly inventory statistics that are segregated into A, B, and C reports. Using a hand-held computer that interfaces with the perpetual inventory system, a series of inventory management reports were developed. These reports, which are based on the EOQ model, provide the following information for each drug line item: EOQ, EOQ proposed carrying cost, actual inventory carrying costs, safety stock, order point, average inventory, and the "on hand/on order" point. Several supplemental inventory management reports were also developed. While implementing the computerized inventory system, the pharmacy also changed its purchasing strategy from predominantly direct accounts to a progressive prime-vendor wholesaler. From December 1980 to December 1981, the ABC/EOQ system with progressive prime-vendor involvement essentially doubled total aggregate inventory turnover. A 46.5% reduction in standing inventory levels occurred. The drug cost per line item dispersed remained relatively constant over the one-year period, despite price increases. The application of the computerized ABC/EOQ inventory model to an online perpetual inventory control data base effectively reduced the inventory operation costs.

**Improving a pharmaceutical purchasing and inventory control system.**

Rubin H; Keller DD

Am J Hosp Pharm ,Jan 1983, 40 (1) p67-70, ISSN 0002-9289

Journal Code: 310

Languages: ENGLISH

A method by which a pharmacy department improved its purchasing and inventory control system is described. System changes to the computerized inventory control system included implementation of a formulary, affiliation with a group purchasing association, and transfer of specified purchasing and inventory control functions to the technical staff of the purchasing department. Pharmacy maintained the decision-making authority over all vendors and dosage forms of drug products. Optimal results were achieved when the purchasing department's pharmacy buyer position was staffed with an employee who had previous experience as a clerical worker in the pharmacy. The authors state that this system has proved to be an effective, cost efficient method of purchasing and inventory control of pharmaceuticals in their hospital.

**Legal implications of preparing and dispensing approved drugs for unlabeled indications.**

Podell LB

Am J Hosp Pharm ,Jan 1983, 40 (1) p111-3, ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

The legal issues surrounding the potential liability of a pharmacist for dispensing or preparing drugs under conditions not contained in the FDA-approved labeling of a product are examined. Although the specific issue of liability of a pharmacist for preparing a drug in a nonapproved manner or dispensing a drug for a nonapproved use has not been adjudicated, based on evolving legal principles it appears that the pharmacist under certain circumstances may be held responsible for the drugs so prepared or dispensed. Preparation of a drug which is adulterated under the federal Food, Drug and Cosmetic Act appears to be negligent, although its precise effect will be dependent upon state law. Liability for dispensing for nonapproved uses will be minimized if the pharmacist, in the exercise of sound professional judgment, concludes that the use is rational, safe, and reasonable.

**Clinical pharmacy services in a pediatric ambulatory care clinic.**

Edwards R; Adams DW

Drug Intell Clin Pharm ,Dec 1982, 16 (12) p939-44, ISSN 0012-6578 Journal Code: EBU

Languages: ENGLISH

The implementation of pharmacy services in an ambulatory pediatric clinic has met with initial success in acceptance by the medical and nursing staffs, the administrator, and the patient population. Errors in medication dispensing and prescription labeling have decreased, and patient understanding of prescribed therapy has improved. The number of ER visits by clinic patients has been reduced since the implementation of our service. The importance of patients' understanding directions for use and of dispensing medications in childproof containers for the pediatric population cannot be overstressed. A future goal of our service is to expand the pharmacist's clinical role to allow further participation in pharmacokinetics, specialty clinics, teaching, and patient education. Further documentation of the value of such services is essential to the expansion of the pharmacist's role in patient care.

**Development and operation of a pharmacy-based intravenous cytotoxic reconstitution service.**

Anderson M; Brassington D; Bolger J

Br Med J [Clin Res] ,Jan 1 1983, 286 (6358) p32-6, Journal Code: B4X

Languages: ENGLISH

An intravenous cytotoxic reconstitution service has proved extremely popular with both medical and nursing staff. Since the pharmacy has taken over the responsibility for presenting these medicines in a readily usable form, many potential hazards to inexperienced medical staff have been eliminated, and much time and money have been saved. The pharmacists are in an excellent position to offer advice on many aspects of cytotoxic treatment and are well equipped to spot prescription errors. They are often asked to supply information concerning rates and methods of administration as well as compatibility data of different diluents with various cytotoxic agents. The eventual objective of the service is to provide reconstituted cytotoxic drugs for all patients in the pharmaceutical district receiving chemotherapy. As it is not practical to have pharmacists available 24 hours a day, some form of batch production of syringe-loaded drugs could be used. In the immediate future the practicality of storing syringe-loaded drugs in a deep freeze (at -20 degrees C) with rapid thawing will be considered.

Jennings RH; Schad RF; Kaurich J  
Hosp Pharm ,Dec 1982, 17 (12) p643-5, 652, ISSN 0018-5787  
Journal Code: G98  
Languages: ENGLISH

The purpose of the project was to develop and implement a method whereby unused intravenous preparations could be redispensed for a subsequent dose to another patient. Even if the stability and sterility of the solution can be assured, since the admixture has left the controls of the Pharmacy, it cannot be reused because of the possibility that further additions have been made. If the pharmacy could assure that an admixture has not been altered in any way, it could be redispensed. Tamper-Proof Safety Caps have been placed over the additive port of Viaflex minibags after preparation, thereby rendering it impossible for further additions to be made, and therefore these admixtures can be reused for a different patient. The Department of Pharmaceutical Services has begun to recycle admixtures and has experienced an annual cost savings in 1981 of \$64,512. The cost of the program for the protective caps was \$17,810. This cost savings has been accomplished without further additions to the staff.

**Strategy to effect change in pharmacy practice.**  
Schondelmeyer SW

Am J Hosp Pharm ,Dec 1982, 39 (12) p2137-42. ISSN 0002-9289  
Journal Code: 310

Languages: ENGLISH

The formulation of a strategy for change in pharmacy practice is described. Pharmacy has focused more on improving efficiency for existing functions than on identifying and adapting to the changing needs of society. The survival of the profession will depend on its ability to meet the present and future needs of society. Structural and procedural aspects of strategy formulation should focus on building a consensus within the profession. Interests of professional leaders, educators, practitioners, and the public should be incorporated into the profession's strategy. A center for strategic planning, supported by national pharmacy organizations, is suggested. Formulation of a strategy for pharmacy should involve: (1) an assessment of health-care needs relevant to pharmacy; (2) comparative evaluations of methods for delivering needed services; (3) integration with other health-care services; (4) organization and management of pharmacy practice; (5) financing considerations; and (6) legislative and regulatory changes. Planned strategic change will provide pharmacy with a mechanism for channeling its future activity in a direction that can effectively and efficiently meet the needs of society.

In this final installment of a 12-article series on managing computer systems for the hospital pharmacy department, contemporary issues related to the topic of the series are discussed. Assessment of institutional strategy for acquiring systems and determining the departmental direction is reviewed. The far-reaching impact of computerization on personnel staffing and job functions is discussed. The results of a telephone survey of 23 pharmacy computer system vendors that had at least one installation of a unit dose and i.v. admixture system are also presented. Because of the current and future widespread use of computers, pharmacists must acquire knowledge of computer systems.

**Hospital pharmacy computer systems--1982.**

Swanson DS; Broekemeier RL; Anderson MW

Am J Hosp Pharm ,Dec 1982, 39 (12) p2109-17. ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

Results of a survey of hospital pharmacy computer systems vendors are reported. A questionnaire was mailed to 317 possible vendors of hospital pharmacy computer systems in August 1982. Of the 89 companies responding, 30 stated that they marketed a hospital pharmacy system. The results are tabulated in this paper according to general system information, system hardware, system software, and system features. The most common classification of the responding companies was the health-system corporation; second most common was pharmacy computer system companies. Twenty companies have marketed their systems for two years or longer. Sixteen companies now claim to have contracts with more than 20 health-care institutions. The survey results are offered as a guide for comparing the similarities and differences among various vendors of hospital pharmacy computer systems.

**Contractual relationships between colleges of pharmacy and university hospitals.**

Gourley DR; Fine DJ

Am J Hosp Pharm ,Dec 1982, 39 (12) p2102-4. ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

The relationships that exist between colleges of pharmacy and university hospitals located in academic medical centers were investigated, and the types of pharmaceutical services that are being offered by these institutions were profiled. Questionnaires were mailed to 35 directors of pharmaceutical

services located in academic medical centers. Of the 30 institutions represented by respondents, 27 had a college of pharmacy on the same campus, and 13 had a formal agreement between the hospital and the college. Ninety-seven percent of the hospitals surveyed had unit-dose or partial unit-dose programs, and all of the hospitals had i.v. admixture services. Nine of the 13 hospitals with formal agreements and 13 of the 17 hospitals without formal agreements had decentralized pharmaceutical services. The staffing patterns in these institutions showed that only 10.3% of the pharmacist FTE positions were funded by the college of pharmacy. There was no difference in trends as related to faculty appointment, title, or tenure between directors in hospitals with and without affiliation agreements. Seven of the directors of pharmacy were in tenure-track positions, and the director's reporting mechanism in the college was either to the dean or the chairman of pharmacy practice. No differences were found between the pharmaceutical services offered, staffing patterns, or status of the director of pharmacy in hospitals with or without formal agreements with colleges of pharmacy. These authors believe that a firm relationship between the college and hospital might prove advantageous to both parties.

**Pharmacist activities under alternative staffing arrangements.**

Dostal MM; Daniels CE; Roberts MJ; Giese RM  
Am J Hosp Pharm ,Dec 1982, 39 (12) p2098-101, ISSN  
0002-9289 Journal Code: 3IO  
Languages: ENGLISH

The proportions of time pharmacists spent in professional and nonprofessional activities is compared under alternative staffing arrangements. Daily activities were observed in three pharmacy satellites each serving approximately 100 beds of a 730-bed hospital. Ten pharmacy administrators and residents recorded more than 8000 observations over a 14-day period, 24 hours per day. In each observation, basic functions were noted; these were chosen from a list compiled to include all pharmacy activities. A specific staffing pattern was identified in each observation. The observations were then categorized as professional or nonprofessional activities as predefined by the majority of the pharmacy staff. As staffing patterns varied, significant differences occurred in the ratio of professional to nonprofessional activities. The greatest percentage of professional activity was observed when one pharmacist worked with more than one technician; where the staffing pattern contained more pharmacists than technicians, a smaller percentage of the pharmacists' time was used in professional activity. Overall, pharmacists were engaged in activities considered professional in 52% of the observations. Assuming that the most efficient use of pharmacy personnel involves a high ratio of professional to nonprofessional activity in the pharmacists' workload, the optimum staffing arrangement would include at least the same number of technicians as pharmacists. Factors other than staff mix affect efficient management of pharmacists' professional time.

The treatment of the hemophilias is a great challenge to all clinicians involved in the care of hemophiliacs. The proper use of blood products, such as whole blood, plasma, fresh frozen plasma, cryoprecipitated factor VIII, commercial factor VIII concentrate, prothrombin complex concentrate, and anti-inhibitor coagulant complex, has a significant effect on the quality of care that these patients receive. Manufacturers now have the ability to commercially prepare some of these products as dry powders requiring reconstitution prior to use. This capability has enabled the department of pharmacy to store, and the pharmacist to dispense, such products as commercial factor VIII concentrate, prothrombin complex concentrate, and anti-inhibitor coagulant complex when needed. Consequently, the practicing pharmacist should possess a basic understanding of how and when the different blood products are used in the treatment of hemophilia. A review of these blood products is presented.

**Pharmacist involvement in a diabetic education centre.**

Kanitz J; Birken B; Ward V  
Can J Hosp Pharm ,Jul-Aug 1982, 35 (4) p114-5, ISSN  
0008-4123 Journal Code: D2K

Languages: ENGLISH

During the past two years, a multi-discipline health team has been meeting with selected diabetic "problem" patients on a regular basis at the North York General Hospital (NYGH). The patients are referred to the programme by their physicians when they appear to be having difficulty handling or coping with their diabetes. The participants in the programme attend the Diabetic Education Centre (DEC) for one week as day patients in the hospital and are exposed to various types of counselling from members of the Diabetic Education Centre Team (DECT), one of which is the pharmacist. Follow-up from this week of intensive education is made at annual intervals. The main purpose of the pharmacist in the clinic is to provide information for the patients regarding their prescriptions and over the counter (OTC) medication. This is achieved by means of individual patient interviews and informal group discussions, as well as rounds with other team members and contact with patients' families. This programme provides a forum for the patient and the patient's family to obtain valid information about diabetes, as well as problems associated with the disease, and aids in coping with these problems. The team concept enables the patient to be analyzed by all disciplines in order to assess his teaching needs and fulfill them. The pharmacist is continually involved in this information system and plays a valuable role on the team.

**Changing the rules of the reimbursement game.**

Curtiss FR  
Am J Hosp Pharm ,Nov 1982, 39 (11) p1975-7, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

Recently enacted federal and state legislation reflect a gradual transition from cost-based reimbursement to rate-based reimbursement for hospital services; the implications of this trend for hospital pharmacists are discussed. Under "The Tax Equity and Fiscal Responsibility Act of 1982," Medicare hospital reimbursement is limited based on total hospital costs, effective for the 1983 fiscal reporting period. In addition, a target limit of costs for each hospital will be computed and hospitals will have positive and negative incentives to keep costs below this amount. These

reimbursement changes calculate limits on the basis of costs per case, not costs incurred. These changes increasingly require hospitals to share in the risk of expenditures attributed to use of services. For hospital pharmacists, this means that the focus is changing from maximizing revenue from drug products to controlling unnecessary use and reducing departmental expense. Clinical pharmacy services will survive only if they are shown to be cost effective. Hospital pharmacists cannot afford to ignore the changing patterns of reimbursement; the consequences of unpreparedness and inaction may be decreased budgets and the relegation of hospital pharmacy practice to assembly-line economics.

The procedures required for software and hardware maintenance of a pharmacy computer system, and methods of dealing with operational and administrative problems of such systems, are described. Maintenance of software and hardware purchased from a vendor is usually provided by the vendor under contract. Repair maintenance is required for programs that do not run, produce incorrect results, or run too slowly. Update and revision maintenance is required when user requirements exceed the limits and design of the original program. Typical problems encountered with computer systems include slow computer response time, performance of maintenance personnel, turnover in user personnel, legal liabilities and restrictions, reliability of hardware and software, downtime, security, and changing configuration of equipment. Successful management of predictable and unpredictable problems with computer systems is accomplished through systematic review of the potential problem area and prospective planning.

**Qualifications required in advertisements for hospital pharmacy management positions.**

Shepherd MD; Pink LA  
Am J Hosp Pharm ,Nov 1982, 39 (11) p1940-3, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

Advertisements for pharmacy management positions were analyzed to determine the extent to which advanced degrees or experience were required. Advertisements were collected from three professional journals for 1971-1981 for the following positions: director and assistant director of pharmacy services, director and assistant director of clinical services, director and assistant director of drug information, and clinical coordinator. The following information was obtained from each advertisement: position title, educational degree required or preferred, number of beds in institution, type of ownership of institution, residency required or preferred, and experience required or preferred. Of 224 advertisements analyzed, 124 were for directors of pharmacy, 59 for assistant directors of pharmacy, and 41 for clinical management positions. No degree was required or preferred in 85 of the advertisements. A degree qualification was specified for all the clinical management positions; 37 out of 41 required a Pharm.D. or advanced degree. Advertisements for directors and assistant directors requiring an advanced degree were evenly divided between Pharm.D. and M.S. degrees. Since 1979, the number of advertisements not specifying a degree appears to have decreased and the number specifying M.S. or Pharm.D. to have increased. Managerial experience was mentioned in 51 of 183 advertisements for directors and assistant directors. For clinical management positions, only 6 specified managerial experience and 22 required clinical experience. Many employers specified residencies as qualifications. Advanced degrees are increasingly in demand for management positions. Advancement opportunities in the future may not be as promising as in the past for pharmacists who hold only B.S. degrees.

**Trends in radiopharmaceutical dispensing in a regional nuclear pharmacy.**

Basmadjian GP; Johnston J; Barker K; Ice RD  
Am J Hosp Pharm ,Nov 1982, 39 (11) p1933-6, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

Dispensing trends for radiopharmaceuticals at a regional nuclear pharmacy over a 51-month period were studied. dispensing records of a regional nuclear pharmacy were analyzed with a forecasting procedure that uses univariate time data to produce time trends and autoregressive models. The overall number of prescriptions increased from 3500 to 5500 per quarter. Radiopharmaceuticals used in nuclear cardiology studies increased from less than 0.1% to 17.5% of total prescriptions dispensed, while radiopharmaceuticals used for brain imaging showed a steady decline from 29% to 11% of

total prescriptions dispensed. The demand for other radiopharmaceuticals increased in areas such as renal studies, bone studies, lung studies, liver-function studies, and Ga-67 tumor-uptake studies, and declined slightly for static liver studies. Changes in dispensing trends for radiopharmaceuticals will continue as the practice of nuclear medicine concentrates more on functional studies and as newer imaging techniques become used for other purposes.

**Accuracy and efficiency of three methods of preparing piggyback admixtures.**

Fraterrigo CC; Jorgenson JA  
Am J Hosp Pharm ,Nov 1982, 39 (11) p1920-3, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

The efficiency and accuracy of three methods of preparing i.v. admixtures in small-volume plastic bags were compared. One hundred individual 1-g doses of cephalothin sodium in 50-ml minibags were prepared by each of three methods: the PharmAide Fluid Dispensing System (PAFDS), the Valleylab IV Formulator, and the Viavac vacuum unit, using 20-g, 20-g, and 1-g vials of cephalothin sodium, respectively. For each method, preparation time and cost were recorded. To determine accuracy, a random 10% sample of minibags prepared by each method was assayed for cephalothin concentration by microbiologic assay. The IV Formulator required the least time to prepare 100 doses, followed by the PAFDS and the vacuum unit. Cost data for the three methods were nearly identical, with a difference of only \$0.07 per dose between the least and most expensive. The minibags prepared using the vacuum pump and unit-of-use vials were more accurate than those prepared with 20-g vials and the other two methods. However, the initial concentration of the cephalothin sodium vials before transferring to the minibags was not tested. Each method studied was found to have advantages and disadvantages. No one system could be judged best for all situations.

**Factors affecting medication-order processing time.**

Beaman MA; Kotzan JA

Am J Hosp Pharm .Nov 1982, 39 (11) p1916-9, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

The factors affecting medication-order processing time at one hospital were studied. The order processing time was determined by directly observing the time to process randomly selected new drug orders on all three work shifts during two one-week periods. An order could list more than one drug for an individual patient. The observer recorded the nature, location, and cost of the drugs ordered, as well as the time to process the order. The time and type of interruptions also were noted. The time to process a drug order was classified as six dependent variables: (1) total time, (2) work time, (3) check time, (4) waiting time I--time from arrival on the dumbwaiter until work was initiated, (5) waiting time II--time between completion of the work and initiation of checking, and (6) waiting time III--time after the check was completed until the order left on the dumbwaiter. The significant predictors of each of the six dependent variables were determined using stepwise multiple regression. The total time to process a prescription order was 58.33 +/- 48.72 minutes; the urgency status of the order was the only significant determinant of total time. Urgency status also significantly predicted the three waiting-time variables. Interruptions and the number of drugs on the order were significant determinants of work time and check time. Each telephone interruption increased the work time by 1.72 minutes. While the results of this study cannot be generalized to other institutions, pharmacy managers can use the method of determining factors that affect medication-order processing time to identify problem areas in their institutions.

**Regional disaster planning for hospital pharmacies.**

Bragdon RL; Gousse GC; Piwarzyk P; Szewczyk T

Am J Hosp Pharm .Nov 1982, 39 (11) p1913-5, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

The development of a disaster plan for hospital pharmacy services in Hartford, CT, is described. In June 1978, directors of pharmacy from 12 hospitals in the Hartford, CT, area began a project designed to ensure an uninterrupted supply of drugs and an adequate supply of pharmacy personnel during and after any natural disaster. The project initially involved standardization of components of the individual hospital pharmacies' disaster plans. A questionnaire was then completed by each director of pharmacy regarding hours of operation, telephone numbers, and pharmaceutical products usually stocked (including blood derivatives, radiologic-contrast media, and intravenous solutions). Information on inventory levels was collected later. Pharmaceutical manufacturers and wholesalers in the region were contracted, and a list of routine and emergency telephone numbers was

compiled. The disaster plan was completed in July 1979. The plan has been tested in a mock catastrophe drill and one natural disaster that caused relatively few injuries.

0224437 83071834

**Establishing a research fund in a hospital pharmacy department.**

Gumpert NF

Am J Hosp Pharm .Nov 1982, 39 (11) p1910-2, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

Development of a fund to support research in the pharmacy department of a community hospital is described. Finding research money difficult to obtain from industry or government sources, members of the pharmacy staff created a research fund from their own resources. Staff members donated time spent preparing and presenting educational programs such as seminars and workshops, and profits from these programs were designated for research. In addition, the hospital allowed direct contributions to the fund through payroll deductions. A board comprising pharmacists, physicians, and the hospital's legal counsel was formed to request, receive, and review grant proposals and to award funds. Objectives of the research fund were to facilitate staff development and recognition; improve communication and managerial skills of those planning the program, administering it, and conducting the actual research; and enhance recruitment efforts. More than \$21,000 has been raised, and the first project, a microcomputer-based pharmacokinetic dosing program, has been completed.

**Documented effectiveness of clinical pharmacy services.**

Gibson FM; Hyneck ML; Scherrer JJ

Am J Hosp Pharm ,Nov 1982, 39 (11) p1902-3, ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

Articles documenting the effectiveness of clinical pharmacy services were reviewed and categorized. A list of articles describing clinical pharmacy services published in the primary pharmacy literature or presented at ASHP Midyear Clinical Meetings was prepared. Selected articles were evaluated further for documented evidence of the impact of these services on patient care. Impact was defined as any one of the following outcomes: decreased morbidity (side effects, toxicity, or adverse drug reactions), decreased mortality, improved prescribing or monitoring practices, improved therapeutic outcome, and increased compliance. Ongoing clinical pharmacy services were described in 144 meeting abstracts and 117 published papers. Of the 33 papers suitable for further review, 16 provided documentation of probable or definite impact on patient care as a result of clinical pharmacy services. Three types of clinical services were provided: patient education and counseling, pharmacokinetic monitoring, and clinical drug monitoring and information. Nine studies involved ambulatory patients; eight of these involved adult patients, while one used pediatric patients. Seven of the nine studies demonstrated increased compliance through patient education and counseling. Seven studies involved adult hospitalized patients. More well-designed studies documenting the effects of clinical pharmacy services on patient outcome are needed.

0224430 83071820

**Role of the director of pharmacy: the first four months.**

Nold EG

Am J Hosp Pharm ,Oct 1982, 39 (10) p1702-6, ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

Specific goals and tasks that should be addressed during a pharmacy director's first four months of employment are reviewed. Individuals must prepare themselves for the director's role, find the right job, and negotiate an acceptable benefits package. During the first two months as director of pharmacy, an individual should primarily work on gathering facts and assessing the department's operations without making many changes. Interrelationships within the hospital should be studied, and many pharmacy and hospital documents should be reviewed so that the director has an understanding of past history. The director should interview all employees of the department and work as a staff pharmacist for one to two days in each area. During the third and fourth months, the new director will need to determine the extent of authority, develop working relationships with key individuals, assess the pharmacy-management team, develop a data-collection system, learn the processes for making changes, and consolidate authority. A major document, containing a

departmental-operations analysis, statement of philosophy, goals, and approach to goal completion, should be the culmination of the four months. The director of pharmacy must meld professional, administrative, and financial activities; the final determinant of success will be the director's ability to implement and follow through with proposed changes.

0224429 83071819

**Managing the implementation of a pharmacy computer system.**

Mildenberger J; Gouveia WA

Am J Hosp Pharm ,Oct 1982, 39 (10) p1692-701, ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

The process of managing the implementation of a pharmacy computer system is described. The three major phases of an implementation plan are (1) orientation and testing, (2) training of personnel, and (3) operation and expansion. Testing procedures described include those for entering new medication orders, profile maintenance, printouts for unit dose cart dispensing, label and report generation, i.v. system orders, back-up system, special edit features, charge generation, and admission, discharge, and transfer status. Personnel training components described are orientation, formal and practical sessions, program development, and training manual development. Implementation programs described include parallel operations of manual and computer systems, limited independent operation, and expansion. Successful implementation of a pharmacy computer system depends on careful planning and coordination.

01073

0224428 83071818

**Word-processing system in a centralized intravenous admixture program.**

Kirschenbaum BE

Am J Hosp Pharm ,Oct 1982, 39 (10) p1690-2, ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

The application of a word-processing system to a centralized i.v. admixture service is described. The pharmacy department of a 560-bed private hospital developed its admixture service with a limited increase in staff and without compromising its clinical services by using a commercially available word-processing system. The system allows the user to type, edit, store, and print patient profiles and labels for total parenteral nutrition solutions, i.v. piggyback medications, and large-volume parenterals. The data for the admixture service are stored in three diskettes--one for piggybacks, one for TPNs, and one for other applications. Operational details regarding all applications are described. The word-processing system provides a relatively inexpensive method of coping with the large amount of data manipulation and label preparation inherent in a sophisticated i.v. admixture program.

0224423 83071811

**Planning for a JCAH survey.**

Crane VS; Louviere ML

Am J Hosp Pharm ,Oct 1982, 39 (10) p1665-71, ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

A pharmacy department's planning and preparation for a JCAH survey are described, and advice on meeting JCAH standards is presented. Problems resulting from expansion of pharmacy programs and staff at the hospital were analyzed, and a plan was developed to correct inconsistent procedures and inadequate documentation. JCAH source materials were studied to gain understanding of the standards and their application in this institution. A manager was appointed to carry out the plan, and the pharmacy staff was directly involved in planning for the survey. Priorities for corrective action were set on the basis of previous recommendations, current JCAH emphasis, and effect of the problem on patient care. Checklists were used to evaluate progress toward correcting deficiencies. Documentation of pharmacy operations was organized and summarized for presentation to the surveyor. A mock survey was conducted to assess preparation of the staff and physical aspects of the pharmacy. The pharmacy's goal was to meet all JCAH standards. The systematic preparation, the quality assurance procedures, and the training of the staff provided a basis for achieving this goal and maintaining high standards of operation.

0224422 83071810

**Obtaining reimbursement for clinical pharmacokinetic monitoring.**

Kelly WN; Gibson GA; Miller DE

Am J Hosp Pharm ,Oct 1982, 39 (10) p1662-5, ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

A method of obtaining reimbursement for clinical pharmacokinetic monitoring is described. The process included reviewing the existing literature, observing the practices of others providing similar services, collecting workload and expense data, selecting an equitable fee, and presenting third party payers with evidence of the service's need, documentation, and effectiveness. The average patient was monitored by the pharmacokinetic service for 8.4 days and had 5.1 serum samples drawn. The physician received 3.1 dosing recommendations. An average of 4.3 hours was spent monitoring each patient with an average cost of \$86. Of the several alternatives for charging considered, an inclusive charge of \$10 per patient day was chosen. Blue Cross reimbursement criteria for pharmacokinetic monitoring stipulated that (1) the service must be physician initiated; (2) documentation of services provided must appear as a permanent part of the patient's record; (3) service provided must be identified with a specific group of patients rather than applied equally to all patients in the institution; and (4) evidence of reduced morbidity, mortality, or length of hospital stay would help. During 1981, \$37,470 in charges was generated for pharmacokinetic monitoring services with reimbursement being received from third party programs, insurance companies, and private patients.

**Evaluation of computer-assisted self-instructional module for pharmacy continuing education.**

Jim LK; Filibeck DJ; Gee JP; O'Bey KA; Fox JL  
Hosp Pharm ,Oct 1982, 17 (10) p551, 555-8. ISSN  
0018-5787 Journal Code: G98  
Languages: ENGLISH

A computer-assisted self-instructional module was developed as a method of providing continuing education to pharmacists. A prospective, nonrandomized study was conducted to investigate the effectiveness of computer-assisted instruction (CAI). Using an Apple II microcomputer and anticoagulant therapy as the content base, a series of ten case studies was written and programmed. Twenty-two staff pharmacists from a university hospital and a community hospital participated. Participants were first given a pretest, proceeded through the CAI, took the same test as a posttest, then two weeks later, took a different posttest to measure knowledge retention. The mean test scores before and immediately after the CAI were 55.8% and 80.4%. The mean test score for the two-week posttest was 74%. The mean difference was found to be highly significant for both the pretest and immediate posttest (P less than 0.0001) and the pretest and two-week posttest (P less than 0.001). The study suggested that the use of a CAI module was effective in improving, as well as maintaining, pharmacists' knowledge and that a significant portion of knowledge gained was retained after a period of two weeks. Pharmacists' evaluations of this method of continuing education were generally favorable.

**A comprehensive program to increase job satisfaction among pharmacy technicians.**

Mahoney CD; Gallina JN; Jeffrey LP  
Hosp Pharm ,Oct 1982, 17 (10) p547-50. ISSN 0018-5787  
Journal Code: G98  
Languages: ENGLISH

A multifaceted personnel management and continuing education program specifically designed to provide job satisfaction for the pharmacy technician is described. Turnover among technicians is often higher than for other personnel categories. One interpretation of a high turnover rate is that it is a direct indication of job dissatisfaction and disillusionment on the part of technicians towards their career potential. Several approaches were initiated at the Rhode Island Hospital to increase job satisfaction among

pharmacy technicians and to assist the pharmacy department in stabilizing this category to reflect a more satisfactory turnover rate. These were: (1) initiating a comprehensive continuing education program; (2) establishing a "career ladder" by developing an advanced level of pharmacy technicians; (3) incorporating technicians in a concept of participative management within the department; (4) increasing job responsibilities as new programs are developed; (5) rotating assignments and responsibilities to foster flexibility and interest. The programs enumerated have made a significant contribution toward increasing the stability and job satisfaction of the technician category. The success of the measures described is reflected in the average tenure of an individual in the technician category, which is 41.9 months.

The potential for clinical pharmacy services to reduce the liability of institutions and the personnel who practice in them is presented. Several studies are reviewed that identify the characteristics of patients who are at a high risk of developing complications. Based on these data and data gathered on drug-related malpractice claims, pharmacists can concentrate their efforts on those patients who have the greatest liability implications to the institution. Pharmacists' efforts to reduce the liability of their institutions can also provide a justification for their clinical services.

The steps involved in preparing to implement a pharmacy computer system are described. Although the order in which the various steps have to be completed varies according to the

hospital specifics, important elements of the preparation process include preparation of the site, organization of personnel, development of policies and procedures, developing and ordering forms, preparation of the implementation schedule, file development, and preparation of other departments. A well-designed plan and a realistic time schedule for the preparation process facilitates the actual implementation of a pharmacy computer system.

Am J Hosp Pharm .Sep 1982. 39 (9) p1517-20. ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

Cost justification of a pharmacy residency training program was prepared. The contributions of the pharmacy residents were tabulated and compared with the cost of the program to the hospital. Contributions were determined by identifying the activities performed by residents that could be quantified in financial terms. The residents' activities that benefited the hospital included administrative support, completion of special projects, scheduling staff assignments, and coordinating education programs. Costs were derived from salaries, fringe benefits, and training expense. An output value analysis was performed by comparing the contributions of the residents to the institution with the cost of the training program. The contributions of the residents exceeded the costs of the training program by a ratio of 1.3 to 1.

**Obstetric drug information service.**

Arulappu RG; Taylor DJ

Am J Hosp Pharm .Sep 1982. 39 (9) p1511-4. ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

An obstetric drug information service in a 435-bed general hospital in Australia is described. The specialized service was established within a general drug information center after receiving a large percentage of calls on the use of drugs during pregnancy and lactation. The service decided to specialize in information on: (1) drugs excreted in breast milk, (2) drug effects on the fetus, (3) drug effects on the pregnant mother, and (4) drugs affecting sperm. An obstetrician is associated with the service to provide clinical judgments, assessments, and his expertise in the field. Monographs were prepared on 97 commonly prescribed drugs. The service provides oral replies and written replies that are checked by the director and deputy director of pharmaceutical services for their accuracy. Of the 1445 inquiries received during an 18-month period, 60% (863) were related to the use of drugs during pregnancy and lactation. The most frequent users of the service were physicians. Specific topics of the calls included inquiries on antibiotics (154 calls), psychotropic drugs (108), and analgesic and cold preparations (58). The center provided written replies for 51% of the calls. The specialized drug information center has received an increasing number of inquiries and positive feedback from its users.

**Applications of a minicomputer to clinical pharmacy services.**

Alberti JC; Walters JK Jr; Nightingale CH

Am J Hosp Pharm .Sep 1982. 39 (9) p1505-7. ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

The application of a minicomputer system to clinical services and administrative record keeping is described. All applications were designed and implemented by pharmacists. Programs were created to increase the efficiency of collecting workload statistics for clinical services and to perform pharmacokinetic analyses of patient-specific data. The time required to generate quarterly workload reports decreased from 15-18 hours to 20-30 minutes. The use of the minicomputer also permitted a substantial expansion in the scope of the information collected and reported. The pharmacokinetic programs required approximately two minutes to calculate patient-specific peak and trough concentrations. The minicomputer system has increased the pharmacy department's administrative efficiency and encouraged staff pharmacist involvement in clinical services.

**Changing an automated drug inventory control system to a data base design.**

Bradish RA

Am J Hosp Pharm .Sep 1982. 39 (9) p1502-5. ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

A pharmacy department's change from indexed sequential access files to a data base management system (DBMS) for purposes of automated inventory control is described. The DBMS has three main functional areas: (1) inventory ordering and accountability, (2) charging of interdepartmental and intradepartmental orders, and (3) data manipulation with report design for management control. There are seven files directly related to the inventory ordering and accountability area. Each record can be accessed directly or through another file. Information on the quantity of a drug on hand, drug(s) supplied by a specific vendor, status of a purchase order, or calculation of an estimated order quantity can be retrieved quickly. In the drug master file, two records contain a reorder point and safety-stock level that are determined by searching the entries in the order history file and vendor master file. The intradepartmental and interdepartmental orders section contains five files assigned to record and store information on drug distribution. All items removed from the stockroom and distributed are recorded, and reports can be generated for itemized bills, total cost by area, and as formatted files for the accounts payable department. The design, development, and implementation of the DBMS took approximately a year using a part-time pharmacist and minimal outside help, while the previous system required constant expensive help of a programmer/analyst. The DBMS has given the pharmacy department a flexible inventory management system with increased drug control, decreased operating expenses, increased use of department personnel, and the ability to develop and enhance other systems.

**Hospital pharmacy practice in the People's Republic of China.**

Liu Gu

Am J Hosp Pharm ,Sep 1982, 39 (9) p1487-90, ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

The practice of hospital pharmacy in the People's Republic of China is described. Since 1949, health care in China has improved. The number of hospitals has increased. While medicines previously were scarce, China now produces approximately 95% of the drugs it needs. China has a long history of traditional medicine; although there are attempts to integrate the concepts of traditional and Western medicine, the practices are still segregated. All hospital pharmacies in China have the responsibilities to guarantee the safe and effective use of drugs within the hospital and to do research.

Even though Chinese factories manufacture many pharmaceutical products, the hospital pharmacy must manufacture many more. Hospitals have established Agreed Prescription programs, whereby drugs are manufactured in large batches, repackaged, and distributed to other hospital pharmacies in the area if needed. Quality is assessed chemically and by modern techniques when equipment is available. Most large hospitals now have automated facilities to manufacture sterile solutions. Each hospital has a medical supply committee that supervises the procurement of medical supplies and the reasonable use of drugs. A government resolution mandates that every hospital pharmacy do research. A primary focus of their research is the integration of traditional and Western medicine. Concepts of traditional and Western medicine are taught in separate pharmacy schools. Most pharmacy undergraduate programs are four years, but some schools recently changed to five years. Future challenges for hospital pharmacists in China are to develop the theoretical and technological knowledge of pharmacy, and to expand the scientific and technical information system that is necessary to do research.

**A pharmacist's audit of antirheumatic drugs.**

Takavarasha L; Scott DL; Constable TJ

Rheumatol Rehabil ,Nov 1982, 21 (4) p201-5, ISSN 0300-3396 Journal Code: TD9

Languages: ENGLISH

The results of an audit, by a hospital pharmacist, of

antirheumatic drug use at four rheumatology units are presented. Profiles can be developed for each drug which indicate their efficacy and the adverse reaction rate in clinical practice. These can be used to make rational therapeutic choices. A pharmacist can effectively collate such data to provide an unbiased information source.

**Exposure of pharmacy personnel to mutagenic antineoplastic drugs.**

Nguyen TV; Theiss JC; Matney TS

Cancer Res ,Nov 1982, 42 (11) p4792-6, ISSN 0008-5472 Journal Code: CNF

Contract/Grant No.: S07RR05828

Languages: ENGLISH

The Salmonella reversion test was used to measure the mutagenic activities of urine concentrates from individuals preparing cancer chemotherapy agents for i.v. administration. Longitudinal studies were performed in which the total urine produced in 24-hr periods was collected, starting on a Sunday at 7 p.m. after a duty-free weekend and extending over an 8-day period. There was no detectable increase in mutagenic activity in the urine concentrates of three pharmacy administrators who had no contact with these drugs. All six individuals admixing drugs in open-faced, horizontal laminar flow hoods displayed a 2-fold increase in mutagenesis by the fourth day with peak values of 2.7- to 24-fold occurring on Days 5 and 6, reduced values by Day 7, and a return to the spontaneous level by Day 8. When four of the six positive individuals in the preceding experiment admixed comparable amounts of chemotherapeutic drugs in a closed-face, vertical laminar flow hood, no increase in mutagenic activity was detected in their urine concentrates over the 8-day period.

**Legal aspects of clinical pharmacy practice.**

Clark JE; Nwangwu PU

Contemp Pharm Pract ,Summer 1982, 5 (3) p198-203, ISSN

0162-3761 Journal Code: DQ9

Languages: ENGLISH

Recent trends in pharmacy have emphasized the concept of a more clinical professional role and a new level of skilled practice for pharmacists. These new roles and responsibilities create a number of legal questions concerning the clinical activities pharmacists can legally perform, and the liabilities pharmacists must bear in the performance or negligence of these duties. The law is not completely clear on all aspects of clinical pharmacy practice. This paper explores the legal basis of certain specific functions performed by pharmacists, and the inherent liabilities involved in the performance of these functions.

**A drug self-administration program: a behavioral approach to patient education.**

Beardsley RS; Johnson CA; Kabat HF

Contemp Pharm Pract ,Summer 1982, 5 (3) p156-60, ISSN

0162-3761 Journal Code: DQ9

Languages: ENGLISH

This study is an evaluation of an in-hospital patient education and drug self-administration program. The main goal of this patient education strategy was to increase appropriate drug use by patients after they were discharged from the hospital. Patients first learned about their medications from hospital staff, including pharmacists, and then gradually assumed the responsibility for self-administration of their drugs. Patients practices taking their medication while hospital staff monitored their actions, correcting inappropriate use and reinforcing correct use. Results showed that the program significantly increased both levels of drug knowledge and patient compliance when compared to a control group. An analysis of covariance revealed that improved compliance was attributable to both participation in the program and to the increase in drug knowledge. Patients were more satisfied with pharmacy services and perceived the pharmacist as being more knowledgeable about prescription drugs after interacting with pharmacists in this program. Analysis of patient locus of control revealed that internally oriented patients complied better after participating in the program than did externally oriented patients. In the control group, externally oriented patients complied better after receiving typical hospital care than did internally oriented patients. Thus, results imply that this behavioral approach benefited internally oriented patients.

**Role effectiveness of a pharmacist in the maintenance of patients with hypertension and congestive heart failure.**

Schneider PJ; Larrimer JN; Visconti JA; Miller WA  
Contemp Pharm Pract ,Spring 1982, 5 (2) p74-9, ISSN

0162-3761 Journal Code: DQ9

Languages: ENGLISH

This study was designed to measure the role effectiveness of pharmacists in the management of patients with hypertension and congestive heart failure. Based on therapy protocols established by physicians and pharmacists prior to the study, the pharmacist was measured against the standard for providing primary care--i.e., the physician. The study showed that the pharmacist competently elected drug therapy and identified adverse drug reactions. As a group, the 20 study patients, whose therapy was determined by the pharmacist, were better managed than the 20 control patients (p less than 0.05). It is suggested that the pharmacist is effective in the role of managing patients with hypertension and congestive heart failure.

**Experiences with the compliance clinic: assessment of the effect.**

Cable GL; Schneider PJ

Contemp Pharm Pract ,Winter 1982, 5 (1) p38-44, ISSN 0162-3761 Journal Code: DQ9

Languages: ENGLISH

A retrospective study was conducted to determine the clinical and financial impact of a pharmacy-based compliance clinic. Charts of patients referred by physicians to the clinic were reviewed. Data were collected during compliance clinic consultation and compared to pre-clinic data to determine if the pharmacists' services were of merit. During the 33-month study period, 25 patients were referred to the pharmacy. Fourteen (56 percent) of these patients were seen regularly by the pharmacist. Eleven of the 14 patients (79 percent) achieved greater than 80 percent compliance with their medication regimen. Six of the 14 (43 percent) demonstrated significant reductions in emergency room visits comparing pre- and post-clinic records. Eight patients (57 percent) exhibited reduced hospitalization. Aggregate cost savings resulting from these reductions totalled \$43,314 for the study period. It is concluded that: physicians are willing to ask pharmacists to assist in managing compliance problems; compliance can be improved when treatment is tailored to patient need; improved compliance may not result in better therapeutic outcome; and cost savings resulting from those patients responding can exceed the costs of providing the service.

**Building a structured learning package.**

Ferencz N

Contemp Pharm Pract ,Winter 1982, 5 (1) p32-7, ISSN 0162-3761 Journal Code: DQ9

Languages: ENGLISH

Pharmacists must become educators of patients and of pharmacy technical personnel. The literature cited in this paper has found that problems of patient compliance, personnel management, the high cost of medical care, and patient medical self-help may very well be solved in part through the application of competently written learning packages. One specific approach to learning package creation is illustrated in this paper, using the training of a unit-dose technician as an example. The subjects of student motivation, step-wise learning using subobjectives, learning feedback, material relevance, and student evaluation are discussed. Higher-level cognitive skills and readability are briefly discussed and illustrated to focus the readers' attention on the more difficult aspects of building learning packages.

**Reviewing the contract.**

Entin FJ

Am J Hosp Pharm ,Aug 1982, 39 (8) p1324-8, ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

The process of preparing and reviewing a contract for a pharmacy computer system is described. The purpose of the contract is to establish rules governing the relationship between the vendor and the buyer. It should identify clearly the performance expectations of both parties. The contract negotiating process also allows each party to gain insight to the other's motives by way of responses to proposals for specific contract inclusions. Generally, the buyer should be wary of: (1) a vendor who insists that his form contract be signed without modification; (2) signing more than one contract with the same vendor; (3) vague, nonquantifiable performance criteria; (4) "best-efforts" warranties; (5) an expectation that difficulties with the vendor can be solved if the remedy is not in the contract; and (6) acceptance upon delivery. The buyer should strive for: (1) a complete contract reflecting the nature of the business deal negotiated, (2) specific performance criteria, (3) warranties of performance with meaningful remedies, and (4) payments tied to performance. The most important provision of the contract is the one that makes payment to the vendor contingent upon the actual demonstration of results.

**Self-study program on drug information for staff pharmacists.**

Poirier TI; Lech JG

Am J Hosp Pharm ,Aug 1982, 39 (8) p1313-5, ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

A self-study inservice educational program on drug information resources was designed to improve staff pharmacist competence in responding to drug information requests. Pharmacists attended two introductory sessions in the drug information center (DIC) that focused on available resources and the systematic search process. Each pharmacist also spent an eight-hour work period in the DIC. Twenty-four hours of regular staff time was allowed for each pharmacist to complete a self-study manual. The manual consisted of three sections: (1) discussion of selected references; (2) assignments based on common types of drug information questions; and (3) assignments that required the use of indexing and abstracting sources. Each pharmacist had to complete 50 questions during a 12-week period. The pharmacists were evaluated through pre- and post-tests and by the accuracy of answers to assignments in the manual. Six pharmacists initially participated in the program; five of them attained an average grade of more than 70 on the post-test and assignments. Three new staff pharmacists now have also completed the program. The success of the program depended on the support of pharmacy administration, as well as the motivation of the participating pharmacists. This staff development program using a self-study manual has been an effective means for improving pharmacists' use of drug information resources. The manual is flexible to accommodate differences in the rate of staff development and it is a useful training tool for new pharmacists.

0219302 83019725

**Establishing a fee for handling investigational drug studies.**

Ngu BQ; Schneider PJ; Kilarski DJ

Am J Hosp Pharm ,Aug 1982, 39 (8) p1308-10, ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

The administrative aspects of a pharmacy coordinated investigational drug service and its related costs are described. The policies and procedures for administering investigational drug studies were reviewed and divided into tasks. The staff involved were interviewed to determine the time they spent performing each task. The space for storage of the investigational drugs was measured. The personnel and storage costs were calculated. An average of five hours is required to coordinate pharmacy participation in a drug study.

A drug information specialist spends about 1.5 hours/study developing a data sheet on the investigational drug. Record keeping time is approximately 11 hours/study. The total annual personnel cost is \$177/study. The space for storing the drugs costs \$15.50/year/study. The pharmacy department charges a fee of \$200/year for its involvement in investigational drug

studies. This does not include dispensing fees, which are charged to the patient. At this hospital, the revenue generated can support a pharmacist half-time or a technician full-time.

**Evaluation of aminophylline suppositories prepared in a hospital pharmacy.**

Fujii T; Kubota A; Togawa K; Mizushima N

Tokai J Exp Clin Med ,May 1982, 7 (3) p371-83, ISSN 0385-0005 Journal Code: VZM

Languages: ENGLISH

Physical and chemical stability of suppositories containing aminophylline and various bases prepared in our hospital pharmacy was investigated. Ethylenediamine in aminophylline decreased, the melting points of the suppositories rose, and the disintegration and liquefaction times were prolonged in suppositories with Witepsol base when stored at room temperature. Thin-layer chromatography produced evidence supporting the assumption that ethylenediamine may react with Witepsol constituents to form an acid amide linkage. However, the suppositories were stable at lower temperatures. Suppositories prepared with PEG base were found to be satisfactorily stable at room temperature.

**Audit of telephone usage in a centralized intravenous admixture area.**

Thompson DF; Sula JA

Hosp Pharm ,Aug 1982, 17 (8) p438-9, 443-4, ISSN 0018-5787 Journal Code: G98

Languages: ENGLISH

An audit of telephone usage in an intravenous admixture area was performed. Over a two-day period (18 hours total) 252 calls were made or received. The average length of a call was 81 seconds. Surgery and medicine nursing units accounted for the majority of the calls. Missing orders or doses were the most frequent topic of calls. Telephone communication may require a large time commitment from pharmacists and prevent them from performing activities which are more easily documentable, such as compounding intravenous admixtures.

**Institutional support of continuing education as a fringe benefit for hospital pharmacists.**

Herbert WJ; Mergener MA; De Muth JE

Hosp Pharm ,Aug 1982, 17 (8) p412-3, 417-8, ISSN 0018-5787 Journal Code: G98

Languages: ENGLISH

The purpose of this study was to examine the extent to which hospital pharmacists in Wisconsin received compensation for continuing education (CE) from their institutions and to compare this with their participation in CE activities. The study was conducted by a mail questionnaire sent to all pharmacists practicing in a hospital setting in Wisconsin. The usable response rate was greater than 45%. Persons in administrative positions received greater support for CE activities than staff in the areas of registration fees (P less than 0.005), travel expenses (P less than 0.0005), dues for professional organizations (P less than 0.0005), and compensatory time (P less than 0.0005). Pharmacists in the sample participated in an average of 123.8 hours of CE yearly, including 77.2 hours of journal reading. Staff size influenced the method of obtaining CE, with smaller staffs relying more heavily on journals and larger staffs on in-house programs. The amount of compensation did not influence total CE participation, suggesting that other factors might influence CE participation.

**Computer-assisted practitioner-response system for studying the use of cimetidine.**  
Schwartz JI; Kennedy TJ  
Am J Hosp Pharm ,Jul 1982, 39 (7) p1198-201, ISSN  
0002-9289 Journal Code: 3IO  
Languages: ENGLISH

A computer-assisted practitioner-response system was used to review cimetidine use in one hospital. All patients receiving cimetidine from April 1, 1981, through May 15, 1981, were identified daily using a computerized medication-profile system. A practitioner-response form, which asked the

physician to indicate the reason for prescribing cimetidine, was placed in the chart of all patients receiving the drug. When these forms were collected, the reviewer scanned the chart for patient demographic information, duration of cimetidine therapy, and other drugs prescribed that potentially could interact with cimetidine. If the physician did not complete the form, the reviewer checked the chart for prescribing information. Cimetidine was prescribed for 10% (247) of all patients admitted during the study period. Seventy percent of the practitioner-response forms were completed; the indication for cimetidine use was obtained for an additional 20% through chart review. Seventy-five percent of the patients were exposed to a potential drug interaction. The most common reason for prescribing cimetidine was to prevent stress ulcers; only 15% of cimetidine orders were for FDA-approved uses. The computer-assisted practitioner-response system was an efficient method for reviewing cimetidine use. The computerized medication profile facilitated identification of patients receiving the drug, and the practitioner-response form provided the indication-for-use data more quickly than conventional chart review.

**Use of a tabletop computer in controlled substances distribution.**  
Markin RE; Schwartz JI; Sell AE  
Am J Hosp Pharm ,Jul 1982, 39 (7) p1195-7, ISSN  
0002-9289 Journal Code: 3IO  
Languages: ENGLISH

The use of a tabletop computer for controlled substances distribution is described. The self-contained system uses programs stored on discs to maintain records for floor stock, individual patient orders, and ambulatory patient prescriptions. Three reports are generated daily: (1) a listing of all floor supplies issued on the current date, (2) a listing of all individual patient supply transactions for the current date, and (3) an alphabetical listing of the inventory for controlled substances, including an alert system to identify any item that has fallen below a preselected minimum stock level. The tabletop computer allowed the pharmacy to take advantage of the accuracy and speed of electronic data processing at its own pace, independent of the hospital's main computer system. Because the tabletop computer and the main system both use a common programming language, any programs developed on the tabletop computer can be converted to the main system.

**Alternative to the traditional discount method of wholesaler purchasing.**

Lee GF; Bair JN; Piz JW  
Am J Hosp Pharm ,Jul 1982, 39 (7) p1192-4, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

A program of purchasing drugs from wholesalers at the wholesaler's exact invoice cost plus a percentage is described and compared with the traditional method of average wholesale price (AWP) less a discount. The comparison was conducted by the pharmacy department of a 310-bed, teaching hospital that awarded a one-year contract to a wholesaler offering its items at the exact cost plus a pre-established percentage. Data collected from monthly wholesaler computer printouts gave the following information on each product: (1) list price per item, (2) actual cost to pharmacy per item, (3) percentage discount from AWP, and (4) quantity ordered. The net percentage discount from AWP for 12 months was calculated and compared to the former (traditional) discount rate. The net discount from AWP was 15.6% for purchases made by the hospital during the first 12 months of the program. When compared with the smaller discount the hospital traditionally received, the new program saved the hospital \$5758 on annual purchases of \$136,419. The actual dollar savings to an institution that changes from a traditional discount program to a cost-plus-percentage program depends on: (1) the negotiated percentage added to wholesaler cost, (2) the discount from AWP that the institution was previously receiving, and (3) the volume of wholesale purchases.

**Quality circles as a management tool for hospital pharmacy.**

Parness MI  
Am J Hosp Pharm ,Jul 1982, 39 (7) p1189-92, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

A pharmacy department's experience with a quality circle program is described. The quality circle is a type of participative management where a group of employees within a department voluntarily meets on a regular basis to identify and research departmental problems and formulate alternative solutions for management. The pharmacy department formed one of the first five circles at the hospital. Each circle meets for one hour weekly on hospital time. The pharmacy quality circle includes three staff pharmacists, two support staff, and a pharmacy supervisor who serves as the leader. Through brainstorming sessions, the circle has identified problems within the department. The circle collects data to help define the problems, and specific solutions are presented to management. Among the solutions recommended have been: assigning a clerk as a receptionist at the pharmacy front window so that the pharmacist would not be interrupted; widening the front window to accommodate separate lines for inpatient and outpatient prescriptions; and instituting a double-ticket procedure to help retrieve employee

prescriptions. Management accepted and instituted all of the circle's proposals. The quality circle has been a successful management tool in this pharmacy department.

**Team approach in providing clinical pharmacokinetic services.**

Maddox RR; Lampasona V  
Am J Hosp Pharm ,Jul 1982, 39 (7) p1186-9, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

A team approach to clinical pharmacokinetic services at a university hospital is described. The clinical pharmacokinetics team (CPT) developed as an outgrowth of a clinical pharmacokinetic service (CPS) as the workload of the service expanded. The CPT serves to: (1) maximize the quality and continuity of clinical pharmacokinetic care; (2) provide a teaching medium for students at the baccalaureate and graduate level; and (3) stimulate the development of clinical pharmacokinetic research. The CPT is responsible for patients in those medical services that are not regularly served by a clinical pharmacist. The structure of the CPT includes an attending clinical pharmacist with a hierarchy of subordinate practitioners ranked by their individual didactic and clinical experience in pharmacokinetics. Students participate in (1) work rounds, where collective discussions of patient evaluations occur, and (2) one-to-one student-preceptor clinical assessments of patients' drug therapy. The attending clinical pharmacist conducts CPT rounds daily, and the students and residents must convey information to the team on: (1) the drug therapy prescribed and the appropriate monitoring methods, (2) the working diagnosis and plan of treatment, (3) results of laboratory and clinical assessments, and (4) details of patient interviews. The CPT is also responsible for ongoing clinical pharmacokinetic research. The team approach to clinical pharmacokinetic services has provided a framework for the education of clinical pharmacists while stimulating research and providing direct patient care.

**Factors potentially influencing aminoglycoside use and expenditure.**

DiPiro JT; Kilsdonk GF; Amerson AB; Record KE  
Am J Hosp Pharm ,Jul 1982, 39 (7) p1180-3, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

Factors that may have influenced aminoglycoside use and expenditure in one hospital were examined. Factors that were evaluated as to their influence on aminoglycoside-use patterns were: (1) formulary status; (2) bacterial susceptibility patterns; (3) identified or perceived differences in toxicity; (4) changes in patient population; (5) price paid by the hospital for aminoglycosides; (6) distribution of newsletters or memoranda; (7) advertising and detailing; and (8) pharmacy policies. For FY 1976-77 to 1979-80, the largest proportion of aminoglycoside expense was for gentamicin. During FY 1980-81, the expenditure for gentamicin decreased and tobramycin accounted for the largest proportion of total expenditure. Monthly gentamicin use decreased 20% during FY 1980-81 from the previous year. Tobramycin use increased from January 1979 to November 1980 and decreased from December 1980 to June 1981. Kanamycin use and amikacin use were fairly constant during the study period. Based on temporal relationships, the following factors appeared to influence aminoglycoside use and expenditure: (1) a study conducted at the institution from June 1977 to June 1979 comparing gentamicin and tobramycin nephrotoxicity; (2) a comparative nephrotoxicity study published in a widely circulated medical journal in May 1980; and (3) an intramural newsletter and memorandum distributed in March 1981 encouraging selective aminoglycoside use. The identification of factors that potentially influenced aminoglycoside use can be used to anticipate the future impact of similar events and to devise strategies to influence antimicrobial use.

**Use of clinical pharmacists to reduce cefamandole, cefoxitin, and ticarcillin costs.**

Abramowitz PW; Nold EG; Hatfield SM  
Am J Hosp Pharm ,Jul 1982, 39 (7) p1176-80, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

The financial impact of using cefamandole and cefoxitin rather than cefazolin and of using ticarcillin rather than carbenicillin in one institution was assessed; the effectiveness of clinical pharmacists in reducing the costs associated with these drugs also was determined. During Phase 1 (July 1, 1980-March 31, 1981), the numbers of intravenous piggyback cefazolin, cephalothin, cefamandole, cefoxitin, carbenicillin, and ticarcillin doses prepared were recorded. Quarterly purchase data for each drug were determined from invoice records. During Phase 2 (April 1, 1981-September 30, 1981), eight clinical pharmacists reviewed all patient charts for cefamandole, cefoxitin, and ticarcillin orders. If the indication for these orders was missing or considered

inappropriate, the pharmacist contacted the prescriber and recommended substituting appropriate doses of cefazolin for cefamandole and cefoxitin and of carbenicillin for ticarcillin. The number of doses prepared and quarterly purchase data were collected as in Phase 1. The projected savings resulting from clinical pharmacist input relating to these drugs was calculated. Based on Phase 1 data, the total theoretical expense resulting from cefamandole and cefoxitin use instead of cefazolin and from ticarcillin use in place of carbenicillin was projected to be \$233,448 annually. Cefamandole and cefoxitin accounted for 59.8 and 39.7% of total cephalosporin use in Phases 1 and 2, respectively. Ticarcillin accounted for 77.1% of the total ticarcillin and carbenicillin doses in Phase 1, and 16.6% in Phase 2. A projected annual savings of \$156,756 was achieved because of clinical pharmacist input at a cost of \$16,000 for time devoted to the effort. Clinical pharmacists were effective in reducing the use of cefamandole, cefoxitin, and ticarcillin in situations where cefazolin or carbenicillin could be substituted.

**Recognizing, reversing, and preventing hospital pharmacist burnout.**

Radde PO  
Am J Hosp Pharm ,Jul 1982, 39 (7) p1161-9, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

The stress-related syndrome of "burnout" is reviewed, especially as it relates to work in hospital pharmacy. Included are suggestions for preventing and reversing burnout among hospital pharmacists. Burnout comprises a distinct series of symptoms that involve a regressive spiral in personal energy, vitality, and interest; it may be described as a disease in personal relationships. The five stages of burnout are: (1) physiological, (2) social, (3) intellectual, (4) psycho-emotional, and (5) spiritual. Regeneration from burnout can be pursued more systematically by striving for balance among these five aspects of life. Certain characteristics of hospital pharmacists increase their susceptibility toward burnout. Preventing imbalance/providing balance in one's life is a basic personal responsibility; no one can do it for another person. However, attentive management can provide conditions that help pharmacy staff members prevent burnout. Preventing burnout requires learning from past burnout-prone behavior and making the necessary changes in life style.

**The 1982 Hoechst Lecture: "Cost effectiveness--the emerging 'bottom line' for pharmacy?!"**

Marshman JA

Can J Hosp Pharm ,Mar-Apr 1982, 35 (2) p39-41, ISSN 0008-4123 Journal Code: D2K

Languages: ENGLISH

In the current climate of budgetary restraint in the health care system, cost effectiveness is a concept which surfaces with increasing frequency, especially in reference to health care services funded by government. Since significant elements of pharmacy services in Canada are thus funded (including in most provinces, hospital pharmacy services, and prescription drug plans for senior citizens), it is important that pharmacy "tune into" the concept, and recognize it as an essential criterion to be met in the maintenance of existing services and in the development of new services. Prerequisite to a consideration of cost effectiveness is, of course, consideration of effectiveness; and a statement about the effectiveness; and a statement about the effectiveness of a service implies a potential for measurement of effect or outcome. In the 1980s, as pharmacy focuses its efforts on patients rather than products, that effect must surely be defined in "people" terms. One of the important dimensions of today's patient-focussed pharmacy services is patient counselling, more broadly, patient education.

0214004 82253906

**Adaptation of a workload measurement system.**

Toohey JB; Herrick JD; Trautman RT

Am J Hosp Pharm ,Jun 1982, 39 (6) p999-1004, ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

An adaptation of a previously reported patient-care unit (PCU) system of workload measurement is described. A PCU is any distributive or clinical pharmacy activity related to patient care, and the PCU system of workload measurement relates the activity frequency and the usual time required to complete each activity. The key to the system is the weighting factor (usual time) for each PCU. The PCU system was modified by breaking each PCU into its various elements and determining the time required to complete each element. Several time units were available from references; other units specific for hospital pharmacy were measured. The modified PCU definitions, counting mechanisms, and weighting factors used at the study hospital are included in an appendix. The number of service hours, which is the product of the frequency of each activity and its weighting factor, is an indicator of personnel time devoted to each pharmacy activity. The cost per service hour can be computed and used to set fees for each pharmacy activity. Other practical applications of the PCU system include evaluation of staffing patterns, trend analysis, and documentation of clinical services. The modified PCU system provides a more precise measurement of weighting factors than previously described methods, and it can be adapted by other institutions.

**Medication errors in nursing homes and small hospitals.**

Barker KN; Mikeal RL; Pearson RE; Illig NA; Morse ML

Am J Hosp Pharm ,Jun 1982, 39 (6) p987-91, ISSN

0002-9289 Journal Code: 310

Contract/Grant No.: HCFA-500-79-0028

Languages: ENGLISH

An observation method for measuring the rate of medication errors, which can be used as an outcome indicator of a medication system's quality, was evaluated in a national sample of long-term care facilities (LTCFs) and small hospitals. Trained nurse and pharmacist observers observed nurses administer medications during the three-hour period surrounding the peak medication workload on one day in national sample of 58 LTCFs and 10 hospitals. Opportunity-for-errors (OE), defined as the total number of doses ordered plus the unauthorized doses given, were counted, as well as all medication errors. The error rate was calculated as the proportion of errors in total OEs. The reliability of the method was evaluated on seven days by comparing the results of a researcher and observer, who were observing the same nurse. The mean-medication-error rate was 12.2 and 11.0% in the LTCFs and hospitals studied, respectively. Three LTCFs and four hospitals had error rates of zero. Only 31% of the LTCFs and 40% of the hospitals would pass a medication-error limit standard of 6%. The authors concluded that the observation method was promising. Recommendations for further study included: (1) implementation of a one-year project to evaluate observer efficiency after becoming proficient with the method, (2) improvement of the reliability measure, and (3) examination of the relationship of medication errors with structure and process variables.

**Managing computer systems. Developing the proposal.**

Nold EG

Am J Hosp Pharm ,Jun 1982, 39 (6) p1032-9, ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

The major components of a thorough proposal to computerize pharmaceutical services are described. The components of the proposal are (1) the introduction; (2) description of current and proposed systems; (3) hardware, software, and supplies; (4) vendor selection; (5) implementation; (6) interface; (7) justification of need; (8) risk analysis; (9) contract; (10) summary; and (11) appendices. Special emphasis is given to justifying the pharmacy system on the basis of decreased cost for personnel, drugs, charging for services, and equipment. Additional justification is based on the benefits of increased production, decreased problems, and increased capacity to produce. A life-cycle cost analysis and engineering economy formula is described that can be used to calculate the number of full-time equivalents that must be reduced in order to offset costs of the system through personnel reduction alone. Because the decision to computerize pharmaceutical services constitutes a major and permanent change, it is important that the proposal be logical, factual, thorough, and organized.

**Therapeutic substitution practices in short-term hospitals.**

Doering PL; Klapp DL; McCormick WC; Russell WL

Am J Hosp Pharm ,Jun 1982, 39 (6) p1028-32, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

Hospital policies concerning the automatic interchange of therapeutically equivalent drugs were examined. A questionnaire was sent to the chief pharmacists at 6326 short-term hospitals throughout the United States. The survey items solicited demographic data and formulary policies on generic and therapeutic substitution. A total of 2437 (39%) usable questionnaires were returned. Approximately 40% of the hospitals reported that their formulary system allows the stocking of a single product to represent a given therapeutic category. A total of 751 hospitals reported that their formulary system allows automatic dispensing of the therapeutically equivalent drug product without contacting the physician for permission. Therapeutic substitution was found particularly prevalent in federally owned hospitals. There were regional variations in the existence of therapeutic substitution. Factors that appeared to be associated with therapeutic substitution were: drug use review activity, medical school affiliation, existence of a formulary system, perceptions of favorable view by the state board of pharmacy, and favorable perception of the savings generated through bid purchasing. Reasons for not engaging in therapeutic substitution included the following: (1) would not be accepted by the physicians, (2) interferes with physicians' right to select the drug, (3) unnecessary risk of civil liability, (4) violation of laws, and (5) expected benefits do not justify the cost. Most respondents thought that physicians are usually aware of therapeutic substitutions that occur. Although they were a minority, a large percent of the respondents had a formulary system that allowed automatic interchange of generically inequivalent products within a therapeutic class of drugs. The influence of therapeutic substitution on drug therapy outcomes and cost savings need to be evaluated.

**Patient satisfaction with outpatient pharmaceutical services.**

Somani SM; Daniels CE; Jermstad RL  
Am J Hosp Pharm ,Jun 1982, 39 (6) p1025-7, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

Patient characteristics and satisfaction with outpatient pharmaceutical services at a large university hospital were assessed. A mail questionnaire was sent to 700 outpatients selected at random. Most questions had fixed-format answers. Of the 388 (58%) returned surveys, 335 (50%) were usable. A large segment of the respondents (40%) were between the ages of 18 and 34. Fifty-nine percent of the respondents paid for their own prescriptions, and this group was less likely to fill their prescriptions at the university pharmacy. Of the patients who received prescriptions but did not have them filled at the university, 29% were unaware of the existence of the pharmacy, 36% found the pharmacy inconvenient for refills, and 21% thought that the waiting time to get their prescriptions filled was too long. Of the respondents who received prescriptions, 46% had them filled at the university pharmacy. Convenience (55%), availability of medications (19%), and low prices (12%) were the major reasons given for going to the university pharmacy. No association was found between the distance from the university and the internal retention rate for prescriptions. Of those who went to the university pharmacy, 94% were satisfied with the services they received.

Languages: ENGLISH

The role of a clinical pharmacist is outlined as interviewing patients on admission, monitoring of 'at risk' patients and drugs, and counselling on discharge. These functions were assessed on a 118 bed medical unit to try to quantify the potential workload and staff requirements needed to achieve it. It is suggested that the establishment of pharmacists for ward pharmacy services may need to be increased two-fold to accomplish the outlined role, and that a 24-hour service would be needed to cover some duties. However, before such a level of staffing can be achieved, the positive benefits of clinical pharmacy must be demonstrated.

The success of evaluation research rests largely in its usefulness. If the sponsors of an evaluation find the data meaningful, then the limitations that the problems of evaluation invariably impose on a study's scientific origin should not be given undue emphasis. In the case of MHMC, the evaluation results were used for program planning in the hospital and for explicating the content of testimony to the California legislature about pharmacy practice in the state. Of course, it would be unthinkable to advocate weak studies and unreliable data. The evaluator must assume the responsibility of determining if and when the balance between what can be done well is tipped in favor of unsound methods. The evaluator is also responsible for judging just how important the data from the study are. How many people will be affected? Are other data available to illuminate or be used with the evaluation? As clinical pharmacy becomes more concerned with program evaluation, it will need to address ethical and political questions like these at the same time that it answers methodological ones.

Penicillin skin tests are of value in detecting patients at risk of experiencing an immediate or accelerated hypersensitivity reaction. This paper briefly reviews the immunologic aspects of penicillin hypersensitivity, the indications and procedure for using penicillin skin tests, and the interpretation of skin test results. A pharmacy-prepared skin test kit is also described. The penicillin skin test kit can facilitate the proper use of penicillin test reagents.

Evaluation and documentation of pharmacists' clinical services in the hospital setting are important for the continued development and implementation of these services. The conceptual model discussed here was designed for use by hospital personnel in evaluating a clinical pharmacy program or a specific clinical service in a hospital. Hospital management's decision to implement clinical services deserves the validation of the expected patient benefits of the services. This conceptual model has been used at Memorial Hospital Medical Center since 1977. The results of studies there are reviewed by the P&T Committee when existing or new clinical services are discussed. This study results have become an important part of the committee's and the hospital management's support for the continuation of clinical pharmacy services.

Results of initial departmental quality assurance audits revealed noncompliance with the intravenous admixture service criteria concerning aseptic technique. In order to better assess this problem, a quality assurance program for aseptic technique was developed. The criteria consisted of 16 characteristics and/or functions that are indicative of aseptic technique. An audit of 13 technicians revealed a number of problems (noncompliance) related to aseptic technique. An educational program was developed and implemented on an individual basis. A reaudit two to four weeks later revealed compliance with the aseptic technique criteria. This study indicates that the audit method is effective in determining compliance to the aseptic technique criteria and standards.

Implications for hospital and community pharmacists of the hospital industry's increased involvement in ambulatory care are discussed. There will certainly be competition between hospital and community pharmacists for the right to provide pharmaceutical services to ambulatory patients. Various developments are encouraging hospitals to expand their ambulatory services, and these will increase the competition and add urgency to minimizing confrontation between the two groups. The need for a forum within pharmacy to discuss difficult issues such as this is emphasized.

**Evaluating vendor responses.**

Williams FL; Tucker SR

Am J Hosp Pharm ,May 1982, 39 (5) p835-9, ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

The process of evaluating computer vendors' responses to a request for proposal (RFP) is described. The steps involved are (1) reviewing vendor proposals, (2) attending vendor presentations (3) reviewing references, (4) visiting vendor clients, (5) reviewing vendor stability, and (6) making the decision. The primary purpose of reviewing proposals is to reduce the number of vendors under consideration. Vendors' proposals should be attended by representatives of all affected departments, and each vendor's presentation should be discussed with the RFP or RFP extension as a guide. Interviewing users of a system helps determine how the system works in practice and how accurately the vendor has represented his product. Likewise, visiting selective vendor clients, without the vendor representative being present, helps establish whether the persons actually using the system like it and find it easy to use. A vendor's stability can be best determined by examining its financial stability and its commitment to the pharmacy product. Making the selection requires elimination of vendors that do not meet minimum requirements, rating the remaining vendors numerically, and deciding which features of each system are most desirable. The vendor selection process provides an opportunity to thoroughly study an operation and helps set priorities for the department.

**Evaluating the performance of technician trainees.**

Oleen MA

Am J Hosp Pharm ,May 1982, 39 (5) p814-7, ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

The development and use of a behavioral performance evaluation form for pharmacy technicians in a hospital-based training program is described. The behavior anchors for the evaluation form were derived from a task analysis of the technician position and a modified critical-incident technique. The appraisal factors were classified under six basic work areas: (1) procurement, (2) intravenous admixtures and sterile solutions, (3) automatic replenishment, (4) manufacturing and prepacking, (5) outpatient dispensing, and (6) inpatient dispensing or unit dose. Five rating categories ranging from exceptional to unsatisfactory were given point values. After an evaluation is completed, the supervising pharmacist reviews it with the trainees and sets objectives for the next appraisal period. The form can be used at regular intervals to assess the trainees' progress, and it can be used in the annual review of a technician's performance. The performance evaluation of technician trainees can determine the proficiency gained from a training program and identify areas where further instruction is needed.

**Evaluating performance in writing drug information consultations.**

Evens RP; Shahan DR; Littlefield JH

Am J Hosp Pharm ,May 1982, 39 (5) p810-4, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

A form for evaluating written drug information consultations was used to measure the performance of pharmacy students in a drug information service clerkship; the reliability of the evaluation process was also assessed. Drug consultations were written by 74 clerks during a four- or five-week rotation. A total of 147 consultations were written: Nine clerks wrote one consultation, 57 clerks wrote two, and eight clerks wrote three. The consultations were evaluated on 11 criteria by 18 different preceptors using an evaluation form. Performance on each criterion was rated on a four-level scale. Clerk improvement over time, reliability of the instrument, and inter-rater reliability for preceptors were analyzed statistically. The overall mean score for all consultations was 84.7%. Some improvement was observed between the first and second consultations completed by clerks, but the difference was not significant. Reliability of the evaluation process was good (coefficient of alpha = 0.666). There was no significant difference among preceptors. The authors concluded that the written drug information consultation evaluation form was a valid and reliable method for measuring individual and program competence.

**Assessing whether a clinical pharmacy program is meeting its goals.**

Fink A; Kosecoff J; Oppenheimer PR; Smith WE; Brodie DC  
Am J Hosp Pharm ,May 1982, 39 (5) p806-10, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

An assessment of whether the clinical pharmacy program at Memorial Hospital Medical Center (MHMC), Long Beach CA, was meeting its goals is presented. MHMC is a 858-bed, nonprofit teaching hospital that initiated a clinical pharmacy program in 1967. The program's three foremost goals were to: (1) establish cohesive and standardized clinical services, (2) promote the acceptance of the roles and functions of clinical pharmacists by physicians and nurses, and (3) assure the provision of good quality care. The evaluation data were collected over a six-week period using questionnaire surveys of approximately 28 pharmacists, 146 physicians, and 389 nurses; pharmacist service reports from 5991 drug monitorings; 228 medical record audits for six drugs; 68 guideline compliance records for three drugs; interviews with 131 users of the drug information services; and logs of 3946 pharmacist encounters with other health-care providers. Generally, the clinical pharmacy program was found to be meeting its goals. Most of the monitorings (81.6%) were initiated by pharmacists, and 20% resulted in changes in drug therapy. The pharmacists adhered to the pharmacy department's monitoring and dosing guidelines. There was unanimous satisfaction among users of the drug information service with the response received from pharmacists, and 99% satisfaction with the promptness of response and accuracy of the information. Sixty-eight percent of the pharmacists reported discussing general issues with physicians, and 72% answered patient-specific questions from physicians. The physicians (96%) and nurses (97%) thought that there was an improvement in the quality of patient care as a result of pharmacist involvement. Pharmacists at MHMC are providing useful clinical services.

**Trends and initiatives in hospital ambulatory care.**

Burns LA  
Am J Hosp Pharm ,May 1982, 39 (5) p799-805, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

Changes in the financing and delivery of hospital ambulatory care are discussed. Ambulatory care encompasses a wide spectrum of clinical services provided to patients who are not confined overnight to an institutional bed as inpatients. There are a large and growing number of ways hospitals and physicians cooperate to provide ambulatory-care services. Technological advancements, which have spurred changes in other sectors of medicine, have also changed patterns of medical practice in ambulatory care. Some of the reasons why hospitals develop and expand ambulatory-care programs relate to the changing demand for health services, the shifting preferences of third-party payers and regulators, competitive

influences, diversification of risk, and use of such programs as feeders for inpatient services and as teaching and research settings. Although outpatient revenues are a small portion of total hospital revenues, they are growing more rapidly than inpatient revenues. Changes in the health industry that offer opportunities to hospitals are described, such as the increasing physician supply and the formation of group practices, the climate of cost consciousness and price competition, and the trend toward new corporate structures for hospitals. These changes portend changes for hospital pharmacists and give them the opportunity to increase their clinical roles in providing ambulatory care.

**Job satisfaction and the future of pharmacy.**

Noel MW; Hammel RJ; Bootman JL  
Am J Hosp Pharm ,Apr 1982, 39 (4) p649-51, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

Reasons for the low levels of job satisfaction reported by hospital pharmacy personnel, the potential impact of this dissatisfaction on the profession, and possible solutions to the problem are discussed. Low levels of satisfaction among hospital pharmacists may be largely because of the manner in which pharmacy is practiced. While leaders in pharmacy have developed innovative programs and colleges of pharmacy have produced highly skilled practitioners, the practice of hospital pharmacy has not kept pace. Young practitioners may be disenchanted with pharmacy practice in the "real world" compared with their expectations, and they may not find their jobs mentally challenging. This may result in boredom, low motivation and commitment, and obsolescence of skills and abilities. To reverse the trend of insufficient mental challenge, the role of the hospital staff pharmacist could be expanded to include some of the challenging functions presently performed by clinical pharmacists. This could be done by decentralizing pharmaceutical services so that pharmacists have more interaction with patients and other health practitioners. To alleviate dissatisfaction with advancement, a position hierarchy in the pharmacy could be established where pharmacists and support personnel would be promoted to a higher grade on the basis of merit, tenure, and demonstrated competence. Soliciting employee input at staff meetings may have a positive impact on satisfaction with hospital policies and practices. Finally, it is necessary for directors of pharmacy to develop the expertise to deal effectively with problems of human-resources management.

**Establishing priorities and distributing the request for proposal.**

Williams FL; Tucker SR  
Am J Hosp Pharm ,Apr 1982, 39 (4) p635-40, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

The process of establishing priorities for a prospective hospital pharmacy computer system and distributing the Request for Proposal (RFP) to computer vendors is described. Priorities are established through the creation of three documents: (1) a priority list, (2) a categorized RFP, and (3) a categorized RFP extension. The priority list outlines important elements in the selection of a vendor; quality of software, reliability of software and hardware, vendor stability, costs, site requirements, expansion capability, vendor support, and system performance. The categorized RFP ranks each specific RFP item as mandatory, highly important, important, or "luxury." The categorized RFP extension ranks the nonimplementation items and is used to grade vendors on items not addressed by the RFP. Each potential vendor should be called and asked the same set of questions in order to quickly eliminate those with unacceptable products. The RFP is then distributed to vendors that qualify. This process helps determine if the system being considered has all the required functions, has reliable software and hardware, and whether the vendor is stable and capable of providing assistance during implementation and throughout the life of the product.

**Pharmaceutical services in a veterinary hospital and clinic.**

Jinks MJ; Paulsen LM  
Am J Hosp Pharm ,Apr 1982, 39 (4) p619-21, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

The pharmaceutical services offered by hospital pharmacists to a veterinary hospital and clinic are described. At Washington State University, the Department of Veterinary Clinical Medicine and Surgery of the College of Veterinary Medicine approached the College of Pharmacy to evaluate the pharmaceutical services in terms of lost charges and to provide recommendations for needed changes. The records of 18 cases were surveyed, and an inventory was taken in two wards to determine outdated drug products, products without expiration dates, and product duplication. The survey and inventory revealed inefficiencies and waste in the billing and distribution systems. The findings indicated the feasibility and potential cost-effectiveness of employing hospital pharmacists to manage the drug distribution system. A combined floor stock and individual prescription order system was implemented under the direction of a pharmacist faculty member jointly appointed by the two colleges. The distribution system has been in successful operation for two years, and the relationship between the two colleges has prompted the development of shared academic positions and joint clinical research.

**The impact of adenine and inventory utilization decisions on blood inventory management.**

Cohen MA; Pierskalla WP; Sasseti RJ

Transfusion ,Jan-Feb 1983, 23 (1) p54-8, ISSN 0041-1132

Journal Code: WDN

Contract/Grant No.: HS000786

Languages: ENGLISH

The use of citrate-phosphate-dextrose-adenine as an anticoagulant for whole blood increases the storage period permitted for whole blood and red cells from 21 to 35 days. A simulation model was used to analyze the possible consequences for outdates and shortages of the addition of adenine. The model accepts as input (1) the maximum age (21 or 35 days), (2) parameters describing the demand and supply distributions, and (3) parameters describing inventory control (crossmatch recycle period, transfusion fraction, deviation from optimal target inventory levels). These parameters were varied over wide ranges, and a full factorial design was carried out. The observed shortage and outdate rates were then related (via multiple regression) to the parameter values. The resulting shortage and outdate functions indicated the effect of parameter changes, including extending the lifetime from 21 to 35 days, and the joint effect of changing more than one parameter. Conclusions indicate that, while the contribution of an increased lifetime to reducing shortages and outdates can be substantial, this contribution can be easily dissipated by relaxing the tightness of other inventory management controls.

**System to maximize inventory performance in a small hospital.**

VanDerLinde LP

Am J Hosp Pharm ,Jan 1983, 40 (1) p70-3, ISSN 0002-9289

Journal Code: 310

Languages: ENGLISH

A computerized system to maximize inventory performance in a small hospital is described. An inventory control system, which integrates economic order quantity (EOQ) and ABC inventory models was implemented in a 146-bed hospital. The perpetual inventory control data base, supported by the hospital's mainframe computer, generates monthly inventory statistics that are segregated into A, B, and C reports. Using a hand-held computer that interfaces with the perpetual inventory system, a series of inventory management reports

were developed. These reports, which are based on the EOQ model, provide the following information for each drug line item: EOQ, EOQ proposed carrying cost, actual inventory carrying costs, safety stock, order point, average inventory, and the "on hand/on order" point. Several supplemental inventory management reports were also developed. While implementing the computerized inventory system, the pharmacy also changed its purchasing strategy from predominantly direct accounts to a progressive prime-vendor wholesaler. From December 1980 to December 1981, the ABC/EOQ system with progressive prime-vendor involvement essentially doubled total aggregate inventory turnover. A 46.5% reduction in standing inventory levels occurred. The drug cost per line item dispersed remained relatively constant over the one-year period, despite price increases. The application of the computerized ABC/EOQ inventory model to an online perpetual inventory control data base effectively reduced the inventory operation costs.

**Improving a pharmaceutical purchasing and inventory control system.**

Rubin H; Keller DD

Am J Hosp Pharm ,Jan 1983, 40 (1) p67-70, ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

A method by which a pharmacy department improved its purchasing and inventory control system is described. System changes to the computerized inventory control system included implementation of a formulary, affiliation with a group purchasing association, and transfer of specified purchasing and inventory control functions to the technical staff of the purchasing department. Pharmacy maintained the decision-making authority over all vendors and dosage forms of drug products. Optimal results were achieved when the purchasing department's pharmacy buyer position was staffed with an employee who had previous experience as a clerical worker in the pharmacy. The authors state that this system has proved to be an effective, cost efficient method of purchasing and inventory control of pharmaceuticals in their hospital.

The steps involved in preparing to implement a pharmacy computer system are described. Although the order in which the various steps have to be completed varies according to the hospital specifics, important elements of the preparation process include preparation of the site, organization of personnel, development of policies and procedures, developing and ordering forms, preparation of the implementation schedule, file development, and preparation of other departments. A well-designed plan and a realistic time schedule for the preparation process facilitates the actual implementation of a pharmacy computer system.

0002-9289 Journal Code: 310  
Languages: ENGLISH

Cost justification of a pharmacy residency training program was prepared. The contributions of the pharmacy residents were tabulated and compared with the cost of the program to the hospital. Contributions were determined by identifying the

activities performed by residents that could be quantified in financial terms. The residents' activities that benefited the hospital included administrative support, completion of special projects, scheduling staff assignments, and coordinating education programs. Costs were derived from salaries, fringe benefits, and training expense. An output value analysis was performed by comparing the contributions of the residents to the institution with the cost of the training program. The contributions of the residents exceeded the costs of the training program by a ratio of 1.3 to 1.

**Changing an automated drug inventory control system to a data base design.**  
Bradish RA  
Am J Hosp Pharm ,Sep 1982, 39 (9) p1502-5, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

A pharmacy department's change from indexed sequential access files to a data base management system (DBMS) for purposes of automated inventory control is described. The DBMS has three main functional areas: (1) inventory ordering and accountability, (2) charging of interdepartmental and intradepartmental orders, and (3) data manipulation with report design for management control. There are seven files directly related to the inventory ordering and accountability area. Each record can be accessed directly or through another file. Information on the quantity of a drug on hand, drug(s) supplied by a specific vendor, status of a purchase order, or calculation of an estimated order quantity can be retrieved quickly. In the drug master file, two records contain a reorder point and safety-stock level that are determined by searching the entries in the order history file and vendor master file. The intradepartmental and interdepartmental orders section contains five files assigned to record and store information on drug distribution. All items removed from the stockroom and distributed are recorded, and reports can be generated for itemized bills, total cost by area, and as formatted files for the accounts payable department. The design, development, and implementation of the DBMS took approximately a year using a part-time pharmacist and minimal outside help, while the previous system required constant expensive help of a programmer/analyst. The DBMS has given the pharmacy department a flexible inventory management system with increased drug control, decreased operating expenses, increased use of department personnel, and the ability to develop and enhance other systems.

Am J Hosp Pharm .Jul 1982, 39 (7) p1195-7. ISSN  
0002-9289 Journal Code: J10  
Languages: ENGLISH

The use of a tabletop computer for controlled substances distribution is described. The self-contained system uses programs stored on discs to maintain records for floor stock, individual patient orders, and ambulatory patient prescriptions. Three reports are generated daily: (1) a listing of all floor supplies issued on the current date, (2) a listing of all individual patient supply transactions for the current date, and (3) an alphabetical listing of the inventory for controlled substances, including an alert system to identify any item that has fallen below a preselected minimum stock level. The tabletop computer allowed the pharmacy to take advantage of the accuracy and speed of electronic data processing at its own pace, independent of the hospital's main computer system. Because the tabletop computer and the main system both use a common programming language, any programs developed on the tabletop computer can be converted to the main system.

**Perishable inventory theory: a review.**

Nahmias S

Oper Res ,Jul-Aug 1982, 30 (4) p680-708, Journal Code: OKC

Languages: ENGLISH

This paper reviews the relevant literature on the problem of determining suitable ordering policies for both fixed life perishable inventory, and inventory subject to continuous exponential decay. We consider both deterministic and stochastic demand for single and multiple products. Both optimal and suboptimal order policies are discussed. In addition, a brief review of the application of these models to blood bank management is included. The review concludes with a discussion of some of the interesting open research questions in the area. (77 Refs.)

**A blood ordering strategy for hospital blood banks derived from a computer simulation.**

Friedman BA; Abbott RD; Williams GW

Am J Clin Pathol ,Aug 1982, 78 (2) p154-60, ISSN 0002-9173 Journal Code: 3FK

Languages: ENGLISH

The ultimate goal of a hospital blood bank inventory control programs is to reduce wastage of blood products and unnecessary use of laboratory services without jeopardizing patient safety. The development of a practical blood ordering policy at the hospital level is an integral part of any such program. In order to explore various blood ordering options in detail, a computer simulation of a hospital blood inventory was used to assess the impact on blood bank performance measures of reductions in group O and non-group-O levels from baseline levels, assuming both a 21-day and 35-day shelf life.

On the basis of data derived from this study showing that such inventory reductions accompanied by partial protection of the group O inventory will not result in significant shortages, a practical strategy was developed for establishing optimal target inventory levels for a hospital on an empirical basis. These target levels can serve as a guide for subsequent blood ordering. A step-by-step approach for analyzing a hospital blood inventory control program is then suggested, accompanied by an action plan for implementing change which incorporates the experimentally-derived blood ordering strategy. Adherence to this plan should result in a low outdate rate, a reduction in unnecessary cross-matching, and

greater availability of blood for those patients with a legitimate need for it.

**A computerized system for control and management of radionuclide inventory: application in nuclear medicine.**

Hoory S; Levy LM; Moskowitz G; Bandyopadhyay D; Vaugeois JC  
Health Phys ,May 1982, 42 (5) p601-9, ISSN 0017-9078

Journal Code: G2H

Languages: ENGLISH

An interactive computerized system for radioisotope management and instantaneous inventory is reported. The system is capable of handling operations such as filing, nuclear imaging and disposing of various radionuclides. All radiopharmaceutical transactions are achieved with the aid of a Prime 300 mini-computer of 192K words of high speed semi-conductor memory and over 120 mega bytes of disk storage.

The system automatically corrects for the appropriate decay, monitors and updates the storage file after every subsequent study. The performed study is recorded in a special file, together with the time and data retrieved from the computer's real time clock at the time of the entry. The system provides an organized and complete bookkeeping of all records concerning radionuclide transactions. It is found to be simple, efficient, highly versatile, and drastically reduces the time of operation and errors in handling the radioisotope inventory.

**Applying management science in developing countries: ABC analysis to plan public drug procurement.**

Quick JD

Socioecon Plann Sci .1982, 16 (1) p39-50, ISSN

0038-0121 Journal Code: UUV

Languages: ENGLISH

Despite the vital role of pharmaceuticals in the prevention and treatment of major causes of death and disability in the developing world, high costs and frequent shortages remain chronic problems for drug supply programs. Yet, management techniques developed to optimize the use of scarce resources have had limited application in the settings of greatest need.

An important determinant of the cost and supply of drugs is the procurement pattern. This study reviews procurement patterns in selected public supply programs and, using management science techniques, compares alternative procurement patterns in terms of inventory costs and shortages. Using drug cost and quantity estimates from two countries, a simulated ABC analysis was performed. This analysis showed drug inventories to be typical of industrial inventories: Over 80% of the consumption in dollars was accounted for by less than 20% of the drugs. Procurement patterns with more frequent purchasing or delivery of high usage drugs could reduce average inventories 20-50% over the commonly observed annual purchasing pattern. Sensitivity analysis of the results confirmed that variability in the delivery time and consumption pattern has a significant impact on the efficiency and economy of a procurement system. Closer supplier monitoring and better forecasting should reduce this variability.

**24-hour unit dose dispensing of class III-V controlled substances.**

Larson RL; Miller BA

Hosp Pharm ,May 1982, 17 (5) p254-5, 258-9, ISSN

0018-5787 Journal Code: G98

Languages: ENGLISH

Methods of controlling controlled substance (CS) inventories in unit dose dispensing systems vary. The two extremes are total floor stock of all CS drugs by the use of declining inventory signout sheets on the nursing unit to controlling only Class II and a few selected class III-V items. The method described herein outlines a systematic approach to controlling items on an individual patient basis consistent with the benefits of unit dose dispensing. A CS card assigned to each patient for each of his required controlled substance medications serves as an audit trail for doses consumed by the patient and provides a declining inventory receipt when returned to the pharmacy.

**Comprehensive pharmaceutical services for a state correctional facility.**

Kingston RL; Pfeifle CE; Cipolle RJ; Zaske DE; Eells CB; Johnson HL

Am J Hosp Pharm ,Jan 1982, 39 (1) p86-9, ISSN 0002-9289

Journal Code: 310

Languages: ENGLISH

A contractual model for comprehensive pharmaceutical services involving a major medical center pharmacy, a university, and a state department of corrections is described. Project goals and methods for the provision of services are described. These include areas of formulary development, inventory management, drug distribution, on-site placement of pharmacy operations, and educational development.

Impact of the program was assessed over a 30-month period. Development of policies and procedures for drug use in a correctional setting enabled implementation of a strict patient population-specific drug formulary. Procedural changes resulted in an 83% decrease in on-site drug inventories and a 62% decrease in quarterly drug expenditures. A one-time saving of more than \$26,500 resulted from the decrease in on-site inventory, and an annual saving of \$44,000 is projected for decreased drug expenditures. All but five controlled substances were removed from the formulary, and only 13 nonprescription items remained in the formulary. An educational course on health care in correctional settings provided exposure for pharmacy students to this new area of institutional practice. The contractual model proved both cost-effective and functional for the department of corrections.

**Bacteriological quality of fabrics washed at lower-than-standard temperatures in a hospital laundry facility.**

Christian RR; Manchester JT; Mellor MT  
Appl Environ Microbiol ,Feb 1983, 45 (2) p591-7, ISSN 0099-2240 Journal Code: 6K6  
Languages: ENGLISH

We determined whether the bacteriological quality of fabrics cleaned in a hospital laundry could be maintained at wash temperatures lower than 75 degrees C by the use of

economically reasonable formulas and wash conditions. Three groups of bacteria were examined to determine bacteriological quality: aerobic, nonexacting chemoorganotrophs, staphylococci, and total coliforms. The distribution of bacteria on soiled fabric was patchy, with staphylococci and total coliforms ranging from less than 0.1 to greater than  $4 \times 10^3$  CFU/cm<sup>2</sup> and chemoorganotrophs ranging from less than 0.1 to greater than  $5 \times 10^5$  CFU/cm<sup>2</sup>. The washing process routinely produced fabric containing less than 1 CFU/cm<sup>2</sup>. Low-temperature (47.8 to 60.0 degrees C) wash procedures eliminated all bacterial groups at least as effectively as did high-temperature procedures. The effectiveness of bacterial density reduction at low temperature was augmented by increased concentrations of bleach. Successful low-temperature washing such as that shown here may save both energy and money for hospitals.

**Is a bed centre in a hospital a hygienic hazard?**  
Hambræus A; Malmberg AS  
J Hyg (Lond) ,Feb 1982, 88 (1) p143-7, ISSN 0022-1724  
Journal Code: IEF  
Languages: ENGLISH  
The contamination of linen and air in a bed centre, supply station and ward were compared, as well as the contamination of gowns used by the staff working in the 'clean' and the 'dirty' rooms of the bed-centre. The contamination of linen and air was low and there was no significant difference between the tested areas. The contamination on gowns used by the staff working in the 'dirty' room was significantly higher than that on gowns used by the staff working in the 'clean' room. This stresses the importance of dividing a bed centre into 'clean' and 'dirty' rooms. So organized, a bed centre does not seem to be a hygienic hazard.

Soc Sci Med ,1982, 16 (11) p1147-56, ISSN 0277-9536  
Journal Code: UT9  
Languages: ENGLISH  
This study examines the spatial patterns of congressional voting on health issues. Thirteen roll call votes on health

care issues occurring during the 1st Session of the 96th Congress are factor analyzed. This analysis shows that health care questions cluster around two major issues: health care regulation and health care spending. The factor scores for each Representative are mapped, and a regression model is developed relating health care voting to characteristics of the Representative, the Congressional district, and the hospitals in that district. The most important findings were: (1) support for both health care spending and regulation is strongest in the Northeast and upper Midwest. (2) Although Representatives from most of the Southern states are opposed to health care regulation, they generally favor health care spending. (3) Representatives from a few of the Southern states, however, do not fit this generalization. (4) Although Representatives from the Pacific Coast states are the strongest proponents of regulation, they are opposed to spending. (5) Opposition to health care spending is particularly strong among Representatives from suburban districts.

Drastic action on specific health issues this year may be less important than the growing discontent in Congress over health care costs. Even if economic trends moderate, hospitals will be confronted with the task of changing incentives in the system that fuel the rate of increase in costs.

Accidents due to medical gas systems being incorrectly  
installed or assembled have drawn attention to the need for  
rigid control over maintenance of contracts and standards,  
communication and responsibility allocation whenever work on  
such systems is undertaken. The format of a Permit to Work  
System introduced into a large general hospital is described,  
based on local needs, and its application has highlighted the  
value of such a system.

**The cost of biomedical equipment repair and maintenance: results of a survey.**

Cohen T  
Med Instrum ,Sep-Oct 1982, 16 (5) p269-71, ISSN  
0004-5446 Journal Code: M12  
Languages: ENGLISH

The survey presented in this paper shows that for 19 large hospitals the average ratio of equipment repair costs to acquisition cost was 7.4%. In addition, this survey shows that costs such as rent for building space, utilities, and test equipment are not included in many clinical engineering department budgets. This is one reason for the divergent cost data reported by the various hospitals. These costs should be considered particularly for comparisons between in-house service costs and other sources of service. It seems that, of the indicators observed in this survey, equipment acquisition cost provides the best indicator for equipment maintenance costs. All hospital finance officers should have acquisition value information, because this information is used in calculating capital equipment depreciation. This information should also be available to clinical engineers. In addition, procedures need to be set up so that the total annual repair and maintenance costs can be easily obtained from hospital finance departments. Providing the clinical engineer with this type of data will allow further analysis of repair cost and will aid in long-term planning for the hospital. The ratio of equipment repair cost to acquisition value may be useful as a tool to predict future costs of a given hospital's medical equipment maintenance. This tool may also be useful as a measurement of the effectiveness of a change in a hospital's approach to biomedical equipment maintenance. Further work must be done to standardize equipment maintenance cost reporting so that more detailed comparisons can be made.

Confusion and inefficiency in the medical electronics laboratory can be reduced with the implementation of a good recordkeeping system. One such orderly process includes a work order form, a device record card, and a status indication form. With consistent use, this system has met with success. It is anticipated that, with further development, the system can grow into a solid data base.

This paper describes a proposed Computerized Documentation System for effectively controlling all biomedical equipment preventive maintenance (PM) and repair functions to be effected by hospitals. There is a critical need for such a system to strengthen the management tools of hospital-based Biomedical/Clinical Engineering programs. The system's design objectives, implementation, and evaluation method are

explained and the benefits attributable to such a computerized control system are summarized.

Two safety test units were developed using microprocessor technology to identify automatically the equipment under test, to test the safety parameters, and to record the test results. A program written on the IBM/360 computer is used to input, analyze and store these results. The purpose of this program is to provide accurate and reliable test data and better documentation, so that detection and even prediction of safety hazards within the hospital can be accomplished.

Hyman WA  
J Clin Eng ,Jul-Sep 1982, 7 (3) p223-7, ISSN 0363-8855  
Journal Code: HQA  
Languages: ENGLISH

The provision of automatic alarm systems on medical equipment is generally designed to supplement the user's ability to monitor a variety of device and patient variables simultaneously. The potential value of such systems in improving the safety and efficacy of medical care is accompanied by the potential for false reliance on or other misuse of the alarm systems. Therefore the alarm provisions become an important aspect of clinical engineering assessment of equipment with respect to selection, user training, hazard analysis, and the provision of effective and appropriate preventive maintenance programs.

The equipment investment in modern health care facilities warrants management attention to selection, maintenance, operation, and retirement requirements. An equipment information system is described that has been working for seven years, and a total system using modern hardware and data base technology is proposed to supplement the present system.

A low cost microcomputer system is described that manages PM and test scheduling, provides lists of selected equipment, prints labels, and calculates management data. The files for 2800 devices fit on a standard mini-diskette and are easily updated.

The board's role in energy management consists primarily in enunciating the hospital's commitment to energy management, asking leadership questions, and keeping energy on the board's agenda. Key energy-saving actions include capital-intensive energy conservation measures, such as the installation of computer-based controls, and improvements in operations and maintenance, such as modification of heating, ventilating, and air conditioning systems.

**Dust-free bedrooms in the treatment of asthmatic children with house dust or house dust mite allergy: a controlled trial.**  
Murray AB; Ferguson AC  
Pediatrics ,Mar 1983, 71 (3) p418-22, ISSN 0031-4005  
Journal Code: OXV  
Languages: ENGLISH

Twenty asthmatic children with prick tests positive for house dust or house dust mites were allocated to two groups that were matched for severity. One group was provided with zippered vinyl covers for pillows, mattresses, and box springs, and instructions for making the bedroom as easy to keep clean as a hospital ward; the other group was not. At the end of a 1-month study period, there was a marked and statistically significant difference in symptoms and signs of asthma between the two groups. Those with a dust-free bedroom had fewer days on which wheezing was observed, medication was given, or an abnormally low peak expiratory flow rate was recorded. Bronchial tolerance to aerosolized histamine significantly improved in the group whose bedrooms had been modified. A dust-free bedroom diminishes bronchial irritability and is a practical and effective method for decreasing asthma in children with house dust or house dust mite allergy.

**Operating room practices for the control of infection in U. S. hospitals, October 1976 to July 1977.**

Garner JS; Emori TG; Haley RW  
Surg Gynecol Obstet ,Dec 1982, 155 (6) p873-80, ISSN  
0039-6087 Journal Code: VBD  
Languages: ENGLISH

We estimated the frequency of selected infection control practices in the operating room from a nationwide survey of hospitals. Our survey confirmed that, in many hospitals, practices which have not received scientific or budgetary scrutiny have become part of the perioperative routine. Almost half of the hospitals reported using nonrecommended tacky, or disinfectant, mats at the entrance to operating rooms, and more than three-fourths were performing nonrecommended environmental cultures in the operating room at a cost ranging from \$2,000 to \$20,000 per year. When routine nose and throat cultures were taken of operating room personnel, we found an obvious pecking order, rather than a scientific rationale for culturing. In almost all instances, we found wide variations in practice among hospitals. This nonuniformity may be due to such factors as lack of a convincing scientific basis for evaluating the relative efficacy of alternative practices, the strong influence of industry marketing, the individual preferences of surgeons and operating room supervisors and the lack of completeness and agreement of statements from various scientific and professional organizations.

**Carpeting in hospitals: an epidemiological evaluation.**

Anderson RL; Mackel DC; Stoler BS; Mallison GF  
J Clin Microbiol ,Mar 1982, 15 (3) p408-15, ISSN

0095-1137 Journal Code: HSH

Languages: ENGLISH

Epidemiological and microbiological studies were conducted in a hospital room with carpet (CR) and in one with carpet (NCR). Microbiological profiles were determined with specimens obtained from patients admitted to these rooms. Patient records were reviewed to note infection status and other case identities. Eleven-millimeter cylindrical core samples of carpet were obtained, and swab template techniques were used on the bare floor for subsequent enumeration and identification of contaminating microorganisms. In each sampling period, higher microbial counts per square inch (1 in(2) = ca 6.452 cm(2)) were measured for the carpet than for the bare floor. Recovery rates of *Enterobacter* spp., *Klebsiella pneumoniae*, and *Escherichia coli* were higher from carpet samples than from bare floor samples. Typable organisms (such as *E. coli*, *Pseudomonas aeruginosa*, *K. pneumoniae*, and *Staphylococcus aureus*) obtained from patients were also more frequently recovered from the carpet than from the bare flooring. Patients who stayed in the CR were shown to be colonized with the same types of organisms as those initially recovered from the carpet. However, no statistically significant differences were found in patients in the CR versus NCR in colonization with all typable and nontypable organisms first found on the floor. Disease in patients was found not to be associated with organisms found as contaminants of the carpet or the bare floor. Air above carpeting contained more consistent concentrations of organisms than air above the bare flooring.

Languages: ENGLISH

The use of citrate-phosphate-dextrose-adenine as an anticoagulant for whole blood increases the storage period permitted for whole blood and red cells from 21 to 35 days. A simulation model was used to analyze the possible consequences for outdates and shortages of the addition of adenine. The model accepts as input (1) the maximum age (21 or 35 days), (2) parameters describing the demand and supply distributions, and (3) parameters describing inventory control (crossmatch recycle period, transfusion fraction, deviation from optimal target inventory levels). These parameters were varied over wide ranges, and a full factorial design was carried out. The observed shortage and outdate rates were then related (via

multiple regression) to the parameter values. The resulting shortage and outdate functions indicated the effect of parameter changes, including extending the lifetime from 21 to 35 days, and the joint effect of changing more than one parameter. Conclusions indicate that, while the contribution of an increased lifetime to reducing shortages and outdates can be substantial, this contribution can be easily dissipated by relaxing the tightness of other inventory management controls.

Current research suggests that a diet high in carbohydrate and fiber (HCF) may be useful in the management of diabetes mellitus, hypercholesterolemia, and hypertriglyceridemia. To meet the needs of our clinic population, a microcomputer program has been developed that allows for individualization of HCF menu patterns that satisfy both the diet prescription and the patient's preferences. Educational materials were prepared to guide and augment the HCF diet instruction. It is hoped that this comprehensive approach to diet planning and teaching can be applied in similar settings to facilitate the delivery of quality patient care.

**Training personnel in the prevention and management of violent behavior.**  
Lehmann LS; Padilla M; Clark S; Loucks S  
Hosp Community Psychiatry ,Jan 1983, 34 (1) p40-3, ISSN  
0022-1597 Journal Code: GCJ  
Languages: ENGLISH

The authors describe a training program on prevention and management of violent behavior for the staff of a Veterans Administration hospital. The one-day workshop focuses on preventive identification of potentially violent situations and on methods of verbal and physical management of violent behavior. A study of workshop participants showed that trainees had improved knowledge about and performance in handling violent behavior after completing the program. Future developments in training in prevention and management of violent behavior should include greater availability of educational resource materials and incorporation of the subject in undergraduate and graduate health care training.

**System to maximize inventory performance in a small hospital.**

VanDerLinde LP

Am J Hosp Pharm ,Jan 1983, 40 (1) p70-3, ISSN 0002-9289

Journal Code: 310

Languages: ENGLISH

A computerized system to maximize inventory performance in a small hospital is described. An inventory control system, which integrates economic order quantity (EOQ) and ABC inventory models was implemented in a 146-bed hospital. The perpetual inventory control data base, supported by the hospital's mainframe computer, generates monthly inventory statistics that are segregated into A, B, and C reports. Using a hand-held computer that interfaces with the perpetual inventory system, a series of inventory management reports were developed. These reports, which are based on the EOQ model, provide the following information for each drug line item: EOQ, EOQ proposed carrying cost, actual inventory carrying costs, safety stock, order point, average inventory, and the "on hand/on order" point. Several supplemental inventory management reports were also developed. While implementing the computerized inventory system, the pharmacy also changed its purchasing strategy from predominantly direct accounts to a progressive prime-vendor wholesaler. From December 1980 to December 1981, the ABC/EOQ system with progressive prime-vendor involvement essentially doubled total aggregate inventory turnover. A 46.5% reduction in standing inventory levels occurred. The drug cost per line item dispersed remained relatively constant over the one-year period, despite price increases. The application of the computerized ABC/EOQ inventory model to an online perpetual inventory control data base effectively reduced the inventory operation costs.

**Improving a pharmaceutical purchasing and inventory control system.**

Rubin H; Keller DD

Am J Hosp Pharm ,Jan 1983, 40 (1) p67-70, ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

A method by which a pharmacy department improved its purchasing and inventory control system is described. System changes to the computerized inventory control system included implementation of a formulary, affiliation with a group purchasing association, and transfer of specified purchasing and inventory control functions to the technical staff of the purchasing department. Pharmacy maintained the decision-making authority over all vendors and dosage forms of drug products. Optimal results were achieved when the purchasing department's pharmacy buyer position was staffed with an employee who had previous experience as a clerical worker in the pharmacy. The authors state that this system has proved to be an effective, cost efficient method of purchasing and inventory control of pharmaceuticals in their hospital.

**Changing an automated drug inventory control system to a data base design.**

Bradish RA

Am J Hosp Pharm ,Sep 1982, 39 (9) p1502-5, ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

A pharmacy department's change from indexed sequential access files to a data base management system (DBMS) for purposes of automated inventory control is described. The DBMS has three main functional areas: (1) inventory ordering and accountability, (2) changing of interdepartmental and intradepartmental orders, and (3) data manipulation with report design for management control. There are seven files directly related to the inventory ordering and accountability area. Each record can be accessed directly or through another file. Information on the quantity of a drug on hand, drug(s) supplied by a specific vendor, status of a purchase order, or calculation of an estimated order quantity can be retrieved quickly. In the drug master file, two records contain a reorder point and safety-stock level that are determined by searching the entries in the order history file and vendor master file. The intradepartmental and interdepartmental orders section contains five files assigned to record and store information on drug distribution. All items removed from the stockroom and distributed are recorded, and reports can be generated for itemized bills, total cost by area, and as formatted files for the accounts payable department. The design, development, and implementation of the DBMS took approximately a year using a part-time pharmacist and minimal outside help, while the previous system required constant expensive help of a programmer/analyst. The DBMS has given the pharmacy department a flexible inventory management system with increased drug control, decreased operating expenses, increased use of department personnel, and the ability to develop and enhance other systems.

This paper reviews the relevant literature on the problem of determining suitable ordering policies for both fixed life perishable inventory, and inventory subject to continuous exponential decay. We consider both deterministic and stochastic demand for single and multiple products. Both optimal and suboptimal order policies are discussed. In addition, a brief review of the application of these models to blood bank management is included. The review concludes with a discussion of some of the interesting open research questions in the area. (77 Refs.)

Languages: ENGLISH

The ultimate goal of a hospital blood bank inventory control programs is to reduce wastage of blood products and unnecessary use of laboratory services without jeopardizing patient safety. The development of a practical blood ordering policy at the hospital level is an integral part of any such program. In order to explore various blood ordering options in detail, a computer simulation of a hospital blood inventory was used to assess the impact on blood bank performance measures of reductions in group O and non-group-O levels from baseline levels, assuming both a 21-day and 35-day shelf life.

On the basis of data derived from this study showing that such inventory reductions accompanied by partial protection of the group O inventory will not result in significant shortages, a practical strategy was developed for establishing optimal target inventory levels for a hospital on an empirical basis. These target levels can serve as a guide for subsequent blood ordering. A step-by-step approach for analyzing a hospital blood inventory control program is then suggested, accompanied by an action plan for implementing change which incorporates the experimentally-derived blood ordering strategy. Adherence to this plan should result in a low outdate rate, a reduction in unnecessary cross-matching, and greater availability of blood for those patients with a legitimate need for it.

Health Phys ,May 1982, 42 (5) p601-9, ISSN 0017-9078  
Journal Code: G2H  
Languages: ENGLISH

An interactive computerized system for radioisotope management and instantaneous inventory is reported. The system is capable of handling operations such as filing, nuclear imaging and disposing of various radionuclides. All radiopharmaceutical transactions are achieved with the aid of a Prime 300 mini-computer of 192K words of high speed semi-conductor memory and over 120 mega bytes of disk storage. The system automatically corrects for the appropriate decay, monitors and updates the storage file after every subsequent study. The performed study is recorded in a special file, together with the time and data retrieved from the computer's real time clock at the time of the entry. The system provides an organized and complete bookkeeping of all records concerning radionuclide transactions. It is found to be simple, efficient, highly versatile, and drastically reduces the time of operation and errors in handling the radioisotope inventory.

**Applying management science in developing countries: ABC analysis to plan public drug procurement.**

Quick JD  
Socioecon Plann Sci ,1982, 16 (1) p39-50. ISSN  
0038-0121 Journal Code: UUV  
Languages: ENGLISH

Despite the vital role of pharmaceuticals in the prevention and treatment of major causes of death and disability in the developing world, high costs and frequent shortages remain chronic problems for drug supply programs. Yet, management techniques developed to optimize the use of scarce resources

have had limited application in the settings of greatest need. An important determinant of the cost and supply of drugs is the procurement pattern. This study reviews procurement patterns in selected public supply programs and, using management science techniques, compares alternative procurement patterns in terms of inventory costs and shortages. Using drug cost and quantity estimates from two countries, a simulated ABC analysis was performed. This analysis showed drug inventories to be typical of industrial inventories: Over 80% of the consumption in dollars was accounted for by less than 20% of the drugs. Procurement patterns with more frequent purchasing or delivery of high usage drugs could reduce average inventories 20-50% over the commonly observed annual purchasing pattern. Sensitivity analysis of the results confirmed that variability in the delivery time and consumption pattern has a significant impact on the efficiency and economy of a procurement system. Closer supplier monitoring and better forecasting should reduce this variability.

Some of the roles of a psychologist on a plastic surgery service, particularly with patients undergoing cleft palate, craniofacial, and breast reconstruction, are explored. Psychological counseling with parents of infants with birth defects is described. For patients with craniofacial anomalies team management, extensive presurgical evaluations, and a psychological support system during hospitalization are required. Patients undergoing breast reconstruction need to work through preexisting feelings and attitudes about mastectomy as well as their anticipation of results of corrective surgery. For all patients, printed materials are used to augment the counseling. Research is emphasized, in keeping with the role of such a plastic surgery service in a university setting.

The relation between quantities of blood ordered to cover obstetrical and gynaecological diagnoses and quantities actually used was studied over a period of 3 months in one Scottish hospital. It appeared that the amount of blood ordered as 'cover' for many operative procedures and for patients under observation was, in many instances, uneconomic. On the basis of this a 'maximum surgical blood-ordering schedule' has been proposed which would reduce the amount of blood cross-matched as 'cover' by 65%. Review of the circumstances of all transfusions given over the study period suggested that adoption of the proposed schedule would not be detrimental to patient study.

**Physician practice in the management of patients with uncomplicated myocardial infarction: changes in the past decade.**

Wenger NK; Hellerstein HK; Blackburn H; Castranova SJ  
Circulation ,Mar 1982, 65 (3) p421-7, Journal Code:

DAW

Languages: ENGLISH

To determine changes in the patterns of care between 1970 and 1980 for patients with uncomplicated acute myocardial infarction, questionnaires were sent to almost 6000 physicians in 1979 and responses were compared with those of a similar survey taken in 1970. Almost all physicians in 1979 reported the availability and use of an intensive care/coronary care unit facility with continuous electrocardiographic monitoring.

Progressive-care facilities are also becoming more widely available. The median length of hospitalization has decreased markedly. Early ambulation and an earlier return to work are more common. There is a high level of informal patient and patient-family counseling about myocardial infarction and its management, both during and after hospitalization, and wider use of educational materials. Most physicians continue to recommend progressive physical activity after hospitalization.

The routine prescription of anticoagulant therapy during hospitalization has declined, while prescription of prophylactic antiarrhythmic agents has increased. Nitrate drugs and tranquilizers are routinely prescribed by a large percentage of physicians for their patients with uncomplicated myocardial infarction. Use of standard exercise tests has increased among all physician specialties. The treadmill test is most often used, and testing is typically done 6 weeks after infarction. A significant increase in the availability of and familiarity with exercise testing is characteristic of all medical specialties. Symptoms of new chest pain and palpitations are now considered important enough to warrant the recommendation to report immediately to an emergency room.

Other current findings include the routine use of coronary angiography by a large percentage of physicians to evaluate the need for surgical intervention, and the routine posthospitalization prescription by only a small percentage of physicians of aspirin and of nitrate drugs for patients with uncomplicated myocardial infarction.

The costs of a clinical chemistry laboratory in a district general hospital were studied. The system used has certain advantages over the conventional Cooper Lybrand method. The time taken by technicians to perform tests was more variable than expected and the cost of sample collection was higher

than process-cost for many tests. Indirect costs (overheads) were greater than direct costs and there were potential economies of scale. The most time-consuming part of this study was collecting the cost of chemicals and other disposables.

**Radiation decontamination unit for the community hospital.**

Waldron RL 2d; Danielson RA; Shultz HE; Eckert DE; Hendricks  
KO

AJR ,May 1981, 136 (5) p977-81, Journal Code: 3AE

Languages: ENGLISH

"Freestanding" radiation decontamination units including surgical capability can be developed and made operational in small/medium sized community hospitals at relatively small cost and with minimal plant reconstruction. Because of the development of nuclear power plants in relatively remote areas and widespread transportation of radioactive materials it is important for hospitals and physicians to be prepared to handle radiation accident victims. The Radiological Assistance Program of the United States Department of Energy and the Radiation Emergency Assistance Center Training Site of Oak Ridge Associated Universities are ready to support individual hospitals and physicians in this endeavor. Adequate planning rather than luck, should be used in dealing with potential radiation accident victims. The radiation emergency team is headed by a physician on duty in the hospital. It is important that the team leader be knowledgeable in radiation accident management and have personnel trained in radiation accident management as members of this team. The senior administrative person on duty is responsible for intramural and extramural communications. Rapid mobilization of the radiation decontamination unit is important. Periodic drills are necessary for this mobilization and the smooth operation of the unit.

**Transfer of responsibility for drug inventories to materials management: the legal perspective.**

Fink JL 3d

Hosp Pharm ,Jan 1981, 16 (1) p8-12, ISSN 0018-5787  
Journal Code: G98

Languages: ENGLISH

In recent years hospitals have been creating materials management departments to effect cost controls and to increase efficiency. In some instances, it has been suggested that responsibility for maintenance of drug inventories should be shifted from the director of pharmacy to the director of materials management. Legal aspects of this shift in responsibility may preclude such changes. The Joint Commission on Accreditation of Hospitals' Standards clearly state that this responsibility is to rest with the pharmacy service. State law may also bear on the issue. Both state pharmacy acts and board of pharmacy regulations may contain provisions which are relevant to the issue. Pennsylvania law is used as an example of the points to be evaluated when considering the question. Clearly, this responsibility must continue to fall within the jurisdiction of the director of pharmacy.

The neonatal drug transport box provides a readily available drug supply in appropriate dilutions for newborns. It also supplies a visible neonatal emergency drug dosage list. The use of this box has demonstrated a saving in nursing time, assured an appropriate supply of all necessary drugs, made drugs readily available for emergency use, and provided dosage check.

The effects of primary care nursing on the provision of pharmaceutical services are discussed. The major pharmacy-related problem caused by primary care nursing is the increased complexity of communications and drug distribution. Decentralized pharmaceutical services and pharmacy-coordinated drug administration programs can be used to overcome the problem. Primary care nursing's advantages are improved control over controlled substances, quicker access to accurate patient information, more complete patient-care plans and drug-charge records, and a more efficient discharge medication program. Understanding the intent of primary care nursing is fundamental to maximizing these benefits and avoiding problems with this type of nursing service.

Katz RM  
Hosp Pharm ,Feb 1980, 15 (2) p62-7, ISSN 0018-5787  
Journal Code: G98  
Languages: ENGLISH

A study was conducted by two mental health institutions to determine the usage and the cost of providing oral solid unit dosage medications to 1400 patients. The results in the two institutions were as follows: 1) 257,732 (12%) and 73,956 (17%) doses were not commercially available; 2) 656 and 134 technician hours per year could be saved by employing a vendor packaging service; 3) only 119,802 (5%) and 66,627 (15%) of the doses were available commercially at little or no additional cost compared to bulk purchase; and 4) 1,856,752 (83%) and 298,712 (63%) doses were available commercially at a premium price of \$34,138 and \$8,544 per year. The unusually high quantity of medications not commercially available in unit dose packages and the high cost of purchasing those that are available may be the result of the specialized care provided by a mental health facility. Therefore, methods of providing unit dose products in acute-care hospitals may not be adaptable to mental health facilities or to other specialized care providers.

A program using a team consisting of a nurse practitioner and a social worker to provide care for nursing-home patients was established. An important feature is the use of a specially designed problem-oriented record. The project disclosed a number of current deficiencies in nursing-home care and demonstrated ways to remedy many of these. The overall cost of the project was offset by the savings realized from reduced hospitalization and related medical costs.

Languages: ENGLISH

Summary: A self-care program for selected inpatients in a mental hospital has been developed and has been in operation for more than a year. The 12-bed unit operates without any nursing or other professional staff during the night and weekend. Certain factors, including the mental hospital as an organization, tend to hamper the development of this type of program as well as the progress and growth of other programs in psychiatric hospitals. It is suggested that the much needed progress in the mental hospital would be facilitated by an open-systems approach to its organization. Mental hospitals should consider the introduction of self-care programs for selected patients, mainly in view of their therapeutic potential, but also because of the financial savings such programs offer.

**[Organization of a psychiatric department in the**

**Hamburg-Eilbek general hospital--a description]**

Einrichtung einer Psychiatrischen Abteilung am  
Allgemein-Krankenhaus in Hamburg-Eilbek--Eine Beschreibung.  
Lorenzen H  
Psychiatr Prax ,Nov 1982, 9 (6) p193-6, ISSN 0303-4259  
Journal Code: QCK

Languages: GERMAN Summary Languages: ENGLISH  
In January 1980 a Psychiatric Department was established at  
the General Hospital for decentralised psychiatric treatment  
of inpatients. The article describes the preparatory planning  
which went into the concept of the Department. First of all,  
the Hospital is scheduled to look after a district with a  
population of 110,000. If patients are in need of psychiatric  
inpatient treatment, they are not selected according to  
diagnostic or other criteria. In connection with the Federal  
German Government's "Psychiatric Key Plan" the hospital set up  
an outpatient department and--financed at its own cost and  
from own resources--a psychosocial contacting department, a  
temporary and permanent home, decentralised sociopsychiatric  
services located in the community itself, and other projects.  
The article then describes the treatment concept which  
includes, besides psychosomatic and sociopsychiatric elements,  
psychotherapeutic aspects as well, the latter having a point  
of emphasis in group therapy. Finally, the article underlines  
fundamental concepts regarding the problem of co-operation  
with a large psychiatric hospital. It is pointed out that it  
will be necessary to develop a comprehensive treatment concept  
so that it becomes possible to find out for each patient which  
type of treatment and care will be most appropriate in his  
particular case both as regards outpatient and hospital  
treatment.

Intentions et realisations de la programmation hospitaliere en psychiatrie.

Brunson W; Parent M

Acta Psychiatr Belg ,Mar-Apr 1982, 82 (2) p147-67, ISSN 0300-8967 Journal Code: IVM

Languages: FRENCH Summary Languages: ENGLISH

Hospital planning : why? how? from when? in which frame? These are the questions raised in this article. A historical review is made for the criteria used in hospital planning today. The most important steps are related to changes in hospital psychiatry policy: creation of open services in 1960, integration of psychiatric services in the law on hospitals and development of outpatient services in 1970. The authors emphasize the difficulties in planning because of services overlapping and economic difficulties. The outpatients services and the services for "handicapped" should also be part of a general planning. The problems of coordination between these sectors both for planning and functioning are also raised in this article.

**A reasoned approach to hospital planning in an uncertain world.**

Bruton P

Health Care Manage Rev ,Fall 1982, 7 (4) p39-43, ISSN 0361-6274 Journal Code: G11

Languages: ENGLISH

The historical approach to planning community hospitals fails to recognize the substantial impact of finance on program decisions. A fundamentally different approach, an approach that involves the chief financial officer in the planning effort, is proposed here. By integrating financial planning within the overall planning effort, a hospital can develop a truly strategic plan based on the best information from everyone on the hospital management team.

**The future of Veterans Administration Hospital programs for psychiatric patients.**

Ewalt JR; Lipkin JO

Hosp Community Psychiatry ,Sep 1982, 33 (9) p732-4. ISSN 0022-1597 Journal Code: GCU

Languages: ENGLISH

In planning for the continued care of its large veteran population, the Veterans Administration is taking into account needs generated by trends such as a decreasing incidence of schizophrenia among veterans, an increasing use of outpatient services, and an increasing number of veterans suffering from alcoholism and substance abuse. The authors discuss the characteristics of the three types of VA medical centers that serve psychiatric patients: small general hospitals without a medical school affiliation; large general hospitals with a medical school affiliation; and large general hospitals with large psychiatric populations. One major goal of future planning is to institute psychiatric services at all of the 172 VA medical centers. Another goal is to ensure that each facility with a medical school affiliation will have a day hospital, a day treatment center, and a mental hygiene clinic.

**The metamorphosis of the country psychiatric service.**

Katz SE; Cancro R  
Hosp Community Psychiatry ,Sep 1982, 33 (9) p728-31,  
ISSN 0022-1597 Journal Code: GCJ  
Languages: ENGLISH

From their beginnings, county or municipal psychiatric services have reflected the political and social attitudes of the times. Traditionally they were public facilities that delivered acute inpatient care and a variable range of outpatient services, and, within their mandate, they functioned well. During the past two decades institutional psychiatry has evolved in such a way that there is little difference in the range of services delivered by county, state, and voluntary facilities. The logical role of the county hospital continues to be the provision of acute care for the poor. But for county systems to survive and flourish, they must be prepared to regionalize some services, and to differentiate their role in relation to voluntary and state facilities, yet integrate services with them where needed. They must strengthen ties with academic institutions and effectively address problems of third-party payment and other financial issues.

Mannisto M  
Trustee ,Sep 1982, 35 (9) p12, 14-5, ISSN 0041-3674  
Journal Code: WG9  
Languages: ENGLISH

Is the deregulatory thrust of this administration having an effect on hospital design and construction? does it threaten to create an expansion and construction free-for-all in the industry? A number of architects and construction industry professionals comment on what effect, if any, they expect deregulation to have on health care construction, as well as the expected effect of financing and management in an increasingly competitive environment.

Health Systems Agencies (HSA) are the official national health planning and regulatory agencies in the United States. This case study examines three HSA activities: determination of need, review and approval of federal grants, and appropriateness review. The article raises questions about planning assumptions and suggests the need to simplify regulatory process and strengthen standards of pediatric care in community hospitals.

**Legislating hospital bed reduction: the Michigan experience.**

Paul-Shaheen P; Carpenter ES

J Health Polit Policy Law , Winter 1982, 6 (4) p653-75,  
ISSN 0361-6878 Journal Code: IBC

Languages: ENGLISH

A variety of programs aimed at health care cost containment have been initiated at the state level. This article presents a case study of one state's effort to deal with health care cost issues, focusing on the formulation of adoption of legislation to reduce the number of hospital beds. The Michigan bed-reduction legislation was the creature of a coalition of powerful, organized "professional consumers" of health services who placed hospital cost containment on the political agenda and framed a solution. The provisions of the legislation were reshaped during the legislative process to grant concessions to a variety of interest groups, particularly the Michigan Hospital Association. Many additional criteria for determining excess bed capacity, some subjective, were added. Cost containment as a goal was, if not subordinated, at least made competitive with other goals--access to care, equity among types of providers, and quality of services. While the initial proposal was attractive as a seemingly simple extension of the certificate-of-need process within the existing regulatory framework, the legislation became increasingly complex in response to new issues raised by political actors who contributed to the shaping of the final version of the legislation. The formulation and adoption of Michigan's overbedding legislation appears to underscore what many other observers have noted: there are no purely technical solutions to health policy problems.

This Order establishes an exemption for certain electronic medical equipment from FCC regulations designed to minimize radio interference caused by devices that employ digital

circuitry. The costs of testing for compliance with specific emissions limits would be severe and most medical equipment has characteristics which inherently reduce the likelihood of interference. The Commission in this action amends the rules to relieve the compliance burden.

**The cost of biomedical equipment repair and maintenance: results of a survey.**

Cohen T

Med Instrum ,Sep-Oct 1982, 16 (5) p269-71, ISSN 0004-5446 Journal Code: M12

Languages: ENGLISH

The survey presented in this paper shows that for 19 large hospitals the average ratio of equipment repair costs to acquisition cost was 7.4%. In addition, this survey shows that costs such as rent for building space, utilities, and test equipment are not included in many clinical engineering department budgets. This is one reason for the divergent cost data reported by the various hospitals. These costs should be considered particularly for comparisons between in-house service costs and other sources of service. It seems that, of the indicators observed in this survey, equipment acquisition cost provides the best indicator for equipment maintenance costs. All hospital finance officers should have acquisition value information, because this information is used in calculating capital equipment depreciation. This information should also be available to clinical engineers. In addition, procedures need to be set up so that the total annual repair and maintenance costs can be easily obtained from hospital finance departments. Providing the clinical engineer with this type of data will allow further analysis of repair cost and will aid in long-term planning for the hospital. The ratio of equipment repair cost to acquisition value may be useful as a tool to predict future costs of a given hospital's medical equipment maintenance. This tool may also be useful as a measurement of the effectiveness of a change in a hospital's approach to biomedical equipment maintenance. Further work must be done to standardize equipment maintenance cost reporting so that more detailed comparisons can be made.

The stretcher is an important and expensive item of equipment in the emergency department. We draw attention to some of the many defects in design and engineering of stretchers, and make some suggestions about how these can be improved. We stress the importance of the role of the emergency department staff in the choice of a new stretcher.

**Hot water systems as sources of Legionella pneumophila in hospital and nonhospital plumbing fixtures.**

Wadowsky RM; Yee RB; Mezmar L; Wing EJ; Dowling JN

Appl Environ Microbiol ,May 1982, 43 (5) p1104-10, ISSN 0099-2240 Journal Code: 6K6

Contract/Grant No.: AI 17047

Languages: ENGLISH

Samples obtained from plumbing systems of hospitals, nonhospital institutions and homes were cultured for Legionella spp. by plating the samples directly on a selective medium. Swab samples were taken from the inner surfaces of faucet assemblies (aerators, spouts, and valve seats), showerheads, and shower pipes. Water and sediment were collected from the bottom of hot-water tanks. Legionella pneumophila serogroups 1, 5, and 6 were recovered from plumbing fixtures of the hospitals and nonhospital institutions and one of five homes. The legionellae (7 to 13,850 colony-forming units per ml) were also present in water and sediment from hot-water tanks maintained at 30 to 54 degrees C, but not in those maintained at 71 and 77 degrees C.

Legionella micdadei was isolated from one tank. Thus legionellae are present in hot-water tanks which are maintained at warm temperatures or whose design results in warm temperatures at the bottom of the tanks. We hypothesize that hot-water tanks are a breeding site and a major source of L. pneumophila for the contamination of plumbing systems. The existence of these bacteria in the plumbing systems and tanks was not necessarily associated with disease. The extent of the hazard of this contamination needs to be delineated.

**An interdisciplinary methodology for the comparative evaluation of splinting materials (orthotics, thermoplastics, clinical research).**

Shimeld A; Campbell G; Ernest M  
Can J Occup Ther Jun 1982, 49 (3) p79-83, ISSN  
0008-4174 Journal Code: CJO  
Languages: ENGLISH

The methodology developed includes both the use of laboratory evaluation and clinical assessment in an area where there are no standard requirements, no specifications, nor any continuity of data available on the various thermoplastic splinting materials now on the market. A series of laboratory tests and clinical trials were devised such that these could be interpreted with regard to clinical considerations, cost analyses and serviceability factors relating to the materials. Laboratory testing covered possible effects on the chemical and mechanical properties of material likely to be caused by various environmental, sterilization and working factors. The complementary clinical evaluation to highlight the behaviour of materials during the fabrication and wearing of splints consisted of specific information generated with the assistance of experienced occupational therapists, occupational therapy students and patients. Biocompatibility studies were also carried out. The data to be published will provide needed information to physicians, occupational therapists, physical therapists, orthotists, prosthetists, and administrators with regard to their making informed decisions on the selection, purchase and use of thermoplastic materials.

**An evaluation of a gas collection valve for use in metabolic measurements in high flow CPAP systems.**

Henry WC; West GA; Wilson RS  
Respir Care Mar 1982, 27 (3) p282-6, ISSN 0730-8418  
Journal Code: QZ3  
Languages: ENGLISH

We have developed a valved gas collection assembly for high-flow CPAP systems that permits the isolation of expired gases for the analysis and computation of oxygen uptake and carbon dioxide production. Using volunteer subjects we compared the valved assembly with a high-flow valveless CPAP system for volume, pressure, and flow differences at end-expiratory pressure levels of 5, 7, 10, and 12 cm H<sub>2</sub>O and found that the valve produced no significant differences in the flow/pressure pattern.

**ECG recorder distribution and hospital utilization.**

Haslam KR  
Med Instrum ,Mar-Apr 1982, 16 (2) p111-3, ISSN  
0004-5446 Journal Code: M12  
Languages: ENGLISH

Although the use of the portable ECG recorder is commonplace, information on actual daily use in an acute care hospital is scarce. To determine whether machines are efficiently used, we attached timers to ECG recorders in 17 wards and clinics to collect data on the time of actual use. Usage ranged from 31 min/day in the coronary care unit to 0.7 min/day in the postpartum ward, and averaged 8.0 +/- 8 min/day for all locations. Seventy-five percent of the recorders were used less than 10 min/day and 25 percent of the recorders were used less than 2 min/day. On a per-bed basis they were used 0.8 +/- 1.4 min/day. Almost no correlation was found between the number of portable ECG recorders and number of beds in 20 teaching and 23 non-teaching hospitals. The number of beds ranged from 11 to 70 per ECG recorder in teaching hospitals and from 14 to 122 in non-teaching hospitals. Nonteaching hospitals averaged 59 +/- 26 beds per recorder; teaching hospitals averaged 34 +/- 17 beds per machine. Some ECG recorders seem to be markedly underutilized and some hospitals seem to be oversupplied with these devices. To reverse this, establishing an equipment committee to see that equipment is efficiently used is recommended.

**An evaluation of water-vapor output from four brands of unheated, prefilled bubble humidifiers.**  
Darin J; Broadwell J; MacDonell R  
Respir Care ,Jan 1982, 27 (1) p41-50. ISSN 0098-9142  
Journal Code: QZ3  
Languages: ENGLISH

We evaluated the water-vapor output from four brands of unheated, prefilled bubble humidifiers-the Aerwey 300, the Aquapak 301, the McGaw 250, and the Travenol 500-at oxygen flowrates of 2, 4, 6, and 8 l/min. We recorded relative humidity (RH) and temperature in a test chamber at intervals over a minimum period of 24 h, and we calculated water-vapor content (WVC) and corresponding RH at 37 degrees C. Ambient RH was 53.4% +/- 5.25% (mean +/- 1 SD) at a test-chamber temperature of 26.2 degrees C +/- 0.79 degrees C. Mean 24-h WVC at 2 l/min (n = 20) ranged from 20.4 +/- 0.63 mg/l (McGaw) to 17.2 +/- 0.76 mg/l (Aerwey). This corresponded to a range of RH at 37 degrees C of 46.6% +/- 1.43% (McGaw) to 39.1 +/- 1.72% (Aerwey). A statically significant difference in mean WVC existed between brands of humidifiers (P less than 0.001). The McGaw and Travenol humidifiers consistently delivered hydrated gas with a greater WVC than did either the Aerwey or Aquapak humidifiers (P less than 0.001). A statistically significant decrease in mean WVC and RH at 37 degrees C occurred as the oxygen flowrate increased (P less than 0.001). None of the humidifiers was able to hydrate the source gas to a mean equivalent of 50% RH at 37 degrees C, at any flowrate. The design of the humidifier bubble diffuser and the source-gas flowrate appear to be the prime determinants of the humidification efficiency of unheated, prefilled bubble humidifiers.

Languages: ENGLISH

The application of a word-processing system to a centralized i.v. admixture service is described. The pharmacy department of a 560-bed private hospital developed its admixture service

with a limited increase in staff and without compromising its clinical services by using a commercially available word-processing system. The system allows the user to type, edit, store, and print patient profiles and labels for total parenteral nutrition solutions, i.v. piggyback medications, and large-volume parenterals. The data for the admixture service are stored in three diskettes--one for piggybacks, one for IPNs, and one for other applications. Operational details regarding all applications are described. The word-processing system provides a relatively inexpensive method of coping with the large amount of data manipulation and label preparation inherent in a sophisticated i.v. admixture program.

Languages: ENGLISH  
Medicine, in its focus on physical illness, has made significant strides in recent decades. New and sophisticated knowledge of disease and techniques of treatment have contributed to sometimes spectacular progress. However, it has been realized that psychiatry, through its consultation and liaison activities, has a most significant contribution to make. The form and content of consultation/liaison activities have been gradually developing. It is from this developmental standpoint that we present the following information relevant to the fusion of Family Therapy and Psychosomatics.

Health Trends ,Aug 1982, 14 (3) p80-3, ISSN 0017-9132  
Journal Code: EJN  
Languages: ENGLISH

A questionnaire combining items on alcohol consumption with the four CAGE questions was used by 27 housemen to detect abnormal drinking among 520 patients of all specialties admitted to a general hospital. 15.6--23.2% of patients were classified as abnormal drinkers with the largest proportions occurring among the emergency surgical, orthopaedic, psychiatric and medical patients. 95% of the abnormal drinkers were detected by the questions on consumption alone, while 22 of the 28 patients who were identified by both the consumption and CAGE questions had been admitted as a direct result of alcohol abuse. With the aid of simple questionnaire and some encouragement, junior medical staff can become quite adept at detecting abnormal drinkers in the course of their routine practice.

**Telephone prompting to increase attendance at a Psychiatric Outpatient Clinic.**

Burgoyne RW; Acosta FX; Yamamoto J  
Am J Psychiatry ,Mar 1983, 140 (3) p345-7, ISSN  
0002-953X Journal Code: 3VG  
Languages: ENGLISH

Although it has been commonly taught and has been reported elsewhere that telephone prompting increases the rate at which patients keep their first outpatient clinic appointment, this study indicated that the increased rate at which patients kept their first appointment was more likely related to socioeconomic factors (such as having a telephone) than to telephone prompting. The authors conclude that measures to improve services to patients need to be carefully scrutinized before one can assume that results following initiation of a new procedure are in fact due to that procedure.

**Recovery from schizophrenic psychosis.**

Szymanski HV; Simon JC; Gutterman N  
Am J Psychiatry ,Mar 1983, 140 (3) p335-8, ISSN  
0002-953X Journal Code: 3VG  
Languages: ENGLISH

Knowledge of changes in patients' symptoms during hospitalization is crucial in planning treatment for acute psychotic exacerbation of chronic schizophrenia. Biweekly assessment of symptoms in 44 schizophrenic patients during the first 4 weeks of hospitalization showed that rapid recovery from psychotic symptoms occurred early in hospitalization; recovery from depression and anxiety was less complete. The rapid recovery in the first few weeks of hospital treatment supports the use of brief hospitalization for psychotic relapse. It is important to focus follow-up treatment on patients' relative lack of recovery in the hospital from depression and anxiety.

0232601 83150286

**The mythical readmissions explosion.**

Weinstein AS  
Am J Psychiatry ,Mar 1983, 140 (3) p332-5, ISSN  
0002-953X Journal Code: 3VG  
Languages: ENGLISH

During the past decade and a half, readmissions increased substantially as a proportion of all admissions to state mental hospitals, and the absolute number of readmissions appeared to rise. These trends were interpreted widely, but incorrectly, as reflecting an accelerated rate of return to the hospitals by discharge patients. Most of the rise in the readmission percentage in New York State mental health facilities was due to a drop in first admissions, and the apparent increase in the number of readmissions was entirely accounted for by several statistical artifacts. There was no appreciable increase in the rate of patients' rehospitalization within given periods of time after their release.

**Are lawyers enemies of psychiatrists? A survey of civil commitment counsel and judges.**

Hiday VA  
Am J Psychiatry ,Mar 1983, 140 (3) p323-6, ISSN  
0002-953X Journal Code: 3VG  
Contract/Grant No.: MH-30548  
Languages: ENGLISH

The author surveyed 101 attorneys and judges involved in civil commitment procedures to answer the question of how they view psychiatrists, mental hospitals, and the mentally ill. She found that these lawyers and judges tended to view psychiatrists in favorable terms, that their attitudes toward mental hospitals reflected their perception of the weaknesses of these hospitals and their view of hospitalization as a last resort, and that they tended to reject negative statements about the mentally ill. She discusses the effect of these attitudes on the behavior of lawyers and judges toward psychiatrists and the mentally ill in civil commitment hearings.

**Psychiatrists' responses to violence: pharmacologic management of psychiatric inpatients.**

Appelbaum PS; Jackson AH; Shader RI  
Am J Psychiatry ,Mar 1983, 140 (3) p301-4, ISSN  
0002-953X Journal Code: 3VG  
Languages: ENGLISH

Court decisions setting limits on the use of medication in psychiatric hospitals often assume that psychiatrists use medications inappropriately in response to patients' violent acts. No empirical data have existed to support or refute this assumption. The authors examined the types and doses of antipsychotic medications received by 45 violent patients and 48 control subjects. They found no significant differences in type and dose of medication before the violent act and no significant changes afterward. Violent patients tended to be on somewhat higher doses at discharge than control patients. The judicial concern that psychotropic medications will automatically be abused or overused is not supported by these results.

**The multiple functions of the state mental hospital.**

Goldman HH; Taube CA; Regier DA; Witkin M  
Am J Psychiatry ,Mar 1983, 140 (3) p296-300, ISSN  
0002-953X Journal Code: 3VG  
Languages: ENGLISH

This report identifies and quantifies the multiple manifest and latent functions of the state mental hospital, using data collected by the National Institute of Mental Health. The data reveal a complex institution providing over 500,000 episodes of care for acute and chronic, voluntarily and involuntarily admitted inpatients and 300,000 episodes of care for the most seriously disturbed and disadvantaged outpatients. In addition, state hospitals employ over 200,000 individuals and train over 3,300 professionals each year. The diversity and significance of these functions, as well as the failure of other institutions to supplant them, account for the endurance of the state mental hospital.

Acta Psychiatr Belg ,May-Jun 1982, 82 (3) p328-40, ISSN  
0300-8967 Journal Code: 1VM  
Languages: FRENCH Summary Languages: ENGLISH

The authors introduce in this paper the first results of a catamnestic research performed in 1980 through interviews on 759 psychiatric emergencies in 1978 at the Saint-Luc clinics (Woluwe). A detailed analysis of psychiatric emergencies confronts the researcher to various problems (how and why is the psychiatrist called?) and more philosophically about mental health, therapeutic efficacy or the objectivity of the analysis. The authors also emphasize deontological problems in this type of research and the image of psychiatry and psychic disarray in the practice of emergency. Furthermore, this research brings up various working accommodations. Finally, the authors indicate some future areas of action, in the specific frame of the studied clinic, in order to ameliorate alternatives to hospitalisation in face of a psychiatric emergency.

The paper submitted deals with the shrinking number of in-patients in psychiatric institutions and proves that this downward trend is not to be explained merely by the introduction of psychotropic drugs.--The method of calculation and the term "average duration of stay" are critically discussed, with reference to other possible parameters as indicators of psychiatric in-patient facilities.--It is shown, in the light of recent and controlled studies, that short hospitalization can be at least as effective and successful as a conventional hospital treatment program, and that a shorter stay in hospital does not inevitably imply an increased risk of readmittance.--A comparison between the Psychiatrische Universitätsklinik Bern (PUK) and all psychiatric hospitals in Switzerland shows in 1980 a 50% higher rate of admissions per hospital bed, a 20% shorter duration of stay, and the extremely high average rate of 98% of beds occupied, that is approximately 10% more than the average number of beds occupied in the other clinics referred to. In spite of the comparatively short duration of stay in the Psychiatrische Universitätsklinik Bern, that is 27 days (median), a further cut in length of stay seems feasible, without provoking an increase of the low rate of 21% of readmissions per annum.

**[6 years of psychiatry in a general hospital]**

Sechs Jahre Psychiatrie an einem Allgemeinkrankenhaus.

Michaelis R; Chrome B; Kulenkampff M; Schwartz RB

Psychiatr Prax ,Nov 1982, 9 (6) p197-202, ISSN 0303-4259 Journal Code: QCK

Languages: GERMAN Summary Languages: ENGLISH

Six years of experience in the psychiatric and neurologic department of the General Hospital at Itzehoe (122 beds, including 78 psychiatric patients and 44 neurological patients; 5 assistant physicians, 1 psychologist, 2 senior physicians, 1 Medical Director [Head]; 38 nurses, 1 social worker, 2 occupational therapists) allow us to summarize initially the efficiency of such an institution: A department like this is basically able to take over full responsibility for the psychiatric care of a community district including the town and adjacent areas of other districts (totalling 120,000 inhabitants). The prerequisites--as is the case in the Steinburg district--are that a hospital is available for patients with chronic mental diseases; close cooperation with an established sociopsychiatric service; and, last but not least, a possibility of transferring patients for the purpose

of long-term rehabilitation and withdrawal treatment in relevant institutions. Hence, it is absolutely out of place to label such work performed by "small" departments as "gilded" or "miniature psychiatry". Such departments are increasingly becoming the representatives of a type of psychiatry which definitely has a future because it operates near the patients' domiciles. However, it will be necessary to revise the job schedules, since the number of personnel employed in this type of work is by no means sufficient for conducting a type of psychiatry which is in line with modern concepts and requirements.

Lorenzen H

Psychiatr Prax ,Nov 1982, 9 (6) p193-6, ISSN 0303-4259 Journal Code: QCK

Languages: GERMAN Summary Languages: ENGLISH

In January 1980 a Psychiatric Department was established at the General Hospital for decentralised psychiatric treatment of inpatients. The article describes the preparatory planning which went into the concept of the Department. First of all, the Hospital is scheduled to look after a district with a population of 110,000. If patients are in need of psychiatric inpatient treatment, they are not selected according to diagnostic or other criteria. In connection with the Federal German Government's "Psychiatric Key Plan" the hospital set up an outpatient department and--financed at its own cost and from own resources--a psychosocial contacting department, a temporary and permanent home, decentralised sociopsychiatric services located in the community itself, and other projects. The article then describes the treatment concept which includes, besides psychosomatic and sociopsychiatric elements, psychotherapeutic aspects as well, the latter having a point of emphasis in group therapy. Finally, the article underlines fundamental concepts regarding the problem of co-operation with a large psychiatric hospital. It is pointed out that it will be necessary to develop a comprehensive treatment concept so that it becomes possible to find out for each patient which type of treatment and care will be most appropriate in his particular case both as regards outpatient and hospital treatment.

Languages: GERMAN Summary Languages: ENGLISH

Anyone who tries to convert a Psychiatric Department into a hospitable home for the benefit on the inmates and their environment, has quite often not reckoned with, the "host", that is to say, with the doctors, nurses and the hospital staff in general. Hence, it seems that a fundamental change in the attitude and consciousness of those who are engaged in psychiatry, is just as important as a new treatment concept or a new building. The author quotes the Bad Driburg Community Hospital as an example: here, planning and construction were not the only important factors. The nurses have taken and accepted advice with regard to their supervisory functions, and in the course of a protracted process they have changed their attitude in favour of a psychiatric practice which follows a treatment pattern based on a "open-minded" approach to community members.

Journal Code: QCK

Languages: GERMAN Summary Languages: ENGLISH

The article reports on the first developmental stage of a psychiatric department in a location close to the place of residence of the majority of patients. This psychiatric clinic has at present 60 beds and facilities for 20 outpatients. The location of the clinic is in the area of a medium-sized town in a rural district classified as an area in which Public Health services are required to be active. First of all, the article gives a detailed description of the clinic itself and of the population and district it has to look after. Secondly, the article describes the present state and development of negotiations regarding the setting-up of an outpatient treatment ward. In this connection, it became unavoidable to point out the discrepancies between the need of the population to receive adequate psychiatric outpatient treatment on the one hand, and the policy followed by the relevant authorities on the other, the latter being unfortunately coloured by vested interests, both politically and by the class-consciousness of representatives of certain trade guilds and corporations. This is followed by a statistical evaluation of the patients treated on an inpatient, outpatient and consultant basis, together with an attempt to give a brief outline of the relevant epidemiology. Since the Social Psychiatric Service of Emden has close associations with the clinic--a fact which is rather untypical--the authors included a report on the starting-up phase and activity characteristics of that service.

**Measuring functional outcomes in chronic disease: a comparison of traditional scales and a self-administered health status questionnaire in patients with rheumatoid arthritis.**

Deyo RA; Inui TS; Leininger JD; Overman SS  
Med Care ,Feb 1983, 21 (2) p180-92. ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

A new "health-status" questionnaire, the Sickness Impact Profile (SIP), was examined to determine whether it offered measurement advantages over the traditional American Rheumatism Association (ARA) functional scale or patient self-ratings of function. Seventy-nine outpatients with rheumatoid arthritis (RA) administered the SIP to themselves and provided self-ratings on a 7-point functional scale. Clinicians independently rated patients on the ARA functional scale, and repeated measures were obtained over a 6-month period. Scores on the SIP or its subscales showed stronger correlations than the other scales with hematocrit, sedimentation rate, grip strength, morning stiffness, duration of RA, anatomic stage, work status, and psychiatric status. Validity of the SIP appeared to be maintained with repeated administrations, and the SIP was more reliable than either of the other scales. These findings, as well as the comprehensiveness and feasibility of the self-administered SIP, suggest that this (and perhaps similar health status instruments) may be a useful supplement to more traditional measures of chronic disease outcome.

The determinants of psychiatric hospitalization, especially nonspecific issues, have been studied extensively. The methodological problem of correlational non-cross-validated findings are seen as contributing to our uncertainties about the critical issues involved in the decision to admit. A cross-validated multiple regression analysis of determinants of hospitalization in an inner-city municipal hospital revealed two determinants of hospitalization: severity of schizophrenic symptoms and active suicidal and/or homicidal ideation. They accounted for one third of the variance without shrinkage. Quasi-experimental designs may be the most efficient means of studying the remaining unexplained variance.

**Physical illness in severe depressives and psychiatric alcoholics in Gothenburg, Sweden.**

Lindgard B  
J Affective Disord ,Dec 1982, 4 (4) p383-93, ISSN  
0165-0327 Journal Code: H3V  
Languages: ENGLISH

The entire middle-aged male urban population of a Swedish city, as defined by a census in November 1969, was assessed for any mental hospital hospitalization during a 3-year period (1978-1980), as well as for any general hospital hospitalization during a 10-year period (1970-1979) within the catchment area. Inpatients of the mental hospital population belonging to the cohort and put in the categories 'Psychiatric alcoholic spectrum' and 'Severe depression' were studied for diagnoses of physical illness during any general hospital hospitalization. The psychiatric alcoholic spectrum was associated positively with infections, injuries, alcohol intoxication, pancreatitis, liver cirrhosis, arthritis/rheumatic diseases and duodenal peptic ulcer; and negatively with malignant neoplasms, myocardial infarction, gallstone disease and urolithiasis. Severe depression was associated positively with infections, myocardial infarction, asthma and alcohol intoxication. A nosologic taxonomy, aimed at explaining the epidemiological associations recorded, is suggested.

**Exploratory study to evaluate staff attitudes towards geriatric psychiatry.**

Jones RG; Galliard PG  
J Adv Nurs ,Jan 1983, 8 (1) p47-57, ISSN 0309-2402  
Journal Code: H3L  
Languages: ENGLISH

This work is part of a larger study carried out at the Murray Royal and Murthly Hospitals within the Tayside Health District. The survey was concerned with staff attitudes towards geriatric psychiatry patients and shows that the nurses in these peripheral hospitals hold a positive attitude towards this area of nursing. These findings appear to contradict the popular opinion held throughout the nursing service, that the geriatric psychiatry nursing area is very unpopular with trained, untrained and learner nurses. In the study by Hooper [Nursing Times (1981) 77 37-40/43-44], anxiety levels among learners towards the geriatric nursing areas were found to be very high. This appears to correlate with Kogan [Journal of Abnormal and Social Psychology (1961) 62, 616-622], which summarized is as follows: 'Young subjects were imputed to have a more consistently negative view of old people.' By using a series of two precoded questionnaires that the subjects completed, an overview of staff attitudes towards the geriatric psychiatry areas was obtained. The hypothesis on which the study was based was as follows: that a negative view towards geriatric psychiatry would be found among the staff of the Murray Royal and Murthly Hospitals. However, the findings of this study did not support the hypothesis on any counts and gave a highly positive attitude scale.

K-corrected MMPI-168 scales using short and long form K scales (N = 2439). The latter increased the correlation between abbreviated and standard scales in most instances. Because using the entire K scale involves the addition of only 18 items to the MMPI-168 while it generally improves the statistical validity of several scales in addition to K, this was proposed as a cost-effective means of improving the MMPI-168.

**The Psychological Screening Inventory as a predictor of predisposition to suicide among patients at the Oregon State Hospital.**

Larsen KS; Garcia D; Langenberg DR; Leroux JA  
J Clin Psychol ,Jan 1983, 39 (1) p100-3, ISSN 0021-9762  
Journal Code: HTJ  
Languages: ENGLISH

Examined all closed patient files for the inclusion of scores from the Psychological Screening Inventory (PSI) at the Oregon State Hospital between 1977-1979. Subsequently, the patient files (N = 123) were assessed for suicidal inclination employing five categories, which ranged from "no suicidal ideation" to "serious attempt." t-tests were completed between Ss placed in category 1 (no suicidal ideation) and remaining categories. Results yielded a significant value for "discomfort," with lower discomfort scores related to higher suicide risks. Subsequent extreme group analysis yielded significant but opposite results for males and females, which suggests the importance of evaluating the results of the PSI separately for sex.

Contract/Grant No.: 26943  
Languages: ENGLISH

Due to fiscal constraints on health care providers, the utilization of time of mental health professionals has come under close examination. The authors conducted a study of the work habits of 193 psychiatrists, psychologists, nurses, rehabilitation therapists, social workers, and mental health workers in 1976 and 1977. The clinicians worked at 18 facilities that offered inpatient, outpatient, partial hospital, or a mix of partial and outpatient services. Their work activities were observed over a two-week period. The data were analyzed for each clinical type and for each service modality across three funding sources--state, private, and mixed. The data, in part, show that a substantial amount of time was spent in all types of facilities in indirect patient care activities, particularly use of psychiatric records. Privately funded inpatient facilities devoted a much greater amount of time to direct patient care than did state inpatient facilities, which spent more time on administration and use of records. Staff of outpatient or partial-mixed facilities spent much more time on individual or other therapies, while inpatient staff spent more time on patient management and informal contacts with patients.

**Minimizing the adverse effects of mass relocation among chronic psychiatric inpatients.**

Kelly GR  
Hosp Community Psychiatry ,Feb 1983, 34 (2) p150-4, ISSN  
0022-1597 Journal Code: GCJ

Languages: ENGLISH

Recent studies have reported conflicting results on the impact of intrainstitutional relocation on chronic psychiatric patients. As part of a hospital renovation project, 82 patients were assessed over a period of eight months to determine the effects of mass transfer on physical, mental, and social functioning. Twenty-five staff members also assessed the social climate before and after the transfer. The author found that involuntary relocation of living quarters within the same institution did not significantly affect the functioning of the chronic psychiatric patients. He attributes the lack of disruption to continuity of care in a familiar environment and to a continuous schedule of supportive activities conducted outside of the ward.

**The limits of general hospital care: a continuing role for state hospitals.**

Ames D  
Hosp Community Psychiatry ,Feb 1983, 34 (2) p145-9, ISSN  
0022-1597 Journal Code: GCJ  
Languages: ENGLISH

An examination of the characteristics of patients transferred to a state hospital after their treatment in a rural community general hospital had failed provides some data for defining the state hospital's role in relation to such patients. Of 2,128 discharges from the general hospital in a three-year period, 33, or 1.6 percent, were referred to the state hospital. The patients could be divided into four subgroups: violent patients, unresponsive patients with severely disorganized mental states, dependent patients treated successfully but referred because of a lack of community residential facilities, and deteriorating alcoholic recidivists who had proved to be unresponsive to treatment. At follow-up, the most improvements had occurred among the unresponsive subgroup. The author believes that, among those subgroups, state hospitals are most useful for violent patients, for deteriorating recidivist alcoholics, and, depending on further research, possibly for unresponsive patients.

**The impact of deinstitutionalization on California's state hospital population.**

DeRisi W; Vega WA

Hosp Community Psychiatry ,Feb 1983, 34 (2) p140-5, ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Deinstitutionalization has dramatically reduced the state psychiatric hospital population in California from 37,000 in 1955 to only 2,500 at the present time. In 1980 and 1982 the California Department of Mental Health conducted two surveys to assess demographic characteristics, psychiatric diagnosis, health status, and behavioral traits of state hospital patients. The results indicate that most patients are young, male, and diagnosed as schizophrenic and frequently engage in dangerous behaviors. The various patient subpopulations exhibited few differences in diagnostic distribution, although Hispanics did have a significantly higher rate of substance use. The author posits that the current hospital population constitutes a "hard core" of patients who may be difficult to place in community treatment facilities.

**Deinstitutionalization and the private general hospital inpatient unit: implications for clinical care.**

Schoonover SC; Bassuk EL

Hosp Community Psychiatry ,Feb 1983, 34 (2) p135-9, ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Deinstitutionalization has led to a rapid shift from reliance on state hospitals to use of community-based inpatient psychiatric services. While these inpatient units were initially envisioned as an integral part of the community mental health system, a number of sociopolitical and clinical pressures have caused general hospitals to respond to their new responsibilities in different ways. The authors review trends in deinstitutionalization, the diverging interests of public and private general hospitals, and problems in patient care that result. Based on a discussion of how Beth Israel Hospital, a nonprofit private general hospital in Boston, has dealt with such issues, they describe adaptive responses in four areas: admission criteria, patient management approaches, aftercare planning, and staff training.

0230859 83133927

**Dealing with suicide on a psychiatric inpatient unit.**

Cotton PG; Drake RE Jr; Whitaker A; Potter J

Hosp Community Psychiatry ,Jan 1983, 34 (1) p55-9, ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Suicide on an inpatient unit can cause severe trauma among patients and staff. Consequently both groups may revert to less adaptive coping styles. In general, staff's recovery is gradual and natural and may yield an opportunity for emotional

growth; however, prolonged disability may also occur. The authors interviewed 23 staff members who had worked on an inpatient unit during a 16-month period when four patients committed suicide. On the basis of these interviews, the authors have developed a framework for understanding the three phases of staff reaction to suicide and guidelines for helping staff through the recovery process. They recommend that ward administrators monitor and facilitate the group process by providing protection and support during the initial phase of shock, appropriate channels and limits for the intense feelings that occur during the second phase, and constructive forums for more mature coping activities during the third phase, as staff regain their equilibrium.

0230857 83133925

**An overview of patient satisfaction with psychiatric treatment.**

Kalman TP

Hosp Community Psychiatry ,Jan 1983, 34 (1) p48-54, ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Patient satisfaction with psychiatric treatment can strongly influence pursuit and use of mental health services as well as treatment compliance and treatment outcome. Although assessment of patient satisfaction is crucial to designing effective mental health programs, no standard methodology exists to measure satisfaction; thus it is difficult to compare findings from different satisfaction studies. The author examines the studies in four areas of satisfaction research: patient satisfaction with treatment, with participation in research, with participation as subjects in psychiatric teaching, and with involuntary commitment. He notes the variance between mental health professionals' expectations of patient satisfaction and the higher satisfaction that patients themselves report. He also discusses the need for more study of the subjective experience of patients who participate in research projects, teaching conferences, and observed psychotherapy and who undergo involuntary commitment.

**The reactions of nursing staff to physical assault by a patient.**

Lanza ML

Hosp Community Psychiatry ,Jan 1983. 34 (1) p44-7. ISSN 0022-1597 Journal Code: GCU

Languages: ENGLISH

Forty nursing staff members in a Veterans Administration neuropsychiatric hospital were surveyed in a study aimed at determining victims' responses to the assault and helping to sensitize clinicians to the frequency and outcomes of assaults on nursing staff. The respondents, who had an average of six years of psychiatric nursing experience, reported being assaulted an average of seven times prior to the study period.

The author summarizes the emotional, social, biophysiological, and cognitive responses of the respondents and notes that a major finding was the large number of staff who indicated they had no reactions to the assault. She speculates that staff may be unable to admit their reactions even to themselves and discusses some possible reasons for that situation.

**Training personnel in the prevention and management of violent behavior.**

Lehmann LS; Padilla M; Clark S; Loucks S

Hosp Community Psychiatry ,Jan 1983. 34 (1) p40-3. ISSN 0022-1597 Journal Code: GCU

Languages: ENGLISH

The authors describe a training program on prevention and management of violent behavior for the staff of a Veterans Administration hospital. The one-day workshop focuses on preventive identification of potentially violent situations and on methods of verbal and physical management of violent behavior. A study of workshop participants showed that trainees had improved knowledge about and performance in handling violent behavior after completing the program. Future developments in training in prevention and management of violent behavior should include greater availability of educational resource materials and incorporation of the subject in undergraduate and graduate health care training.

**Employees' job satisfaction, residents' functioning, and treatment progress in psychiatric institutions.**

Buffum WE; Konick A

Health Soc Work ,Nov 1982. 7 (4) p320-7. ISSN 0360-7283 Journal Code: FZ6

Languages: ENGLISH

This article examines the job satisfaction of 297 direct care workers in relation to residents' levels of functioning and treatment progress in twenty-two wards of three long-term psychiatric institutions. Employees' satisfaction with work was significantly associated with residents' progress in

community adjustment potential, but not with residents' change in pathology or behavior on the ward.

**An approach to psychiatric referrals in pediatric patients.  
Psychosomatic complaints.**

Hodas GR; Honig PJ  
Clin Pediatr (Phila) ,Mar 1983, 22 (3) p167-72, ISSN  
0009-9228 Journal Code: DHE  
Languages: ENGLISH

Psychiatric referral is an important aspect of clinical pediatric practice. This paper discusses referral to a family-oriented psychiatrist of difficult families with children who have an acute or chronic psychosomatic complaint.

It is the responsibility of primary care physicians to develop facility in making psychiatric referrals. In this way the physician will be equipped to deal effectively with cases requiring attention beyond his time and expertise, as well as cases that he will manage alone. The paper considers five decision-points relevant for pediatricians making effective referrals of children with somatic complaints. (1) The pediatrician decides whether to conduct the evaluation on an outpatient or inpatient basis. In either case the work-up should be completed rapidly. A diagnostic hospitalization, whereby the parents agree to accept the results of a clearly defined evaluation as definitive, may be used with inpatient evaluations. The proposal of such a diagnostic hospitalization is considered. (2) After the medical evaluation is completed, the pediatrician decides whether to manage the case alone or to make a psychiatric referral. (3) A family conference can be used to initiate pediatric management or to make a psychiatric referral. A joint meeting, with both pediatrician and psychiatrist present, may be a crucial part of the management of difficult psychosomatic cases. The four stages of a typical joint meeting are described. (4) The utility of giving indirect rather than direct explanations of the meaning of a somatic symptom is described. By scapegoating the symptom rather than either the child or the parents, indirect explanations are often less threatening and more acceptable to the family. (5) Similarly, psychiatric involvement is often best proposed by recommending evaluation rather than treatment, since evaluation is less binding and takes into account the natural reluctance of many families to see the psychiatrist. After the referral has been made, ongoing contact between psychiatrist and pediatrician is important.

**The use of the MMPI for the differentiation of suicidal and non-suicidal depressions.**

Waters BG; Sendbuehler JM; Kincaid RL; Boodoosingh LA; Marchenko I  
Can J Psychiatry ,Dec 1982, 27 (8) p663-7, ISSN  
0706-7437 Journal Code: CLR  
Languages: ENGLISH

The MMPI profiles of forty suicidal and forty non-suicidal male and female depressed patients, matched for age, were compared. Significant differences between MMPI scale T scores which showed some sex specificity were found between the suicidal and non-suicidal depressives. These results replicate

previous findings. However neither individual scale T scores, derived discriminant functions, nor actuarial or cluster analysis-derived MMPI profiles could completely discriminate between suicidal and non-suicidal depressed inpatients of either sex. The relevance and implications of these findings to the ascertainment of suicidal risk are discussed.

The Consultation-Liaison Outcome Evaluation System characterizes the effectiveness of consultative activities. The initial phase of the system identifies consultees' responses to psychiatric consultants' recommendations and diagnoses and the variables critical to concordance with the use of quantitative measures. The observed incidence and concordance rates of the consultant-consultee interaction were integrated (1) to establish a concordance hierarchy clarifying consultees' priorities in seeking psychiatric consultation, (2) to provide reference points to guide psychiatric consultants' clinical actions, (3) to establish tentative standards with which to evaluate the effectiveness of psychiatric consultation, and (4) to signal the need for further outcome studies and the development of data-based consultation practices.

**The occupational therapist in Papua New Guinea.**

Rodgers-Wilson M  
Papua New Guinea Med J ,Jun 1982, 25 (2) p123-6, ISSN  
0031-1480 Journal Code: YEU  
Languages: ENGLISH

The Occupational Therapist (O.T.) is an indispensable member of all health teams in major general hospitals, rehabilitation centres, sheltered workshops, psychiatric clinics and special centres for children and elderly people, as well as contributing to many community health projects. The O.T. provides rehabilitation programmes for patients with spinal injuries, degenerative neurological disease, head injuries, blindness, amputations, and leprosy as well as many other disabling conditions. In addition occupational therapy is important in paediatric practice. Supervision of the sheltered workshop is a further responsibility of the O.T. It is recommended that the position for an O.T. in Port Moresby General Hospital be maintained, and that Papua New Guineans be trained overseas to meet future needs within the country.

Recent changes in mental health policy and treatment have largely been attributed to a professional concern for patients' rights. This view is challenged by patients' rights organizations and their allies, such as legal advocacy groups. These parties argue that psychiatric planners and providers are trying to coopt a popular movement and to use patients' rights as a convenient explanation for the mental health system's limited self-reform and fiscal limitations. A key issue here is the gap between planned policy and implemented practice. Patients' rights activists maintain that rights are only very sparsely implemented, while the mental health system believes that it has progressed quite far. A study of patients' rights attitudes held by the various involved forces can illuminate the conflicts in patients' rights policy and provide understanding of the potential for resolving these conflicts. Such an analysis also touches on some general themes concerning the relationships between health providers and social movements in the health field. This paper examines attitudes towards mental patients' rights on the part of mental patients rights groups, state departments of mental health, state hospitals and statewide mental health associations. One hypothesis was borne out: that patients' rights groups do not believe as much as does the mental health establishment that concern for patients' rights has played a large role in mental health policy. Further, the activist groups are more favorable than are the other respondents to abolition or sharp curtailment of intrusive psychiatric treatments. And, mental health officials and their lay supporters are less prone to accept patients' rights groups' initiative in reform efforts. The second main hypothesis, that the mental health establishment would be more antagonistic to patients' rights in states where patients rights groups existed, was not supported. One possible explanation for this is that patients' rights groups have had a nationwide impact, and that mental health officials face common problems throughout the country. Alternatively, or in conjunction, an antecedent variable of political liberalism may operate in some states, creating both activist groups and more liberal psychiatric professionals. The significance of these findings is discussed and suggestions are offered for future research in this area.

The staff of the department of psychotherapy at the Salpêtrière Hospital (Department of Prof. Duche) includes five psychoanalysts who are in charge of the consultations and treatment of hospitalized children, out-patients and parents. Individual psychoanalytical psychotherapy and psychodrama are the methods used. For adolescents and psychotic children, psychotherapy is carried out in a more flexible way. Special attention is given to the outset of therapy and to the support provided to parents. Two groups for the training of child therapists are ongoing.

L'urgence existe-t-elle en psychiatrie de l'enfant et de l'adolescent?

Giret G; Sibertin-Blanc D; Sender C; Mazet P

Sem Hop Paris ,Nov 18 1982, 58 (42) p2477-80, ISSN 0037-1777 Journal Code: ULD

Languages: FRENCH Summary Languages: ENGLISH

From our experience in the pedopsychiatric emergency unit at the Salpêtrière Hospital, we discuss the concept of psychiatric emergency in children and adolescents. In 90% of cases, patients are adolescents aged 14 to 18 years. The acting out and the ensuing emergency consultation seem to be a propitious time for establishing a relationship with the adolescent, meeting his difficulties from a psychological rather than affective standpoint and instituting an exchange with the family.

Sem Hop Paris ,Nov 18 1982, 58 (42) p2473-6, ISSN 0037-1777 Journal Code: ULD

Languages: FRENCH Summary Languages: ENGLISH

Among the various means of answering psychiatric problems in young children, specialized care units for the very young, such as the one set up at psychiatric department for children and adolescents at the Salpêtrière Hospital, appear to be helpful in some situations which are psychologically highly

dangerous as well as life-threatening. The modalities of the reception and therapy of the child and its family are described and discussed. It seems that this type of hospitalization may contribute to the resuming of dynamic developing processes in the child and of positive relationships between child and family, particularly the mother.

Allilaire JF; des Lauriers A

Sem Hop Paris ,Nov 18 1982, 58 (42) p2467-70, ISSN 0037-1777 Journal Code: ULD

Languages: FRENCH Summary Languages: ENGLISH

Psychiatric emergencies concern not only sectorized psychiatric organizations but general hospitals as well, especially in large cities. No set-ups for long-term management are available in general hospitals and means for short-term intermittent action should be evolved. Family crisis may be responsible for psychiatric emergencies as they may lead to decompensation due to the breaking-up of familial relationships. When confronted with such situations, practitioners must of course face the emergency by using various specific chemotherapeutic agents or by hospitalizing the patient. However, practitioners should also concern themselves with acting upon the whole family in order to help them to develop solutions to the crisis. The modalities of this global approach of psychiatric disorders are delineated in the family crisis therapeutic technique.

Languages: FRENCH Summary Languages: ENGLISH

Although it remains valuable for evaluating the patient and planning pharmacotherapy, hospitalization in a psychiatric department is no longer restricted to these purposes. Hospitalization enables separation of the child or adolescent from his usual environment during periods of acute conflict. It is aimed at modifying and overcoming the conflicts between family members which are underlying in the child's or parent's request for support. Hospitalization can become an essential part of the child's treatment if it is carefully planned and harmonized with the other curative and preventive methods.

**Who receives the aftercare? Utilization of services by  
discharged in-patients.**

Keane P; Fahy TJ

Psychol Med ,Nov 1982, 12 (4) p891-902, ISSN 0033-2917  
Journal Code: QER

Languages: ENGLISH

A prospective one-year follow-up of 216 in-patients showed that utilization of aftercare was significantly associated with certain clinical and social factors in the year after discharge from hospital. Rural domicile, a diagnosis of schizophrenia, long dependence on services, and ease of access to care comprised an aftercare dependency syndrome with substantial predictive power. Alcoholic and personality disordered patients were light users of services. Staff-patient relationships and attitudes of staff and

patients to the need for aftercare were important. Depot neuroleptics were associated with high levels of aftercare for patients with chronic schizophrenia. The findings reveal the steady silting up of a new area service for the adult mentally ill by patients with a combination of social disadvantage and severe chronic psychosis. Family doctors played very little part in the delivery of aftercare. Some implications of the findings for the future development of community-based psychiatric services are discussed.

Languages: ENGLISH

Before 1950, publicly supported psychiatric services (i.e., those of so-called public psychiatry) were provided primarily at state hospitals. Over the past 30 years public psychiatry has shifted its emphasis away from long-term custodial care to outpatient and community-based services. Paradoxically, this broadening of focus has become associated with both an expanded use of psychiatric services and a threatened decline in clinical standards and treatment goals. Five areas of policy confusion and contradiction threaten the stability of public mental-health services: the shift in emphasis from public to private services, the issue of rehabilitation and reintegration into society versus custodial care, the differential treatment of the lower-class patient, the demedicalization of public services, and conflict between professionals and blurring of roles within the psychiatric profession. These problems reflect public psychiatry's overemphasis on social reform and political rather than clinical definitions of treatment, its lack of specific treatment and of defined treatment goals, and its inability to change psychiatry's (and society's) historical assignment of low status to the public patient.

**Mental health in the Third World.**

Lin TY  
J Nerv Ment Dis ,Feb 1983, 171 (2) p71-8, ISSN  
0022-3018 Journal Code: JAF  
Languages: ENGLISH

In spite of great national and international efforts and relative success in achieving technological and economic progress, the underlying situation in the Third World offers little cause for optimism. Some notable exceptions notwithstanding, in most countries poverty is increasing at an alarming rate, with its accompanying misery, poor health, and social unrest. Unequal distribution of material wealth, political instability, and the crumbling of traditional and cultural values are also increasingly prevalent. Critical assessment of the philosophy, goals, and methodology of development is an urgent requirement in many nations. Mental health endeavors in the Third World need similar reformulation of both immediate and long range objectives and methods, if ever-increasing mental health demands fostered by such rapid and sweeping changes are to be met. Four major models--the hospital-based model, the medical school-based model, the community-based model, and the voluntary organization model--have so far been the basis for mental health development in Third World nations and, to a certain extent, have produced the needed personnel and services. A fifth model--the primary health care model--seems to hold more promise for the future. By virtue of its integration with general health and other administrative social networks, it can more easily reach out to the community, providing both curative and preventive mental health. Whichever model or combination of models any one nation or region adopts, future mental health endeavors in the Third World should be an integral part of overall social policy and health planning. Taking children, family, and school as major foci, such efforts are indispensable and should constitute a positive force in shaping the continuing process of social evolution.

**Validity of the Minnesota Multiphasic Personality Inventory (MMPI) to psychopathology in patients with epilepsy.**

Dikmen S; Hermann BP; Wilensky AJ; Rainwater G  
J Nerv Ment Dis ,Feb 1983, 171 (2) p114-22. ISSN  
0022-3018 Journal Code: JAF

Contract/Grant No.: 1-NS-6-2341; HS-04146; OS-H-000150-11

Languages: ENGLISH

Information regarding the sensitivity of the Minnesota Multiphasic Personality Inventory (MMPI) to psychopathology and the meaning of MMPI elevations in neurological patients, particularly in those with epilepsy, is of both theoretical and clinical concern. Such information has a particular relevance to the temporal lobe epilepsy-psychopathology controversy. In order to investigate evidence for increased psychopathology as a function of complex partial seizures (temporal lobe epilepsy in the old nomenclature), three groups of epilepsy patients differing in seizure type were compared on the MMPI. No supportive evidence was present for such an association. Second, the sensitivity of the MMPI to psychopathology was examined by comparing three groups of epilepsy patients differing in history of psychiatric problems. The results clearly indicated that the MMPI is sensitive to psychopathology in patients with epilepsy. Finally, the Sc scale was examined in relation to items descriptive of "disease-related experiences" and the psychiatric implications of endorsing such items. About one third of the items were identified as descriptive of "real experiences." Nevertheless, patients with psychiatric histories endorsed more of such items. In conclusion, the MMPI appears to be sensitive to psychopathology in epilepsy. Therefore, insensitivity of this instrument cannot be advanced as an explanation for the results of many studies that have not supported the temporal lobe epilepsy-psychopathology controversy.

**Work environments of different types of nursing subunits.**

Leatt P; Schneck R  
J Adv Nurs ,Nov 1982, 7 (6) p581-94. ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH

Based upon organizational theory, the purpose of this research was to identify and describe similarities and differences in the work environments of nine different types of nursing subunits (intensive care, medical, surgical, psychiatric, auxiliary, rehabilitation, rural, paediatric and obstetrical) in hospitals. Six measures of nursing subunit environment were developed: these included measures of nursing subunit autonomy, and the complexity and pervasiveness of other medical and hospital groups interacting with the nursing subunit. Data were collected by questionnaire from headnurses in 157 nursing subunits located in 24 hospitals in Alberta, Canada. The results indicated that the types of nursing subunits were similar in their degree of autonomy from both physicians and administration in the larger context in which

they were located but were significantly different in terms of number and heterogeneity of groups outside nurses with which they interacted and the extent to which such groups pervaded the subunits. For example, intensive care units appeared as the type of nursing subunit with the greatest need for interaction with physicians, paramedics, hotel services and so on, whereas, psychiatric subunits appeared to be the least dependent on groups outside nursing in the hospital. These findings have implications for the management practices and educational programme for nursing.

**The medical assessment of seriously delinquent boys: a comparison of pediatric, psychiatric, neurologic, and hospital record data.**

Lewis DO; Shanok SS; Pincus JH; Giammarino M  
J Adolesc Health Care ,Dec 1982, 3 (3) p160-4. ISSN  
0197-0070 Journal Code: HAM

Languages: ENGLISH

This study documents a high prevalence of medical disorders, especially head and face injury, seizures, and other neurological problems in violent incarcerated adolescent delinquents. It documents the failure of three different medical specialties--pediatrics, psychiatry, and neurology--to consistently elicit significant potentially treatable disorders during routine evaluations. It explores possible causes for overlooking significant medical factors in these youngsters and proposes ways to improve the health evaluations of delinquent adolescents.

Hosp Community Psychiatry ,Dec 1982, 33 (12) p996-1001,  
ISSN 0022-1597 Journal Code: GCJ

Contract/Grant No.: MH-1643B

Languages: ENGLISH

Thirty to 60 per cent of the patients in general hospitals suffer from significant psychological dysfunction or psychological dysfunction secondary to their medical illness. In addition to helping medically ill patients adapt to their illness and hospitalization, psychiatrists who work in general hospitals should develop the biopsychosocial model of diagnosis and management and improve the staff's capacity to detect, diagnose, and manage their patients' psychological problems. The author discusses specific needs for consultation-liaison psychiatry in the general hospital such as development of prevention scheme, case detection, continuing education programs for staff, and education groups for patients and families. He also describes structural innovations to meet the increasing demands for psychiatric services in the general hospital setting. These innovations include the establishment of a biopsychosocial data-base system and the use of screening devices, medical-psychiatric inpatient units, and medical-psychiatric aftercare clinics in ambulatory facilities.

**Consultation-liaison psychiatry at the crossroads: in search of a definition for the 1980s.**

Pasnau RO

Hosp Community Psychiatry ,Dec 1982, 33 (12) p989-95,  
ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Consultation-liaison psychiatry did not emerge as a prominent psychiatric subspecialty until the remedicalization of the psychiatric profession in the 1970s. The author traces the history of consultation-liaison and discusses the various definitions of the subspecialty. He outlines how consultation-liaison psychiatrists work in general hospitals and medical school departments of psychiatry. The future of consultation-liaison psychiatry, the author says, depends on developments in four areas: psychosomatic research, behavioral medicine, holistic health care, and general hospital psychiatry. To ensure a bright future for the subspecialty, consultation-liaison psychiatrists must meet fiscal, research, and political challenges, make peace with other behavioral scientists, develop close relations with the nursing profession, enjoy the support of medical school departments of psychiatry, and transform the consultation model into a comprehensive consultation-liaison model.

**Attitudes of nonpsychiatric physicians toward psychiatric consultation.**

Cohen-Cole SA; Friedman CP

Hosp Community Psychiatry ,Dec 1982, 33 (12) p1002-5,  
ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

The authors report on an opinion survey of 200 nonpsychiatric attending physicians at a university teaching hospital about the process and outcome of consultation psychiatry. Over-all, physicians felt that 37 per cent of their patients had problems with significant psychological components, but that consultation was indicated for only 11 per cent. Physicians reported a high level of global satisfaction with consultations; 68 per cent were satisfied frequently or almost always. Factor analysis reduced consultees' evaluations of 18 different consultation activities to five dimensions, with patient disposition considered the most important and services to medical and ward staff the least important. Analysis of differences by specialty revealed that family medicine physicians seemed the most oriented to psychological issues and surgeons the least.

**A comparison of borderline and nonborderline alcoholic patients.**  
Nace EP; Saxon JJ Jr; Shore N  
Arch Gen Psychiatry ,Jan 1983, 40 (1) p54-6, ISSN  
0003-990X Journal Code: 72C  
Languages: ENGLISH

Attempts to document systemically the presence of borderline personality disorder in alcoholic patients were made in 94 alcoholic patients consecutively admitted to an inpatient alcoholism program. Operational diagnoses of borderline or not borderline used Gunderson's semistructured Diagnostic Interview for Borderlines (DIB). With the use of conservative criteria, 12.8% of alcoholic patients could be designated as

having borderline disorders. Borderline alcoholics were significantly younger and were more likely to have a history of drug abuse, suicide attempts, and accidents. Diminished satisfaction with self and family life and a greater tendency to experience craving across a variety of situations was reported.

**Diagnosing borderline conditions in an outpatient setting.**  
Koenigsberg HW; Kernberg DF; Schomer J  
Arch Gen Psychiatry ,Jan 1983, 40 (1) p49-53, ISSN  
0003-990X Journal Code: 72C  
Languages: ENGLISH

Application of the Gunderson-Kolb Diagnostic Interview for Borderline to a population of psychiatric outpatients suggested two complicating factors in diagnosing borderline conditions in an ambulatory setting: the reduced level of borderline symptoms and the confounding presence of recompensated psychotic patients. Overlap between the Gunderson and Kernberg borderline constructs, which is relatively high in the inpatient setting, is diminished in the outpatient setting. Contrary to expectation, distinguishing borderline patients from patients with other personality disorders was not a source of difficulty.

**Psychiatric disorders in the families of borderline patients.**  
Soloff PH; Millward JW  
Arch Gen Psychiatry ,Jan 1983, 40 (1) p37-44, ISSN  
0003-990X Journal Code: 72C  
Languages: ENGLISH

The prevalence of psychiatric disorders was studied among the families of hospitalized borderline patients, defined by Gunderson and Singer's criteria, and compared with the families of schizophrenic and depressed control patients. Among borderline probands, 38.3% have a first-degree relative with depression, 25.5% had one with pathological mood swings, and 23.4% had one with "eccentric or peculiar behavior." There was no significant increase in the prevalence of schizophrenia among the relatives of borderline patients. Depression was more prevalent in the families of schizotypal borderlines compared with unstable or mixed-pattern patients. There were no schizophrenic diagnoses among the impaired relatives of schizotypal borderlines. A relationship is suggested between affective disorder and criteria-defined borderline disorders.

**Seclusion and restraint and prediction of violence.**

Phillips P; Nasr SJ

Am J Psychiatry ,Feb 1983, 140 (2) p229-32, ISSN  
0002-953X Journal Code: 3VG

Languages: ENGLISH

The authors studied the use of seclusion and restraint on an inpatient unit in a state psychiatric hospital. Of 69 randomly selected inpatients, 51% experienced seclusion or restraint at least once. More psychotic than nonpsychotic patients required seclusion or restraint. However, neither psychosis/nonpsychosis nor voluntary/involuntary admission status predicted the likelihood of violent threats or actions. Patients experiencing seclusion and restraint showed a nonsignificant trend toward longer mean length of stay in the hospital. The frequency of patient behavior leading to seclusion or restraint appeared to be directly related to the stimulation caused by the presence of many staff members and other patients.

**Cross-cultural comparison of British and American psychiatric emergencies.**

Bassuk EL; Winter R; Apsler R

Am J Psychiatry ,Feb 1983, 140 (2) p180-4, ISSN  
0002-953X Journal Code: 3VG

Languages: ENGLISH

The authors compare patient characteristics in a psychiatric emergency setting in the United States with a similar service in the United Kingdom. They found that despite many significant differences in nonclinical variables, the severity of clinical symptoms did not differentiate between the two groups. In both countries, it was not the degree of psychopathology but the lack of an available support network, an inability to engage the patient in the system, and a history of serious chronic maladjustment that led to the majority of "emergency" visits. The authors conclude that use of an emergency service sensitivity mirrors the gaps in health care delivery.

**The genetics of schizophrenia: a reassessment using modern criteria.**

Abrams R; Taylor MA

Am J Psychiatry ,Feb 1983, 140 (2) p171-5, ISSN  
0002-953X Journal Code: 3VG

Languages: ENGLISH

The authors present two reasons for reassessing familial transmission of schizophrenia: recent major changes in diagnostic criteria and methodological weaknesses of older studies. Their own study of this subject employed narrowly defined, operational research criteria; prospective proband selection; semistructured family interviews; and blind, independent diagnoses of probands and relatives. For 30 schizophrenic probands they found an age-corrected morbidity risk in first-degree relatives of 1.61%, a figure that would only support familial transmission if the true population prevalence of schizophrenia were .2% or less. The authors conclude that the case for familial transmission of narrowly defined schizophrenia is weak and suggest alternative hypotheses.

0227280 83098026

**Underrecognition of patients' psychosocial distress in a university hospital medical clinic.**

Thompson TL 2d; Stoudemire A; Mitchell WD; Grant RL

Am J Psychiatry ,Feb 1983, 140 (2) p158-61, ISSN  
0002-953X Journal Code: 3VG

Languages: ENGLISH

Seventeen areas of psychosocial distress were evaluated in 87 university hospital internal medicine clinic patients by a self-administered questionnaire and a psychiatric interview. These patients' internists then predicted the patients' distress level in each area. Their predictions correlated significantly with their patients' self-reports of distress-level problems in only 3 of the 17 areas. Even when the internists felt that they had sufficient information to make an accurate prediction, their perceptions were often erroneous, including evaluations of such areas as suicidal ideation and drug use. These data suggest the need for active psychiatric education components in internal medicine training programs.

**Homicidally aggressive young children: neuropsychiatric and experiential correlates.**

Lewis DO; Shanok SS; Grant M; Ritvo E  
Am J Psychiatry ,Feb 1983, 140 (2) p148-53, ISSN  
0002-953X Journal Code: 3VG

Languages: ENGLISH

Of 55 children admitted to a children's psychiatric service, 21 were homicidally aggressive. Psychiatric symptoms and diagnoses did not distinguish these children from the nonhomicidal children, but the homicidally aggressive children were significantly more likely to 1) have a father who behaved violently, often homicidally, 2) have had a seizure, 3) have attempted suicide, and 4) have a mother who had been hospitalized for a psychiatric disorder. The authors explore explanations for the contribution of these factors to juvenile violence.

**Effects of illicit drug use in an inpatient psychiatric population.**

Alterman AI; Erdlen DL; Laporte DJ; Erdlen FR  
Addict Behav ,1982, 7 (3) p231-42, ISSN 0306-4603  
Journal Code: 2GW

Languages: ENGLISH

All 533 patients in the acute and subacute psychiatric wards of a VA psychiatric facility were evaluated by nursing staff for substance abuse history and for illicit drug use. Eighteen percent had a history of either drug or combined drug and alcohol problems, 40% had a history of alcohol abuse, and only 42% had no substance abuse problems. Fifty-six of the patients with a history of drug problems (58%) were illicitly using drugs in the hospital. They were compared with a group of 64 randomly chosen patients with no substance abuse history. Drug users were much younger and tended to be black; they had more re-admissions, even though their original hospital admission was much more recent. Eighty-three percent of both groups had a primary diagnosis of schizophrenia, but drug users were more likely to be diagnosed paranoid schizophrenic. The groups did not differ significantly in treatment status and progress, except that drug users were more likely to exhibit marked mood changes. Half of the drug users were taking drugs three or more times weekly. Marijuana use was by far the most common substance observed. Ten consequences of drug use occurred in at least one-third of the users on a regular basis, the most common effects being negative attitudes toward treatment.

cliquishness, secretiveness, and a need for greater supervision. The treatment problems and effects of drug use were much more serious for about half of the drug users than for the others.

**[Interventions with a patient in a psychologic or social crisis in the hospital of the psychiatric district]**

Interventions chez le patient en etat de crise psychologique ou sociale a l'hopital et au secteur.

Corten P; Pelc I; Vermeylen J  
Acta Psychiatr Belg ,Mar-Apr 1982, 82 (2) p181-94, ISSN  
0300-8967 Journal Code: 1VM

Languages: FRENCH Summary Languages: ENGLISH

Three questions have been analysed in the study on patients in a state of psychosocial crisis: Who is coming? Who is intervening? Where are they sent? Three epidemiological studies have been taken into account: one study on 16 medical surgical centers in Brussels, the second study on two public emergency services linked to psychiatric services and the third one on a psychiatric district of a popular suburb in Brussels. The study stresses the importance of alcoholism and analyses the differences in population, intervention and response brought by the hospital or the district.

**[Intentions and realizations of hospital planning in psychiatry]**

Intentions et realisations de la programmation hospitaliere en psychiatrie.

Brunson W; Parent M  
Acta Psychiatr Belg ,Mar-Apr 1982, 82 (2) p147-67, ISSN  
0300-8967 Journal Code: 1VM

Languages: FRENCH Summary Languages: ENGLISH

Hospital planning: why? how? from when? in which frame? These are the questions raised in this article. A historical review is made for the criteria used in hospital planning today. The most important steps are related to changes in hospital psychiatry policy: creation of open services in 1960, integration of psychiatric services in the law on hospitals and development of outpatient services in 1970. The authors emphasize the difficulties in planning because of services overlapping and economic difficulties. The outpatients services and the services for "handicapped" should also be part of a general planning. The problems of coordination between these sectors both for planning and functioning are also raised in this article.

**Paths and gates: the sources of recidivism and length of stay on a psychiatric ward.**

Gruber JE  
Med Care ,Dec 1982, 20 (12) p1197-208, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

Four "pathway" (age, sex, social class, and number of dependents) and three "gatekeeper" (previous admission, previous ward terms, and severity of patient disorder) variables are used to predict recidivism rates and lengths of stay for patients admitted to a psychiatric ward in a general hospital during a 1-year period. There were three major findings. First, the gatekeeper variables were, by themselves, useful for predicting length of stay; additional information, in the form of the pathway variables, was needed to adequately explain differences in recidivism. Second, while most of the effects on recidivism were direct, most of the effects on length of stay were indirect or mediated through the variable of the severity of patient problems. Third, it was discovered that recidivism and length of stay are inversely related: patients with high recidivism rates, for example, tend to have relatively short average lengths of stay. Based on four patterns of recidivism and length of stay, a typology was developed to facilitate a better understanding of patient behavior.

**Comprehensive health care for the elderly.**

Fisk AA  
JAMA ,Jan 14 1983, 249 (2) p230-6, ISSN 0098-7484  
Journal Code: KFR  
Languages: ENGLISH

Health care for the elderly in the United States remains fragmentary and noncomprehensive despite concern for the needs of an expanding elderly population and a new emphasis on geriatrics. Model health care programs for the elderly have been few and not generally applicable to central city populations. A model health care program has been designed to offer a continuum of comprehensive, multidisciplinary health care to Milwaukee elderly. An acute care unit for the elderly, rehabilitation-oriented nursing home, outpatient clinic, home care service, outreach clinics, rehabilitation day hospital, Alzheimer's Disease Day Care program, and acute geriatric psychiatric unit have been developed and integrated into one continuum of care. The program serves chiefly the frail elderly, who are demonstrated to be markedly impaired physically, mentally, and socially, requiring the services of multiple professionals to enable the patients to achieve maximum independence. Alternatives to institutionalization are emphasized, and geriatric education and research programs are part of the model program.

**Process analysis of two dimensions of the negotiated approach in relation to satisfaction in the initial interview.**

Eisenthal S; Koopman C; Lazare A  
J Nerv Ment Dis ,Jan 1983, 171 (1) p49-54, ISSN 0022-3018  
Journal Code: JAF  
Contract/Grant No.: MH-22922; MH-14246  
Languages: ENGLISH

This study examined relationships between patient and clinician satisfaction ratings and the use of a negotiated approach to the initial psychiatric interview. Two dimensions of the negotiated approach were distinguished--mutuality in making treatment decisions and mutuality in communicating explanatory information. Forty-four patients sampled from a larger pool of 158 patients in a walk-in clinic of a large, urban general hospital participated in the study. At the conclusion of clinical interviews, three kinds of satisfaction ratings were obtained--those of patients' satisfaction, clinicians' perceptions of patients' satisfaction, and clinicians' own satisfaction. Transcripts of patients' audiotaped interviews with these clinicians were independently rated on each of the 10 negotiated approach process measures, comprising five measures of each process dimension. Patient satisfaction was found to be associated with explanatory processes--being given clear and complete explanations concerning the recommended treatment plan, its rationale, and its link to the patient's complaints, and with decision-making processes--stating a request before the start of the disposition phase and having the clinician pursue consensus with the patient on the clinician's recommended treatment plan. None of the negotiation variables was significantly correlated with clinician satisfaction. Moreover, clinicians appeared to be inaccurate in their perception of the sources of patient satisfaction. The study's findings suggest that two sources of strain between the clinician and the patient that may adversely affect the outcomes of their initial interview are the divergence in their value systems concerning initial interview processes and the clinician's misreading of the patient's perspective.

**MMPI correlates of the BEM Sex Role Inventory and Extended Personal Attributes Questionnaire in a male psychiatric sample.**

Evans RG; Dinning WD  
J Clin Psychol ,Oct 1982, 38 (4) p811-5, ISSN 0021-9762  
Journal Code: HTJ  
Languages: ENGLISH

Obtained normative data and MMPI correlates of two measures of sex role orientation (Bem Sex Role Inventory and Extended Personal Attributes Questionnaire) in a sample of male psychiatric inpatients (N = 55). Means and subscale intercorrelations similar to those found in college samples were found for each sex role scale. With regard to self-reports of psychopathology, desirable masculine traits generally were related positively to adjustment, undesirable masculine and feminine traits were related negatively, and desirable feminine traits were unrelated to pathology. No consistent sex role correlates with MMPI MF were found, contrary to previous research with normal groups.

**Comparison among inpatients, outpatients, and normals on three self-report depression inventories.**

Byerly FC; Carlson WA  
J Clin Psychol ,Oct 1982, 38 (4) p797-804, ISSN 0021-9762 Journal Code: HTJ  
Languages: ENGLISH

Used the Beck Depression Inventory, Form E of the Depression Adjective Check Lists and also the Generalized Contentment Scale to measure depression in 219 Ss, who included inpatients, outpatients, and normals. Data were analyzed using t-test comparisons of means using Bonferroni procedures. Results indicated that depression was significantly greater (for all three depression measures, patient-normal differences were significant at p less than .000) in a general psychiatric patient sample than in a normal group. Inpatients were not found to be more depressed than outpatients, and females did not indicate greater depression than males. The expectation that patients diagnosed depressed would score higher on self-report depression scales than patients not diagnosed depressed received partial support. Kuder-Richardson reliabilities computed for the depression inventories were judged to be acceptably reliable. Concurrent validity was appraised by computing Pearson product-moment correlations for the scales on each of the samples. All correlations were

positive and significant at p less than .002.

**Depression in children: relationship between plasma imipramine levels and response.**

Preskorn SH; Weller EB; Weller RA  
J Clin Psychiatry ,Nov 1982, 43 (11) p450-3, ISSN 0160-6689 Journal Code: HIC  
Contract/Grant No.: MH-00272  
Languages: ENGLISH

The effects of imipramine treatment and plasma drug levels were studied in 20 prepubertal children (16 males, 4 females; age range 7-12 years) hospitalized for major depressive disorder (DSM-III criteria). No change in symptomatology was seen after 2 weeks of individual/group/family psychotherapy, but 12 children experienced a remission within 6 weeks of beginning imipramine. Response to the drug was concentration-dependent; of the children who achieved total tricyclic (imipramine plus desipramine) plasma levels of 125-225 ng/ml, 92% responded, compared with 25% of those outside this range. Antidepressant response was correlated both with total tricyclic plasma levels and with plasma desipramine levels (r = 0.72 and 0.56, respectively), but not with plasma levels of imipramine alone.

**Study of behavioral factors associated with psychiatric rehospitalization.**

Morell MA; Levine M; Perkins DV

Community Ment Health J ,Fall 1982, 18 (3) p190-9, ISSN 0010-3853 Journal Code: DNH  
Contract/Grant No.: MH 08060  
Languages: ENGLISH

Archival data from daily logs maintained at a private proprietary home were tracked from four to 29 weeks prior to psychiatric rehospitalization for ten deinstitutionalized adult females and ten nonhospitalized controls. Three raters coded behavioral incidents into ten categories. The rehospitalized women had significantly more incidents than did the controls, including more affective disturbances (depression, anxiety, anger, and interpersonal concerns) and more attempts to secure psychiatric rehospitalization. The rehospitalized groups also exhibited symptomatic behavior for

a greater number of weeks than did the control group, suggesting that the symptom pattern was probably detectable long before rehospitalization was necessary. Peaks in incidence frequency often occurred several weeks prior to rehospitalization.

**Quieting response training: treatment of psychophysiological disorders in psychiatric inpatients.**

Ford MR; Stroebel CF; Strong P; Szarek BL  
Biofeedback Self Regul ,Sep 1982, 7 (3) p331-9, ISSN  
0363-3586 Journal Code: A15

Languages: ENGLISH

Self-regulation methods incorporating biofeedback are known to be useful in the treatment of psychophysiological disorders in psychologically normal patients. In this study, the effectiveness of Quieting Response (QR) training for the treatment of secondary psychophysiological complaints in psychiatric inpatients was assessed. Ten male and 27 female inpatients with a variety of secondary psychophysiological diagnoses were accepted into the study. Severely disturbed, confused, or depressed patients were excluded. All patients received QR training, which integrated EMG (electromyogram) and thermal feedback with breathing, progressive relaxation, and autogenic exercises. Daily practice of a 15-minute sequence of exercises was encouraged, and a 6-second reinforcement exercise was presented for use whenever an annoyance was encountered. No other therapeutic modalities were employed. Patients were followed for up to 2 years, and outcome was assessed with a multifactor quartile system. Rate of success at final follow-up for the inpatients (51%) was found to be equivalent to that of outpatients coming to the clinic with primary psychophysiological diagnoses (55%) and was not related to psychiatric diagnosis or nature of presenting complaint. Stepwise discriminant analysis indicated that older, less depressed individuals were more successful. Inpatients differed from nonpsychiatric patients only in the number of additional sessions received. Only one minor incident of increased psychopathology was observed. It was concluded that QR training was as effective for treating secondary psychophysiological disorders in all but the most severely disturbed inpatients as it was for the outpatient clinic population.

**[Evaluation of community care of psychiatric patients. Results of 4 years' scientific association with the building phase of the Mannheim model]**

Evaluation gemeindenaher Versorgung psychisch Kranker. Ergebnisse von 4 Jahren wissenschaftlicher Begleitung der Aufbauphase des Mannheimer Modells.

Hafner H; an der Heiden W

Arch Psychiatr Nervenkr ,1982, 232 (1) p71-95, ISSN 0003-9373 Journal Code: 8DE

Languages: GERMAN Summary Languages: ENGLISH

The implementation of a community mental health service in Mannheim (FRG), a city with 315,000 inhabitants, is being evaluated by means of the data of the Cumulative Psychiatric Case Register at the Central Institute of Mental Health. Within a four-year period of extending services for crisis intervention and emergency care, aftercare (sheltered apartments, homes, workshops) and of providing psychiatric beds in the city, the total number of treatment episodes has increased by more than 100% from about 1.1 to about 2.2 per 1000 inhabitants aged over 14, mainly at the out-patient level of care. Admissions to hospital showed an increase of about 40% whereas bed occupancy remained stable at a rate of about 1.7/1000-respectively 1.3/1000 if beds provided by a psychogeriatric nursing home are deducted. This development can be attributed to various factors: (1) A true increase of morbidity may occur mainly in diagnostic groups I.C.D. No.300, 301, 305-308, especially an increase in attempted suicides and in alcohol- and drug-related diseases. (2) The increased provision of help, mainly on the sector of crisis intervention and emergency care and - in diagnostic categories - mainly in minor neurotic disorders, crises, and affective psychoses, has resulted in a large rise in utilization. (3) The continuous decrease of long-term hospital stays, above all in schizophrenic patients, has led to increased utilization of out- and in-patient services in the community when crises and relapses occurred. A comparison of two cohorts of "old" and "new" patients, the latter having accumulated under the conditions of a community mental health service, has shown that these patients are admitted for a long-term hospital stay considerably later and less frequently than formerly, mostly only after several attempts for rehabilitation. In the group of schizophrenic patients, only about 5% of all first admissions stayed in a psychiatric hospital for more than one year in 1979/80. About the year 1900, this group had still amounted to between 60% and 70%. A comparison with evaluations of comprehensive community care systems in other countries shows that there are largely identical trends, although the initial rate for psychiatric beds was comparably lower in Mannheim.

**Association between changes in psychiatric services and increases in suicide rates.**

Bjarnason O

Arch Psychiatr Nervenkr ,1982, 232 (1) p15-23, ISSN

0003-9373 Journal Code: 8DE

Languages: ENGLISH

The purpose of the study is to discover whether there is an association between changes in the psychiatric services offered by the largest psychiatric hospital in Iceland during the period 1955-1978 and changes in the rate of suicide. Marked changes occurred in the services after 1965. The rate of suicide in the patient population was significantly higher during 1965-1978 than during 1955-1964. It is concluded that the changes in the psychiatric services are associated with an increase in the rate of suicide and that this increase may to some extent be a side effect of therapeutic methods introduced after 1965. The conclusion is thought to imply the necessity for further evaluation of those therapeutic methods as applied in the hospital and increasing the application of measures for the prevention of suicide.

**Variability in rates of affective disorders in relatives of depressed and normal probands.**

Weissman MM; Kidd KK; Prusoff BA

Arch Gen Psychiatry ,Dec 1982, 39 (12) p1397-403, ISSN 0003-990X Journal Code: 72C

Contract/Grant No.: MH 28274

Languages: ENGLISH

Familial studies of depressed probands vary in the absolute rates of affective disorders in relatives. In a study of 215 mild and severely depressed nonbipolar major depressives and normal probands and 1,331 adult first-degree relatives, attempts were made to account for the sources of variance. The results demonstrated familial aggregation, although degree of aggregation of absolute rates of affective disorders varied among relatives according to the definition of depression used for the relatives, the source of data, and the composition of the relative sample. Despite this variability, the magnitude of the difference in rates between relatives of the normal persons and of the depressed probands remained constant. The rates of affective disorders were always higher in the relatives of the depressed than in the relatives of the normal probands. The magnitude of the difference in rates of depression between the relatives of the depressed subjects and the relatives of the normal probands ranged approximately between twofold and fivefold.

**Prevalence of autism and related conditions in adults in a mental handicap hospital.**

Shah A; Holmes N; Wing L  
Appl Res Ment Retard ,1982, 3 (3) p303-17, ISSN  
0270-3092 Journal Code: 6KL

Languages: ENGLISH

The proportions of subjects with severe social impairment and those retaining the features of childhood autism were investigated in a population of mentally retarded adults in a long-stay hospital. The results confirmed the findings of an earlier study of mentally retarded children (Wing & Gould, 1979) that the administrative category of mental retardation includes a substantial minority of people with severe impairment of two-way social interaction. Such social impairment occurred in 38% of the adult population and was very significantly associated with abnormalities of communication and imaginative activities. Muteness, repetitive stereotyped behaviour, including repetitive speech, and a range of behaviour problems also occurred more frequently in the socially impaired group. Two methods of sub-classifying the socially impaired were compared. Classification based on the severity of social impairment gave more statistically significant associations with behavioural and psychological variables than did a method based on the presence or absence of typical autism. The implications of these findings and their relevance for management and planning of services for the mentally retarded were briefly discussed.

**Depressive phenomenology in North and South American patients.**

Escobar JI; Gomez J; Tuason VB  
Am J Psychiatry ,Jan 1983, 140 (1) p47-51, ISSN  
0002-953X Journal Code: 3VG

Languages: ENGLISH

The authors assessed patients newly admitted to two North American health centers and one South American (Colombian) center according to a standardized protocol, with a structured interview, a symptom checklist, and a depression scale. The patients were suffering from major depressive disorders with endogenous features. There was an impressive similarity in symptoms of depression across cultures, supporting the idea of a universal core depressive syndrome. However, somatization indexes, psychomotor components of depression, and levels of psychopathology differed between U.S. and Colombian samples. The authors offer a general discussion of potential determinants of these cross-cultural differences.

**Predictors of assaultiveness in latency age children.**

Pfeffer CR; Plutchik R; Mizruchi MS  
Am J Psychiatry ,Jan 1983, 140 (1) p31-5, ISSN  
0002-953X Journal Code: 3VG

Languages: ENGLISH

The authors evaluated the presence of assaultive behavior in 103 children, aged 6-12 years, seen in the psychiatric inpatient and outpatient services of a municipal hospital. No racial or ethnic differences were found. Boys were significantly more assaultive than girls and used fire setting and hitting with objects more often. Inpatients were significantly more assaultive than outpatients. Children with conduct disorders, specific developmental disorders, and mental retardation were more assaultive than those with neurotic disorders. Multiple regression analysis showed that the child's past aggressive behavior, absence of anxiety and depression, and parental assaultive behavior were the best predictors of assaultive behavior.

When the authors investigated aggressive behavior on a phencyclidine (PCP) detoxification and rehabilitation unit and compared similar types of behavior on a heroin unit, they found no differences between the two units. The urinary PCP levels of a subgroup of 75 patients admitted to the PCP unit who had PCP-positive urine were significantly higher than those of 75 patients admitted to an acute psychiatric ward because of violent behavior who also had PCP-positive urine. The authors discuss the implications of these findings and the need for more information on the relationship between PCP levels in blood and urine and behavior.

**Vitek v. Jones: transfer of prisoners to mental institutions.**

Gottlieb NR  
Am J Law Med ,Summer 1982, 8 (2) p175-207. ISSN  
0098-8588 Journal Code: 3IP  
Languages: ENGLISH

In *Vitek v. Jones*, the United States Supreme Court interpreted the due process clause as requiring that certain procedures be followed before transferring prisoners to mental institutions. This Note analyzes the Court's reasons for concluding that the existing transfer procedures embodied in the state's commitment statutes infringed on the prisoner's liberty interests and, therefore, were constitutionally inadequate. It finds that not only was one of the grounds used by the Court to find a constitutionally protected liberty; inappropriate, but the calculus that the Court employed in mandating additional procedures was incorrect. This Note suggests alternative methods of holding the statutes unconstitutional, methods that would not lead to markedly different procedures for committing prisoners and civilians. Finally, the Note examines the procedures that the Court actually prescribed and discusses their implementation.

**Relationship between country of birth and psychiatric admissions in Western Australia.**

Burvill PW; Reymond J; Stampfer H; Carlson J  
Acta Psychiatr Scand ,Oct 1982, 66 (4) p322-35. ISSN  
0001-690X Journal Code: 1VY  
Languages: ENGLISH

The rates of admissions in 1976-78 to all hospitals in Western Australia, both psychiatric and non-psychiatric, of patients with a primary psychiatric diagnosis were analysed specifically for country of birth and whether they lived in Perth or in country areas. Eastern European migrants had the highest hospitalization rates, and Southern European migrants the lowest. Rates for schizophrenia were high in the Eastern Europeans, and for alcoholism low in Southern European and Asian females and high in Northern European males. The United Kingdom migrants were most like the Australian born in regards to admission rates, diagnostic composition, and in the distribution of hospitalization patterns between psychiatrists and non-psychiatrists. Women, especially Southern European, in the country areas are at special risk to be admitted for neurosis/personality disorder.

**Factors determining the use of the emergency recommendation for compulsory psychiatric care.**

Masterton G; Gallagher J; Timbury GC  
Scott Med J ,Oct 1982, 27 (4) p318-22. ISSN 0036-9330  
Journal Code: UJK  
Languages: ENGLISH

The factors determining the use of Section 31 admissions and reclassifications at a district psychiatric hospital were investigated prospectively over an eight month period. Thirty-six per cent of patients failed to meet the criteria laid down for full detention and, particularly with reclassification, Section 31 was invoked to secure treatment. While the Emergency Recommendation is not used as the legislators intended, a seven day detention order appears more relevant to modern psychiatric practice than the full detention procedure.

**[Consultation and liaison psychiatry--a contribution to the holistic thinking in medicine]**

Konsiliar- und Liaisonpsychiatrie--ein Beitrag zum ganzheitlichen Denken in der Medizin?  
Wildbolz A

Schweiz Arch Neurol Neurochir Psychiatr ,1982, 131 (1)  
p81-8. ISSN 0036-7273 Journal Code: UDS  
Languages: GERMAN Summary Languages: ENGLISH

After some introductory remarks about consultation and liaison psychiatry, the psychiatric consultation and liaison service in the general university hospital of Bern is presented. It has a statistically expressible exterior activity and an interior activity. It gives its contribution to holistic medical thinking in the fields of patient care, teaching, research, expertising and public relations. Problems of integration of consultation and liaison psychiatry and their possible overcoming are discussed on the base of two other studies of this author. The importance of creating psychiatric services in general hospitals is emphasized.

**International comparison of the prevalence of psychosomatic disorders in schizophrenic patients.**

Ramsay RA; Krakowski AJ; Rydzynski Z; Jarosz M; Engelsmann F; Ananth J

Psychother Psychosom ,1982, 38 (1) p206-20, ISSN 0033-3190 Journal Code: QHA

Languages: ENGLISH

An epidemiological survey was carried out in Montreal (Canada), Plattsburgh (USA) and Lodz (Poland) to test the hypothesis that certain psychosomatic disorders show a low lifetime prevalence in schizophrenic patients (total n = 665).

The same method for collection and evaluation of demographic and clinical data was used in order to establish the lifetime prevalence of peptic ulcer (PU), bronchial asthma (BA), neurodermatitis (ND) and rheumatoid arthritis (RA) in the patients as well as in their nuclear families. Low values of lifetime prevalence were found in schizophrenic patients in chronic hospitals as compared with those in general-university hospitals. Similarities were found in age- and sex-related patterns of these psychosomatic disorders in both samples. However, PU showed higher prevalence, and BA, ND and RA showed lower prevalence in the Polish sample.

Behandlung alkoholabhängiger Patienten in Rostock.

Friemert K; Schmitz K; Herbst A; Heydenreich A

Psychiatr Neurol Med Psychol (Leipz) ,Sep 1982, 34 (9) p544-53, ISSN 0033-2739 Journal Code: QAZ

Languages: GERMAN Summary Languages: ENGLISH

In the first part of the paper is reported on differential-therapeutic experiences in the hospital treatment of 307 alcoholics with disulfiram R, Lithium R and Apomorphine R as monotherapy as well as in combined application. Our investigations show that neither lithium R nor apomorphine R have ascertained advantages to the monotherapy with Disulfiram R. An improvement of the still unsatisfactory number of success is to be achieved in the first place by an optimization of the after-care by means of a close sociotherapeutic and if necessary psychotherapeutic care, possibly in special outpatient departments. In the second part of the paper is reported on first experiences.

**Medical care in a geriatric psychiatry unit: impact on psychiatric outcome.**

Weingarten CH; Rosoff LG; Eisen SV; Grob MC  
J Am Geriatr Soc ,Dec 1982, 30 (12) p738-43, ISSN  
0002-8614 Journal Code: H6V

Languages: ENGLISH

The medical care of 49 randomly selected patients admitted to a geriatric psychiatry evaluation unit was assessed to determine the impact on psychiatric care and outcome. Medical factors were identified as directly causing psychiatric symptoms in 12 of the 49 cases, whereas psychiatric decompensation was precipitated by medical illness in 25. Previously undiagnosed significant medical problems were found in ten patients. In 25 cases concomitant medical illness had a major effect on psychiatric treatment, and in 23 the course of the medical illness affected psychiatric outcome. Seventy-nine per cent of the patients had at least moderately improved at the time of discharge, and most were able to return to their homes. Improvement in medical condition was correlated significantly with psychiatric improvement. Implications for the care of geriatric psychiatry patients are discussed.

**Pyramidal training: a large-scale application with institutional staff.**

Page TJ; Iwata BA; Reid DH  
J Appl Behav Anal ,Fall 1982, 15 (3) p335-51, ISSN  
0021-8855 Journal Code: HDR

Languages: ENGLISH

This study evaluated an indirect method of training 45 institutional direct care staff to conduct behavioral programs. Three supervisors were trained to improve teaching behaviors (instructions, prompts, and consequence) used by the direct care staff while working with severely and profoundly handicapped residents. In addition to training, daily feedback was provided to supervisors regarding performance of their staff. Results of a multiple baseline analysis across teaching behaviors (instructions, prompts, and consequences) and content areas (communication and gross motor skills) showed that providing training and feedback to supervisors resulted in increases in correct teaching behavior by direct care staff. However, teaching behavior newly learned in one content area (communication) did not generalize to the other area (gross motor skills). Data collected on resident behavior showed small but noticeable improvement in terms of correct responses and attending behavior during programming. Results are discussed in terms of the benefits of a pyramidal approach to training institutional staff.

**Systemic consultation in a general hospital.**

Tarnow JD; Gutstein SE  
Int J Psychiatry Med ,1982, 12 (3) p161-86, ISSN

0091-2174 Journal Code: GSJ

Languages: ENGLISH

Consultation psychiatry has long offered the potential for psychiatrists to impact on the mental health of large numbers of individuals. However, workers in consultation psychiatry have often described it as a stressful, ungratifying experience. Over the last fifty years, since the initiation of consultation psychiatry, a series of models of consult work has been presented in the literature. These models have increasingly become more complex in the system of organization in which they operate. Moreover, there has been a constant movement toward viewing the function of the psychiatrist as intervening in behavior outside of the patient. After reviewing the history of consultation psychiatry, the authors conclude that a logical development would be a systemic model in which the entire hospital system is seen as the focus of consultation and in which the goal of the consultant's work is seen as creating a more open and flexible hospital system. The authors, therefore, describe a systemic model in which the potential crisis offered by any request for consultation work is seen as a tool for intervening with the hospital system. The difficulties of attaining the objectivity necessary for implementing a systemic intervention are discussed. A method of systemic diagnosis of the hospital is presented as well as a number of strategies of intervention with the hospital system. The authors conclude that using a systemic model (with the hospital as the focus of consultation) can lead to the development of a more comprehensive science of consultation which will lead to an increase of gratification for the psychiatrist and a more healthy functioning hospital system.

**Selection criteria for partial hospitalization.**

Klar H; Frances A; Clarkin J  
Hosp Community Psychiatry ,Nov 1982, 33 (11) p929-33,  
ISSN 0022-1597 Journal Code: GCJ  
Languages: ENGLISH

During the early 1960s partial hospitalization emerged as an important component of community-based psychiatric treatment. Initially partial hospitals offered all types of treatment to all types of patients. To help mental health professionals make informed decisions when matching specific treatments to specific patient characteristics, the authors define three kinds of partial hospitals--intensive care, chronic care, and rehabilitation partial hospitals--and propose selection criteria for referral to each model. Factors to be considered in making differential therapeutic decisions between a specific type of partial hospital program and alternative methods of treatment, such as inpatient treatment, are discussed.

**Partial hospitalization: state of the art.**

Weiss KJ; Dubin WR  
Hosp Community Psychiatry ,Nov 1982, 33 (11) p923-8,  
ISSN 0022-1597 Journal Code: GCU  
Languages: ENGLISH

While partial hospitalization as a treatment modality has existed since the 1930s it has been only recently begun to gain widespread attention. The attempts at defining partial hospitalization are traced to the current standards and guidelines. The authors review studies of efficacy and cost-effectiveness and find that partial hospitalization almost invariably compares favorably with inpatient treatment.

There are a number of factors militating against increased use of the modality, including haziness in the definitions of goals and target populations, prejudice among clinicians and patients, institutions' resistance to relinquishing beds, and difficulty in establishing third-party reimbursement. The state of the art in partial hospitalization is an attempt to translate face-value validity into an acceptable and fundable alternative to inpatient treatment. The authors conclude that, despite the relatively small growth of programs nationwide and the reluctance of third-party payers to reimburse for the modality, partial hospitalization has an enduring role as a treatment modality.

**An inpatient program for Vietnam combat veterans in a Veterans Administration hospital.**

Berman S; Price S; Gusman F  
Hosp Community Psychiatry ,Nov 1982, 33 (11) p919-22,  
ISSN 0022-1597 Journal Code: GCU  
Languages: ENGLISH

The Veterans Administration's first inpatient program for Vietnam War veterans was opened in January 1978 at the VA Medical Center in Palo Alto, California. The unit treats a range of psychiatric disorders; however, the typical patient is a 34-year-old white male with a diagnosis of posttraumatic stress disorder and at least one previous hospitalization. The program is designed as a three-phase therapeutic community based on mutual support and group solidarity. Medication is minimized. The program also reflects the assumptions that a debriefing, however belated, from military experience is essential, and that the clinical regimen should enable veterans to resume the transition to adulthood that the war interrupted. The average stay is five months; preliminary evaluation indicates that 60 per cent of the veterans achieve relief from acute psychological distress, resolve a crisis with a spouse or significant other, and begin a job or schooling.

**Contributions in teaching consultation-liaison psychiatry. The use of the medical team model on a consultation-liaison**

**teaching service.**

Guggenheim FG  
Gen Hosp Psychiatry ,Sep 1982, 4 (3) p219-24, ISSN  
0163-8343 Journal Code: FNK  
Languages: ENGLISH

This paper describes a consultation-liaison (C/L) teaching service that uses a medical team rounding model; four teams cover distinct geographic areas of the hospital, each team consisting of an attending psychiatrist, a resident, two medical students, and a psychology graduate student. Daily attending rounds on the medical/surgical wards provide prompt and direct patient care supervision for the team members, allowing for coordination of their activities and communication with the attending physician, who serves as a role model. Psychological testing can be readily integrated into the clinical setting; neurology and family practice residents can also get their psychiatric training in this setting. The medical team model of rounding is different from other models used on C/L services; its pros and cons are discussed.

**Evaluative research in consultation-liaison psychiatry. Review of the literature: 1970-1981.**

McKegney FP; Beckhardt RM  
Gen Hosp Psychiatry ,Sep 1982, 4 (3) p197-218, ISSN  
0163-8343 Journal Code: FNK  
Languages: ENGLISH

In the last decade, the biopsychosocial concept of medicine had flourished clinically in the form of consultation-liaison (C-L) psychiatry. However, full acceptance by the medical profession will depend, in part, upon scientific demonstration that psychological and social factors influence biological medical illness, and that C-L psychiatric teaching and patient intervention can improve the medical treatment of patients. This review surveys the literature over the last 10 years that describes and evaluates C-L activities as they impact upon clinical medicine and medical education. A conceptual grid for organizing research in the field is presented that distinguishes decision-oriented, or descriptive studies, from conclusion-oriented, or outcome studies. Further, this grid specifies the focus of the C-L activity, either the patient or health care professional. It seems clear that the very recent shift from descriptive studies to more outcome-oriented research, particularly regarding patient outcomes, should be the direction of the future. A greater emphasis on defining the exact components of C-L work that are most useful is also indicated. Several other specific recommendations for evaluative research in C-L psychiatry conclude this review. (182 Refs.)

This paper examines the task and functioning of a contemporary mental institution. The author, drawing from his experience, explores the world within such an institution whose purpose often contradicts the officially stated one. This world with its own assumptions is a creation in response to needs and anxieties of its participants. In the face of rapid shifts and increasing complexity in institutional environments, the capability to change becomes critical. Real change is impossible unless the underlying assumptions of an institution are recognized, understood and dealt with.

**Psychologist and physician diagnoses of hospitalized patients with similar MMPI symptomatology.**  
Page S  
Can J Psychiatry ,Oct 1982, 27 (6) p471-3, ISSN  
0706-7437 Journal Code: CLR  
Languages: ENGLISH  
MMPI profiles, including L, K, and F validity scale data, were examined for 40 hospitalized psychiatric patients, for whom diagnoses from both psychologists and physicians were

available. Comparison of diagnostic patterns of the same patients, especially for diagnoses of Personality Disorders and Schizophrenics, showed relatively little agreement between disciplines. Discriminant function analyses showed also that each discipline weighted MMPI scales differently in determining diagnosis, even though the scale profiles for each patient in the sample were essentially identical. The MMPI seemingly played a nonsignificant role in determining a set of inconsistently applied diagnoses.

The staff of the department of psychotherapy at the Salpetriere Hospital (Department of Prof. Duche) includes five psychoanalysts who are in charge of the consultations and treatment of hospitalized children, out-patients and parents. Individual psychoanalytical psychotherapy and psychodrama are the methods used. For adolescents and psychotic children, psychotherapy is carried out in a more flexible way. Special attention is given to the outset of therapy and to the support provided to parents. Two groups for the training of child therapists are ongoing.

**[Role of specialized care units in the psychiatric approach of very young children]**

La place d'une unite de soins specialisee dans l'abord psychiatrique de tres jeunes enfants.

Buffet Y; Mazet P

Sem Hop Paris ,Nov 18 1982, 58 (42) p2473-6, ISSN 0037-1777 Journal Code: ULD

Languages: FRENCH Summary Languages: ENGLISH

Among the various means of answering psychiatric problems in young children, specialized care units for the very young, such as the one set up at psychiatric department for children and adolescents at the Salpetriere Hospital, appear to be helpful in some situations which are psychologically highly dangerous as well as life-threatening. The modalities of the reception and therapy of the child and its family are described and discussed. It seems that this type of hospitalization may contribute to the resuming of dynamic developing processes in the child and of positive relationships between child and family, particularly the mother.

Allilaire JF; des Lauriers A

Sem Hop Paris ,Nov 18 1982, 58 (42) p2467-70, ISSN 0037-1777 Journal Code: ULD

Languages: FRENCH Summary Languages: ENGLISH

Psychiatric emergencies concern not only sectorized

psychiatric organizations but general hospitals as well, especially in large cities. No set-ups for long-term management are available in general hospitals and means for short-term intermittent action should be evolved. Family crisis may be responsible for psychiatric emergencies as they may lead to decompensation due to the breaking-up of familial relationships. When confronted with such situations, practitioners must of course face the emergency by using various specific chemotherapeutic agents or by hospitalizing the patient. However, practitioners should also concern themselves with acting upon the whole family in order to help them to develop solutions to the crisis. The modalities of this global approach of psychiatric disorders are delineated in the family crisis therapeutic technique.

**Paths and gates: the sources of recidivism and length of stay on a psychiatric ward.**

Gruber JE

Med Care ,Dec 1982, 20 (12) p1197-208, ISSN 0025-7079

Journal Code: LSM

Languages: ENGLISH

Four "pathway" (age, sex, social class, and number of dependents) and three "gatekeeper" (previous admission, previous ward terms, and severity of patient disorder) variables are used to predict recidivism rates and lengths of stay for patients admitted to a psychiatric ward in a general hospital during a 1-year period. There were three major findings. First, the gatekeeper variables were, by themselves, useful for predicting length of stay; additional information, in the form of the pathway variables, was needed to adequately explain differences in recidivism. Second, while most of the effects on recidivism were direct, most of the effects on length of stay were indirect or mediated through the variable of the severity of patient problems. Third, it was discovered that recidivism and length of stay are inversely related: patients with high recidivism rates, for example, tend to have relatively short average lengths of stay. Based on four patterns of recidivism and length of stay, a typology was developed to facilitate a better understanding of patient behavior.

**Systemic consultation in a general hospital.**

Tarnow JD; Gutstein SE

Int J Psychiatry Med ,1982, 12 (3) p161-86, ISSN

0091-2174 Journal Code: GSJ

Languages: ENGLISH

Consultation psychiatry has long offered the potential for psychiatrists to impact on the mental health of large numbers of individuals. However, workers in consultation psychiatry have often described it as a stressful, ungratifying experience. Over the last fifty years, since the initiation of consultation psychiatry, a series of models of consult work has been presented in the literature. These models have increasingly become more complex in the system of organization in which they operate. Moreover, there has been a constant movement toward viewing the function of the psychiatrist as intervening in behavior outside of the patient. After reviewing the history of consultation psychiatry, the authors conclude that a logical development would be a systemic model in which the entire hospital system is seen as the focus of consultation and in which the goal of the consultant's work is seen as creating a more open and flexible hospital system. The authors, therefore, describe a systemic model in which the potential crisis offered by any request for consultation work is seen as a tool for intervening with the hospital system. The difficulties of attaining the objectivity necessary for implementing a systemic intervention are discussed. A method of systemic diagnosis of the hospital is presented as well as a number of strategies of intervention with the hospital system. The authors conclude that using a systemic model (with the hospital as the focus of consultation) can lead to the development of a more comprehensive science of consultation which will lead to an increase of gratification for the psychiatrist and a more healthy functioning hospital system.

Languages: ENGLISH

A two-year, prospective study of 123 first-admission patients examined the impact of different inpatient treatment decision-making styles on patient outcome on a therapeutic community ward and a medically oriented psychiatric ward. Ward philosophy, programmatic and administrative structure, and ward atmosphere defined the ward milieus. Data on length of stay and the use of various therapeutic modalities provided comparisons of treatment process. Standardized ratings of psychopathologic condition and levels of function, readmissions, and illness attitudes were used to assess two-year outcomes. The major finding was the absence of outcome differences despite longer lengths of stay on the therapeutic community ward. Hence, differences in ward decision-making style may not influence outcome, but may affect the process of care among diagnostically heterogeneous, first-admission patients treated in a university setting.

The general hospital of the future faces the difficult task of maintaining quality of care in light of increasing demands for service and increasing efforts to control costs. Psychiatric units in general hospitals will share this challenge, reflected in such issues as the need to document the cost-effectiveness of services, delineate what circumstances justify the use of inpatient services, and resolve conflicts between (and obtain appropriate reimbursement for) all mental health disciplines. Psychiatry will find it easier to adapt to other changes in general hospital practice, such as the need for greater continuity of care and for varying levels of intensity of care, because of its previous experience in those areas. Through all the changes, psychiatry must continue to speak for the individuality of each patient, not only the psychiatric service but throughout the general hospital.

**The future of Veterans Administration Hospital programs for psychiatric patients.**

Ewalt JR; Lipkin JO

Hosp Community Psychiatry ,Sep 1982, 33 (9) p732-4,  
ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

In planning for the continued care of its large veteran population, the Veterans Administration is taking into account needs generated by trends such as a decreasing incidence of schizophrenia among veterans, an increasing use of outpatient services, and an increasing number of veterans suffering from alcoholism and substance abuse. The authors discuss the characteristics of the three types of VA medical centers that serve psychiatric patients: small general hospitals without a medical school affiliation; large general hospitals with a medical school affiliation; and large general hospitals with large psychiatric populations. One major goal of future planning is to institute psychiatric services at all of the 172 VA medical centers. Another goal is to ensure that each facility with a medical school affiliation will have a day hospital, a day treatment center, and a mental hygiene clinic.

**The value of exercise on a psychiatric hospital unit.**

Conroy RW; Smith K; Felthous AR  
Hosp Community Psychiatry ,Aug 1982, 33 (8) p641-5,  
ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

A number of reports in the literature have shown the value of exercise programs in reducing depression among psychiatric patients. Most of these papers have dealt with outpatients; this paper recounts a study of hospitalized inpatients who elected to participate in a six-week exercise program. After six weeks, participants showed significant decreases in their levels of reported depression, and nonsignificant trends toward a decrease in anxiety and an increase in their sense of accomplishment. The program did not ameliorate many disturbing feelings such as anger and fear, nor did it elicit a wide range of positive affects such as cooperation and feelings of acceptance. However, the authors conclude that a well-designed exercise program has enough potential benefit to make it a regular part of a psychiatric inpatient program.

Languages: ENGLISH

This study was carried out to determine whether long term chronic deteriorated patients could be taught skills in activities of daily living by therapy aides to improve their quality of life in the hospital. It was designed as a controlled trial comparing active intervention in the experimental wards with routine nursing care in the control wards. The results showed that, even in such a short period as 3 months, active treatment produced results which were statistically significantly better than the controls. It is concluded that mental hygiene therapy aides, given adequate support and encouragement, can make measurable and observable improvements in the behavior of long term patients. The implications of the results are considered.

**Effective use of community meetings on psychiatric treatment units.**

Arons BS  
Hosp Community Psychiatry ,Jun 1982, 33 (6) p480-3,  
ISSN 0022-1597 Journal Code: GCJ  
Languages: ENGLISH

The community meeting is often established as a part of the program on a psychiatric treatment unit to enhance the therapeutic atmosphere and advance the unit's goals. Such meetings usually consist of at least 30 or more individuals, including patients, staff, and trainees, and therefore incorporate small-group dynamics as well as phenomena more typical of large groups. Leaders should try to ensure the effectiveness of their meetings by assessing tasks and boundaries, as well as the extent to which small-group dynamics and techniques used in large groups apply.

**Effects of the urban crisis on the community general hospital.**

Bluestone H; Melinek M  
Hosp Community Psychiatry ,Jun 1982, 33 (6) p477-80,  
ISSN 0022-1597 Journal Code: GCJ  
Languages: ENGLISH

The contemporary urban crisis has necessitated a drastic transformation of the community general hospital. The Bronx-Lebanon Hospital Center, in New York, has struggled through this crisis by adapting to the changing needs of the patients it serves. The authors describe the hospital's new emphasis on conditions such as alcoholism, drug abuse, traumatic injuries, high infant-mortality rate, and teen-age pregnancy, and discuss the critical need for community-oriented psychiatric services. Over the past 15 years the patient population has changed, as has the type of service provided, marked by a major shift toward use of the emergency room. Psychiatric services have been expanded at the expense of a more traditional hospital program. One of the few remaining institutions in the decaying inner city, the hospital also becomes the sole provider of medical care as private-practice physicians leave. The problems of recruiting and retaining high-level professional staff are discussed, along with the need for the urban general hospital to take a leading part in meeting the enormous demands caused by the continuing urban crisis.

**A comparative trial of home and hospital psychiatric treatment: financial costs.**

Fenton FR; Tessier L; Contandriopoulos AP; Nguyen H; Struening EL  
Can J Psychiatry ,Apr 1982, 27 (3) p177-87, ISSN  
0706-7437 Journal Code: CLR  
Languages: ENGLISH

The financial costs of community-based treatment, stressing home treatment, were compared with the cost of hospital-based treatment during one year. Of 155 patients destined to receive inpatient treatment, 76 were randomly assigned to home treatment, 79 to hospital treatment; the two groups were similar as to important social, demographic, and clinical characteristics. The principal differences between the two treatments concerned the focus of treatment, the locale of treatment, the degree to which continuity of treatment was maintained, and the roles of the respective treatment staffs. Manpower and operating costs, measured in dollars, were estimated in two ways. Either way, hospital-based treatment was more expensive during the year: 64.1% more expensive (+3,250 vs. +1,980 per patient) in the first instance, 108.9% more expensive (+6,750 vs. +3,230 per patient) in the second. With two exceptions during the first month of treatment, the proportions of patients and families receiving either treatment who incurred other costs of treatment were low, and the differences between groups were not significantly different. A higher proportion of patients and families receiving home-based treatment defrayed the cost of the patient's psychotropic drugs; second, a higher proportion of families of patients receiving hospital-based treatment defrayed transportation costs. The proportions of patients and families incurring costs of the consequences of illness were low, and the differences between treatment groups were not significant. We compared this study with similar studies, discussed the generalizability of the results of this study and similar studies, and identified issues for future research.

The structure, functioning, and treatment concept of a psychodynamically oriented psychiatric unit for young soldiers within Israeli civilian hospital are discussed stressing: (1) the integration of the patient's military self; (2) the resolution of psychological conflicts necessary to avoid traumatic developmental arrest of the patient's personality and to foster personality growth; (3) the involvement of the patient's family in the therapeutic process. Problems in the patient-therapist relationship specifically pertaining to Israeli conditions are outlined.

Using routine data from the Mental Health Enquiry, the work of two district general hospital (DGH) units and a mental hospital was examined. There was a marked difference in the way the two DGH units operated and between the way the mental hospital worked as support hospital or as independent complete in-patient service. The operational policy practised by psychiatrists is more important than the structure of the system. It is important to establish sensitive policies for a wide variety of organizational structures.

Although the elderly's need for psychiatric treatment has long been recognized, publicly funded community mental health centers generally have been unsuccessful in establishing geriatric programs. If properly used, state mental hospitals remain a potential resource, but the more appropriate community-based placement of mentally impaired elderly persons is in special psychiatric units of general hospitals or in geropsychiatric units of private psychiatric hospitals. Principles for establishing such units in either setting include organizing a treatment team that empathizes with older patients and that has been trained to deal with the complex problems of the elderly. Formulation of comprehensive diagnoses and prognoses may require consultation and facilities outside the hospital; treatment planning should involve the patient's family from the beginning. Follow-up and supervision of referral after the patient's discharge are essential to the program's success.

Nelson TA  
Hosp Community Psychiatry ,Jan 1982. 33 (1) p46-8. ISSN  
0022-1597 Journal Code: GCJ  
Languages: ENGLISH

Nineteen patients who left a short-term psychiatric crisis unit against medical advice were compared with 109 patients who received a regular discharge during a six-month period. Demographic, historic, assessment, and diagnostic variables of both groups were examined. Results indicated that patients diagnosed as having personality or substance use disorders and patients judges abnormal on a mental status examination were more likely to be AMA patients. However, AMA patients indicated fewer social problems as rated on Linn's Social Dysfunction Scale. It was concluded that diagnostic variables best differentiated patients leaving the treatment unit against medical advice from those who completed treatment.

This paper presents a checklist of conceptual issues and operational guidelines determining the organization of clinical services within a general hospital department of psychiatry. Issues emphasized include philosophy, target population, definition, structure, location, financing, and cost effectiveness of services, utilizing the experience of a specific department of psychiatry to illustrate their application. As the trend continues for mental health service delivery within a general hospital, recognition of these issues and their application is essential to effective service delivery.

Gen Hosp Psychiatry ,Dec 1981. 3 (4) p301-5. ISSN  
0163-8343 Journal Code: FNK  
Languages: ENGLISH

In response to pressure to assume more responsibility for chronic patients, many general hospitals have asserted that they should limit care to those suitable for voluntary treatment on an open ward. This assertion appears to be based primarily on political and symbolic arguments. The limitation of admission to voluntary patients would serve to exclude many acutely psychotic patients with excellent prognosis best treated in a general hospital. The locked ward appears to offer the maximum flexibility in dealing with illnesses which in varying degrees affect the individual's judgment and impulsivity. The limitation of psychiatric units to voluntary patients in open wards would preclude psychiatry from joining in the mission of the general hospital - the best possible care for the community it serves.

**The borderline patient in the general hospital.**

Adler G

Gen Hosp Psychiatry ,Dec 1981, 3 (4) p297-300, ISSN

0163-8343 Journal Code: FNK

Languages: ENGLISH

The usefulness of the general hospital inpatient service for the borderline patient is described. The short-term nature of most general hospital units requires a setting that facilitates the rapid establishment of a holding environment and the re-establishment of self-object transferences. Borderline patients have particular difficulty in accepting responsibility for their feelings and behavior and, instead, tend to blame themselves and others. An approach to inpatient care that defines expectations of both patient and family prior to and early in the admission of the patient is elaborated clinically and theoretically. Such an approach offers a way of working with the potential regression in borderline patients, especially around the important issues of responsibility and blaming. The staff's awareness of countertransference problems related to the patient and family as well as to the patient's therapist are described as important ingredients in successful work with these patients.

**Electroconvulsive therapy in general hospital psychiatry: a focus on new indications and technologies.**

Yudofsky SC

Gen Hosp Psychiatry ,Dec 1981, 3 (4) p292-6, ISSN

0163-8343 Journal Code: FNK

Languages: ENGLISH

This paper documents the recent dramatic shift towards the delivery of psychiatric services in the general hospital setting and outlines the increasing number of special indications for electroconvulsive therapy (ECT). These include: delusional depression; depressions which are not responsive to antidepressants; affective illness in geriatric populations, depression, mania or schizophrenia in patients who cannot tolerate medication side effects, and drug-refractory Parkinson's disease. Such technological advances as nondominant unilateral placement of electrodes, brief pulse electrical stimulation, and simultaneous ictal monitoring of EEG and EKG have increased the safety while reducing the side effects of the procedure. In that comparative studies show ECT to have safety and efficacy superior to antidepressant agents in the treatment of severe depressive illness, the author encourages physicians to consider this treatment which is becoming increasingly available through our general hospital services.

**The allegedly suicidal patient in a general hospital.**

Pinsker H

Gen Hosp Psychiatry ,Dec 1981, 3 (4) p277-82, ISSN

0163-8343 Journal Code: FNK

Languages: ENGLISH

Of 50 emergency room admissions of patients believed to need protection against imminent suicide, the admission decision was, in 74% of the cases, solely on the patient's allegation (i.e., assertion without proof) that he was suicidal. Over half of the allegedly suicidal patients were chronic schizophrenic, and 20% were individuals with substance abuse problems. Only those allegeders with affective disorders manifested any behavior or thinking after admission that could cause staff concern about suicide. Assuming that the suicidal thoughts and impulses described were products of intense, although transient, feeling and were in no instance feigned, extended hospital care did not appear indicated. Concern about possibility of suicide, if not based upon consideration of risk factors, diagnosis, and clinical judgment, may distract from attention to the patient's needs for long-term outpatient rehabilitation or psychotherapy, and may encourage episodic rather than continuous care for the chronically ill.

**Establishment of a local psychiatric service.**

Wang AG

Acta Psychiatr Scand ,Aug 1981, 64 (2) p150-7, ISSN  
0001-690X Journal Code: 1VY

Languages: ENGLISH

The Faroe Islands are a group of islands in the North Atlantic Ocean between Norway and Iceland inhabited by about 42,000 people. They are considered a nation with home rule within the Danish Kingdom. A Psychiatric Department was not established on the islands until 1969. Before this, psychiatric patients were referred to the local General Hospital and about half of the patients in each diagnostic group were sent on the Psychiatric Hospital in Nykobing on Zealand, Denmark. Since the establishment of the department, admissions have increased in all diagnostic groups, especially in the group of senile psychoses. The total increase amounts to 2.4 times the admission rates of psychiatric cases to the General Hospital and 4.4 times the admission rates to the Psychiatric Hospital in Nykobing in the last years prior to the start of the local service. The outpatient department has grown steadily, the patients attending are distributed in diagnostic groups similar to Danish outpatient departments.

**Assessment of a secure/intensive care/forensic ward.**

Basson JV; Woodside M

Acta Psychiatr Scand ,Aug 1981, 64 (2) p132-41, ISSN  
0001-690X Journal Code: 1VY

Languages: ENGLISH

Recent trends in psychiatric hospitals have re-established the need for semi-secure, well-staffed acute wards. Such a ward is described and 400 consecutive admissions over a 34-month period reviewed. Using 13 beds all the acute patients requiring security and intensive treatment are managed from a total catchment area of 600,000. A wide range of referral agencies and diagnostic categories are encountered. Staff in the general psychiatric hospital where the ward is situated are satisfied with the service. A small group of chronically-disturbed patients require separate facilities.

Gruppenvisite versus Zimmervisite--Patienten nehmen Stellung.

Begemann-Deppe M; Jacobi I

Psychiatr Prax ,Nov 1981, 8 (4) p142-6, ISSN 0303-4259  
Journal Code: QCK

Languages: GERMAN Summary Languages: ENGLISH

In the course of the restructuring of an open psychiatric general ward doctors began to introduce group rounds in addition to established ward rounds. A description is given of the problems the therapeutic team had in adapting to this new

method. --After a "consolidation phase" of approximately a year, structured interviews referring to the above-mentioned new system were carried out with fifty patients over a six month period. These interviews showed that the patients tended to have reservations about the group rounds, and the majority of them showed a preference for the individual attention they were familiar with. The results are being discussed.

**The value of administrative experience for the clinician: opportunities of the chief residency in psychiatry.**

Peteet JR; Gutheil IG

Psychiatr Q ,Fall 1981, 53 (3) p155-61, ISSN 0033-2720  
Journal Code: QBP

Languages: ENGLISH

Administration has been traditionally contrasted with clinical work; experiences such as the chief residency in psychiatry are viewed as clinically-based training for unfamiliar administrative activity. In contrast to these viewpoints we propose that recognition of tasks common to clinical work and administration leads to a broader understanding of both activities, and that administrative experience can make specific contributions to the development of a clinician.

**Psychogeriatric care in the general hospital.**

Sadavoy J

Can J Psychiatry ,Aug 1981, 26 (5) p334-6, ISSN 0706-7437 Journal Code: CLR

Languages: ENGLISH

This study examines treatment outcome in 52 psychogeriatric patients to help determine the role of the general hospital in psychiatric care of the elderly. The author reviewed the charts of all patients 65 years of age and over admitted to the psychiatric ward from 1974 to 1978. Approximately 80% of this group showed symptom remission. Treatment failures correlated closely with the presence of major organic brain syndrome. Despite an average age of 73.4 years and a high proportion of widowed patients only 10 patients needed new placements on discharge. The author discusses the reluctance of general hospitals to treat the psychogeriatric patient despite the high success rate, the merits of such an active treatment approach and the effect of short-term therapy programs on the treatment of this group.

Bachrach LL

Hosp Community Psychiatry ,Nov 1981, 32 (11) p786-90, ISSN 0022-1597 Journal Code: GCJ  
Languages: ENGLISH

As deinstitutionalization has proceeded, it has left in its wake a variety of basic changes in patterns of service delivery to chronic mental patients. Although all components of the psychiatric service system have been affected by the diminishing utilization of state mental hospitals, changes are perhaps most marked in the psychiatric services of general hospitals. The effects of deinstitutionalization on general hospital psychiatry are examined, and some future implications are discussed.

Molnar G; Bernardo A

Hosp Community Psychiatry ,Nov 1981, 32 (11) p782-5,  
ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

The care and treatment of adolescents on an adult acute psychiatric unit in a general hospital can pose serious problems for unit staff. Adolescents with behavior or character problems who prove violent or manipulative can disrupt treatment of both the adolescent and adult patients on the unit. Yet the demand for immediate treatment for many adolescents and the accessibility of general hospital psychiatric units often mean that adolescents may be placed there inappropriately. This paper describes how an adult acute unit in a general hospital solved the problems caused by acting-out, manipulative adolescents on the unit. A committee found problems in inappropriate admissions, unworkable treatment plans, management of acting-out behaviors, case disposition, and staff attitudes. Remedies came in the form of more specific admission and discharge guidelines, strict enforcement of those guidelines, staff discussion of treatment plans, an inservice education program, and improved liaison with community facilities for adolescents.

Gen Hosp Psychiatry ,Sep 1981, 3 (3) p245-53, ISSN  
0163-8343 Journal Code: FNK

Languages: ENGLISH

The issue of whether involuntary patients can be treated safely and effectively on inpatient psychiatry units of general hospitals is addressed from several points of view. Parallels are drawn between contemporary reform efforts and 19th century hospital psychiatry, and the danger of repeating errors of the past is pointed out. An account follows, illustrating the recent planning process for mental health care in Massachusetts and recommending the active participation of psychiatrists in that process. Also discussed are the differences in the process of establishing a treatment alliance with voluntary and involuntary patients. The practical considerations in the development of a locked unit in a general hospital area explored, with respect to its

effect on reimbursement, the private practice model, and the length and appropriateness of stay. In conclusion, the shared concern is stated that, in respect to making the transition from one system of care to another, safeguards be built in to protect and expand good treatment.

The role of the general hospital within the psychiatric service delivery network has undergone profound changes in recent years. Current issues in general hospital psychiatry revolve around questions concerning boundaries, target populations, appropriate services, structural characteristics, and deinstitutionalization. Decisions in general hospital psychiatry derive from a series of influences that originate at varying distances from day-to-day hospital operations. Planning should ideally be filtered through the hospital's internal decision-making process in order to ensure a "bottom-up" rather than a "top-down" emphasis in service policy. (98 Refs.)

In a 256-bed general hospital, psychiatric patients are cared for on a single unit with medical patients. The unit, developed in collaboration with a state university's medical school, has been employed successfully in the teaching of psychiatric residents and medical students and has provided benefits to both the psychiatric and medical patients. A normalizing effect on the disturbed behavior of psychiatric patients has been observed and has been attributed to the presence of nonpsychiatric patients, and the treatment of medical patients on the unit has been humanized through greater nurse-patient interaction and the provision of activity programs and recreational facilities. The experience indicates that a wide range of psychiatric patients can be cared for in a mixed setting and that such a setting fosters continuity of care. The limitations of the unit and the policies and conditions necessary for its operation are discussed.

**Admissions to a South African general hospital psychiatric unit.**

Levin A; Schlebusch L; Willgoose L; Naidoo NK  
Gen Hosp Psychiatry .Jun 1981, 3 (2) p165-70, ISSN  
0163-8343 Journal Code: FNK  
Languages: ENGLISH

In a study of admissions to the psychiatric unit of a general hospital from December 1, 1977, to November 30, 1978, data obtained from all 478 admitted patients were analyzed; the most prevalent condition was found to be neuroses, followed by organic brain syndromes. Most patients admitted fell into the 19--39 age groups, with a preponderance of male admissions between the ages of 6--39, but more admissions of females above 40. A significant difference in the occurrence of conditions between the sexes was noted: the most prevalent condition for males between the ages of 6--39 years was schizophrenia, while more females suffered from the neuroses. Males 40 years and older presented predominantly with organic brain syndromes; females in that age group presented predominantly with affective psychoses. The average length of stay for both sexes was eight days. Schizophrenia required the longest hospital stay, an average of 11 days. Seventy-eight patients (16.3%) were admitted more than once during the period of study. Conditions commonly associated with readmission were affective psychoses and schizophrenia. The role of the general hospital psychiatric unit and its advantages and shortcomings are discussed.

**Decision making in an interdisciplinary team.**

Chase S; Wright JH; Ragade R

Behav Sci ,Jul 1981, 26 (3) p206-15, ISSN 0005-7940

Journal Code: 9KW

Languages: ENGLISH

Decision making in an interdisciplinary team occurs at the interface between groups with varied backgrounds, orientations, interests, and goals. Most interdisciplinary teams attempt to identify the complex set of variables influencing their decisions and then utilize this knowledge to maximize efficiency in health care delivery. Models of information and decision analysis developed by general systems theory are suggested as a method for advancing the understanding of where, when, and how decisions are made by the interdisciplinary team. A university-affiliated psychiatric service in a private general hospital is studied. Here the following forces meet, complement, compete, and collide: the community, university, hospital administration, private practitioners, insurance companies, consultation and liaison psychiatrists, university staff psychiatrists and residents, nurses, aides, social workers, activities personnel, patients and their families, the patient group, the ward milieu. Considering these factors, we describe: (1) the flow of information and feedback loops into, within, and out of the psychiatric service; (2) the location of decision nodes; (3) decision-making echelons. The general systems theory concepts utilized in this analysis are proposed as pragmatic tools for improving interdisciplinary team function.

**The inpatient psychiatric unit as a system.**

Chase S; Wright JH; Ragade R

Behav Sci ,Jul 1981, 26 (3) p197-205, ISSN 0005-7940

Journal Code: 9KW

Languages: ENGLISH

A university-affiliated psychiatric inpatient unit in a private general hospital is an organization which serves many purposes. However, the primary purpose is quite evident: to provide various psychiatric therapies to patients with diverse psychopathologies. This becomes extremely complicated if the unit attempts an eclectic approach. Thus, the unit must consider: (1) psychopathological frameworks such as genetic, sociocultural, psychoanalytic, behavioral, and biochemical etiologies; (2) therapeutic interventions such as individual, group, and family therapy; insight-oriented, supportive, and behavioral psychotherapy; milieu therapy; and psychopharmacological treatment; (3) the various philosophies, attitudes, and skills of the multidisciplinary team of psychiatrists, psychologists, nurses, aides, social workers, activities therapists, expressive therapists, and administrative support personnel. General systems theory and general living systems models may further the conceptualization and understanding of the inpatient unit. This, in turn, may improve patient treatment. For the inpatient psychiatric unit, we describe the 19 critical

subsystems of general living systems theory, with special emphasis on the decider subsystem.

**The developmental phases of the nurse/resident relationship on an in-patient psychiatric unit.**

Feldman R; Cousins A; Grimaldi D  
Perspect Psychiatr Care .Jan-Feb 1981, 19 (1) p31-9,  
ISSN 0031-5990 Journal Code: OZT  
Languages: ENGLISH

We have identified four developmental phases of the nurse-resident relationship during a six month residency rotation. The first phase is the "Honeymoon Phase," characterized by the nurse and resident working together to maintain superficial harmony. The second, or "Testing Phase," raises issues of trust and control which must be resolved before the more collaborative team work characteristic of the "Cohesive Phase" may begin. The third, or "Cohesive Phase," is a period of sharing in which the nurse and the resident have developed trust in one another's abilities. Finally, during the "Separation Phase," the nurse must identify and resolve her own feelings about the resident's upcoming departure. When the nurse has successfully resolved these feelings, she is then in a position to reinvest her energies in the initial stages of another nurse-resident relationship. The nurse's awareness of developmental phases and their respective developmental tasks fosters her objectivity and ability to define specific professional goals.

Journal Code: QCK  
Languages: GERMAN Summary Languages: ENGLISH

The article reports on the setting-up of a department of psychiatry at the general hospital in the Freudenstadt district. The department comprises 60 beds and represents the first hospital-integrated psychiatric department of its kind of the Baden-Wurtemberg Land government. It was inaugurated in the summer of 1976. The experience collected over a period of 3 years, presented here in detail, can be made use of within the overall framework of the discussions on the controversial issue of psychiatric departments in general hospitals, which has also been discussed on a political plane.

Adams PE

Russell H. Morgan Department of Radiology, Johns Hopkins Medical Institutions, Baltimore, MD.

Radiol Technol (UNITED STATES) ,Jan-Feb 1983, 54 (3) p223-5, ISSN 0033-8397 Journal Code: QRD

Languages: ENGLISH

At the Johns Hopkins Hospital, a cardiovascular radiology "clinical assistant" position was created to assist the radiologist in performing interventional radiology procedures.

It was soon apparent that the clinical assistant could contribute a great deal to patient management before and after the procedure. Additionally, patient and housestaff education was facilitated, and continuity of care was maintained. The clinical assistant has become an indispensable part of the health care team in interventional radiology.

Malott JC; Fodor J 3d

University of Cincinnati Hospital, Department of Radiology, OH.

Radiol Technol (UNITED STATES) ,Jan-Feb 1983, 54 (3) p216-9, ISSN 0033-8397 Journal Code: QRD

Languages: ENGLISH

The need to reduce the dose of radiation to radiologists and technologists involved in peripheral angiography at the University of Cincinnati Hospital resulted in the development of a radiation shield. This shield is lightweight, transparent, and adequately reduces the level of scatter radiation produced during fluoroscopy without interfering with the angiographer or the sterile field. The shield is effective, fairly inexpensive, and simple to construct.

**The effect of clinical education programs on hospital production.**

Leiken AM; Stern E; Baines RE

School of Allied Health Professions, State University of New York at Stony Brook.

Inquiry (UNITED STATES) ,Spring 1983, 20 (1) p88-92, ISSN 0020-1731 Journal Code: GDT

Languages: ENGLISH

Because of rising hospital costs and the reluctance of third-party payers to reimburse for clinical training, major questions have been raised about the costs and benefits of these programs. The effect of student programs on production has, nonetheless, been largely neglected, in part because of the difficulty of measuring the effectiveness of these programs. To address this deficiency, multiple regression analysis was used to determine the impact of physical therapy, occupational therapy, and radiologic technology students on production in a large hospital in a metropolitan area. The impact of students on departmental output in all three areas was found to be positive.

**Accelerator room photoneutron and photon background measurements using thermoluminescent dosimeters.**

Anderson DW; Hwang CC  
Health Phys ,Feb 1983. 44 (2) p115-25. ISSN 0017-9078  
Journal Code: G2H  
Languages: ENGLISH

Photoneutron dose equivalents and photon doses in the treatment room of a clinical linear accelerator were measured with sets of isotopically enriched LiF thermoluminescent dosimeters and a moderating sphere. Dosimeter neutron calibrations with <sup>252</sup>Cf sources were repeated many times during the extended series of measurements because the <sup>6</sup>LiF dosimeter sensitivity increased with successive neutron irradiations. Expressed as a fraction of the primary bremsstrahlung beam dose at maximum, the photoneutron background was 2.04 +/- 0.05 mrem/rad (10<sup>-3</sup> Sv/Gy) at 1 m lateral to beam center in the patient midplane at 25 MV. The fraction of this result due to thermal neutrons was found to be only about 2%. The photon background dose was 2.98 +/- 0.04 mrad/rad (10<sup>-3</sup> Gy/Gy). The photoneutron dose equivalent per unit primary dose was found to be nearly independent of the collimator size used but increased by 40% when the bremsstrahlung endpoint energy was increased from 20 to 35 MeV with no change in flattening filters.

**Radiographic workload and use factors for orthopedic facilities.**

Bushong SC; Glaze SA  
Health Phys ,Jan 1983. 44 (1) p53-9. ISSN 0017-9078  
Journal Code: G2H  
Languages: ENGLISH

Observations of technique factors at 9 radiographic installations dedicated to orthopedic radiography have been made. Monthly area radiation measurements with thermoluminescent dosimeters were made at three of these facilities. The results of these observations and measurements suggest that current NCRP recommended assumptions utilized in protective barrier computations result in considerably more shielding than is necessary. We observed an average workload of 224 mA min/wk and a maximum weekly average of 670 mA min/wk. The use factor for the chest wall averaged 5%. That for all other vertical barriers was less than 1%. The average operating potential was 75 kVp. Room radiation measurements confirm the suggestion that at least two of the walls and the control booth barrier in an orthopedic radiographic facility may be considered secondary barriers.

**Why are radiologists in the UK not using computers in their departments?**

Sutherland GR  
Clin Radiol ,Mar 1983. 34 (2) p215-20. ISSN 0009-9260  
Journal Code: DIU  
Languages: ENGLISH

The value of administrative support computers in radiology departments has been evident, particularly in the United States, for more than a decade. It is difficult to understand why so little interest appears to have developed in this country; it is, perhaps, our inherent conservatism. The advent of the inexpensive microprocessor with a wide range of program packages has set the scene for an expansion of the use of computing in a wide range of clerical tasks. This article sets out to describe the various applications which we have demonstrated to be particularly suitable for incorporation into a computer system and suggests a number of additional applications which may be appropriate to particular radiology departments.

Worrell J

South Med J ,Feb 1983, 76 (2) p216-7, ISSN 0038-4348  
Journal Code: UVH  
Languages: ENGLISH

I reviewed 100 consecutive radiologic examinations with particular attention to the clinical information included. The referring physician originated this clinical information in only 33% of cases. Other personnel, including nurses and aides, added information on the requisitions 57% of the time. When nonphysician personnel completed the requisitions, 46% of the cases were completed with either inappropriate or misleading clinical information. In 9% of the cases, there was no clinical information. Because all of the cases originated by physicians were appropriately completed, a strong plea is made for requiring physicians to originate radiologic requisitions.

This article is concerned with establishing a revenue and expense budget for a diagnostic radiology department. It deals with setting up a breakout of examinations into specific categories and projecting the volume in each category. The volume should be expressed in RVUs rather than examinations. The volume predictions for the upcoming year would then be decided by factoring in such things as new procedures, new technology, patient day projections, ER projections, and any known outside influences. Once the volume is projected, expenses should be matched to these increases or decreases. These expenses would be prior to adding inflationary impacts. Finally, a follow-up should be performed on a monthly basis to ensure that the percentage change in volume is being matched by the same percentage change in expenses.

**productivity.**

Hage SJ

Radiol Manage ,Sep 1982, 4 (4) p14-7, ISSN 0198-7097

Journal Code: Q5J

Languages: ENGLISH

Productivity in radiology is a complex and elusive issue. The fact that radiology is the practice of medicine makes management of it very different from management in traditional "smokestack" industry. Management itself is very young, and more familiar with smokestacks and widgets than with radiology or any other service industry. Before management can hope to affect productivity in radiology, it must first come to understand what it (radiology) is, and how it works.

A unit measurement system for diagnostic radiology has been prepared. The basic data were collected in fifteen small, medium and large sized Canadian hospitals. Detailed measurements were made of the technologists' time for performing radiographic examinations. Analysis of work activity established the time contribution for each category of support staff. The basic data were tested in a field trial of forty-two Canadian hospitals and found to be reliable. Comparisons with other systems, particularly in Finland and Scotland, revealed a great similarity of results. A method of productivity analysis was developed. The study will be likely to form the basis for national reporting of work in Canadian radiology departments.

In this study, the authors describe how to determine the effective dose equivalent absorbed by occupationally exposed persons during a gynecologic radium therapy. The observed irradiation conditions of the physician and the medical staff are approximated by a standard geometry, for which conversion factors between the measured personal dose, the effective dose equivalent and different organ doses, respectively, are calculated. The results are job-specific conversion factors between dose to a personal dosimeter and the effective dose equivalent for the occupationally exposed persons involved. According to the individual tasks, these factors are between 0.59 and 1.13.

The small digital computer is becoming ever more powerful, reliable, and inexpensive. Diagnostic radiology and the computer are becoming more intertwined. During the past decade, computed tomography (CT) has achieved outstanding success. CT and other digital image systems that are capable of computer manipulation, storage, and viewing are becoming more numerous. Of increasing importance are the new and maturing reporting and operations/management systems. The many facets of newer computer and diagnostic radiology developments are discussed, and a model is presented here that integrates all applications into a single system. Many benefits in improved patient care and general operations of the department would result from its implementation. Some elements of this model exist now and can be installed with relatively little effort. Development of the entire model is within the state of current technology. A number of trends suggest that diagnostic radiology is becoming more ready to use such a model.

**A computer system to monitor radiology department activity: a management tool to improve patient care.**

Jost RG; Rodewald SS; Hill RL; Evens RG  
Radiology ,Nov 1982, 145 (2) p347-50, ISSN 0033-8419  
Journal Code: QSH  
Languages: ENGLISH

A microcomputer system has been developed and installed at the Mallinckrodt Institute of Radiology to monitor the moment-to-moment activity in a radiology department. Data about department performances are collected, summarized, and displayed in graphs and tables on terminals at stations throughout the department. The system is currently used to monitor a wide variety of functions including patient waiting time, report production time, film-library operations, equipment maintenance, and room use. Since the displays are updated in real-time, it is possible to identify and address problems as they occur, thereby providing a method of evaluation that leads to improved performance as related to patient care.

The number of diagnostic radiology examinations being performed on digitally formatted imaging equipment is continually increasing. However, most digital data are recorded as analogue images and the films stored in a central file. The dynamic range of raw digital data is lost. Currently, the space and cost requirements for storage of all digital data have discouraged most users from attempting it. This article presents the concepts and describes the requirements and initial fabrication of a system that will capture and retain all digital data using a network of peripheralized image acquisition, display, and storage devices. Any piece of digitally formatted equipment can be interfaced into the system. A real-time computer capability provides that any digital examination can be reviewed at any display station for up to 10 days.

**The operation of a radiology consultation service in an acute care hospital.**

Baker SR

JAMA ,Nov 5 1982, 248 (17) p2152-4, ISSN 0098-7484

Journal Code: KFR

Languages: ENGLISH

The operation of a radiology consultation service in an acute care teaching hospital is described. The radiologist acts as an active advisor in the structuring of diagnostic evaluations in three disease categories; biliary tract disease, nonemergency gastrointestinal tract bleeding, and abdominal mass. There was a 64% reduction in the time needed to establish a diagnosis and a 32% decrease in the number of studies for each patient on the consultation ward compared with a control group, which consisted of patients with similar clinical presentations. A formal partnership between clinician and radiologist serves two important functions in teaching hospitals. It can simultaneously expedite diagnostic evaluations and teach the best utilization of imaging examinations.

**A basic X-ray service for a rural community in Southwestern Nigeria 1976-1980. A preliminary report.**

Lagundoye SB; Olowa P

Diagn Imaging ,1982, 51 (3-4) p193-7, ISSN 0378-9837

Journal Code: EAI

Languages: ENGLISH

The development of a basic X-ray service in a rural community in southwestern Nigeria is reviewed over a period of 5 years. Of the 3,278 examinations done during this period, chest X-rays constituted 56%. Most of the other examinations were requested on account of trauma of upper and lower extremities: 42 and 43%, respectively. Injuries to the elbow region constituted half of the X-rays for the upper extremities. There was an early upsurge of attendance for all X-rays reaching its peak at the first 2 years of the project, but a stable state was soon established within the subsequent 3 years. The non-chest examinations remained equally divided between the years under review. It is estimated that the introduction of the X-ray service has saved the community some 6,600 working days or 18 years in the 56-month period. This estimate excludes transportation for the accompanying relatives.

**Traumatology in rural Kenya. Role of simple X-ray services.**

Raja RS

Diagn Imaging ,1982, 51 (3-4) p187-92, ISSN 0378-9837

Journal Code: EAI

Languages: ENGLISH

Kenya with a population of 16 million has 143 X-ray units of which 119 provide services to the rural areas. Figures from

these units show that trauma cases form the major work load in most rural X-ray departments, followed by chest radiography; the incidence of trauma radiography diminishes significantly in the smaller peripheral health centers. The commonest form of trauma is to the limbs and skull; motor vehicle accidents constitute the major cause. The role of X-rays in diagnosis, treatment, and follow-up of trauma is extremely important at the district hospitals where there is a doctor. However, at subdistrict hospitals and health centers this importance decreases proportionately to the availability of (1) trained personnel with ability to interpret X-rays and (2) facilities to treat trauma.

A meeting was held in Mexico City in 1980 to discuss the situation of diagnostic radiology in Latin America. X-ray departments are part of the medical care system of each country, utilized mainly in diagnosis. There are various approaches to health care, some of which are political, but technology should be used for its own value only. Social needs must be defined and the availability and costs studied. Priorities must also be defined. 80% of the morbidity is related to socioeconomic factors. Resources cannot satisfy demand, but should be concentrated on the most common problems. This should be the beginning of an ongoing analysis searching for the solutions for diagnostic radiology in Latin America.

**Influence of industrialization on an African urban community.**

Prinsloo SF  
Diagn Imaging ,1982, 51 (3-4) p146-8, ISSN 0378-9837  
Journal Code: EAI  
Languages: ENGLISH

There is a steady trend towards urbanization in all countries, especially in developing countries. This leads to concentration of medical care, adding to road traffic congestion. In one hospital in South Africa the number of patients X-rayed increased significantly, from 80,402 in 1977 to 96,251 in 1980. 62% of all the patients were from casualty or outpatient clinics. Only 20% of the ambulatory patients were admitted. About 50% of all patients X-rayed were, therefore, not hospitalized. Most of them required relatively simple X-ray examinations, whereas inpatients needed more complex procedures. Building bigger hospitals and X-ray departments may not be the correct solution. Decentralized and cheaper facilities may be better and would also decrease the load on the larger and more complex X-ray departments.

**Radiation safety.**

Benson JM

J Fam Pract ,Sep 1982, 15 (3) p435-9, ISSN 0094-3509

Journal Code: I4L

Languages: ENGLISH

Radiation safety is rapidly becoming a major concern of every patient. Poor understanding of ionizing radiation and its effects frequently heightens anxiety. The average United States resident receives about 125 mrem of radiation per year from natural background radiation and another 120 mrem from man-made sources. The 240 million x-ray procedures performed annually contribute 90 percent of the man-made portion. It is assumed that the risks of medical radiation are outweighed by the benefits gained from the information obtained. If present in sufficiently high dosage, radiation can have harmful effects, such as induction of leukemia and thyroid malignancy.

No deleterious effects have been shown to have been caused by diagnostic radiation. It is reassuring that the risks of medical radiation appear to be quite small compared with other common hazards most people face daily. Careful attention to the use of radiographic safety and protective technique will ensure the lowest possible radiation dose. The physician's discretion in ordering only appropriate and indicated x-ray films will ensure the patients are exposed to the lowest possible amount of radiation.

Journal Code: LSM

Contract/Grant No.: HS-02577

Languages: ENGLISH

Traditionally, many hospital costs have been allocated to patients using indirect measures that do not always reflect the value of the resources used to provide care. When, for

example, costs are allocated by multiplying the patient's charges by the hospital's ratio of costs to charges, the allocated cost does not reflect actual cost because the hospital does not uniformly charge for services in proportion to their cost. The choice of method for cost allocation will be as important for the newly developed case-mix cost-accounting systems as it has been for traditional cost-accounting systems. To illustrate how the use of an indirect cost-allocation method might affect the output of a case-mix cost-accounting system, operating room, radiology and clinical laboratory costs were assigned to 106 hospitalized inguinal hernia patients in two diagnosis-related groups (DRGs) using both the hospital's existing cost-allocation method and a method that measures costs directly. Total costs and the costs in each department were significantly lower in each DRG using the direct method. It was concluded that patients in these two DRGs were being assigned more than the actual cost of their care with the existing cost-allocation method and, therefore, that the existing method prevented the case-mix accounting system from providing accurate management information.

**Radiology nursing: a new dimension.**

Watkins GG; Schick A

Radiol Manage ,Mar 1982, 4 (2) p6-8, ISSN 0198-7097

Journal Code: Q5J

Languages: ENGLISH

Radiology departments all over the country are inundated with new technology being introduced into the radiographic market. This more complex environment has created a new role in many radiology departments. The position of radiology patient advocate is somewhat new, but growing in potential for maintaining the quality of patient care being delivered. The nurse in radiology can assist in humanizing the patient's experience. The nurse can also act as a liaison with other professional departments. Finally, the nurse can assist in maintaining and improving the quality of care provided in a radiology department. The department of radiology now, more than ever, needs to consider complementing their staff with a nurse.

Languages: ENGLISH

Discriminant analysis was applied to larynx data from the Patterns of Care Study (PCS) in order to evaluate and classify radiation therapy procedures. Since PCS has recorded information on a large number of separate procedures, a method was needed to treat them coherently. Discriminant analysis provided such a method through a comprehensive score of performance. The particular discriminant score used was calculated from the contrast between facilities with and without radiation therapy resident training programs. Because residents drastically affect the practice of radiation therapy in a facility, this factor provided a foundation for analyzing the procedures themselves. Results of the discriminant analysis were used to derive a condensed list of generalized procedural criteria which contains almost all the discrimination information of the original procedures and which elucidates their relative importance and the relations among them.

This study reports on the hourly costs of providing comprehensive dental services to mentally retarded adults in a hospital-based group dental practice. The analysis indicated average total hourly costs of \$56.11 for dentist-provided services and \$22.25 for dental hygienist-provided services. When compared to the revenues available for program maintenance, a net hourly deficit of \$18.82 per dentist hour and \$9.89 per dental hygienist hour resulted. The implications of this operating loss on the continued care of this patient population are discussed.

**Traditional and emerging forms of dental practice. Cost, accessibility, and quality factors.**

Rovin S; Nash J  
Am J Public Health ,Jul 1982, 72 (7) p656-62, ISSN  
0090-0036 Journal Code: 3XW  
Languages: ENGLISH

The traditional and predominant manner of delivering dental care is through a fee-for-service, private practice system. A number of alternative dental care delivery systems have emerged and are being tested, and others are just emerging. These systems include department store practices, hospital dental services, health maintenance organizations, the independent practice of dental hygiene, and denturism. Although it is too soon to draw final conclusions about the efficacy and effectiveness of these systems, we examine them for their potential to compete with and change the way dental care is currently delivered. Using the parameters of cost, accessibility, and quality, we compare these systems to traditional dental practice. Some of these emerging forms clearly have the potential to compete favorably with traditional practice. Other seem less likely to alter the existing system substantially. The system which can best control costs, increase accessibility, and enhance quality will gain the competitive edge.

**Impact of community health centers and Medicaid on the use of health services.**

Okada LM; Wan TT

Public Health Rep .Nov-Dec 1980, 95 (6) p520-34, ISSN  
0033-3549 Journal Code: QJA

Languages: ENGLISH

The impact of improved access to health care through the Federal community health center (CHC) and Medicaid programs was examined in five urban low-income areas. Data on access to care and physician, hospital, and dental services utilization were collected by baseline and followup health surveys in the CHCs' services areas. There was a shift in use from hospital clinics to CHCs. Followup surveys indicated that 23 percent of the population reported CHCs as usual source of care. Travel time to source of care was reduced for users of CHCs. Medicaid coverage of the population in the survey areas increased from 16 to 37 percent between the baseline and followup surveys, an interval of 4 to 7 years. Increases occurred in the use of physicians and dental care between the baseline and followup surveys, but the rates scarcely kept pace with the national rates. Respondents who reported CHCs as their usual source of care, however, had a higher rate of physician visits and a lower rate of hospitalization compared with those using private physicians or hospital clinics as the usual source of care. Respondents with Medicaid coverage usually had higher physician and hospital use, irrespective of usual source of care. Both CHC and Medicaid programs contributed to increased use of dental care by providing financial and dental care resources. Although these two programs greatly facilitated the use of health services, disparity in physician and dental utilization remains between the five low-income areas and the averages for the nation.

**Health problems in a city-county workhouse.**

Derro RA

Public Health Rep .Jul-Aug 1978, 93 (4) p379-85, ISSN

0033-3549 Journal Code: QJA

Languages: ENGLISH

This study was part of a continuing effort to define the health profile of a city-county workhouse inmate population. To supplement data previously obtained on the health status of inmates on admission, all subsequent encounters for medical problems were recorded and analyzed. Of 491 inmates examined on admission, 312 subsequently made 1,257 visits for medical care. The rate of clinic use was two to three times higher than rates reported in national surveys. Of 1,549 problem encounters, trauma, musculoskeletal complaints, skin disorders, and diseases of the eyes, ears, nose, and throat accounted for 52.3 percent. Dental disease, trauma, and other musculoskeletal disorders comprised 66.3 percent of problems that required referral of patients to the city-county hospital. A significant relationship was seen between depression as determined by a self-rating questionnaire and numbers of visits and problem encounters, as well as several frequently encountered problems. The results of this study have implications for health services in correctional institutions with similar inmate populations. The provision of limited but onsite dental services is advisable. Athletic activities and work details should be closely supervised. Physicians and nurses should be skilled in the evaluation and management of minor trauma and other musculoskeletal disorders. Algorithms are appropriate aids in the management of common but minor medical problems. These measures and proposals are designed also to deal with the problem of overuse of clinic services. However, the measures do not diminish and, in some instances, they increase access to care for medical and dental health needs.

Estimates of the incidence of handicap are totally confused, and there is little coordination in provision of information as to types of disability. The author attempts to distinguish between the various handicaps from a standpoint of dental services delivery. Some of the psycho-social problems of the handicapped are discussed in relation to dental care, and distinction is made between those who can be treated on an ambulatory basis and those who have to be hospitalized. Guidelines are established for each of the aforementioned techniques in order to make the experience more bearable for patient, parent and dentist.

Eight hundred and ninety-four inpatients in four hospitals in Edinburgh were assta were used to estimate future inpatients' dental requirements and the hospital dental services which would be necessary to meet these needs. Seventeen percent of the sample was found to be suffering from pain or discomfort of dental origin and over 30% were considered to require some form of dental treatment before their expected date of inpatient discharge.

This report presents the results of an investigation into one possible administrative route that would increase the accessibility and availability of dental services for the handicapped. Specifically, this paper assesses the desirability of, perceived level of need for, and feasibility of incorporating a dental service into the total hospital rehabilitation program for adults. The Delphi technique, a method of gathering the opinions of experts through a sequentially designed set of questionnaires, was used to ascertain the views of ten chairpersons of physical medicine and rehabilitation units. The results of this discussion indicate that the perceived need is great, that access to care is difficult, and that a feasible solution would be to establish a hospital-based dental service, preferably convenient to the rehabilitation dormitory, which would provide a full range of dental services.

**Dental status and treatment needs among institutionalized mentally subnormal persons in Norway.**

Svatun B; Heloe LA  
Community Dent Oral Epidemiol ,Sep 1975, 3 (5) p208-13,  
ISSN 0301-5661 Journal Code: DNF  
Languages: ENGLISH

Dental status and treatment needs were studied in a random sample comprising 353 mentally subnormal persons. The sample was drawn to represent institutionalized mentally subnormal persons in Norway aged 5-45. The overall dental health was poor, primarily due to inadequate and fragmentary treatment facilities. Whereas the dental condition of children below 15 years of age was acceptable, as measured by the DMFT index, tooth loss increased rapidly with advancing age. Nearly every second dentulous person needed some conservation, and every tenth needed extraction of one or more teeth. One-third of the patients needed treatment requiring general anesthesia. It was concluded that a new system for the investigation of treatment requirements should be developed. This system must be based on diagnostic and social criteria, and should serve as a guideline for the planning and delivery of dental services to the various subgroups of mentally subnormal persons.

**Dental status of the institutionalized elderly population of Edinburgh.**

Manderson RD; Etinger RL  
Community Dent Oral Epidemiol ,May 1975, 3 (3) p100-7,  
ISSN 0301-5661 Journal Code: DNF  
Languages: ENGLISH

A randomly selected population of 442 persons in Edinburgh was interviewed and examined. Although 71 % of the sample required treatment, only 52 % were physically and mentally able to benefit from treatment. Thirty percent of the sample were able to use public transport to attend a dentist, 66 % would require cars and ambulance transport and 4 % were bedridden and would require domiciliary dental services. Twenty-one percent of the sample had thought about seeking dental treatment, while only 25 % had heard how to claim exemption from or help towards dental charges. Edentulousness was present in 91 % of the sample, only 41 persons having remaining natural teeth. Seventy-three percent were wearing dentures which required adjustment or replacement, but only 39 % thought their dentures were unsatisfactory. In 58 % of the patients the oral tissues were so deformed or resorbed that the prosthodontic treatment needed would be complex and require special skills. Half of the sample had some form of denture-induced pathology which required either conservative or surgical treatment.

The relationship of drug price and purchasing group size was evaluated. Thirty drug line items were studied in 26 private hospital purchasing groups of various sizes. Prices were analyzed relative to purchasing group size, age, and location. Drug prices were negatively correlated to group size in a linear relationship. Prices were significantly lower in groups representing greater than 10,000 beds. No significant relationship was found between group age or location and drug prices. The theory that increasing purchasing group size will result in better contract prices was supported.

The ever-increasing negative balance between the offer of an demand for organs with regard to transplantation surgery is very problematic. The transplantation centres are confronted with an insolvable problem and for this reason the co-operation of hospitals, other than the transplantation centres, is of vital importance where the explantation of kidneys, under specified conditions, is concerned. There are reports of new experiences in the removal of organs through in-situ-perfusion and en-bloc-removals as well as combined consignments of organs and typing material. The favourable results personally achieved during the past 6 years have given cause to believe that other clinics or hospitals, other than the transplantation centres, will participate in the explantation or organs for the purpose of transplantation.

Languages: ENGLISH

Dispensing trends for radiopharmaceuticals at a regional nuclear pharmacy over a 51-month period were studied. dispensing records of a regional nuclear pharmacy were analyzed with a forecasting procedure that uses univariate time data to produce time trends and autoregressive models. The overall number of prescriptions increased from 3500 to 5500 per quarter. Radiopharmaceuticals used in nuclear cardiology studies increased from less than 0.1% to 17.5% of

total prescriptions dispensed, while radiopharmaceuticals used for brain imaging showed a steady decline from 29% to 11% of total prescriptions dispensed. The demand for other radiopharmaceuticals increased in areas such as renal studies, bone studies, lung studies, liver-function studies, and Ga-67 tumor-uptake studies, and declined slightly for static liver studies. Changes in dispensing trends for radiopharmaceuticals will continue as the practice of nuclear medicine concentrates more on functional studies and as newer imaging techniques become used for other purposes.

Current research suggests that a diet high in carbohydrate and fiber (HCF) may be useful in the management of diabetes mellitus, hypercholesterolemia, and hypertriglyceridemia. To meet the needs of our clinic population, a microcomputer program has been developed that allows for individualization of HCF menu patterns that satisfy both the diet prescription and the patient's preferences. Educational materials were prepared to guide and augment the HCF diet instruction. It is hoped that this comprehensive approach to diet planning and teaching can be applied in similar settings to facilitate the delivery of quality patient care.

**Protein, fat, and amino acid content and protein quality of selected pre-prepared foods.**  
Koehler HH; Hard MM  
J Am Diet Assoc ,Mar 1983, 82 (3) p241-5, ISSN 0002-8223  
Journal Code: H6F  
Languages: ENGLISH

Total protein (Kjeldahl) and fat contents were determined in 24 pre-prepared foods as served in a hospital food service line. Amino acid content and protein quality were estimated for eight entree foods. Entree foods were 11 to 36% protein and provided 22 to 54% of an adult man's RDA for protein as served. Fat content of entree foods ranged from 1.5 to 18.6%. Other pre-prepared foods (vegetables, salads, fruit gelatins, and desserts) contained 0.4 to 3.3% protein and 0.1 and 3.9% fat. The Food and Nutrition Board's recommendations for sulfur amino acids were fulfilled by all entree foods as served

except "low-calorie, low-sodium" meatballs, cheese omelette, and Swedish meatballs. Only "low-sodium" and regular roast beef and "low-calorie" beef-with-noodles met amino-acid requirements for nitrogen balance for older men. Protein quality for all entree foods compared favorably with that of casein.

Planning means projecting management; it is often irregular, non-linear, and erratic. It is important to identify aspects of high predictability. Planning is the process of knowing the needs of the areas to be served, deciding on objectives for the food service, and making changes in these objectives. Good planning occurs before design decisions are made. Most important, the dietitian should be prepared to play a key role in planning--from the visionary concept to the functioning operation--while bearing in mind the practical aspects of the "real world" of planning.

The Dietary Order Entry System is a computerized system which instantaneously communicates orders/messages from the patient care units to the floor diet offices. The system also produces up-to-date management reports such as diet lists and diet census at pre-determined times and on demand. Dietary and nursing personnel believe it is an extremely beneficial system in terms of both increased accuracy of data and time savings in transmission of information. We believe that improved patient care will result from this improved method of diet ordering.

**Determining labor production time for roast entrees in hospital food services.**

Zemel PC; Matthews ME

J Am Diet Assoc ,Dec 1982, 81 (6) p709-14, ISSN

0002-8223 Journal Code: H6F

Languages: ENGLISH

The Master Standard Data (MSD) Quantity Food Production Code was used to simulate entree production in a hospital food service for 100 through 400 portions of roast entree at intervals of 25 portions. Increases in labor time occurred at 125, 225, and 325 portions and were due to increased handling of containers and pans by employees. Production schedules, based on the MSD Quantity Food Production Code, may be developed and implemented in facilities where managers have identified standards for labor production time.

**Master standard data quantity food production code.**

Zemel PC; Matthews ME

J Am Diet Assoc ,Dec 1982, 81 (6) p702-8, ISSN

0002-8223 Journal Code: H6F

Languages: ENGLISH

The Master Standard Data (MSD) Quantity Food Production Code was applied to production of roast entrees in a hospital food service. Ten stopwatch time studies were used to measure actual production times for roast entrees in the operation. Comparison showed that median production times by stopwatch exceeded MSD-predicted time by 27 min. Analysis of 13 macro elements in the hospital food service operation showed wide variability in production times because of differences in performance of individual employees and/or fluctuations in product demand. Further study of these variables, in the facility where the research was conducted, may isolate contributing factors.

**How to avoid malnutrition during hospitalization?**

Isaksson B

Hum Nutr Appl Nutr ,Oct 1982, 36 (5) p367-73, Journal Code: G9G

Languages: ENGLISH

Doctors often consider malnutrition as a set of symptoms rather than being a state of nourishment. Consequently, the nutrition of patients without obvious signs of malnutrition is often neglected. Among all categories of patients, unrecognized malnutrition at admission or under-feeding during hospitalization are everyday occurrences. Dietary records of hospitalized patients often show energy intakes well below their calculated BMR and their need for an increased supply of essential nutrients, such as protein, is seldom met. The significance of food preparation, food distribution and ward staff attitudes for proper feeding of the patients is discussed and the responsibility of the doctors for the

nutritional care of every patient is stressed.

**[Potassium and sodium content of hospital general diets--comparison of calculated and analytical values]**

Zur Frage des Kalium- und Natriumgehaltes von Klinik-Vollkost--Gegenuberstellung von Berechnungen und Analysen.

Herzberger U; von Klein-Wisenberg A; Kluthe R

Z Ernahrungswiss ,Jun 1982, 21 (2) p87-97, ISSN

0044-264X Journal Code: XTU

Languages: GERMAN Summary Languages: ENGLISH

Our knowledge on the composition of general hospital diets still relates virtually exclusively to calculated values derived from food tables. To find out how relevant these are for the estimation of potassium and sodium contents of the general diet data were chemically analysed and compared to table values. The chemical analysis of daily general diet portions resulted in a mean value of 1.86 g potassium/day in contrast to the calculated mean value of 2.72 g/day. As far as the sodium contents of the general diets are concerned, the picture was reversed (calculated: 3.16 g/day, analysed: 5.20 g/day). These results suggest that only chemical analysis of hospital diets guarantees an adequate supply of potassium and sodium.

**Use of a branch and bound algorithm to schedule food production in a semi-conventional food service system.**

Stinson JP; Guley HM

J Am Diet Assoc ,Nov 1982, 81 (5) p562-7, ISSN

0002-8223 Journal Code: H6F

Languages: ENGLISH

A new computerized technique for solving the problem of production scheduling in a semi-conventional food service system was found to be a branch and bound algorithm. The primary objective was to minimize, on a daily basis, the overall time required for noon-time production from the start of hot food preparation to the completion of all menu items. The second objective was, through modification of the algorithm, to produce right-through modification of the algorithm, to produce right-shifted schedules so that all menu items would be completed as close to meal time as possible. Benefits of the computerized procedure include increased productivity through more efficient utilization of resources and enhancement of nutritional, organoleptic, and microbiological properties of foods.

**Bacterial safety of reconstituted continuous drip tube feeding.**

Hostetler C; Lipman TD; Geraghty M; Parker RH  
JPEN ,May-Jun 1982, 6 (3) p232-5, ISSN 0148-6071  
Journal Code: KGA

Languages: ENGLISH

Chemically defined diets require reconstitution and transfer to a delivery system. When reconstituted High Vivonex was noted in our Medical Center to be bacteriologically contaminated, we instituted a series of control procedures. We then reevaluated bacterial growth in reconstituted High Nitrogen Vivonex and diluted Isocal under ward conditions. The mixtures were prepared with sterile water versus tap water, using a hand washed blender versus a machine washed blender. We also investigated the bacteriological effect of blast freezing reconstituted High Nitrogen Vivonex. All preparations of the nonfrozen High Nitrogen Vivonex showed occasional low level contamination, although quantitative cultures did not show logarithmic growth over eight hours of observation. No growth occurred in the blast frozen High Nitrogen Vivonex or in the Isocal. We conclude that reconstituted High Nitrogen Vivonex and diluted Isocal may be prepared and hung safely for eight hours, and that blast freezing of High Nitrogen Vivonex is bacteriologically safe. As a result of our initial findings of bacteriologic contamination, we believe a program for bacterial monitoring of the tube feeding is desirable.

**Microbiological evaluation of food items. For patients undergoing gastrointestinal decontamination and protected isolation.**

Pizzo PA; Purvis DS; Waters C  
J Am Diet Assoc ,Sep 1982, 81 (3) p272-9, ISSN 0002-8223 Journal Code: H6F

Languages: ENGLISH

In an attempt to expand and improve the semi-sterile "cooked food diet" usually administered to patients undergoing gastrointestinal decontamination or protected isolation, the authors have evaluated the microbiologic content of 236 commercially available food items. The items tested were selected by patients for their ease of preparation, ready availability, and palatability. Approximately 66 percent of the food items met the criteria of microbiologic acceptability (less than 500 Bacillus species per gram or cubic centimeter) with only a minimal burden to the dietary staff, thus providing palatable alternatives for patients undergoing protected isolation.

**Evaluation of two nutrition education modules for hospital staff members.**

Looker A; Walker S; Hamilton L; Shannon B  
J Am Diet Assoc ,Aug 1982, 81 (2) p158-63, ISSN 0002-8223 Journal Code: H6F

Languages: ENGLISH

Two nutrition education modules for inservice training of hospital food service personnel were evaluated in 16 hospitals. The modules, dealing with cardiovascular disease and diet, contained a leader's guide, a teaching package, audiovisual material, and suggested learning activities. Pretests and post-tests were used to assess knowledge gains resulting from learning sessions. Participants were divided so that one group took the post-tests before the sessions and one group after the sessions. When differences between groups were controlled, the sessions were shown to have a significant positive effect on post-test scores. Three-fourths of the participants rated the sessions as "very good" to "excellent."

**Quality assurance. II. Application of oncology standards against a levels of care model.**

Oberfell MS; Ometer JL  
J Am Diet Assoc ,Aug 1982, 81 (2) p129-35, ISSN 0002-8223 Journal Code: H6F

Languages: ENGLISH

Application of standards of practice for oncology patients against the model previously described allows the clinical dietitian to determine priorities and delineate the degree of care required and to ensure the delivery of high-quality nutritional care. During Step I, identification, questions designed to identify specific nutritional problems of the oncology patient are asked. A basic medical record review is completed. Step II, assessment phase, is completed and a level of care is assigned to each patient. Step III uses the standards to develop, implement, and evaluate a nutritional care plan.

0215360 82266700  
**Quality assurance. I. A levels of care model.**  
Ometer JL; Oberfell MS  
J Am Diet Assoc .Aug 1982. 81 (2) p129-32. ISSN  
0002-8223 Journal Code: H6F  
Languages: ENGLISH

A model used to identify patients requiring increased nutritional support and to determine priorities and delineate the degree of care required and role responsibilities is described. The model includes three levels of care; Level I is the most basic care and Level III the most intense. Assignment to a level of care is based on the presence, absence, or anticipated development of nutritional problems and/or the degree of dietary teaching required. Within each level of care, practitioner responsibilities have been defined by frequency and by position.

J Am Diet Assoc ,Jun 1982, 80 (6) p530-6, ISSN 0002-8223  
Journal Code: H6F  
Languages: ENGLISH

Twenty-four pre-prepared foods sampled as served at the VA hospital in Tacoma, Washington, were analyzed for contents of nine minerals (sodium, potassium, magnesium, calcium, iron, copper, zinc, manganese, and phosphorus). Samples were taken at three different times during the menu cycle. There were significant differences among the three monthly sampling times for nearly all minerals. Variation by month was partly attributed to varying proportions of food components in mixed food samples received in the food service line and to different manufacturers, food lots, and sources of raw materials. Two prepared foods labeled "low-sodium" contained 36 to 43 percent as much sodium as the comparable "regular" foods.

**Analysis of meal census patterns for forecasting menu item demand.**

Chandler SJ; Norton LC; Hoover LW; Moore AN

J Am Diet Assoc ,Apr 1982, 80 (4) p317-23, ISSN  
0002-8223 Journal Code: H6F  
Languages: ENGLISH

The purpose of this research was to identify functional relationships between the patient census and the official institutional census recorded at midnight for hospital inpatients and for mental health patients cared for in a satellite facility at the University of Missouri-Columbia Health Sciences Center. Investigation of these relationships was necessary to provide knowledge essential for the design of a statistical menu item forecasting system. Patient census for three meals (breakfast, lunch, and supper) was compared with the midnight census, using graphical analysis and analysis of variance. Reliable patterns were identified in the patient census data which required accommodation in a mathematical forecasting model. Three forecasting design options were identified and appraised. The simplest design option and the two more complex design options forecasted identical

quantities.

**Automated hospital information system functions for dietetics.**

Hoover LW; Leonard MS

J Am Diet Assoc ,Apr 1982, 80 (4) p312-6, ISSN  
0002-8223 Journal Code: H6F  
Languages: ENGLISH

Utilization of computer technology in health care is expanding, and managers need information regarding existing automated functions when making decisions relative to system design or acquisition. The Automated Hospital Information System (AHIS) Component Catalog, compiled by the Health Services Research Center/Health Care Technology Center (HSRC/HCTC) at the University of Missouri-Columbia, describes the features of software packages offered by vendors and utilized in hospitals. On the basis of an analysis of the contents of the Catalog relative to automated functions for dietetic departments, charge capturing and diet change notification were the functions used most frequently in hospitals. Although a stores inventory was not included as a component offered by any of the responding vendors, 23 of the hospital systems described in the catalog included a stores inventory component. Menu planning and meal scheduling were functions which were both available from vendors and utilized in hospitals. The nutrient analysis function was implemented in some of the larger hospitals. The information in the Catalog reflects the availability and adoption of automated hospital information system components for dietetic functions.

**Energy usage for food service infrared heat processing of egg sandwich loaf.**

Unklesbay NF; Thompson BW; Unklesbay K  
J Can Diet Assoc ,Jan 1982, 43 (1) p42, 47-54, ISSN  
0008-3399 Journal Code: HM9

Languages: ENGLISH

Simulating volume demand within hospital food service departments, infrared heat processing conditions were used to heat two similar protein menu items to determine both energy consumption required for heat processing and energy/nutrient rations. A larger, conveyorized infrared oven (CTX-70) and a smaller, infrared unit (Krups 2002) were used to heat process varying sizes of oven loads which ranged from one to 36 slices. Although no significant differences were found for product yield after 12, 24 and 36 slices were heat processed in the CTX-70, the energy usage was significantly different: 637, 798 and 1005 watt hours/load were consumed, respectively.

In the Krups 2002, a load of one slice had greater heat processing losses than either two or four slices. Energy consumption was 39, 47 and 50 watt hours/load to heat process one, two and four slices in the Krups 2002, respectively. Significantly more energy was used to heat process turkey-ham than egg sandwich loaf in the Krups 2002. The potential use of energy/nutrient rations by dietitians was discussed.

**Development of on-line real-time menu management system.**

Hoover LW; Waller AL; Rastkar A; Johnson VA  
J Am Diet Assoc ,Jan 1982, 80 (1) p46-52, ISSN  
0002-8223 Journal Code: H6F

Languages: ENGLISH

An on-line, real-time menu management system was developed as a module of the integrated computer-assisted food management system implemented at the University of Missouri-Columbia Health Sciences Center Department of Nutrition and Dietetics. This system supplants a former automated form generating system and permits flexibility in menu design. The major data base in the system is the Master Menu File, which is updated using real-time processing. This file contains data about each occurrence of menu items and is interfaced with existing recipe files to produce numerous printed documents and to display the menu on a video display terminal. The major benefits of the system are flexibility and elimination of typing of worksheets. Entering a new menu or changes to the menu require only a brief amount of time; new revised documents relative to the menu can be generated on the same day. Some of the types of documents available from this system are: master menu, nutrient syllabi, menu audit, and food production forms. The menu is available on-line at all times for reference by dietitians and supervisors. The Master Menu File will be utilized more fully as new modules are designed to interface with the Menu Management System. Production forecasting, patient menu printing, and individualized diet planning are three potential enhancements to the system which will utilize data in the Master Menu File.

The file was designed to accommodate additional data as the system in further matured.

Anderson JG; Jay SJ  
J R Soc Med ,Jan 1983, 76 (1) p45-52, ISSN 0141-0768  
Journal Code: JX1  
Languages: ENGLISH

This study examines the influence of physician networks on the utilization of computers in clinical practice. Data on patient referrals, consultations, professional discussions, and on-call coverage were collected from 24 physicians who comprise a private group practice. Their utilization of a computerized hospital medical information system (HIS) in caring for patients admitted to a 1160-bed private, university affiliated, teaching hospital was determined. A matrix representing the professional relations among these physicians was subjected to smallest space analysis, a form of multidimensional scaling. Also, a number of indices that describe structural and interactional properties of the network and individual physicians were computed. The three-dimensional representation of the network that resulted from the analysis suggests a two-step process of adoption and utilization of medical technology. Physicians who were engaged in outside professional activities and in the training of medical students and house staff were more likely to utilize the system in caring for patients. These physicians, who were more centrally located and dominant in the referral and consultation process, were more likely to influence the practice patterns of their colleagues. The use of network analysis to identify influential physicians whose involvement is essential to the success of efforts aimed at introducing computers into clinical practice is discussed.

**Allocation of spectrum in a certain MHz band and to establish other rules, policies, and procedures for one-way paging stations in the Domestic Public Land Mobile Radio Service--Federal Communications Commission. Final rule.**

Fed Regist ,Jun 7 1982, 47 (109) p24557-71, ISSN 0097-6326  
Journal Code: B58  
Languages: ENGLISH

This First Report and Order allocates 3 MHz of spectrum for paging services in the 929-932 MHz band. Private paging services will use frequency band 929-930 MHz, common carrier services will use frequency band 931-932 MHz, with a flexible boundary between the two bands effective after five years. The 930-931 MHz band will be reserved for advanced technology paging systems. This allocation was made in response to petitions filed by the Ad Hoc Private Paging Committee and Telocator Network of America. These new paging frequencies will allow for substantial growth of the paging industry, which has been restricted by a shortage of frequencies.

Sailer HR; Schlacter J; Edwards MR

Personnel ,Jul-Aug 1982, 59 (4) p35-48, ISSN 0031-5702

Journal Code: PAP

Languages: ENGLISH

Because of the negative effect stress has on employee health and productivity, ways to manage stress should be of particular concern to human resources managers. Recognizing this, authors Heather R. Sailer, territorial sales representative for American Medical Systems, a division of American Hospital Supply Corporation, John Schlacter, professor of marketing, and Mark Edwards, assistant professor of agriculture--the latter two at Arizona State University--created a model for applying stress-management strategies. Their model integrates seven categories of strategies--two of which are physical maintenance and outside assistance. The model shows at which stage of stress--before, during, or after the stressful event--each strategy can most effectively be used, and in which are of management--self-management, systems management, or organizational management--it is most appropriate.

**A versatile mobile clinical microcomputer system.**

Engler PE; Greisler HP; Stahlgren LH

J Clin Eng ,Oct-Dec 1982, 7 (4) p287-95, ISSN 0363-8855

Journal Code: HQA

Languages: ENGLISH

A microcomputer system is described that has been incorporated into a custom-designed cart for mobility throughout a clinical setting with consequent increased utilization and cost-effectiveness. A library of clinical profiles has been developed that processes and consolidates quantitative clinical data into a bar-graph format for more convenient interpretation and documentation. It is suggested that even a small hospital can acquire a mobile computer system and hire a senior or graduate student in the physical or computer sciences, on a part-time basis, from a neighboring university or technical college, to develop clinical computer software suitable for that particular institution.

**Pharmacy department costs and patient charges associated with a home parenteral nutrition program.**

Brakebill JI; Robb RA; Ivey MF; Christensen DB; Young JH; Scribner BH

Am J Hosp Pharm ,Feb 1983, 40 (2) p260-3, ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

The pharmacy department costs of a home parenteral nutrition (HPN) program were identified, and the patient charges for HPN were compared with the charges for hospitalization for parenteral nutrition. Ten patients were randomly selected from 55 patients active in the HPN program at the University of Washington Hospital. Cost identification included quantification of supplies, personnel, equipment, freight, miscellaneous, and indirect costs. Patient charges were identified through billing documents. Charges included clinic visits and laboratory tests. Inpatient charges were identified in a similar manner and included a standard daily hospital charge. Average yearly costs to the pharmacy department were nearly +9000 per HPN patient. Patient charges for HPN were +48.19 per infusion day compared with +205.68 per infusion day for the hospitalized patient. The cost savings of HPN to the patient and the hospital were clearly demonstrated.

Languages: GERMAN Summary Languages: ENGLISH

Problems arising during the examination and treatment of paediatric gynaecological patients are described. 387 out of 600 girls seen at the outpatient department for infants and juveniles of the 1st Department of Obstetrics and Gynaecology of the University of Vienna were premenarchal and 213 were post-menarchal (average age 7.45 years). The most frequent diagnosis was vulvovaginitis (43%), followed by pathological vaginal bleeding (12%), vulval disorders (6%) and pubertas praecox (5%); about twenty additional conditions were diagnosed. Absolute and extended indications for gynaecological and vaginoscopic examinations are demonstrated.

**Delivery of genetic services in Lyons (France) 1960-1980.**

Robert JM

Prog Clin Biol Res .1982. 103 Pt B p407-11. ISSN 0361-7742 Journal Code: PZ5

Languages: ENGLISH

In conclusion, the delivery of genetic services seems guaranteed now because it is based on a university school of medicine, important hospitals, and private resources. Other structures in different cities of the world are certainly as effective as or better than these. The European Club of genetic counseling was created in Lyons in 1972 to bring together the geneticists of 52 university towns of French-speaking Western Europe. The 120 members of this club meet each year for a congress. The themes of our seminars are genetic counseling and the exchange of information to allow us to improve the delivery of genetic services. Generally speaking, in the Rhone-Alpes region, the delivery of genetic services has indeed taken advantage of new discoveries. In an early stage, routine services have worked with conventional techniques borrowed from other centers. Today they enable us to reap the fruit of modern research.

**Patients' priorities for medical care.**

Fletcher RH; O'Malley MS; Earp JA; Littleton TA; Fletcher SW  
; Greganti MA; Davidson RA; Taylor J

Med Care ,Feb 1983, 21 (2) p234-42, ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

Relatively little research has been done on the importance patients attach to various aspects of their medical care when their options are constrained. We studied priorities for care among 225 patients attending the medical clinics of a university teaching hospital. Eight attributes of medical care were considered: continuity, coordination, comprehensiveness, availability, convenience, cost, expertise, and compassion. Priorities were established by the method of paired comparisons. Continuity of care was the highest priority for these patients, while cost and convenience were lowest. Priorities varied in subgroups of patients defined by demographic, illness, and utilization characteristics. Patients with acute problems preferred coordination and expertise, while those with chronic problems ranked continuity higher. Patients younger than 30 years old valued coordination most; older patients preferred continuity and comprehensiveness. Since all aspects of medical care cannot be provided to all people, and choices are necessary, patients' priorities should be considered when planning health services.

Pridham KF; Schutz ME

JOGN Nurs ,Jan-Feb 1983, 12 (1) p50-5, ISSN 0090-0311

Journal Code: K52

Languages: ENGLISH

In order to assess the extent to which the obstetric care they were providing was oriented to the family's goals, health-care professionals at a midwestern university hospital planned and conducted an evaluation study of patient services.

A mailed questionnaire survey of 91 families who used three family practice residency program model clinics for obstetric care focused on the goals, plans, and experiences that parents has regarding the labor, delivery, and postpartum periods. Parents reported wanting opportunities to be close to the infant immediately postpartum, more time with the infant in the recovery room, earlier rooming-in, more time spent with the infant at night for feeding, and sibling visitation as well as opportunities for siblings to hold the new infant.

**Utilization of computers in clinical practice--role of physician networks: preliminary communication.**

Anderson JG; Jay SJ

J R Soc Med ,Jan 1983, 76 (1) p45-52, ISSN 0141-0768  
Journal Code: JX1

Languages: ENGLISH

This study examines the influence of physician networks on the utilization of computers in clinical practice. Data on patient referrals, consultations, professional discussions, and on-call coverage were collected from 24 physicians who comprise a private group practice. Their utilization of a computerized hospital medical information system (HIS) in caring for patients admitted to a 1160-bed private, university affiliated, teaching hospital was determined. A matrix representing the professional relations among these physicians was subjected to smallest space analysis, a form of multidimensional scaling. Also, a number of indices that describe structural and interactional properties of the network and individual physicians were computed. The three-dimensional representation of the network that resulted from the analysis suggests a two-step process of adoption and utilization of medical technology. Physicians who were engaged in outside professional activities and in the training of medical students and house staff were more likely to utilize the system in caring for patients. These physicians, who were more centrally located and dominant in the referral and consultation process, were more likely to influence the practice patterns of their colleagues. The use of network analysis to identify influential physicians whose involvement is essential to the success of efforts aimed at introducing computers into clinical practice is discussed.

**A computer assisted quality assurance model.**

Edmunds L

J Nurs Adm ,Mar 1983, 13 (3) p36-43, ISSN 0002-0443

Journal Code: JEL

Languages: ENGLISH

This article describes a modular quality assurance program that was designed for computer automation. The author explains how the quality assurance model not only meets this need but also satisfies other critical objectives, including integration with the hospital's multidisciplinary quality assurance program and minimal redundancy in developing standards and measurement criteria. Readers will benefit from ideas for refining or developing effective quality assurance programs that can also use computer technology to increase productivity.

**Success with an inpatient geriatric unit: a controlled study of outcome and follow-up.**

Lefton E; Bonstelle S; Frengley JD

J Am Geriatr Soc ,Mar 1983, 31 (3) p149-55, ISSN 0002-8614 Journal Code: H6V

Languages: ENGLISH

To assess the worth of a newly established geriatric unit, outcomes for 50 subject patients cared for on this unit were compared with outcomes for 50 control patients. Both groups of patients were hospitalized in Highland View Hospital, the chronic illness and rehabilitation section of a major teaching

hospital in Cleveland, Ohio. Analysis of admission data showed the two groups to be closely comparable. All patients were managed by multidisciplinary teams, and the length of stay of both groups was comparable. The discharge data showed that the subject patients were more independent, with significantly greater numbers improving in ambulation and significantly more subject patients being discharged to a home setting. Although the patients in the control group were discharged at lower levels of function, they showed improvement at follow-up. Follow-up data also showed that both groups largely remained in their discharge environments. Explanations for these findings are discussed. The results of this study support the establishment of geriatric inpatient units.

**The defined daily dose per 100 bed-days as a unit of comparison and a parameter for studying antimicrobial drug use in a university hospital. A retrospective study of the effects of guidelines and audit on antimicrobial drug use.**

Hekster YA; Vree TB; Goris RJ; Boerema JB

J Clin Hosp Pharm ,Dec 1982, 7 (4) p251-60, ISSN 0143-3180 Journal Code: HTT

Languages: ENGLISH

Growing awareness of problems arising from over-use of antimicrobial agents has led to attempts to develop policies or guidelines for rational treatment. To follow the effects of guidelines, the percentage of patients receiving anti-microbial drug therapy, acquired from patient records, has been a frequently used parameter. In this paper the Defined Daily Dose (DDD) per 100 bed-days has been used instead. This parameter can be calculated by converting the number of units of antimicrobials, delivered to individual wards, to defined daily doses per bed-day. This parameter determines the probability of treating a patient with a particular drug, based on pooled data. The DDD per 100 bed-days has been used to follow changes in prescribing habits arising from the acceptance of and adherence to guidelines over a period of 5 years in a University Hospital.

**[Analysis of the criteria of choice of hospital materials and technologies]**

Analyse des criteres de choix des materiels et technologies a l'hopital.

Morizet-Mahoudeaux P; Dubuisson B

Int J Biomed Comput ,Jan 1983, 14 (1) p53-63, ISSN 0020-7101 Journal Code: GQO

Languages: FRENCH Summary Languages: ENGLISH

Decision-making in hospital, when a biomedical instrumentation investment has to be decided, is not simple because of the large amount of criteria which should be considered. To show the most important criteria in decision-making, their respective weight and their interdependencies, we used multi-dimensional analysis methods.

A quasi-exhaustive list of criteria has been constructed and sent to all the heads of medical departments, the directors and the clinical engineers of the French university hospitals, in order to obtain their appreciation of the influence of these criteria in their own decision-making experience. The application of factorial analysis methods to the answers gives two main results. There is no characteristic behaviour of professional groups, such as engineers, directors, surgeons, radiologist, etc.... A list of 21 criteria, which are the most influential in decision-making, can be identified. This result will be emphasized in order to develop a tool which allows one to measure the adequacy of a biomedical instrument that shows a clinical need.

**[HBs-antigen determination during pregnancy with reference to prevention of a postnatal infection in the newborn infant]**

HBs-Antigennachweis in der Schwangerschaft unter dem Gesichtspunkt der Pravention einer postnatalen Infektion des Neugeborenen.

Zippel C; Eggers HJ; Zippel HH; Fuhrmann U; Bolte A

Geburtshilfe Frauenheilkd ,Dec 1982, 42 (12) p862-5, ISSN 0016-5751 Journal Code: FK5

Languages: GERMAN Summary Languages: ENGLISH

In 1980 and 1981 the blood samples of 2040 pregnant women from the Department of Obstetrics of the University Hospital of Cologne have been examined for HBs-antigen. In 37 samples (1.8%) HBs-antigen was detected. As there are considerable racial as well as geographic differences in the frequency of HBs-antigenemia, we differentiated between German and foreign women. In 10 out of 1519 (0.7%) German and in 27 out of 521 (5.2%) foreign women, respectively, HBs-antigen could be demonstrated. Only 1 woman was known to be HBs-antigen positive. Until now, 38 children have been born in the University Hospital to 33 HBs-antigen-positive mothers. After birth, 35 children received hepatitis B immune globulin (HBIG). So far, none of these immunised children exhibited signs of a hepatitis B infection--22 children have been followed up 5-19 months, and 13 children 1-4 months. Three newborns did not receive HBIG: One child was already infected at time of birth, the 2 other children were erroneously not

given HBIG. One of these 2 children fell ill at the age of 5 months with clinical and serological manifestations of hepatitis B, the other child appears healthy up to date (11 weeks).

**Clinical causes and classification of perinatal mortality in Lagos.**

Abudu O; Akinkugbe A

Int J Gynaecol Obstet ,Dec 1982, 20 (6) p443-7, ISSN 0020-7292 Journal Code: E4T

Languages: ENGLISH

Perinatal deaths in singleton births at the Lagos University Teaching Hospital during a 5-year period were reviewed. Causes of deaths were classified into eight groups using a modified form of the Aberdeen classification. Perinatal mortality was high (42.5/1000 total births). The stillbirth rate was 32.5/1000 total births. The major causes of perinatal mortality were trauma (30.5%), low birth weight (23.9%), hemorrhage (13.7%), toxemia of pregnancy (10.3%) and mature, cause unknown (10%). Congenital malformation (4.3%) was not a major cause of perinatal deaths in this study.

**Design considerations for a medical school hospital cancer patient data system.**

Hokanson JA; Costanzi JJ; Smith MS; Richard P; Dugat PS

Cancer ,Apr 15 1983, 51 (8) p1556-61, ISSN 0008-543X Journal Code: CLZ

Contract/Grant No.: CA-17701

Languages: ENGLISH

Tumor registries abound, but there are few that successfully incorporate information age data management resources. This article describes the evolutionary process of designing, implementing, and maintaining a computer-based cancer patient information system for a medical school hospital. The primary requirement was that accurate information about the cancer experience at University of Texas Medical Branch (UTMB) be readily available. Since the tumor registry staff were not data processing professionals, this system had to use commonly available, well documented, readily maintained, and easily used data management resources. The UTMB registry, as documented by the marked increase in frequency and scope of use, demonstrates that a quality information resource can have a significant impact on hospital cancer programs and could serve as a prototype for other institutions having similar needs.

**A respiratory intensive care unit computing system: clinical experience at Loma Linda University Medical Center.**

Sheldon RL; Cooley WS; Knox WL  
Respir Care ,Jul 1982, 27 (7) p821-9, ISSN 0730-8418  
Journal Code: QZ3

Languages: ENGLISH

At Loma Linda University Medical Center we have successfully developed a computerized monitoring system for our respiratory intensive care unit (RICU). Three important goals must be accomplished to achieve success in designing a useful computer system: (1) a workable hardware system must be designed, (2) the hardware and programs must be molded to fit the needs and abilities of the clinicians using the system, and (3) the necessary data must be made available to the system. Our typical applications of the RICU computer system include storage of pathology and clinical laboratory data, management and calculation of hemodynamic variables, census taking, retrieval of information on returning patients, nutritional assessment, monitoring and evaluation of respired gases, assessment of drug administration, interpretation of arterial blood gases and related measurements, and monitoring of EKGs. We believe it is essential to clearly define the needs of a clinical unit and goals of its computer system in order to design and select the proper computer hardware and software.

**Pharmacy-based controlled substances distribution for a university campus.**

Hibbard FJ; Bair JN; Sylvester KL  
Am J Hosp Pharm ,Jan 1983, 40 (1) p74-7, ISSN 0002-9289  
Journal Code: 310

Languages: ENGLISH

A university-wide pharmacy-based controlled substances distribution system is described. The purchasing and control of controlled substances for the entire university campus is centralized in the hospital pharmacy department. The distribution system uses the concept of restricted versus nonrestricted drugs, where restricted drugs are all Schedule II controlled substances and other drugs needing restrictive control. The restricted or nonrestricted status of a drug is based upon suspected or observed abuse potential. After receipt by the pharmacy, all controlled substances and restricted drugs are stored in a vault. A 24-hour audit-disposition record system is used to control the inpatient distribution of restricted drugs, which are stored

in locked cabinets on each nursing unit. In the outpatient pharmacy, a small supply of restricted drugs is stored in a locked cabinet; the inventory is reconciled weekly. Nonrestricted controlled substances, such as phenobarbital and chloral hydrate, are distributed to the inpatient satellite pharmacies and the outpatient pharmacy in the same manner as other prescription drugs. Campus practitioners and researchers order all controlled substances from the pharmacy using the appropriate order forms; each individual is responsible for maintaining a record and control system. A quality assurance program was established to review and improve the quality of service. The centralized pharmacy-based system improved the control, monitoring, and efficiency of controlled substances distribution for the entire university campus.

**Health care services received by children with chronic illness.**

Stein RE; Jessop DJ; Riessman CK  
Am J Dis Child ,Mar 1983, 137 (3) p225-30, ISSN  
0002-922X Journal Code: 3GS

Languages: ENGLISH

The mothers of 209 children with chronic illness who were being treated at a university-affiliated municipal hospital were interviewed in their homes to assess the extent to which their children received health services. Most families received traditional biomedical types of care, but few families had received psychosocial services. Children with the most severe conditions tended to receive more services than others, and receipt of nonbiomedical services was associated with identification of a specific provider. Mothers indicated that, in addition to traditional services, they wanted advice on how to manage the child's condition at home. These results confirm previous findings and suggest that gaps in service provision may be generalizable to children with chronic illness regardless of the setting and diagnosis.

**[Pathological] liver enzyme values--a suitable warning symptom of imminent intrauterine fetal death in EPH gestosis]**

Pathologische Leberenzymwerte--Ein geeignetes Warnsymptom des drohenden intrauterinen Fruchttodes bei EPH-Gestosen?

Fischl F; Grunberger W

Zentralbl Gynakol ,1982, 104 (20) p1282-7, ISSN 0044-4197 Journal Code: Y5S

Languages: GERMAN Summary Languages: ENGLISH

Liver functions (bilirubin, SGOT, SGPT, alkaline phosphatase) and electrolyte changes (sodium+, potassium+, calcium+) were tested in a prospective study in all patients admitted to the First Department of the Hospital of Gynaecology and Obstetrics, University of Vienna, throughout 24 months, for moderate, medium or severe EPH gestosis as well as in pregnant women admitted for intra-uterine foetal death. All 102 cases were subdivided by three groups by severity of gestational toxicosis. A somewhat expected insight was gained from comparison of the three groups, in that aggravated severity of EPH gestosis symptoms was accompanied by higher incidence of pathological liver findings. A comparison between these findings, obtained from existing but impaired pregnancies, and findings obtained from women with intra-uterine foetal death showed that certain limit values were pathological, as were some of the routine findings. --Action should be taken to speed up the course of labour and complete delivery, as soon as thresholds are exceeded in foetuses with mature lungs, in order to prevent intrauterine foetal death.

**The use of computerized learning in intensive care: an evaluation of a new teaching program.**

Skinner JB; Knowles G; Armstrong RF; Ingram D  
Med Educ ,Jan 1983, 17 (1) p49-53, ISSN 0308-0110

Journal Code: MZ3

Languages: ENGLISH

A computer-assisted learning program in respiratory intensive care was introduced into the undergraduate curriculum at University College Hospital. Educational effectiveness was assessed. This method of learning was found to be highly acceptable to students. The improvement in students knowledge of the subject was up to three times greater in those who used the computer program, than a control group of students who received only teaching by conventional means, (P = 0 X 016). The results of a questionnaire designed to elicit students' attitudes to this learning experience are discussed.

**Teaching behavioral pediatrics and to pediatric residents: the state of the art and description of a program.**

Felice ME; Friedman SB

JOBP ,Dec 1982, 3 (4) p225-31, ISSN 0196-206X Journal Code: HTF

Languages: ENGLISH

In 1978, the Task Force on Pediatric Education strongly recommended that all pediatric residency programs include at least one full-time rotation and biosocial pediatric, preferably in the 1st or 2nd year. Since 1977, the University of Maryland has had a structured, integrated, required program in Behavioral Pediatrics, including 2 months in both the PL-1 and PL-2 years for a total of 4 months addition of elective experience is available in the PL-3 year. The development and description of this program is presented as well as a review to the relevant literature.

**Enrollment bias and variation in clinical manifestations: a review of consecutive cases of familial paroxysmal polyserositis.**

Armenian HK  
J Chronic Dis ,1983, 36 (2) p209-12, ISSN 0021-9681  
Journal Code: HQV

Languages: ENGLISH

The effect of systematic enrollment bias was studied in a series of 158 patients with familial paroxysmal polyserositis (F.P.P.) from a special clinic in a university hospital. The characteristics of 79 patients seen for the first time at this special clinic in its first 16 months of operation, were compared with the characteristics of 79 patients presented during the last 6 yr of its operation. As a group the patients studied first at the clinic had a more severe form of the disease. This group had a significantly larger number of patients with multiple clinical manifestations, with proteinuria and amyloidosis. In addition, there were more males and more patients with positive family history of the disease in this earlier group. It is probable that much of the temporal variation in these clinical characteristics between patients studied in the earlier and later periods can be explained by case selection originating from differentials in referral patterns. Thus, a larger proportion of the earlier patients were referred following an episode of hospitalization. Differences in referral pattern, in case selection and in the sources of data, can account for the significant variation in the frequency of the various clinical manifestations in the different published F.P.P. case series from several countries. The effect of enrollment bias on the results of clinical studies and the importance of a population base for such studies is emphasized.

**Medical admissions due to noncompliance with drug therapy.**

Levy M; Mermelstein L; Hemo D  
Int J Clin Pharmacol Ther Toxicol ,Dec 1982, 20 (12)  
p600-4, Journal Code: GQO

Languages: ENGLISH

In 34 (2.9%) of 1184 medical admissions monitored at the Hadassah University Hospital in Jerusalem, noncompliance with drug therapy appeared to be the principal factor leading to hospitalization. The main diseases presented on admission were cardiovascular conditions and exacerbation of chronic pulmonary and inflammatory diseases. The reasons given for noncompliance were the occurrence of adverse reaction (39% of the cases), lack of symptoms (19%), too many drugs (16%), and forgetfulness (10%). The main drugs involved were diuretics, digoxin, and antibiotics. Nonprofessional employment, low level of education, as well as old age in males were identified as factors associated with hospitalization due to noncompliance. Poor knowledge of possible adverse reactions and results from noncompliance were evident in the entire patient population. Educational measures are required to increase patient participation in the therapeutic process.

**Attitudes of nonpsychiatric physicians toward psychiatric consultation.**

Cohen-Cole SA; Friedman CP  
Hosp Community Psychiatry ,Dec 1982, 33 (12) p1002-5,  
ISSN 0022-1597 Journal Code: GCJ  
Languages: ENGLISH

The authors report on an opinion survey of 200 nonpsychiatric attending physicians at a university teaching hospital about the process and outcome of consultation psychiatry. Over-all, physicians felt that 37 per cent of their patients had problems with significant psychological components, but that consultation was indicated for only 11 per cent. Physicians reported a high level of global satisfaction with consultations: 68 per cent were satisfied frequently or almost always. Factor analysis reduced consultees' evaluations of 18 different consultation activities to five dimensions, with patient disposition considered the most important and services to medical and ward staff the least important. Analysis of differences by specialty revealed that family medicine physicians seemed the most oriented to psychological issues and surgeons the least.

**Selection for mercurial resistance in hospital settings.**

Porter FD; Silver S; Ong C; Nakahara H  
Antimicrob Agents Chemother ,Nov 1982, 22 (5) p852-8,  
ISSN 0066-4804 Journal Code: 6HK  
Contract/Grant No.: AI15672  
Languages: ENGLISH

The frequency of resistance to Hg<sup>2+</sup> in 1980 to 1981 collections from Barnes Hospital, St. Louis, Mo., was only 2% for Staphylococcus aureus and 9% for Escherichia coli. The frequency of Hg<sup>2+</sup> resistance in E. coli isolates from Jikei University Hospital, Tokyo, Japan, was 57% during 1972 to 1977 and decreased to 29% in 1979 to 1982; for S. aureus the frequency of Hg<sup>2+</sup> resistance dropped from 36% in 1972 to 1977 to 10% in 1979 to 1982. Frequencies of resistances to cadmium (S. aureus) and arsenic (S. aureus and E. coli) remained approximately constant during this time. The decrease in frequency of mercurial resistance is attributed to the termination of the use of organomercurials (largely phenylmercury and thimerosal) in hospital liquid detergents and disinfectants. It is proposed that selection for mercurial resistance occurred within the hospital setting when there was widespread use of mercurials. The resistance patterns and phage types for each of four new mercurial-resistant S. aureus isolates from St. Louis were distinct, indicating that no single type of "hospital staph" predominates. Furthermore, resistance to thimerosal, merbromin, and methylmercury and the ability to volatilize <sup>14</sup>C from [<sup>14</sup>C]methylmercury were found with the new isolates and never with previously known mercurial resistance plasmids in S. aureus.

**Regionalization of surgical services.**

Peterson DL; Bloom BS  
Am J Public Health ,Feb 1983, 73 (2) p179-83, ISSN  
0090-0036 Journal Code: 3XW  
Languages: ENGLISH

Using data from the Studies on Surgical Services for the United States (SOSSUS), the extent of existing surgical care regionalization was examined in a defined area. Specialist surgeons comprised 55 per cent of all physicians who did operations, but performed nearly three-fourths of all operative work. About one-third of the most complex operations (CRV greater than or equal to 30), more than one-fifth of medium complexity (CRV = 20-29), and 14 per cent of low complexity (CRV less than 20) were obtained out of county of

residence. Nearly one-half of all surgical patients at the university hospital were from other counties; but for those obtaining the most complex operations (CRV greater than or equal to 30), three-fourths of them were from other counties. Thus there was a substantial amount of regionalization of surgical care already existing in this area.

**Underrecognition of patients' psychosocial distress in a university hospital medical clinic.**

Thompson TL 2d; Stoudemire A; Mitchell WD; Grant RL  
Am J Psychiatry ,Feb 1983, 140 (2) p158-61, ISSN  
0002-953X Journal Code: 3VG  
Languages: ENGLISH

Seventeen areas of psychosocial distress were evaluated in 87 university hospital internal medicine clinic patients by a self-administered questionnaire and a psychiatric interview. These patients' internists then predicted the patients' distress level in each area. Their predictions correlated significantly with their patients' self-reports of distress-level problems in only 3 of the 17 areas. Even when the internists felt that they had sufficient information to make an accurate prediction, their perceptions were often erroneous, including evaluations of such areas as suicidal ideation and drug use. These data suggest the need for active psychiatric education components in internal medicine training programs.

**Contractual relationships between colleges of pharmacy and university hospitals.**

Gourley DR; Fine DJ  
Am J Hosp Pharm ,Dec 1982, 39 (12) p2102-4. ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

The relationships that exist between colleges of pharmacy and university hospitals located in academic medical centers were investigated, and the types of pharmaceutical services that are being offered by these institutions were profiled. Questionnaires were mailed to 35 directors of pharmaceutical services located in academic medical centers. Of the 30 institutions represented by respondents, 27 had a college of pharmacy on the same campus, and 13 had a formal agreement between the hospital and the college. Ninety-seven percent of the hospitals surveyed had unit-dose or partial unit-dose programs, and all of the hospitals had i.v. admixture services. Nine of the 13 hospitals with formal agreements and 13 of the 17 hospitals without formal agreements had decentralized pharmaceutical services. The staffing patterns in these institutions showed that only 10.3% of the pharmacist FTE positions were funded by the college of pharmacy. There was no difference in trends as related to faculty appointment, title, or tenure between directors in hospitals with and without affiliation agreements. Seven of the directors of pharmacy were in tenure-track positions, and the director's reporting mechanism in the college was either to the dean or the chairman of pharmacy practice. No differences were found between the pharmaceutical services offered, staffing patterns, or status of the director of pharmacy in hospitals with or without formal agreements with colleges of pharmacy. These authors believe that a firm relationship between the college and hospital might prove advantageous to both parties.

**Changes of panorama in renal disease mortality in Finland after phenacetin restriction.**

Sillanpaa M; Kasanen A; Elonen A  
Acta Med Scand ,1982, 212 (5) p313-7. ISSN 0001-6101  
Journal Code: 14G  
Languages: ENGLISH

The purpose of the present study was to examine the effect of phenacetin consumption and its restriction on the mortality from nephropathy. Changes in this mortality in Finland during 1951-77 were investigated. The second part of the study was concerned with the frequency of papillary necrosis in cases autopsied in the Department of Medicine, Turku University Central Hospital, during 1952-79. These figures were studied in relation to increased phenacetin consumption after World War II, its restriction in 1962 and its complete banning in 1965. Both the epidemiologic survey of the mortality from nephropathy in Finland and the autopsies showed a clear and strong correlation both with increased phenacetin consumption and with its discontinuation. The banning of phenacetin led within 2-4 years to a decline in the mortality from

nephropathy to its pre-phenacetin level.

**Report on blood access for hemodialysis in the Department of Transplantation, Tokai University School of Medicine and a satellite hospital.**

Hida M; Iida T; Shimbo T; Nakamura K; Saitoh H; Satoh T  
Tokai J Exp Clin Med ,Jul 1982, 7 (4) p497-504. ISSN  
0385-0005 Journal Code: VZM  
Languages: ENGLISH

There were 316 patients being treated by maintenance hemodialysis in the Department of Transplantation, Tokai University School of Medicine and its satellite hospital (Bohsei Clinic, Medical Treatment Cooperation, Showakai) as of December 31, 1981. Forty eight male (23.1%) and 39 female (35.7%) patients were operated on for external shunts. One case of external shunt was functioning well 48 months later. No patient was dialysed through external shunts on December 31, 1981 in our Department or the satellite. The majority of patients, who were maintained on hemodialysis with an arteriovenous (native vein) fistula available, experienced no difficulties. Nearly 50 percent of cases with the first fistula were functioning on December 31, 1981. There were some complications with fistulas such as pseudoaneurysms, infections, the sore thumb syndrome or the steal syndrome. We experienced 14 hemodialysis cases using expanded polytetrafluoroethylene (E-PFTE) grafts and one case using femoral artery repositioning as blood access.

**Health care for rheumatic disorders in a Swedish county.**

Bjelle A; Magi M  
Scand J Rheumatol ,1982, 11 (4) p209-16, ISSN 0300-9742  
Journal Code: UD1  
Languages: ENGLISH

Utilization of rheumatological care by individual patients was studied in a Swedish county at all levels of the health care system. Calculated per population at risk, 0.6--0.8% per year were seen for rheumatoid arthritis. Of these, 35--81% were patients at the rheumatology department, varying according to distance of residence from the university hospital. The number of patients with other inflammatory diseases was, however, larger in primary care than in the specialist department. Only a minor part of the total care for rheumatic disorders (Chapt. XIII of ICD) in the county was provided by the rheumatology department. Back disorders constituted the largest diagnostic group of rheumatic disorders in primary care. During a period of one year a total of 12--14% of the population had contact with primary care, of the district hospital and/or the rheumatology department, because of rheumatic disorders. The results show the value of epidemiological studies to follow the development of and to define the future objectives of rheumatological care.

Rolland C; Huet B; Battesti JP  
Int J Biomed Comput .Nov 1982. 13 (6) p457-69. ISSN  
0020-7101 Journal Code: GQQ

Languages: ENGLISH

Instead of a technology-oriented approach of a hospital information system (HIS), the authors present a structure oriented approach built on three elements: objects, events and operations which allow one to model a static and dynamic schema of an information system (IS). Objects of the static schema lead to a relational model. Events expose various states of Information System; operations allow one to build a dynamic schema. Such a schema is interesting for IS description in order to enhance the analytical capability of the designer, to define IS solutions and to limit the risks of errors. It allows the clinician better management of information relative to patients, especially thanks to the dynamical schema which enables one at any moment to know the patient's state. Finally, it has to free clinicians from managing information and allow them to give an always more important consideration to human relationships in medicine.

**Iatrogenic complications in surgery. Five years' experience**

**in general and vascular surgery in a University Hospital.**

Adar R; Bass A; Walden R  
Ann Surg .Dec 1982. 196 (6) p725-9. ISSN 0003-4932  
Journal Code: 675

Languages: ENGLISH

Advances in medicine that have led to more sophisticated methods of diagnosing, treating and monitoring patients take an ever increasing toll in iatrogenic complications. It may be argued that the net effect is an improvement in care, but it is self-evident that minimizing iatrogenic complications will increase the benefit to the patients of the ever increasing complex methods of treatment. Iatrogenic complications tend to be sporadic and varied in nature, and are difficult to study as a group. Psychological and medicolegal problems add to this difficulty. However, if the incidence of iatrogenic complications is to be decreased, a concerted effort has to be made to study them. Their report deals with an effort.

0349-652X Journal Code: IYL

Contract/Grant No.: CA-19278

Languages: ENGLISH

The records of 503 patients with carcinoma of the tongue diagnosed between 1958 and 1972 were reviewed. The preponderance of tongue carcinoma among men was confirmed both in The Norwegian Radium Hospital (NRH) and the University of Wisconsin Hospitals (UW), but it was relatively more frequent among women in NRH and in UW than in southern Europe. More women had on presentation less advanced tumors at NRH than at UW. The incidence of tongue carcinoma in Norway increased steadily with age for both sexes. The sex ratio did not change in Norway such as in England, Canada and the United States. Tumor of the posterior one-third of the tongue was relatively infrequent in women both in NRH and UW, in agreement with reports from other countries. The length of survival was analysed and no significant sex difference was demonstrated. The younger patients had less advanced tumors and a better prognosis.

**[Consultation and liaison psychiatry--a contribution to the holistic thinking in medicine]**

Konsiliar- und Liaisonpsychiatrie--ein Beitrag zum ganzheitlichen Denken in der Medizin?

Wildbolz A

Schweiz Arch Neurol Neurochir Psychiatr ,1982. 131 (1) p81-8. ISSN 0036-7273 Journal Code: UDS

Languages: GERMAN Summary Languages: ENGLISH

After some introductory remarks about consultation and liaison psychiatry, the psychiatric consultation and liaison service in the general university hospital of Bern is presented. It has a statistically expressible exterior activity and an interior activity. It gives its contribution to holistic medical thinking in the fields of patient care, teaching, research, expertising and public relations. Problems of integration of consultation and liaison psychiatry and their possible overcoming are discussed on the base of two other studies of this author. The importance of creating psychiatric services in general hospitals is emphasized.

**A ten-year follow-up of a hepatitis B epidemic in a dialysis unit.**

Lofgren B; Nordenfelt E; Lindholm T; Lindergard B

Scand J Infect Dis ,1982. 14 (3) p165-9. ISSN 0036-5548 Journal Code: UCX

Languages: ENGLISH

A hepatitis B epidemic at the hemodialysis unit of the University Hospital of Lund, Sweden, occurred in 1968-71. Since then all patients on regular hemodialysis have been tested with regard to hepatitis B. 196 patients were followed for more than 6 months (5 for more than 10 yr). 50 patients (26 males/24 females) became HBsAg-positive. The majority, 40 (25/15), never lost their HBsAg during the observation period. 35 of these chronic HBsAg carriers were also chronic HBeAg carriers. 10/50 HBsAg-positive patients lost their HbsAg; females in much higher frequency than men. Six HBsAg-negative patients developed anti-HBs and anti-HBc. The highly infectious carriers constituted a continuous source of infection. Nevertheless, it was possible to keep the spread of infection under control in the unit. The most effective precaution from spread to the staff is probably protective gloves during all handling of patients. As regards the patients the most important measure was the introduction of separate units for HBsAg-positive and HBsAg-negative patients.

Prog Pediatr Surg .1982. 15 p187-94. ISSN 0079-6654  
Journal Code: Q50  
Languages: ENGLISH

Sixty cases of imperforate anus treated at the Lagos University Teaching Hospital, Nigeria between 1969 and 1979 are reviewed. Late presentation at our hospital was a remarkable feature. Although there were only 18 attempts at Wangenstein-Rice (Wangensteen and Rice 1930) inversion radiograms using all the information available, it was possible to categorize 27 children as having high and 17 as having a low-type imperforate anus. Only 16 of the children with high lesions have had abdominoperineal pull-through procedures with an operative mortality of 31%. Eleven definite procedures for low lesions were carried out in newborn infants. The rest were decompressed either by a colostomy or a congenital fistula and are waiting for definite surgery. One child died before any surgical treatment. Some of the problems related to the outcome of treatment of this disease in our hospital are late presentation, inadequate facilities and shortage of specialized personnel, problems peculiar to a developing country. We suggest an urgent colostomy performed under local anaesthesia as a safe and expedient treatment for babies with obstruction and in whom the presence of a translevator anomaly cannot be immediately verified.

**Integration of the psychosomatic approach with internal medicine: development of concepts and preliminary results of evaluation of doctor-patient interaction.**

Kohle K; Gaus E; Simons C; Westphale C  
Psychother Psychosom .1982. 38 (1) p221-30. ISSN 0033-3190  
Journal Code: QHA  
Languages: ENGLISH

An account is presented of an attempt (made in the period between 1972 and 1979) to integrate a psychosomatic approach in routine patient care in a medical hospital. Following disappointment with a service run on a consultation-liaison basis, patient care on a small general medical ward was reorganized systematically according to psychosomatic principles. Within this relatively independent subsystem of the hospital, it was possible to integrate the medical and the psychosomatic aspects into a single approach. The organizational concept for the ward is described; first results are reported of an attempt to evaluate the factual changes in doctor-patient communication during the daily ward round. This communication was studied in the form of verbal contacts between doctor and patient. Finally a summary is presented of the advantages of the integrated approach over the traditional consultation-liaison service.

**International comparison of the prevalence of psychosomatic disorders in schizophrenic patients.**

Ramsay RA; Krakowski AJ; Rydzynski Z; Jarosz M; Engelsmann F; Ananth J  
Psychother Psychosom .1982. 38 (1) p206-20. ISSN 0033-3190  
Journal Code: QHA  
Languages: ENGLISH

An epidemiological survey was carried out in Montreal (Canada), Plattsburgh (USA) and Lodz (Poland) to test the hypothesis that certain psychosomatic disorders show a low lifetime prevalence in schizophrenic patients (total n = 665). The same method for collection and evaluation of demographic and clinical data was used in order to establish the lifetime prevalence of peptic ulcer (PU), bronchial asthma (BA), neurodermatitis (ND) and rheumatoid arthritis (RA) in the patients as well as in their nuclear families. Low values of lifetime prevalence were found in schizophrenic patients in chronic hospitals as compared with those in general-university hospitals. Similarities were found in age- and sex-related patterns of these psychosomatic disorders in both samples. However, PU showed higher prevalence, and BA, ND and RA showed lower prevalence in the Polish sample.

**Moral reasoning and decisions in dilemmas of neonatal care.**

Candee D; Sheehan TJ; Cook CD; Husted SD; Bergen M  
Pediatr Res ,Oct 1982, 16 (10) p846-50, ISSN 0031-3998

Journal Code: OWL

Languages: ENGLISH

The relationship between levels of moral reasoning and decisions in dilemmas of neonatal care was investigated in a sample of 452 pediatricians. Subjects included residents, faculty members, and practitioners recruited from a variety of university-affiliated and community hospitals. It was hypothesized that physicians whose moral reasoning was more fully developed would less actively treat particular cases. Such cases might include those where a patient's family requested such a limit (designated "negative family attitude") or the quality of life likely to be led after therapy was so low as to preclude even a minimal degree of human activity or social interaction (designated "unsalvageable prognosis"). The hypothesis was tested through the use of two questionnaires. The first questionnaire, devised by Crane, assessed the physician's reported degree of activism in treating six cases of infants born with severe defects. The structure of moral reasoning was measured by a second questionnaire, Rest's Defining Issue Test. Subjects were scored by the degree to which they use universal, ethical principles in resolving a series of moral dilemmas. Results of the absolute level of activism (Table 1) showed that among both residents and postresidents, the degree to which cases are actively treated depends, for salvageable patients, on the type of damage and on the possibility for research. Results involving moral reasoning showed a different pattern among residents and postresidents. Among residents, a significant correlation exists between principled reasoning and the absence of active treatment ( $r = -0.41$ , Form A;  $r = -0.23$ , Form B). As predicted, such correlations were strongest for cases of negative family attitude or of unsalvageable prognosis. The pattern of correlations among postresidents showed either no relationship to moral reasoning or the reverse of the residency pattern ( $r = -0.08$ , Form A;  $r = 0.30$ , Form B). The influence of the type of institution a resident operates within was assessed by analysis of variance. Inasmuch as moral reasoning and institutional type both had significant main effects (Form A), their magnitude differed. Institutional type accounted for 43% of the variation in mean activism scores whereas moral reasoning accounted for only 4%; however, because one could, a priori, expect institutional norms and customs to be powerful determinants of behavior, any additional, identifiable influence deserves attention. The structure of individ

**Michigan's Medical Service Plan: factors responsible for its success.**

Herrmann TJ; Bachrach DJ; Gronvall JA  
J Med Educ ,Dec 1982, 57 (12) p903-10, ISSN 0022-2577

Journal Code: J13

Languages: ENGLISH

Eight years after the implementation of its medical service plan, the University of Michigan Medical School carried out a study to determine the extent to which the plan met its original objectives. An analysis of the plan's revenue and expenses, a review of the impact on medical school programs of education, research, and patient care, and an assessment of the environment influencing chairman and faculty recruitment and retention all support the conclusion that Michigan's medical service plan has been successful. In an effort to determine why the plan has succeeded, 35 individuals were surveyed to identify the factors thought to be responsible. A total of 32 potential factors were named; six were considered to be "key/critical," and another 11 were identified as "important/contributory." It is hoped that a sharing of Michigan's experience and understandings will be of help to the approximately 110 medical service plans that exist within the nation's 126 medical schools.

Experience gained during clinical trials at Johns Hopkins University Hospital has led to refinements in a commercial arrhythmia monitoring system. The performance capabilities and limitations are described for normal Coronary Care Unit use. The system evaluation spanned a time period of over 16 months and included 3,176 monitored patient days. The majority of both false and true arrhythmia alarms was found to be produced by two small, statistically independent segments of the patient population.

**Evaluation of computer-assisted self-instructional module for pharmacy continuing education.**

Jim LK; Filibeck DJ; Gee JP; O'Bey KA; Fox JL

Hosp Pharm ,Oct 1982, 17 (10) p551, 555-8, ISSN  
0018-5787 Journal Code: G98

Languages: ENGLISH

A computer-assisted self-instructional module was developed as a method of providing continuing education to pharmacists. A prospective, nonrandomized study was conducted to investigate the effectiveness of computer-assisted instruction (CAI). Using an Apple II microcomputer and anticoagulant therapy as the content base, a series of ten case studies was written and programmed. Twenty-two staff pharmacists from a university hospital and a community hospital participated. Participants were first given a pretest, proceeded through the CAI, took the same test as a posttest, then two weeks later, took a different posttest to measure knowledge retention. The mean test scores before and immediately after the CAI were 55.8% and 80.4%. The mean test score for the two-week posttest was 74%. The mean difference was found to be highly significant for both the pretest and immediate posttest (P less than 0.0001) and the pretest and two-week posttest (P less than 0.001). The study suggested that the use of a CAI module was effective in improving, as well as maintaining, pharmacists' knowledge and that a significant portion of knowledge gained was retained after a period of two weeks. Pharmacists' evaluations of this method of continuing education were generally favorable.

**The characteristics of stat laboratory tests.**

Chu RC; Williams SV; Eisenberg JM

Arch Pathol Lab Med ,Dec 1982, 106 (13) p662-5, ISSN  
0363-0153 Journal Code: 79Z

Contract/Grant No.: HS 02577

Languages: ENGLISH

We studied the use of stat (ie, statim--as soon as possible)

laboratory tests at a university teaching hospital. For the 20 most frequently performed tests, 35.7% of the determinations were performed on a stat basis. The frequency with which a test was ordered on a stat basis ranged from 6.0% (for ESR) to 61.5% (amylase level). The proportion of laboratory test requests from a hospital service that were ordered stat ranged from 3.8% (orthopedic surgery) to 100% (emergency services). The daily number of regular laboratory test requests decreased significantly over the weekend, but the daily number of stat requests fell less sharply. The number of requests for routine tests decreased after 6 pm, but the number of requests for stat tests remained relatively constant until about midnight.

**First-admission psychiatric ward milieu: treatment process and outcome.**

Lehman AF; Strauss JS; Ritzler BA; Kokes RF; Harder DW; Gift TE

Arch Gen Psychiatry ,Nov 1982, 39 (11) p1293-8, ISSN  
0003-990X Journal Code: 72C

Contract/Grant No.: MH 25466-03; MH 00006-02

Languages: ENGLISH

A two-year, prospective study of 123 first-admission patients examined the impact of different inpatient treatment decision-making styles on patient outcome on a therapeutic community ward and a medically oriented psychiatric ward. Ward philosophy, programmatic and administrative structure, and ward atmosphere defined the ward milieus. Data on length of stay and the use of various therapeutic modalities provided comparisons of treatment process. Standardized ratings of psychopathologic condition and levels of function, readmissions, and illness attitudes were used to assess two-year outcomes. The major finding was the absence of outcome differences despite longer lengths of stay on the therapeutic community ward. Hence, differences in ward decision-making style may not influence outcome, but may affect the process of care among diagnostically heterogeneous, first-admission patients treated in a university setting.

**Research and development in obstetrics & gynaecology in the Department of Obstetrics & Gynaecology at the National University of Singapore.**

Ratnam SS; Karim SM; Ng CS; TambyRaja RL; Tsakok FH; McCarthy IG; Ng SC; Goh HH

Ann Acad Med Singapore, Jul 1982, 11 (3) p313-21. ISSN 0304-4602 Journal Code: 53F

Languages: ENGLISH

This is a review of the research and achievements of the Department of Obstetrics and Gynaecology, National University of Singapore since 1949. The research activities reviewed are Fertility Control, Subfertility, Reproductive Endocrinology, In-Vitro Fertilization, Trophoblastic Disease, Prostaglandins and Perinatal Medicine. The University Department has kept abreast with the Singapore norm of two-child families by providing the most sophisticated technology and expertise. The perinatal mortality and stillbirth rates have been reduced to 11 and 6 per thousand births. Prostaglandin research in the Department includes an investigation of the involvement of these substances in various physiological processes, pharmacological studies with different prostaglandins and development of clinical applications. Between 1974 and 1981 we had studied 12 intrauterine contraceptive devices, both on a departmental basis and in conjunction with international agencies. The newer medicated devices have proved to offer significant advantages over the original inert plastic configuration. Metabolic changes in Singapore women on the oral pill and injection Depoprovera were studied. Impaired glucose tolerance and raised fasting total lipids were found in women on the pill. Marginal changes in carbohydrate metabolism only were found in women on injection Depoprovera. Hypercoagulation changes in the blood occurring in Singapore women varied with the dose of the synthetic or natural oestrogen medication. Initially, the fibrinolytic activity was enough to compensate for these changes; however after two years there were signs of decompensation. Progestogens affect coagulation via their influence on the liver functions. Hypercoagulation changes also occurred in pregnancy and was of a greater magnitude than oestrogen or progestogen medication. In many obstetric disorders, including hydatidiform mole, there was evidence of intravascular coagulation. The introduction of endocrine function tests has greatly improved patient care in our Department, in particular those related to endocrine disorders. Application of the immunoassays to basic research has shown that physiological levels of oestradiol exert a negative feedback effect on both FSH and LH secretions in men. The greater suppression of LH than of FSH secretion by pharmacological doses of estradiol is possibly due to different control mechanisms in the pituitary for the synthesis and release of both gonadotrophins. Physiological lev

A formulary for enteral nutrition products was developed at a university hospital. Advice was solicited from clinical dietetics and the medical staff. Reported important product variables were osmolality, caloric density, protein content and source, fat content and source, freedom from lactose, and, for oral supplements, available flavors. Data were also obtained from manufacturers regarding the composition of their products. Products were categorized as follows: liquid supplemental feedings, high calorie supplemental feedings, isotonic tube feedings, high caloric/high nitrogen tube feedings, high nitrogen tube feedings, and blenderized tube feedings. Bids were solicited in April 1981 (and annually thereafter) from manufacturers of the classified enteral nutrition products, and a contract was signed with the manufacturer in each category submitting the lowest bid. In contrast with previous experience, there was no loss from outdated products during the first year of the formulary. Categorizing enteral nutrition products into therapeutic categories appears to be a workable method to limit the number of products used in a hospital, thereby potentially decreasing inventory, waste, and hospital costs. The descriptive category titles also may encourage rational use of these products without promoting allegiance to a particular company or product.

**Emergence of occupational medical services outside the workplace.**

Rosenstock L; Heyer NH  
Am J Industr Med ,1982, 3 (2) p217-23, ISSN 0271-3586  
Journal Code: 3IN

Languages: ENGLISH

A new type of occupational medicine clinic has recently emerged in the United States. These clinics are multispecialty in staffing, are located in hospital outpatient departments, and are affiliated with academic medical centers. Their primary goal is to provide personal health and medical services including diagnosis, treatment, and follow-through of occupationally related diseases. Approximately 15 such clinics have been established in the last several years. A review of the medical, economic, and social forces that have historically shaped the content and scope of occupational medical and health services for workers explains in large part the reasons why many of these clinics have now come into being. Characteristics of eight of these clinics are reviewed in detail. These clinics provide a setting for interdisciplinary and interspecialty education of personnel and offer the medical community a demonstration of a means for better recognition and treatment of occupationally related illnesses.

**Developing a system of comprehensive care for the spinal cord injured patient in Houston, Texas, U.S.A.**

Donovan WH; Clifton G; Carter RE  
Paraplegia ,Jun 1982, 20 (3) p174-9, ISSN 0031-1758  
Journal Code: 00T

Languages: ENGLISH

The authors agree with the principle, widely accepted, that spinal cord injured (SCI) individuals should receive all their

acute, rehabilitative and follow-up care in a spinal cord injury centre. The evolution of rehabilitation medicine and services in the United States, however, has favoured the separation of acute and rehabilitation care for spinal cord injured patients, as well as other disabilities. This has resulted partly from specialisation of medical and allied health personnel, physical separation of acute and rehabilitation facilities, and reluctance of some funders of health care to see rehabilitation as a natural extension of medical care in these patients. In Houston the proximity of a rehabilitation facility to three acute care university hospitals, representing three medical schools, provided an opportunity to improve communication among the medical personnel. These individuals have recognised the value of early rehabilitation even while the patient is acutely ill; they agreed to institute a system of care wherein the rehabilitation physician partakes in the early management in a designated area of the acute hospitals for spinal cord injured patients and works toward early transfer to the rehabilitation hospital in as ideal a condition as possible. Surgeons, who have initial primary responsibility, also visit the rehabilitation hospital, following their patient's progress at selected conferences and at the bedside. This paper describes how, a spinal cord injury service was established, how the major barriers to early transfer were confronted, and the results of the first 6 months of operation.

**A description of a means of improving ambulatory care in a large municipal teaching hospital: a new role for nurse practitioners.**

Becker DM; Fournier AM; Gardner LB  
Med Care ,Oct 1982, 20 (10) p1046-50, ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

We describe a nurse practitioner program that has improved ambulatory care in a large municipal teaching hospital. The significant feature of this program is an expanded role for nurse practitioners in the follow-up of patients with complicated illnesses. Benefits of this program include improved continuity of care and an easing of the house staff's service burden. Similar use of nurse practitioners at other municipal teaching hospitals would be a useful approach to problems in quality of care and continuity of care.

Languages: ENGLISH

One hundred severe perianesthetic accidents occurring in hospitals in the eastern part of France were tested between 1975 and 1980 at the Immunological Unit of the University Hospital in Nancy. Tests were carried out "a posteriori"; mean time: three weeks after the accident (extremes: one week to one year). A second battery of tests was carried out in 35%, and a third one in 8% of the patients. Anaphylaxis was differentiated from anaphylactoid reactions by means of the tests. Responsible drugs were determined by intradermal testing, by the human basophil degranulation test and P.K. tests. Predisposing factors were studied: atopy (IgE dosage), increase of histamine release (intradermal testing with 48/80), abnormal reactivity to histamine (intradermal histamine), spasmophilia (electromyography recordings). The results show that 42 accidents were due to true anaphylaxis (one of them due to IgG); 48% of the reported accidents were due to succinylcholine. Some of the predisposing factors, in the tested population, are found in a higher proportion than in the French population as a whole; atopy, hypersensitivity to histamine, previous drug allergy, spasmophilia.

**Career paths of graduates of a degree-linked nursing course.**

Montague SE; Herbert RA  
J Adv Nurs ,Jul 1982, 7 (4) p359-70, ISSN 0309-2402  
Journal Code: H3L  
Languages: ENGLISH  
The aim of this study was to follow the career development of all 103 former students of the BSc (Hons) degree in human

biology at the University of Surrey who also took the nursing option leading to qualification as SRN, at St George's School of Nursing, London. These individuals qualified between 1970 and 1980. A postal questionnaire was used and a 97% response was obtained. The employment of each respondent was recorded at various time intervals after qualification and categorized to facilitate analysis. Findings were generally in accordance with the preliminary findings of the Universities of Manchester and Edinburgh follow-up studies. The majority of respondents chose and followed careers in nursing. The most common categories of employment for the first 5 years after qualification were hospital and community nursing. Sixty-two percent had taken further training in various fields of nursing. A larger proportion of human biologist nurse graduates had selected careers in community nursing, nursing research and nursing education than had Edinburgh nurse graduates. There was support for the suggestion that nurse graduates choose to consolidate their experience before breaking their career on account of motherhood. Between 9 and 31% were in non-nursing employment during the first 5 years of employment. Most of these were studying or working in health related fields. This figure was higher than that found in Edinburgh and reflects the nature of the degree-linked human biology/nursing option course.

**Increasing occurrence of methicillin-resistant Staphylococcus aureus in the United States.**

Boyce JM; Causey WA  
Infect Control ,Sep-Oct 1982, 3 (5) p377-83, ISSN  
0195-9417 Journal Code: GTM  
Languages: ENGLISH

Although several outbreaks of methicillin-resistant Staphylococcus aureus (MRSA) infections have been reported in recent years, the geographic distribution and frequency of MRSA infections in American hospitals is unknown. We conducted a questionnaire survey to determine the magnitude of the problem. Data from 261 hospitals were included in the survey. MRSA were reported by 145 hospitals located in 36 states. Large hospitals reported these organisms significantly more often than small hospitals (p less than .001). University hospitals reported MRSA more often than community or community-teaching hospitals (p less than .001 and p less than .005, respectively). The number of hospitals reporting MRSA increased from 24 in 1975 to 112 in 1980 (p less than .001). Our data suggest that MRSA are widely distributed geographically and that the number of hospitals with these organisms has increased dramatically since 1975. (68 Refs.)

**Monitoring perinatal mortality by birth weight specific mortality rates.**

Erkkola R; Kero P; Seppala A; Gronroos M; Rauramo L  
Int J Gynaecol Obstet ,Jun 1982, 20 (3) p231-5. ISSN  
0020-7292 Journal Code: E4T  
Languages: ENGLISH

The perinatal mortality at University Central Hospital of Turku, Finland decreased significantly from 15.7/1000 in years 1970-75 to 8.9/1000 in years 1976-78. The main decrease has occurred in weight groups of 1000 g and more. In years 1976-78 the perinatal mortality of non-malformed babies in the weight group 1500-1999 g was 93/1000, in the group 2000-2499 g 21/1000 and in the group of 2500 g and over 1.7/1000. The early neonatal mortality of non-malformed infants has decreased significantly only in the weight group of 1500-1999 g. The 1-week survival rate has been 48% in the weight group 500-999 g, but 77% in the weight group 1000-1499 g. The birth weight specific mortality rates are greatly required when the quality of obstetrical care is assessed. Birth weight specific neonatal mortality rates are essential when guidelines for elective termination of third trimester pregnancy are designed.

**Results of highly selective vagotomy in a non-university teaching hospital.**

Busman DC; Munting JD  
Br J Surg ,Oct 1982, 69 (10) p620-4. ISSN 0007-1323  
Journal Code: B34  
Languages: ENGLISH

Clinical and laboratory results are presented of 229 patients treated by highly selective vagotomy for duodenal ulcer in a non-university teaching hospital. Sixty-two per cent of the operations were performed by residents as part of their training. After 1-8 years follow-up (97 per cent complete) there were 22 recurrences (9.6 per cent). The residents had fewer recurrences than the consultants, but their patients follow-up was shorter. The usual Visick grading is presented (1, 2: 83.5 per cent; 3, 4: 16.5 per cent) as well as an additional way of grading described by Visick in 1948 which suggests that 4 per cent appear to be permanent failures. Mortality rate was 0.4 per cent, complications rate was low and side effects were in general of minor importance. Laboratory results are presented showing that the basal acid output (BAO) was reduced permanently by 65 per cent, and the PAO by 50 per cent. In patients with recurrences BAO was not reduced and the PAO was less reduced than in the non-recurrence group. Metabolic parameters did not deteriorate. Basal serum gastrin rose after operation while serum vitamin B12 remained constant with a minimal tendency to decrease.

**The clinical pharmacist as a member of the burn team.**

Anderson PD; Wachtel TL; Frank HA; Trubo BG  
Contemp Pharm Pract ,Spring 1982, 5 (2) p120-3. ISSN  
0162-3761 Journal Code: D09  
Languages: ENGLISH

Pharmacists are becoming involved increasingly in a patient care. At the University of California, San Diego Medical Center, a pharmacist has become a member of the multidisciplinary burn team. Through participation in work rounds and team conferences, the pharmacist has had a considerable beneficial impact on drug therapy, drug dosing, monitoring adverse drug reactions, and total parenteral nutrition. Specific benefits to patient care that the pharmacist provides are discussed and also the benefits derived in using a burn unit as a clinical teaching rotation for pharmacy students. The pharmacist has found his association with the burn unit to be professionally rewarding and the attending surgeons and surgical house staff have found his input to be valuable. The authors encourage other burn units to enlist a pharmacist as part of their burn team.

**Prospective evaluation of central venous pressure (CVP) catheters in a large city-county hospital.**

Eisenhauer ED; Derveley RJ; Hastings PR  
Ann Surg .Nov 1982. 196 (5) p560-4. ISSN 0003-4932  
Journal Code: 675

Languages: ENGLISH

Over a 12-month period, this survey was conducted prospectively to examine the complication rate associated with the insertion and use of central venous catheters on the Louisiana State University Service at Charity Hospital, New Orleans. No attempt was made to alter or influence the current techniques and methods for catheter insertion. Three-hundred and ninety-seven patients received 554 catheters. The overall complication rate was 13.7%. Major mechanical complications occurred with 4.0% of catheters, and infectious complications occurred with 5.2%. Of the 22 major mechanical complications, 13 were associated with morbidity. Twelve of the 13 complications with morbidity occurred with 286 subclavian catheterizations (4.2%), while only 1 of the 13 complications with morbidity occurred with 248 internal jugular catheterizations (0.4%). Based on these data, it is recommended that the internal jugular approach be used in the majority of patients, reserving the subclavian approach for patients on long-term parenteral nutrition or when the internal jugular approach is not feasible technically.

Languages: GERMAN Summary Languages: ENGLISH

Reported are results obtained from systematic interviews with 250 tumour after-care patients at the Gynaecological Hospital of Jena University. Information was gathered on psychic and sexual problems, and conclusions were drawn for medical practice, with particular reference being made to enlightenment on the disease and to sexual rehabilitation. It is the established intention of all people involved in treatment and after-care to counteract by active therapy-accompanying spiritual influence psychic disbehaviour caused by the disease. Efforts to build up optimistic attitudes are intended to produce favourable effects upon all phases of the disease.

Die Zusammenarbeit von Internisten und Psychiatern bei der Nikotinentwöhnung, dargestellt an einem gemeinsamen Projekt der Medizinischen Universitätsklinik Innsbruck und der Abteilung für Medizinische Psychologie.

Prokop H; Rhomberg HP  
Wien Med Wochenschr .Jun 30 1982. 132 (12) p287-90.  
ISSN 0043-5341 Journal Code: X0U

Languages: GERMAN Summary Languages: ENGLISH

This paper shows a model of team-work between an internal specialist and a psychiatrist or psychotherapist, which aims at fighting against addiction to nicotine. Such team-work helps to increase the rate of success. The study described in this paper was carried out in a village in the Tyrol. An instructive campaign was organized, which lasted for several years. During this campaign an internal specialist informed the population about the sequelae of nicotine addiction. This informative work was complemented by intensive counselling and psychotherapy including hypnosis and autogenous training. After one year half of the patients were still non-smokers.

**Determinants of staff nurses' perceptions of autonomy within different clinical contexts.**

Alexander CS; Weisman CS; Chase GA  
Nurs Res .Jan-Feb 1982, 31 (1) p48-52, ISSN 0029-6562  
Journal Code: 09K

Contract/Grant No.: NU00568

Languages: ENGLISH

Studies of nurses and other health professionals indicate that autonomy is an important determinant of job satisfaction and turnover. This study analyzed selected characteristics of hospital nursing units to identify those features of the work setting that influence staff nurses' perceptions of autonomy: comparisons among nurses who work in different clinical areas were made. Data were collected by interviewing 789 nonsupervisory registered nurses who were employed full time at one large university-affiliated hospital. Personal and job-related information was obtained for each nurse. Structural features of units, such as workload, were gathered from head nurse reports and hospital records. Findings indicated that nurses' perceptions of autonomy are influenced by both personal characteristics of the nurse and structural features of the units. The nurse's sense of personal efficacy and the relationship she has with her head nurse are two important determinants of autonomy across all units. Workload, primary nursing, and staffing patterns are influential factors in predicting autonomy for nurses who work in critical care areas. Implications of these findings for nursing administrators are discussed.

**[Ceftriaxone (Rocephine) in major African infectious pathology. Results at the Niamey Hospital (Niger) ]**

Ceftriaxone en pathologie infectieuse majeure africaine. Resultats obtenus au CHU de Niamey (Niger).

Rey JL; Konarjevski R; Madras R; Ousseini A; Felix H  
Pathol Biol (Paris) .Jun 1982, 30 (6 Pt 2) p513-6, ISSN 0031-3009  
Journal Code: 05G

Languages: FRENCH Summary Languages: ENGLISH

Ceftriaxone is a wide-spectrum-third generation cephalosporin characterized by outstandingly high efficacy as well as pharmacokinetic properties making it suitable for administration in a single daily injection. Ceftriaxone has been found to be useful for treatment of the very severe infectious pathology in countries where hygiene and medical superstructures are still rudimentary. Eighteen of 20 patients with purulent meningitis (13 to *Neisseria meningitidis* A, 3 to *Streptoc. pneumoniae*, 1 to *Listeria* and 3 aseptic) recovered (there being 2 deaths at the 36th hour) after a mean 6 days of hospitalization. Despite the very delicate patient condition, recovery was seen in all 11 cases of very grave bronchopneumopathy, generally due to *Streptoc. pneumoniae*. A dose of 2 g/day in 1 or 2 IV injections is sufficient in the adult, 0.50 g in a single dose being injected to infants weighing less than 10 kg. Meningitis required 4 to 7 days treatment (9 days in a case of *Listeria*) while the treatment

period was longer for respiratory infections. Seven patients had been refractory to treatment with beta-lactamines and/or aminosides, and no adverse drug reactions were noted.

**[The physician's obligation to educate patients - legal aspects - patients' expectations]**

Zur arztlichen Aufklärungspflicht - juristische Aspekte - Erwartungen der Patienten.

Gramer E; Leydhecker W; Kriegelstein GK  
Klin Monatsbl Augenheilkd ,Jul 1982, 181 (1) p46-53,  
ISSN 0023-2165 Journal Code: KWA

Languages: GERMAN Summary Languages: ENGLISH

There is some uncertainty among doctors and lawyers about the form and content of presurgical medical enlightenment of the patient. Presurgical enlightenment is of increasing significance with respect to malpractice suits. Current jurisdiction has developed principles of enlightenment that are often difficult for the doctor to handle. For routine procedures in major hospitals a standardized, pragmatically designed consent form is therefore necessary. At Wurzburg University Eye Hospital the results of glaucoma and cataract surgery have been documented for years by using computer-readable forms. On the basis of these large-scale results from many thousands of procedures a written consent form was developed and tested for its suitability. Two hundred and twenty-two patients were questioned on their expectations as to proper enlightenment. The results of these broadly scattered interviews are summed up and presented. Especially with glaucoma patients, the best method of enlightenment, satisfying both medical and legal requirements, is an information booklet designed for lay people together with verbal information furnished by the doctor. Nearly all of the patients interviewed found the preoperative enlightenment complete and sufficiently clear. The majority of them could repeat the contents of the enlightenment form four to six days after the operation. This speaks well for the adequacy of the enlightenment. As a rule, the written consent form was supplemented by verbal enlightenment from the operating physician immediately before hospitalization of the patient. A psychological investigation of preoperative anxiety with enlightened and non-enlightened patients revealed that the enlightenment form did not increase preoperative anxiety. Surgical ophthalmology lends itself to a written consent form more readily than other surgical disciplines, because diseases with poor prognoses for life are fortunately rare.

**Postpartum home visits by maternity nursing students.**

Barrett JE  
JOGN Nurs ,Jul-Aug 1982, 11 (4) p238-40, ISSN 0090-0311  
Journal Code: KS2  
Languages: ENGLISH

Fewer babies are being born; hospital postpartum days are being shortened; and many families are choosing home births. These facts have prompted nursing educators to seek maternity experiences for students outside the hospital setting. At the university where the student-visit program was implemented, faculty appreciated the need for follow-up home care and focused on more than the experiences in prenatal clinics and

the acute-care setting. Rather than turning the family over to another community service or colleague when indicated, second and third home visits are being considered. These additional visits would assure a greater opportunity for primary prevention in the care of the total family. Hospital management and home-care maternity nurses have found that postpartum visits have decreased the need for parents to return to the emergency room or the hospital. Problems have been anticipated or assessed and nursing intervention provided on the home visit. This service gradually is becoming available to more families, with both physical and psychosocial needs being considered. It is hoped that it soon will be provided to all families. Postpartum families, nurses, and nursing students benefit from follow-up postpartum visits in the home. The families are assisted in their parenting roles and nurses gain satisfaction in providing continuity of care.

**The effect of sibling visitation on bacterial colonization rate in neonates.**

Wranesh BL  
JOGN Nurs ,Jul-Aug 1982, 11 (4) p211-3, ISSN 0090-0311  
Journal Code: KS2  
Languages: ENGLISH

The effect of postpartum sibling visitation on the incidence of bacterial colonization in neonates was investigated in a 32-bed obstetrical unit of a midwestern university hospital. Siblings, following a temperature check, handwashing with a Hibiclens solution, and the donning of a patient covergown, were allowed unrestricted interaction with the infant. Statistical analysis of discharge cultures of nares and umbilici revealed that there was no significant difference between the control group and the experimental group. There was no difference between the two groups in the chart audit for postnatal infection at the first pediatric visit. Data analysis supported the hypothesis that sibling visitation does not increase bacterial colonization in neonates.

**Assessment and training of clinical interviewing skills: analogue analysis and field replication.**

Iwata BA; Wong SE; Riordan MM; Dorsey MF; Lau MM  
J Appl Behav Anal ,Summer 1982, 15 (2) p191-203, ISSN 0021-8855  
Journal Code: HDR  
Languages: ENGLISH

Two studies were conducted to assess the train clinical interviewing skills. In Experiment 1, eight university practicum students ("therapists") and either role played or volunteer "clients" were audiotaped during simulated interviews. Following the collection of baseline data on both therapist and client responses, training was provided by way of written materials, classroom instruction and practice, and quizzes. Results of a multiple baseline design across subjects showed improvements in therapists' interviewing skills and subsequent increases in client responding. Experiment 2 replicated and extended the research to a hospital outpatient clinic, in which therapists interviewed the parents of children with behavior problems. In addition, four months following the completion of Experiment 2, follow-up data collected during a maintenance condition showed continued high levels of therapist and client behavior. Finally, a panel of expert peers indicated that each response category was judged highly relevant to the behavioral assessment process.

**Referral patterns of childhood brain tumors in the state of Connecticut.**

Duffner PK; Cohen ME; Flannery JT  
Cancer ,Oct 15 1982, 50 (8) p1636-40, ISSN 0008-543X  
Journal Code: CLZ  
Contract/Grant No.: N01CP61002  
Languages: ENGLISH

Data from the Connecticut Tumor Registry (1968-1979) were analyzed to determine whether referral patterns influenced survival rates in children with brain tumors. Two-hundred-seventy-eight children with brain tumors were identified. Less than one-third of the children received all their treatment at university cancer centers. An actuarial analysis of survival rates revealed that children with medulloblastomas treated solely at university cancer centers had projected five-year survival rates of 7.4%. Children with medulloblastomas treated solely at community hospitals had projected five-year survival rates of 29%. Children with brainstem gliomas treated at university cancer centers had projected five-year survival rates of 40% whereas of those children treated at community hospitals only one patient was alive at 13 months. No major differences in survival were identified among children with other tumor types. These data suggest that children with certain types of brain tumors may fare better when treated at university cancer centers.

**Sydney Eye Hospital.**

Price L

Br J Ophthalmol ,Oct 1982, 66 (10) p617-21, ISSN 0007-1161 Journal Code: AZK

Languages: ENGLISH

This year, 1982, marks the centenary of the Sydney Eye Hospital, originally the ophthalmic department of the old Sydney Infirmary, which was founded with the settlement of the Colony in 1788. Established in 1882, the hospital was transferred to its present site 60 years ago, and it still provides ward accommodation. After alternating periods of stagnation and progress the new hospital (stage 1) was completed in 1974, with modern clinic and research facilities.

It is now the largest eye hospital in the southern hemisphere and is a first-class referral centre with an annual attendance of 75,000. The Department of Ophthalmology, University of Sydney, is based at the hospital, providing undergraduate instruction and a comprehensive postgraduate training programme for Australian ophthalmologists and others in more distant continents.

Lion J; Altman S

Health Care Financ Rev ,Sep 1982, 4 (1) p89-98, Journal Code: GHX

Languages: ENGLISH

The belief that patients seen in hospital outpatient departments are sicker than those patients seen by private practice physicians is examined in this article. A large scale data set developed by Robert Mendenhall at the University of Southern California and modeled on the National Ambulatory Medical Care Survey (NAMCS) is used for secondary analysis. Differences in case-mix complexity were found to be slight, using two separate techniques.

**Epidemiology of nosocomial infections caused by methicillin-resistant Staphylococcus aureus.**

Thompson RL; Cabezudo I; Wenzel RP

Ann Intern Med ,Sep 1982, 97 (3) p309-17, ISSN 0003-4819 Journal Code: 5A6

Contract/Grant No.: 5T32A107046

Languages: ENGLISH

Outbreaks of hospital-acquired infections caused by methicillin-resistant Staphylococcus aureus are being recognized with increasing frequency in the United States. Two thirds of outbreaks have been centered in critical care units.

Infected and colonized inpatients appear to be the major institutional reservoir, and transient carriage on the hands of hospital personnel appears to be the most important mechanism of serial patient-to-patient transmission. In over 85% of hospitals into which they have been introduced, methicillin-resistant strains of S. aureus have become established as endemic nosocomial pathogens. A program designed to control a widespread outbreak in a university hospital used three surveillance methods to identify the major institutional reservoir of colonized and infected inpatients. Daily clinical laboratory surveillance, monthly prospective microbiology surveys of high-risk inpatients, and the recognition of previously infected 38%, 31%, and 31% of new cases, respectively. After control measures were instituted, the prevalence (p less than 0.001) and the number of acquisitions (p less than 0.002) of methicillin-resistant S. aureus declined over a 12-month period.

**The emergence of methicillin-resistant Staphylococcus aureus infections in United States hospitals. Possible role of the house staff-patient transfer circuit.**

Haley RW; Hightower AW; Khabbaz RF; Thornsberry C; Martone WJ; Allen JR; Hughes JM  
Ann Intern Med .Sep 1982. 97 (3) p297-308. ISSN 0003-4819 Journal Code: 5A6

Languages: ENGLISH

Infections with methicillin-resistant strains of Staphylococcus aureus appear to be occurring with increasing frequency in some U.S. hospitals about a decade after a similar increase in Britain and other countries. In the United States, clustered methicillin-resistant S. aureus infections reported in scientific journals and in three hospital surveys have been almost entirely in large, tertiary referral hospitals affiliated with medical schools. Among 63 hospitals regularly reporting infections from 1974 to 1981 in the National Nosocomial Infections Study, the increase in methicillin-resistant S. aureus infections was entirely due to substantial increases in only four hospitals, all of which were large, tertiary referral centers affiliated with medical schools. The predominance of methicillin-resistant S. aureus infections in these large hospitals may be due to the large numbers of patients at high risk of infection and to the interhospital spread of the organism by the transfer of infected patients and house staff from similar hospitals or from nursing homes.

**The Northwestern University Drug Dependence Program: the impact of intensive prenatal care on labor and delivery outcomes.**

Rosner MA; Keith L; Chasnoff I  
Am J Obstet Gynecol .Sep 1 1982. 144 (1) p23-7. ISSN 0002-9378 Journal Code: 3NI

Languages: ENGLISH

In 1976, the Department of Obstetrics and Gynecology at the Prentice Women's Hospital was invited to provide obstetric services to patients of the Drug Dependence Program administered by the Department of Psychiatry at Northwestern University Medical School. Patients were referred in the early stages of pregnancy if they agreed to participate in the Drug Dependence Program at the same time. Between April, 1976, and October, 1980, 58 women received prenatal, intrapartum and postpartum care. Forty-two of these patients had been abusers of opiates; 16 were polydrug abusers. The obstetric performance of these women was characterized by an absence of major problems. The mean weight of all infants delivered was 2,935 gm. There were no perinatal deaths. The individual weights, lengths, and head circumferences of the newborn infants were distributed in a relatively normal manner. Ninety percent of the infants were delivered at 37 weeks or more of gestation.

**Team approach in providing clinical pharmacokinetic services.**

Maddox RR; Lampasona V  
Am J Hosp Pharm .Jul 1982. 39 (7) p1186-9. ISSN 0002-9289 Journal Code: 310  
Languages: ENGLISH

A team approach to clinical pharmacokinetic services at a university hospital is described. The clinical pharmacokinetics team (CPT) developed as an outgrowth of a clinical pharmacokinetic service (CPS) as the workload of the service expanded. The CPT serves to: (1) maximize the quality and continuity of clinical pharmacokinetic care; (2) provide a teaching medium for students at the baccalaureate and graduate level; and (3) stimulate the development of clinical pharmacokinetic research. The CPT is responsible for patients in those medical services that are not regularly served by a clinical pharmacist. The structure of the CPT includes an attending clinical pharmacist with a hierarchy of subordinate practitioners ranked by their individual didactic and clinical experience in pharmacokinetics. Students participate in (1) work rounds, where collective discussions of patient evaluations occur, and (2) one-to-one student-preceptor clinical assessments of patients' drug therapy. The attending clinical pharmacist conducts CPT rounds daily, and the students and residents must convey information to the team on: (1) the drug therapy prescribed and the appropriate monitoring methods, (2) the working diagnosis and plan of treatment, (3) results of laboratory and clinical assessments, and (4) details of patient interviews. The CPT is also responsible for ongoing clinical pharmacokinetic research. The team approach to clinical pharmacokinetic services has provided a framework for the education of clinical pharmacists while stimulating research and providing direct patient care.

**A financial planning model for estimating hospital debt capacity.**

Hopkins DS; Heath D; Levin PJ  
Public Health Rep ,Jul-Aug 1982, 97 (4) p363-72, ISSN  
0033-3549 Journal Code: QJA  
Languages: ENGLISH

A computer-based financial planning model was formulated to measure the impact of a major capital improvement project on the fiscal health of Stanford University Hospital. The model had to be responsive to many variables and easy to use, so as to allow for the testing of numerous alternatives. Special efforts were made to identify the key variables that needed to be presented in the model and to include all known links between capital investment, debt, and hospital operating expenses. Growth in the number of patient days of care was singled out as a major source of uncertainty that would have profound effects on the hospital's finances. Therefore this variable was subjected to special scrutiny in terms of efforts to gauge expected demographic trends and market forces. In addition, alternative base runs of the model were made under three distinct patient-demand assumptions. Use of the model enabled planners at the Stanford University Hospital (a) to determine that a proposed modernization plan was financially feasible under a reasonable (that is, not unduly optimistic) set of assumptions and (b) to examine the major sources of risk. Other than patient demand, these sources were found to be gross revenues per patient, operating costs, and future limitations on government reimbursement programs. When the likely financial consequences of these risks were estimated, both separately and in combination, it was determined that even if two or more assumptions took a somewhat more negative turn than was expected, the hospital would be able to offset adverse consequences by a relatively minor reduction in operating costs.

A questionnaire was developed to obtain information from the graduates of the Marquette University Program in Physical Therapy from 1956, the year the program was established, to 1980. The response rate was 65 percent, with 433 graduates from 25 classes returning the questionnaire. The profile derived from the responses is of a graduate who remains employed in physical therapy full time or part-time, is satisfied with the undergraduate preparation received, and is a member of the American Physical Therapy Association. Compared with other studies, this survey reveals that lower percentages of physical therapy graduates are employed in hospital settings, higher percentages are earning graduate credits, and the dropout rate from the profession has decreased significantly. Other information obtained from the

questionnaire is presented relating to demographics, continuing education, and participation in professional organizations.

J Trauma ,Aug 1982, 22 (8) p703-5, ISSN 0022-5282  
Journal Code: KAF  
Languages: ENGLISH

Therapeutic results from extremity vascular injuries have been improved by early definitive care by surgeons trained in peripheral vascular techniques. Serious venous injuries are uncommonly seen other than in large urban referral centers or military installations. Seventeen patients with major femoral venous injuries were evaluated over the past 25 years at the North Carolina Memorial Hospital. The records from these patients were analyzed regarding mechanisms of injury, time delay for definitive care, clinical presentation, significant associated injuries, operative management of the venous injury, early and long-term morbidity, and mortality. Major femoral venous injury was associated with simultaneous arterial injury in 59% of cases. Primary venous repair was performed in seven cases with a satisfactory functional result in all instances. Chronic venous insufficiency developed in five patients (29%), all of whom had arterial injuries and venous ligation. Postoperative complications were commonly related to associated injuries. No patient in this series developed thrombophlebitis or a pulmonary embolus. Isolated femoral vein injuries are usually associated with both early and late favorable results. Femoral vein ligation in the presence of arterial injuries usually leads to serious long-term venous disability. When technically feasible,

operative repair of major femoral vein injuries is advocated.

**[The incidence of congenital malformations. A five-year study carried out in a Paris maternity unit (author's transl)]**

Frequence des malformations a la naissance. Etude d'une maternite parisienne pendant cinq ans.  
Roux C; Migne G; Mulliez N; Youssef S  
J Gynecol Obstet Biol Reprod (Paris) ,1982, 11 (2)  
p215-26, Journal Code: IAZ

Languages: FRENCH Summary Languages: ENGLISH  
The congenital malformations arising out of 13,335 deliveries that occurred over the course of five years in the University Clinic of Gynecology and Obstetrics in the hospital of Saint-Antoine were recorded. Their overall frequency was 3.37%. Details are given of each malformation. Often malformations are linked to perinatal mortality (14.2% of stillbirths are malformed). There was no difference to be found between different ethnic groups. Pathological developments in previous pregnancies were not particularly frequent. Bleeding in the first trimester of pregnancy was significantly more frequent in congenital abnormalities.

**[A review of six years use of a computerised case history in obstetrics (author's transl)]**

Bilan de six ans d'exploitation d'un dossier informatise en obstetrique.

de Mouzon J; Mandry J; Baron M; Grandjean H; Reme JM; Monrozies M; Pontonnier G

J Gynecol Obstet Biol Reprod (Paris) ,1982, 11 (2) p201-13. Journal Code: IAZ

Languages: FRENCH Summary Languages: ENGLISH

The University Centre for Gynaecology and Obstetrics in Toulouse have been using a computerised record system for obstetrics since 1974. This makes it possible for a review for a review to be undertaken each year of the work carried out in the Service and has made it possible to study over six years the evolution of the characteristics of the population who have been followed, as well as the changes in attitudes and techniques adopted during pregnancy and labour. A study has been carried out on the factors associated with perinatal mortality and prematurity. Computerisation of 13,500 records has made it possible to draw curves of birth weights, according to the duration of the pregnancy, and characterising the service given. Finally the adoption of a prospective record system used in common by several teams and checked by people specialised in this work has improved the quality and quantity of retrieval and has made it possible to foresee cooperative studies between different departments.

**Family orientation: initiating patients and their families to psychiatric hospitalization.**

Scharfstein B; Libbey M

Hosp Community Psychiatry ,Jul 1982, 33 (7) p560-3, ISSN 0022-1597 Journal Code: GCU

Languages: ENGLISH

Multiple family groups have been used for some time as a treatment for hospitalized psychiatric patients. However, there is no indication that they have been used in orienting patients and their families during the traumatic initial period on the inpatient ward. The authors describe the use of family orientation group meetings on the psychiatric inpatient ward of a university hospital. The theoretical bases of the group format are explained and the kinds of information relayed to parents and patients are outlined. The authors believe that use of one-time orientation meetings can help turn the crucial initial period into a therapeutic gain for the patient.

**Development of a model practice for pediatric residents. Economic and administrative considerations.**

Mankad VN; Shell RT

Clin Pediatr (Phila) ,Sep 1982, 21 (9) p519-24, ISSN 0009-9228 Journal Code: DHE

Contract/Grant No.: 5528 PE 14236-04

Languages: ENGLISH

A model pediatric residents' group practice which functions independently of the hospital administration and, to a large extent, of the university administration was developed for the specific purpose of training pediatric residents. During the second year of operation (1981), the residents' group practice met 91 per cent of all expenses, including faculty and resident salaries. The residents' group practice shares many characteristics of private practice (e.g., continuity of physician-patient relationship, appointment keeping, efficient patient flow, and physician participation in practice management). Through their involvement in the management of the practice, residents learn about socioeconomic aspects of pediatric practice and learn how to provide affordable primary care of high quality. Suggestions for developing similar models elsewhere are described.

**Patient satisfaction with outpatient pharmaceutical services.**

Somani SM; Daniels CE; Jermstad RL  
Am J Hosp Pharm ,Jun 1982, 39 (6) p1025-7, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

Patient characteristics and satisfaction with outpatient pharmaceutical services at a large university hospital were assessed. A mail questionnaire was sent to 700 outpatients selected at random. Most questions had fixed-format answers. Of the 388 (58%) returned surveys, 335 (50%) were usable. A large segment of the respondents (40%) were between the ages of 18 and 34. Fifty-nine percent of the respondents paid for their own prescriptions, and this group was less likely to fill their prescriptions at the university pharmacy. Of the patients who received prescriptions but did not have them filled at the university, 29% were unaware of the existence of the pharmacy, 36% found the pharmacy inconvenient for refills, and 21% thought that the waiting time to get their prescriptions filled was too long. Of the respondents who received prescriptions, 46% had them filled at the university pharmacy. Convenience (55%), availability of medications (19%), and low prices (12%) were the major reasons given for going to the university pharmacy. No association was found between the distance from the university and the internal retention rate for prescriptions. Of those who went to the university pharmacy, 94% were satisfied with the services they received.

**The role of the psychiatrist in the general hospital. I. Investigation and analysis pertaining the status of the psychiatrist in the general hospital.**

Hashimoto M; Kano R  
Tokai J Exp Clin Med ,Mar 1982, 7 (2) p181-6, ISSN  
0385-0005 Journal Code: VZM  
Languages: ENGLISH

Data for this study consisted of answers to a series of questions on the image of clinical psychiatry addressed to all the non-psychiatric clinicians in the Tokai University Hospital, and all the referral sheets for psychiatric consultation from non-psychiatric departments of the hospital for about 2 years since the beginning of the hospital's operation. The reaction was analysed as follows: (1) psychiatric services were requested for the reasons of "no organic abnormality" or for "differential diagnosis" in 59.4% of total referrals, (2) as many as 37.9% of non-psychiatric clinicians made no attempt to refer the patient to psychiatrists in spite of their recognition that these patients apparently needed psychiatric treatment, (3) trouble in doctor-patient relationship, if it was the real reason for asking for psychiatric services, was frequently not mentioned in the referral sheet, and (4) the reason for psychiatric consultation was rarely told clearly to the patient. On the basis of the above-mentioned findings, the role of the

psychiatrist in the general hospital setting was reexamined.

**[Use of drugs in a medical polyclinic]**

L'usage des médicaments dans une policlinique de médecine.  
Tigretti T; Berthoud S; Dayer P; Fabre J  
Schweiz Med Wochenschr ,May 15 1982, 112 (20) p706-13,  
ISSN 0036-7672 Journal Code: UEI  
Languages: FRENCH Summary Languages: ENGLISH

The medical prescriptions of 18 house officers working at the Polyclinique Universitaire de Médecine in Geneva were analyzed for a period of 17 working days and provide insight into drug therapy chosen for 2194 outpatients at 2694 consultations. These patients were prescribed an average of 1.39 drugs each or 1.13 per call. Of the 298 different drugs thus prescribed, the following were chosen most frequently (in decreasing order): Digoxin, Hygroton, Lexotanil, Metamucil, Voltaren, Aspirin, different insulins and Aldomet. Antimicrobial agents accounted for only 2.5% of all prescriptions, while vitamins and "fortifiers" represent an even lower percentage. It would be possible to limit the number of drugs, since half of the prescriptions cover 23 drugs and 90% of all prescriptions cover 119 drugs. Prescription patterns vary markedly from one subspecialty of internal medicine to another, but also between physicians working in the same field. House officers in charge of given sectors of the city (internists not working in a subspecialty) may thus prescribe between 1.83 and 2.9 drugs per patient, whereas the number of drugs chosen may vary between 81 and 134. Some quaint individual preferences for drugs were also noted and the trend is analyzed. The data is compared with results of the few existing similar studies and offers food for thought on prescription habits, directed ultimately towards a more rational approach to drug therapy for outpatients.

**[Effect of premature birth risk and prenatal care on the maturity and morbidity of the newborn infant]**

Einfluss von Frühgeburtsrisiko und Schwangerenbetreuung auf Reife und Morbidität der Neugeborenen.

Coradello H

Pediatr Pado1 .1982, 17 (2) p445-55, ISSN 0030-9338  
Journal Code: DDY

Languages: GERMAN Summary Languages: ENGLISH

Risk of premature birth was evaluated according to the prematurity risk score proposed by Thalhammer 1973 in 610 newborn infants hospitalized during 1974 to 1979 at the Division of Neonatology and Congenital Disorders of the Department of Pediatrics, University of Vienna. 324 infants had a birth weight of less than 2501 grams and 286 infants a birth weight of more than 2500 grams. Prematurity risk was compared with regard to prenatal care to birth weight and gestational age as well as to the duration of hospital stay, the incidence of respiratory distress syndrome, the need of ventilatory support and the mortality rate. Quality of prenatal care was judged from the frequency of medical attendances obtained during pregnancy. Less than 0,5 medical visits for 4 weeks were classified as bad prenatal care, more than 0,8 visits as good prenatal care. At any prematurity risk newborn infants from pregnancies with good prenatal care had a higher gestational age and a higher birth weight. They also had shorter hospital admissions, less frequent a respiratory distress syndrome or the need for ventilatory support and a lower mortality rate. The benefit of good prenatal care was supported further by the finding that important individual risk factors as well as the total prematurity risk score was the same in infants without respiratory distress syndrome but birth weights below 2501 grams as well as in infants with the respiratory distress syndrome in infants with ventilatory support and in infants who died. The mothers on the other hand of the healthy newborn infants weighing below 2501 grams shared significantly more medical attendances during pregnancy.

**Epidemic of hospital-acquired infection due to methicillin-resistant Staphylococcus aureus in major Victorian hospitals.**

Pavillard R; Harvey K; Douglas D; Hewstone A; Andrew J; Collopy B; Asche V; Carson P; Davidson A; Gilbert G; Spicer J; Tosolini F

Med J Aust .May 29 1982, 1 (11) p451-4, ISSN 0025-729X  
Journal Code: M26

Languages: ENGLISH

During 1979, the Victorian Health Commission received reports of a rising proportion of methicillin-resistant Staphylococcus aureus (MRSA) isolates from an increasing number of institutions. At least 31 metropolitan hospitals were involved, and six of these reported MRSA totaling between 20% and 40% of all Staph. aureus isolates. Since that time, the problem has continued. In some university teaching hospitals, strains of MRSA now cause from 200 to 300 new cases of hospital-acquired infection each year. Sepsis occurs mainly in patients who underwent surgery, premature neonates and in the immunocompromised or debilitated patients. The organism involved is multiresistant. Recent isolates show increasing resistance, particularly against gentamicin, chloramphenicol and, more lately, fusidic acid and rifampicin. Only vancomycin can be relied upon for empirical treatment. There is concern that increasing use of vancomycin will select vancomycin-resistant strains of MRSA, so that, in the near future, there may no longer be any effective antibiotic therapy against hospital staphylococci.

**Psychiatric consultations at medical and surgical wards: the role of psychiatric consultant.**

Mimoto K; Nishiura K; Tominaga K; Matsushima M; Kono R; Kato Y; Ogata R; Hikita K

Folia Psychiatr Neurol Jpn .1982, 36 (1) p17-22. ISSN 0015-5721 Journal Code: F3R

Languages: ENGLISH

A one-year survey was conducted on the psychiatric consultation work at Kyushu University Hospital. It was found that an organic brain syndrome was the most frequent psychiatric diagnosis of the referred patients. The most frequent purpose of request for psychiatric consultations was for the management of the patient. The main consultant functions were diagnoses and to advise on the management of the patient. The consultant functions agreed with the purposes of request in many cases, but discrepancies between the two were found about the patient disposition. The nature of the consultant role was compared with some American studies. It was deemed necessary that consultation-liaison psychiatry based on Japan's present conditions, medical and social, should be developed.

**Follow-up of 40,000 infants screened for hearing defect.**

Feinmesser M; Tell L; Levi H

Audiology .1982, 21 (3) p197-203. ISSN 0020-6091 Journal Code: 90V

Languages: ENGLISH

During a 7-year period beginning in 1967, approximately 40,000 infants born in Jerusalem were screened for hearing impairment. The hearing of all infants who visited the well-baby clinics at the age of 7-9 months (85% of the child population) was tested and a set of selective criteria was applied to them to detect the children at risk of hearing impairment. Those children suspected of having a hearing impairment were followed up at the Speech and Hearing Center of the Hadassah University Hospital. 69 children were identified as having substantial hearing impairment (moderate to profound); the distribution of risk factors among them is presented. Rehabilitation was carried out from infancy to preschool age, at which time the children were enrolled in suitable educational frameworks. The role of the parents was crucial. At the age of 6 years, many of the hearing-impaired children were integrated into the elementary school system;

others attended the School for the Deaf or special institutions. The distribution of the hearing-impaired children in the various school systems is discussed.

**Personal characteristics of house staff candidates: a quantitative analysis of relative weights.**

Greganti MA; McGaghie WC; Finn WF

Ann Intern Med .Jul 1982, 97 (1) p108-11. ISSN 0003-4819 Journal Code: 5A6

Languages: ENGLISH

We surveyed the faculty, fellows, and residents of a department of medicine to determine the relative importance of each of eight personal characteristics evaluated during the interview of house staff candidates. A booklet containing all possible pairings of the eight characteristics was distributed to 219 participants who were asked which member of each pair should have greater weight for assigning an overall interview grade. Usable data were returned by 172 persons (79%) and analyzed by the psychometric scaling method of paired comparisons. The four characteristics with the greatest relative weights were professional attitude, maturity, enthusiasm and energy, and knowledge. The faculty, fellows, and residents were highly consistent in their judgments. However, three of the characteristics (motivation for clinical practice, knowledge, and verbal skill) significantly distinguished the three departmental groups. These results show that utility of the paired comparison method for identifying a department's weighting of variables for selection of house staff.

**Early surgical excision versus conventional therapy in patients with 20 to 40 percent burns. A comparative study.**

Gray DT; Pine RW; Harnar TJ; Marvin JA; Engrav LH; Heimbach DM

Am J Surg, Jul 1982, 144 (1) p76-80, ISSN 0002-9610  
Journal Code: 3Z4

Languages: ENGLISH

Using the records of 72 patients treated at the University of Washington Burn Center, this study compared the results of early surgical excision (by 14 days postburn) and autografting to those of autografting after spontaneous separation and bedside debridement of burn eschar. Excised patients had shorter hospitalizations and lower rates of burn wound sepsis and serious burn wound contamination, and less use of potentially toxic antibiotics (p less than 0.05) than did the prognostically equivalent group treated before the introduction of early excision. Excised patients required more blood transfusions (p less than 0.05), but did not differ significantly from controls in rates of mortality or other inpatient complications, in the number of operations performed, or in the adjusted hospital costs. Evaluation of patients treated over the entire study period for more shallow burns indicated no concurrent change in other aspects of burn care which might account for the observed results. We conclude that early excision and grafting in young, otherwise healthy patients with 20 to 40 percent total body surface area burns that are likely to heal within 3 weeks is more effective than the more traditional management of slow wound separation and debridement.

0211746 82227834

**Very low-birth weight infant. I. Influence of place of birth on survival.**

Cordero L; Backes CR; Zuspan FP

Am J Obstet Gynecol, Jul 1 1982, 143 (5) p533-7, ISSN 0002-9378  
Journal Code: 3NI

Languages: ENGLISH

In order to assess the influence of place of birth on the survival of the very low-birth weight (VLBW) infant, premature deliveries that occurred at hospitals located in an urban county were studied. All premature infants born alive during the years 1977 through 1979 whose birth weights ranged from 500 to 1,250 gm were included. The outcome for the VLBW infants born at the Ohio State University Regional Perinatal Center (OSU-RPC) was compared to that for VLBW infants delivered at the other five community hospitals with maternity services. Thirty-eight percent of the 270 VLBW neonates born at the community hospitals and 53% of the 186 VLBW premature infants delivered at the OSU-RPC survived. These differences are statistically significant at the p less than 0.01 level. Delivery at a perinatal center where comprehensive maternal-fetal-neonatal services are available improves survival for the VLBW infant.

**Diagnostic utility of carboxyl-terminal and intact parathyroid hormone immunoassays in hospitalized patients.**

Juan D; Wehrmeister J

Am J Clin Pathol, Jun 1982, 77 (6) p720-5, ISSN 0002-9173  
Journal Code: 3FK

Languages: ENGLISH

In a university-affiliated community hospital, medical records of 58 patients on whom the intact parathyroid hormone immunoassay (I-PTH) and 29 patients on whom both the carboxyl terminal PTH(C-PTH) and I-PTH ordered by physicians were reviewed to determine the reasons for requesting these tests. Reasons for ordering the PTH tests include (1) the evaluation of hypercalcemic patients (25/58 I-PTH); (2) the evaluation of hypocalcemic patients (2/58 I-PTH); (3) to rule out primary hyperparathyroidism in normocalcemic stone formers (4/58 I-PTH, 4/29 C-PTH) and in those with abnormal skeletal x-ray (3/48 I-PTH, 1/29 C-PTH); (4) to follow patients with chronic renal failure on dialysis (11/58 I-PTH, 9/29 C-PTH); (5) to rule out ectopic hyperparathyroidism in patients with cancer (2/58 I-PTH, 3/29 C-PTH); (6) to satisfy physicians' intellectual curiosity of patients with diabetes mellitus (3/58 I-PTH, 3/29 C-PTH) and obesity (5/58 I-PTH, 6/29 C-PTH); (7) to evaluate acute renal failure (1/29 C-PTH). In 3/58 patients on whom I-PTH tests were ordered, reason(s) could not be determined. The C-PTH was elevated in 9/9 patients with chronic renal failure, 4/6 obese patients, 2/3 patients with cancer, 1/3 diabetic patients, 1/4 stone formers, 2/2 patients with primary hyperparathyroidism. Patients with chronic renal failure had the highest C-PTH. Based on well established indications for ordering the PTH immunoassays, 25 out of 58 (43%) of I-PTH and 9 out of 29 (31%) of C-PTH ordered are inappropriate.

**Cancer patient accessions into clinical trials: a pilot investigation into some patient and physician determinants of entry.**

McCusker J; Wax A; Bennett JM  
Am J Clin Oncol , Apr 1982, 5 (2) p227-36, ISSN  
0277-3732 Journal Code: 3E2  
Contract/Grant No.: CA-11083; CA-11198  
Languages: ENGLISH

This study investigated the external validity (or generalizability of results) of randomized clinical trials in cancer. Two ECOG lung cancer chemotherapy protocols active in the early 1970s were studied using a case-control design. All lung cancer patients of the four specified cell types resident in Monroe County during the ECOG study period were identified from the Rochester Regional Tumor Registry. All of the patients entered into either protocol ("ECOG cases") and a random sample of the nonprotocol cases were examined by medical records review. Thirty-seven percent of the nonprotocol cases were determined to have been eligible for either of the two ECOG protocols, but not entered ("eligible controls"). A comparison of the ECOG cases (n = 65) and the eligible controls (n = 109) revealed that (1) ECOG cases were more likely than eligible controls to have been diagnosed at a hospital which participated in the University of Rochester Cancer Center's medical oncology program; (2) ECOG cases were of higher occupational status than eligible controls; (3) duration from diagnosis to protocol entry for ECOG cases was longer than duration from diagnosis to earliest date of eligibility for eligible controls. The implications of these findings for the conduct of cancer clinical trials are discussed.

**Pain treatment in a palliative unit or team of a university hospital.**

Scott JF  
Acta Anaesthesiol Scand [Suppl] , 1982, 74 p119-23, ISSN  
0515-2720 Journal Code: 080  
Languages: ENGLISH

A Palliative Care Unit and Team provides a model for delivering care, in which narcotic analgesics can be optimally effective in the treatment of cancer pain. Our rapidly expanding knowledge of pain physiology and narcotic pharmacokinetics will not benefit patients unless we design more appropriate organizational structures to implement therapy and to teach symptom control. The Palliative Care Service model, as developed at several university hospitals in Canada, is designed to assist and complement oncology departments. Its primary role is to provide a consultation service to cancer patients wherever they may be in the health care system (home, O.P.D., hospital). A multi-specialty and interdisciplinary team offers assessment and therapy of pain and other symptoms. The McGill Pain Questionnaire is one useful tool in evaluating pain treatment. The Service also provides the university with a Palliative Care Unit designed

for patients with advanced cancer who have complex symptomatology. Hospital organization must reflect the fact that environmental and psychosocial factors alter pain perception and response. Oral morphine is more effective when administered in a Palliative Care Unit than when it is given to patients in other settings. The Unit provides personnel skilled in analgesic titration and a supportive environment in which psychological, social and spiritual components of the pain experience can be evaluated and treated.

**[Molestation of patients and personnel in noise-exposed gynaecological hospital (author's transl)]**

Zur Larmbelastigung von Patienten und Personal in einer larmexponierten Frauenklinik.  
Hergt R; Oll M; Woelk M; Franz RD; Schwarz R  
Zentralbl Gynakol , 1982, 104 (6) p368-74, ISSN  
0044-4197 Journal Code: Y5S

Languages: GERMAN Summary Languages: ENGLISH

Noise levels were measured in the Gynaecological Hospital of the University of Rostock. Patients, medical doctors, and nurses were interviewed on their own molestation. The equivalent permanent sound level, Leq, was 63.5 dB (AI) on average in patient rooms on daytime, while the average night value was 59.8 dB (AI). Maximum sound pressures, Lmax, varied between 55 and 80 dB (AI) in patient rooms. An Lmax of 85 dB (AI) was measured on a ward corridor, when instruments were cleaned in the wash-basin of a service room. Molestation by outdoor noise was reported by 88 per cent of 85 patients interviewed, while 29 per cent felt disturbed by indoor noise. The noise was perceived as disturbing also by the personnel. While the gravest role for the hospital investigated by played by outdoor noise, greatest attention should be given also to the control of indoor noise.

**[A report on two year of ophthalmological work in Kenya (author's transl)]**

Über unsere ophthalmologische Tätigkeit in Kenia. Ein Zweijahresbericht.

Klauss V; Dechant W

Klin Monatsbl Augenheilkd ,Feb 1982, 180 (2) p180-3, ISSN 0023-2165 Journal Code: KWA

Languages: GERMAN Summary Languages: ENGLISH

After two years' work as lecturers in ophthalmology at the University of Nairobi we report on our experiences in both teaching as well as outpatient and inpatient-care at the Kenyatta National Hospital. Special emphasis is given to the socio-economical background of the public health service in Kenya, to point out the special aspects of day-to-day medical work as well as the different needs of a postgraduate program in ophthalmology in this country. The main purpose of our work, supported by the Federal German Ministry of Economic Cooperation, Munich University Eye Clinic and many other organizations, was to train ophthalmologists in their own country. Finally, medical research programs currently in progress and concerning special aspects of tropical ophthalmology are reported on. These studies are designed to help find a solution of the problem of blindness, which is briefly analysed, and which is much more urgent in Kenya than in Western Europe.

**Clinical use of radionuclide bone imaging in a university medical center.**

Fihn SD; Larson EB; Rudd TR; Nelp WB

JAMA ,Jul 23 1982, 248 (4) p439-42, ISSN 0098-7484  
Journal Code: KFR

Languages: ENGLISH

To assess the diagnostic utility of radionuclide bone imaging, we reviewed all examinations performed during a two-year period in a university medical center. The indication(s) for each bone image and its interpretation were compared by reviewing requisition forms and medical records. Thirty-nine percent of 988 studies demonstrated relevant abnormalities. Yields of pertinent positive findings were greatest in patients with cancers of the breast (40%) and prostate (38%) and lowest in women with uterine cancer (15%), patients with previously normal bone images, and individuals with suspected but unconfirmed malignancy. Incidental findings, unrelated to the indication for imaging, occurred frequently (up to 41% of cases). We did not find a sizable number of negative studies that could readily be labeled as unnecessary, suggesting that bone imaging to generally a useful procedure as applied by physicians in this setting.

**The Med-COR study: preparing high school students for health careers.**

Davis JA; Davidson CP

J Med Educ ,Jul 1982, 57 (7) p527-34, ISSN 0022-2577  
Journal Code: J13

Languages: ENGLISH

Recognizing the need for adequate representation of minorities in the health field, many professional schools initiated special recruitment efforts to attract minority students and developed programs to provide academic enrichment. Between 1971 and 1977, 480 black and Hispanic high school students from four inner-city schools in Los Angeles participated in the Med-COR Program (Medical Counseling, Organizing, and Recruiting) at the University of Southern California School of Medicine. The program was designed to increase the number of minority health professionals by offering enriched courses in the sciences and field experience in hospitals and laboratories. The positive results of a follow-up of 480 Med-COR students support the rationale that the number of minority health professionals can be increased by high school recruitment programs.

There has been little documentation on how to care for the patient with hyperemesis gravidarum. This article presents one method for managing patients with severe hyperemesis gravidarum in the hospital. At MacDonald House of University Hospitals of Cleveland, this method has been used quite successfully for the last five years. The combination of team support, individualized care, supplements created by the dietitian on the basis of patient preferences, and an adapted documented approach for patients with eating aberrations are important aspects of effective management of hyperemesis gravidarum.

**Telemedicine in critical care: problems in design, implementation, and assessment.**  
Grundy BL; Jones PK; Lovitt A  
Crit Care Med ,Jul 1982, 10 (7) p471-5, ISSN 0090-3493  
Journal Code: DTF

Languages: ENGLISH  
We introduced telemedicine, i.e., telecommunications for delivery of health services, to alleviate scarcity and maldistribution of critical care services. For 18 months, we used interactive television to provide consultation with university-based critical care physicians for patients in the ICU of a 100-bed hospital. Telemedicine "visits" (1548) were made to 395 patients. Television consultation had greater clinical and educational impact than consultation using the telephone. Equipment was expensive but proved to be reliable and easy to use. Interactive television extended the availability of specialist expertise, but full exploitation of this technology for delivery of critical care services was not achieved. Extensive background research, currently underway at the University of Pittsburgh, is necessary before the next telemedicine demonstration.

**Treatment outcome and efficiency in surgery.**  
Haig TH  
Can J Surg ,May 1982, 25 (3) p293-6, ISSN 0008-428X  
Journal Code: CKJ  
Languages: ENGLISH

Health gains for patients treated on the surgical service of the University Hospital in Saskatoon have been measured using an illness index matrix and these gains have been related to financial costs. Although many patients benefited, 46.5% did not, either because they suffered self-limiting complaints or because their diseases were beyond the surgeon's ability to help. This 60-bed surgical service generated costs of \$8 million in 1979, of which about \$3 million were for services from which there was little or no gain for the patient. Since 72% of expenditures were for basic bed, board and nursing costs, more exacting use of hospital beds holds the greatest potential for increasing efficiency. There is evidence, too, that our use of medical manpower may be improvident.

**Appointment-keeping behavior and patient satisfaction: implications for health professionals.**

Gunter-Hunt G; Ferguson KJ; Bole GG  
Patient Couns Health Educ .4th Quarter 1982. 3 (4)  
p156-60. ISSN 0190-2040 Journal Code: PAL  
Contract/Grant No.: AM20557  
Languages: ENGLISH

This study examines patient satisfaction with care received in a subspecialty clinic, appointment-keeping behavior in that clinic, and the interrelationships between satisfaction and appointment-keeping compliance. The implications for health education and patient counselling are also discussed. The setting is an outpatient clinic of a large university hospital that serves both an urban and rural population. A mailed questionnaire was returned by 150/270 (56%) patients. While satisfaction and compliance were not significantly related, satisfaction was significantly related to the patient's perception of benefit received as a result of care provided by the clinic.

**Maternal mortality in a major referral hospital, 1926 to 1980.**

Varner MW; Daly KD; Goplerud CP; Keettel WC  
Am J Obstet Gynecol .Jun 1 1982. 143 (3) p325-39. ISSN  
0002-9378 Journal Code: 3NI  
Languages: ENGLISH

This review describes the changes in the causes of maternal deaths in a major referral hospital over a span of 55 years. There has been a significant decline in direct maternal deaths from infection, hemorrhage, and toxemia. Continued vigilance is needed since 58% of direct obstetric deaths in our hospital during the last 30 years were considered to have been preventable. Heart disease and nonobstetric infection as indirect causes of maternal deaths have decreased also. Greater effort is necessary to identify those patients with conditions that predispose to indirect deaths and to provide appropriate contraception, sterilization, early pregnancy termination, or optimal multidisciplinary care in a referral hospital.

**Pharmaceutical services in a veterinary hospital and clinic.**

Jinks MJ; Paulsen LM  
Am J Hosp Pharm .Apr 1982. 39 (4) p619-21. ISSN  
0002-9289 Journal Code: 3IO  
Languages: ENGLISH

The pharmaceutical services offered by hospital pharmacists to a veterinary hospital and clinic are described. At Washington State University, the Department of Veterinary Clinical Medicine and Surgery of the College of Veterinary Medicine approached the College of Pharmacy to evaluate the pharmaceutical services in terms of lost charges and to provide recommendations for needed changes. The records of 18 cases were surveyed, and an inventory was taken in two wards to determine outdated drug products, products without expiration dates, and product duplication. The survey and inventory revealed inefficiencies and waste in the billing and distribution systems. The findings indicated the feasibility and potential cost-effectiveness of employing hospital pharmacists to manage the drug distribution system. A combined floor stock and individual prescription order system was implemented under the direction of a pharmacist faculty member jointly appointed by the two colleges. The distribution system has been in successful operation for two years, and the relationship between the two colleges has prompted the development of shared academic positions and joint clinical research.

**A multisite comparison of student activities in the surgery clerkship.**

Calhoun JG; Davis WK; Erlandson EE; Maxim BR  
Surgery Jun 1982, 91 (6) p622-7, ISSN 0039-6060  
Journal Code: VC3  
Languages: ENGLISH

The purpose of this study was to develop a method that would provide baseline data for the ongoing assessment of surgical clerkships at The University of Michigan Medical School. Of specific concern was the comparability of clerkship experiences among five different sites and the degree of variability in student experiences as the academic year progressed. Students (n = 168) in the required surgery clerkship at five affiliated sites completed a standardized daily log of the time spent on seven patient care activities and five formally structured educational activities for 1 week during each of five rotations. Analysis of variance and the Scheffe method for multiple comparisons were used to determine differences attributable to clerkship site and time of academic year. The results of the study revealed significant site-, rotation-, and activity-specific variations in the surgery clerkship experiences. However, the students at each of the five sites distributed their time almost equally between patient care and formal educational activities. The study has provided a model for assessing variability and change in the surgery clerkship program both within individual sites and across an entire affiliated hospital system. The instruments and methods are presented for adoption by other institutions with similar goals.

Pediatrics May 1982, 69 (5) p621-5, ISSN 0031-4005  
Journal Code: DXV  
Contract/Grant No.: RR-00081  
Languages: ENGLISH

From 1961 to 1976, 229 infants with birth weights ranging from 751 to 1,000 gm were admitted to the Stanford University Hospital Intensive Care Nursery. The overall neonatal mortality for these infants was 63% (144/229), and there were ten late deaths. Before 1967, no infant in this group who required mechanical ventilation survived; thereafter, 30% (34/114) of the ventilated patients survived. Of the 75 long-term survivors 60 participated in a high-risk infant follow-up program; these included 23 infants who had received mechanical ventilation. The mean birth weight of these infants was 928 +/- 67 (SD) gm. Seventeen children (28%) had significant morbidity: seven (12%) with severe handicaps and ten (17%) with moderate handicaps. During this same period, seven infants weighing less than 750 gm at birth were also observed. The three infants who had not required ventilatory support thrived; the other four infants had required respirators and were significantly handicapped. More recently, neonatal mortality for infants with birth weights from 751 to 1,000 gm has improved: for 1977 to 1980, it was 28% (33/118). Furthermore, neonatal mortality for ventilated infants in this weight group was 27% (26/95). These data indicate an improved prognosis for very low-birth-weight infants, even with ventilatory support.

**Infection as a predominant cause of perinatal mortality.**

Christensen KK

Obstet Gynecol .Apr 1982. 59 (4) p499-508, ISSN  
0029-7844 Journal Code: DC2

Languages: ENGLISH

During a 15-month period, all 34 infants delivered at the department of obstetrics and gynecology at University Hospital in Lund, Sweden, who died perinatally or neonatally were included in a prospective study of causes of death. Autopsies--including extensive culturing of specimens for bacteria, chlamydia, fungi, mycoplasmas, and viruses--were performed for all infants. Maternal sera obtained during pregnancy and after delivery were examined regarding titers against a number of microorganisms. During the study period, the perinatal mortality rate was 0.60% and the neonatal mortality rate 0.56%. It was found that 37% of the deaths were caused by lethal malformations, 17% by idiopathic respiratory distress syndrome, and 9% by ablatio placentae. However, no less than 21% occurred as a direct consequence of infections, including 2 deaths caused by group B streptococci, 2 by Coxsackie B virus, and 3 deaths each by Hemophilus influenzae, Pseudomonas pyocyanea, and Candida albicans. A 6-month study of late abortions revealed another case of intrauterine group B streptococcal infection. The study has demonstrated that autopsy, including microbial examination, is recommended in all cases of perinatal and neonatal deaths.

**Syncope of unknown origin. The need for a more cost-effective approach to its diagnosis evaluation.**

Kapoor WN; Karpf M; Maher Y; Miller RA; Levey GS

JAMA .May 21 1982. 247 (19) p2687-91, ISSN 0098-7484  
Journal Code: KFR

Languages: ENGLISH

The records of 121 patients hospitalized in Presbyterian-University Hospital, Pittsburgh, during 1976 to

1980 for syncope of unknown origin were reviewed. There were 58 men and 63 women, whose mean age was 63.1 years. Cardiac monitoring in 67 patients showed abnormalities in seven patients, considered diagnostic of the cause of syncope. In 13 patients with electrophysiologic studies, four patients had abnormal results, suggesting a probable cause for the syncope.

Cardiac catheterization in 14 patients showed significant findings that demonstrated the cause of syncope in three patients. Glucose tolerance tests in 37 patients, head computed tomographic scans in 39 patients, radionuclide brain scans in 15 patients, lumbar punctures in 22 patients, and skull roentgenograms in 46 patients did not aid in the diagnosis of the cause of syncope in any patient. In 67 patients, EEGs produced abnormal results in 26, but the role of EEGs in the diagnostic workup of syncope could not be completely defined. The definitive cause for syncope was diagnosed in only 13 of 121 patients, with an average hospitalization of nine days and an average cost of \$2,463 per patient. These findings suggest that an extensive evaluation of syncope is cost-ineffective and that prospective goal-directed approaches need to be developed.

**An integrated university emergency medicine - trauma program.**

Gels WP; Altergott RA; Giacchino JL; Freeark RJ  
 J Trauma .Apr 1982, 22 (4) p295-302, ISSN 0022-5282  
 Journal Code: KAF

Languages: ENGLISH

Systems for prehospital care, emergency medical care, and trauma care clearly overlap educationally, medically, financially, and politically. Most systems have not accomplished separation of this interdisciplinary tangle. To solve this dilemma we have customized an Emergency Medicine and Trauma Service (EM & TS) at a regional trauma medical center. The program (annually): 1)treats 32,000 patients (11,330 are trauma); 2) educates 140 paramedics, residents, students. Physician personnel: Members are fully trained in Internal Medicine, Surgery, or Pediatrics; are members of other academic departments. Each is approved by three chairman: Emergency Department, The physician's specialty, and Surgery. Structure: Board-qualified trauma surgeon always present; other faculty supplement surgical manpower; physicians are salaried; each is responsible to Director of EM & TS; trainees are not included as patient-care manpower. Organization: Academically, EM & TS is a Section of the Department of Surgery; the Section Chief is Director of EM & TS, and is responsible for Emergency Department, prehospital care, and trauma admissions. The solution: A vertical responsibility structure to this multidisciplinary system has provided a successful solution and may be tailored to other systems.

**Nursery epidemic due to multiply-resistant Klebsiella pneumoniae: epidemiologic setting and impact on perinatal health care delivery.**

McKee KT Jr; Cotton RB; Stratton CW; Lavelly GB; Wright PF;  
 Shenai JP; Evans ME; Melly MA; Farmer JD; Karzon DT; Schaffner  
 W

Infect Control .Mar-Apr 1982, 3 (2) p150-6, ISSN  
 0195-9417 Journal Code: GTM

Languages: ENGLISH

Gram-negative bacilli frequently cause epidemics in high-risk newborn intensive care units. Recently, an epidemic caused by a multiply-resistant K. pneumoniae, serotype 21, occurred in the Vanderbilt University intensive care nursery. The background of this outbreak included an increasing endemic nosocomial sepsis rate, operation of the facility in excess of rated capacity, and increasingly inadequate nurse-to-patient staffing ratios. The epidemic lasted 11 weeks; 26 (12%) of the 232 infants at risk in the unit became colonized. Five infants developed systemic illness and one died. Cohorting, reinforcement of strict handwashing and isolation procedures, and closure of the unit to outborn admissions resulted in rapid termination of the outbreak. Followup studies performed on infants colonized with the epidemic bacterium demonstrated persistent fecal shedding up to 13 months following discharge

from the hospital. This epidemic had a detrimental influence on high-risk newborn and obstetric health care delivery in an area encompassing portions of three states. Under a system of progressively more sophisticated referral units, nosocomial infections occurring at a tertiary center can have an impact on other hospitals within the network.

**Professional review of laboratory utilization.**

McConnell TS; Berger PR; Dayton HH; Umland BE; Skipper BF  
 Hum Pathol .Apr 1982, 13 (4) p399-403, ISSN 0046-8177  
 Journal Code: GEC

Languages: ENGLISH

Overutilization of laboratory procedures is a significant problem, particularly in teaching institutions. The purpose of this study was to assess laboratory utilization patterns on the medical service of a university hospital, comparing data from implicit peer review by a pathologist with those from a group of practicing primary care physicians. Also, utilization of the most frequently ordered laboratory tests was compared with that of less common procedures. For charts reviewed both by the pathologist and by a panel of primary physicians, the pathologist found 26.5 per cent of tests unnecessary, while the primary physicians found 42.8 per cent unnecessary. The ten most frequently ordered tests had a significantly higher rate of overutilization than all other tests. Attempts to modify physicians' laboratory utilization should include concomitant peer review of the most commonly ordered procedures.

**Psychiatric manpower and public mental health: Maryland's experience.**

Harbin HT; Weintraub W; Nyman GW; Karahasan A; Book J; Krajewski T

Hosp Community Psychiatry .Apr 1982. 33 (4) p277-81. ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

From July of 1976 through December 1981, 67 psychiatrists who graduated primarily from American medical schools and who had completed university residency training programs were recruited into Maryland's state mental health system. As of 1981, 43 of these psychiatrists still worked in inpatient facilities; they represented 33 per cent of all state hospital psychiatrists in Maryland. The Maryland Mental Hygiene Administration and the University of Maryland have used two general strategies to develop psychiatric manpower and improve employment conditions. They established close linkages between academia and the public sector and demonstrated positive, effective leadership by psychiatrists within the state mental health system.

**Quality of care of epilepsy in Italy: multi-hospital survey of diagnosis and treatment of 1104 epileptic patients.**

Beghi E; Sasanelli F; Spagnoli A; Tognoni G

Epilepsia .Apr 1982. 23 (2) p133-48. ISSN 0013-9580 Journal Code: EIX

Languages: ENGLISH

We surveyed the treatment of 1104 patients admitted to 27 out of the 46 departments of neurology (64.5%), neurosurgery (23.0%), and child neurology (12.5%) of Lombardy, the largest Italian Region (population, 9,000,000). Our main aim was to assess the penetration of correct diagnostic and clinicopharmacological information into routine practice. A detailed analysis and discussion are given to data concerning reasons for hospital admission (therapeutic adjustment accounting for 27.3%; diagnostic ascertainment, 53.8%); characteristics of the disease, in terms of duration, clinical manifestations, and pattern of seizures; associated disorders; prevalence and criteria for the use of instrumental diagnostic procedures (EEG, brain scan, computed tomography, etc.); pattern of prescriptions of anticonvulsant drugs at admission and at discharge, with particular emphasis on specific drug choices by specialty; prevalence of single-drug therapy (41% at admission and 47.0% at discharge) versus polytherapy; degree of correspondence between recommended and observed dosage regimens (undertreatment being a more common problem than excessive dosing); and reporting of side effects. Although some of the findings of some recent studies are confirmed, this report documents the feasibility of a regular audit program of the performance of an entire health care system in the treatment of epilepsy.

**Public health training programs at the University of the West Indies.**Standard KL; Pinnock M; Kumar AK  
Educ Med Salud .1982. 16 (1) p62-8. ISSN 0013-1091  
Journal Code: EDR

Languages: ENGLISH

The Department of Preventive Medicine of the University of the West Indies was established in 1957 with the idea of improving undergraduate teaching facilities to enable medical students to study patients in their homes and social environment. The authors describe the two public health diploma programs available at the University and cite pertinent enrollment and geographic distribution statistics. Candidates for the Diploma in Public Health are registered medical practitioners who take a series of compulsory and elective subjects and have a period of supervised field training and research during the 12-month course. The Diploma in Community Health trains students in the health and diseases of man in his total environment. Students choose among three program options: the general program, specialization in health education, or specialization in health services administration/hospital administration. The general program is the most popular because it gives the student a rounded education suitable to the needs of small states. The 12-month diploma course features the interdisciplinary approach where students from various fields discuss important issues in community health. Comprehensive courses in these areas include health services administration, social sciences, environmental health, epidemiology and biostatistics, family health, communication science, and community mental health. The authors state that the candidate for the Diploma in Community Health is assessed on the basis of course and field work, a special project report, and a final written and oral examination.

**High risk of hospital-acquired infection in the ICU patient.**

Donowitz LG; Wenzel RP; Hoyt JW

Crit Care Med ,Jun 1982, 10 (6) p355-7, ISSN 0090-3493

Journal Code: DTF

Languages: ENGLISH

Patients admitted to the ICU have a higher risk of nosocomial infection than other hospitalized patients. Whereas general medical/surgical ward patients have a 6% overall risk of acquiring an infection during their hospital stay, critically ill patients in the ICU have an 18% risk (P greater than 0.001). During this 2-year study, 440 of 2441 patients admitted to an ICU developed nosocomial infections. Patients who had prolonged ICU stays and those on the obstetrics and gynecology, orthopedics, and general surgery services were more likely to become infected. The most common bloodstream pathogens were Staphylococcus epidemidis, Staphylococcus aureus, and Serratia and Pseudomonas species.

**Evidence that hospital care for acute myocardial infarction has not contributed to the decline in coronary mortality between 1973-1974 and 1978-1979.**

Goldman L; Cook F; Hashimoto B; Stone P; Muller J; Loscalzo

A

Circulation ,May 1982, 65 (5) p936-42, Journal Code:

DAW

Languages: ENGLISH

To investigate whether the reported 17% decline in the national rates of acute ischemic heart disease mortality between 1973 and 1978 was attributable to decreased in-hospital mortality for patients with acute myocardial infarction (MI), we surveyed all 63 acute care hospitals in the Boston, Massachusetts, area. Compared with 1973-1974, more 1978-1979 MI patients were admitted to hospitals in metropolitan Boston, and especially to the five university teaching hospitals. Between 1973-1974 and 1978-1979, hospital admission rates decreased for younger patients and increased for older patients, but overall admission rates were almost identical. In-hospital mortality rates from acute MI did not change significantly in any age group. Because overall MI mortality was declining while in-hospital MI mortality was unchanged, the proportion of acute MI deaths that occurred inside the hospital increased from about 30% to about 40%. Although current hospital care undoubtedly benefits many individual patients, this study suggests that improvements in the in-hospital care of acute MI patients are a major explanation for nationwide mortality trends between 1973 and 1978.

**A five point approach to staff development for quality assurance.**

Shimeld A

Can J Occup Ther ,Apr 1982, 49 (2) p53-6, ISSN

0008-4174 Journal Code: CJO

Languages: ENGLISH

The nature of Quality Assurance is outlined, as well as the range of activities encompassed in a Quality Assurance program. The need to provide occupational therapy personnel with an organizational framework within which to develop the skills to implement a Quality Assurance program is given as the rationale for utilizing a model that focuses on five key areas of professional practice. The model is described, and the way it has facilitated the Quality Assurance program in the Occupational Therapy Services Department of the University Hospital, London, Ontario is discussed. Reference material, useful when implementing a program, is included.

**Infective endocarditis in a community hospital.**

Venezio FR; Westenfelder GO; Cook FV; Emmerman J; Phair JP  
Arch Intern Med ,Apr 1982, 142 (4) p789-92, ISSN  
0003-9926 Journal Code: 7FS

Languages: ENGLISH

Recent reviews from major university centers of infective endocarditis have stressed an increase in unusual infections owing to virulent pathogens. This article compares the 40 episodes of infective endocarditis at a community hospital complex with the recent literature. It was observed that the majority of infecting microorganisms were penicillin-susceptible streptococci similar to those seen in the early antibiotic era. An older patient population was encountered, but overall mortality was low. Streptococcus bovis was a frequent cause of both natural and prosthetic valve infections. Symptoms lasting longer than two months were associated with vegetations demonstrated by echocardiography and high morbidity. Clinical features in this series that significantly correlated with a poor prognosis were height of fever at admission, the failure of fever to resolve within one week of appropriate therapy, the degree of peripheral leukocytosis, gross hematuria, and CNS signs. Conservative parenteral treatment closely monitored by serum bactericidal levels was employed. No relapses occurred among patients surviving initial therapy.

**Psychologist in a plastic surgery service.**

Clifford E  
Ann Plast Surg ,Jan 1982, 8 (1) p79-82, ISSN 0148-7043  
Journal Code: 5VB

Languages: ENGLISH

Some of the roles of a psychologist on a plastic surgery service, particularly with patients undergoing cleft palate, craniofacial, and breast reconstruction, are explored. Psychological counseling with parents of infants with birth defects is described. For patients with craniofacial anomalies team management, extensive presurgical evaluations, and a psychological support system during hospitalization are required. Patients undergoing breast reconstruction need to work through preexisting feelings and attitudes about mastectomy as well as their anticipation of results of corrective surgery. For all patients, printed materials are used to augment the counseling. Research is emphasized, in keeping with the role of such a plastic surgery service in a university setting.

**Impact of attending level supervision of the emergency department experience.**

Kroboth FJ; Brown FH; Stewart R; Karpt R; Karpf M; Levey GS  
Ann Emerg Med ,Apr 1982, 11 (4) p192-6, ISSN 0196-0644  
Journal Code: 427

Languages: ENGLISH

Medical experiences encountered in the activities of an emergency department are important for the development of a well-trained internist. Therefore, a rotation in the emergency department must remain an integral part of any program in internal medicine. At the University of Pittsburgh, faculty members from both the internal medicine and emergency medicine departments worked together in order to develop the emergency department to its fullest capacity as part of a broad educational program. The faculty attendings provide supervision, immediately available consultation, and an on-going curriculum, including daily lectures and chart review. The results of their programmatic change have been the following: 1) enthusiasm and satisfaction on the part of the housestaff; 2) a 20+ increase in admissions to the hospital from the emergency department; 3) decreased utilization of the observation unit; and 4) fewer patients leaving without being examined.

**[Acupuncture therapy in the outpatients-department of the University Clinic Heidelberg (author's transl)]**

Akupunkturtherapie in der Anaesthesieambulanz des Universitätsklinikums Heidelberg.

Fischer MV

Anaesthesist ,Jan 1982, 31 (1) p25-32, ISSN 0003-2417  
Journal Code: 4MY

Languages: GERMAN Summary Languages: ENGLISH

Encouraged by the good results obtained using acupuncture anaesthesia, we started therapeutic acupuncture in our institute of anaesthesiology four years ago. In the meantime acupuncture is as important a therapeutic method in our out-patients department as are therapeutic local anaesthesia, transcutaneous electrical nerve stimulation and biofeedback. The results in 520 patients who have been treated with acupuncture for different diseases are reported. The success of treatment, the number of sessions and the recurrence-rate within one and a half years are discussed for the different diseases. Acupuncture treatment was regarded successful when 1. the patient had no complaints at all without medication, and 2. when there was significant improvement (no long term medication, only mild complaints with unusual strain, which were responsive to minimal medication). Thus treatment in cephalgia was successful in 83% with no recurrences (NR) in 84%. In cervical pain syndromes the respective percentages were 80% (NR = 74%) in constipation 80% (NR = 72%), sinusitis 85% (NR = 100%), insomnia 100% (NR = 100%). Good results, albeit with high recurrence rate were achieved in cases of trigeminal neuralgia in 90% (NR = 23%), colitis ulcerosa in 100% (NR = 0%), in bronchial asthma 70% (NR = 50%) and in tumour pain 61% (NR = 0%). Treatment in patients suffering from parathyroid conditions were unsatisfactory and results in cases of tinnitus were negative.

Geschlechtsunterschiede in der Institutionskarriere Schizophrener - ein Beitrag zur Sozialepidemiologie psychischer Erkrankungen.

Angermeyer MC; Hofmann J; Robra BP

Psychiatr Prax ,Jan 1982, 9 (1) p27-33, ISSN 0303-4259  
Journal Code: QCK

Languages: GERMAN Summary Languages: ENGLISH

All Patients residing within the area looked after by the Psychiatric Clinic of the Medizinische Hochschule Hannover (Hannover Medical University) who had been initially hospitalized with schizophrenic psychosis (ICD 295) and discharged between 1.1.1973 to 31.12.1978, were followed up until 31.12.1979. Men were rehospitalized significantly earlier and more often than women. This difference between the sexes were independent of age, diagnostic sub-category, school education, professional activities at the time of first hospitalization, marital status and - with men - of the duration of the first period of inpatient treatment. The following points are discussed: careers of schizophrenics; sex-determined course of the disease; aspects of the behavioural attitude of the patients in relation to their disease, role obligations and reactions on the part of the social environment; and influences exercised by the medical care system.

**Participation of community hospitals in clinical trials: analysis of five years of experience in the Eastern Cooperative Oncology Group.**

Begg CB; Carbone PP; Elson PJ; Zelen M

N Engl J Med ,May 6 1982, 306 (18) p1076-80, ISSN 0028-4793  
Journal Code: NOW

Contract/Grant No.: N01-CN-75348; CA-23318; CA-21076

Languages: ENGLISH

The Eastern Cooperative Oncology Group (ECOG) initiated a program in 1976 to involve community hospitals in multi-institutional clinical trials. The community hospitals can be characterized as generally having no tradition of participating in clinical trials of cancer therapy, whereas the ECOG member institutions are university hospitals or major treatment centers. More than 100 community hospitals participated in 97 randomized trials involving 4506 patients from November 1976 through February 1981. Comparisons between the community hospitals and the ECOG member institutions indicate that the quality of participation was similar, as measured by rates of ineligibility, compliance with the protocol, and submission of data. Objective measures of outcome, such as survival, response, and toxicity, were also comparable. We conclude that under the mechanism adopted by the ECOG, it is possible to include community hospitals in clinical trials of cancer therapy without reducing the quality of the data or compromising the therapeutic outcomes.

**Impact of a family practice residency on a community hospital: a case study of costs and benefits.**

Patrick K; Castle CH; Danforth N  
J Fam Pract ,Apr 1982, 14 (4) p727-33, ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

A modified framework of cost-benefit analysis, including explication of direct, indirect, and intangible costs and benefits, is used to assess the financial impact of a university-affiliated family practice residency program upon a community hospital. During resident year 1978-79 it was found that a community hospital affiliated with the University of Utah Family Practice Residency Program may have experienced a net financial benefit of as much as \$243,543 or a net financial cost of as much as \$12,537. At the same time, the hospital is likely to have experienced substantial intangible benefits and moderate intangible costs. This approach may have utility in similar settings where community hospitals support family practice resident education.

**Trimethoprim resistance in hospitals.**

Huovinen P; Mantylarvi R; Toivanen P  
Br Med J [Clin Res] ,Mar 13 1982, 284 (6318) p782-4,  
Journal Code: B4X

Languages: ENGLISH

During November 1980 to April 1981, 1561 urinary tract pathogens were collected from Turku City Hospital, Turku University Central Hospital, and Kuopio University Central Hospital. Resistance of the strains was tested by agar-plate dilution against trimethoprim, sulphamethoxazole-trimethoprim, sulphamethoxazole, ampicillin, and nitrofurantoin. Resistance to trimethoprim (greater than 8 mg/l) occurred in 8.6-12.2% of strains from the university hospitals (Pseudomonas excluded) and 38.3% of strains from Turku City Hospital. Resistance of Escherichia coli occurred in 4.1-6.2% of strains from the university hospitals and 21% of strains from Turku City Hospital. Proteus mirabilis was the most resistant of the clinically important bacterial species with resistance to trimethoprim in 29-78%. Attention is called for in defining the type of hospital used for a particular study: bacterial resistance in different hospitals cannot be compared direct and one hospital is not necessarily representative for a whole country. After seven years' use of plain trimethoprim the prevalence of resistance in the two university hospitals in Finland was similar to that in a London hospital just before

**When psychiatrists are liable: risk management and violent patients.**  
Kroll J; Mackenzie TB  
Hosp Community Psychiatry ,Jan 1983, 34 (1) p29-36, ISSN 0022-1597  
Journal Code: GCJ  
Languages: ENGLISH  
In an era of rapid discharge and community treatment, psychiatrists must assess, with insufficient information, their patients' potential for committing a violent act outside of the hospital every time they authorize a pass or a discharge. The authors review court decisions on prediction of

dangerousness and research data on the risk of homicide, assault, and suicide among released mental patients. They then discuss a risk-management approach to decision-making that consists of three components--risk assessment, risk evaluation, and risk reduction. The authors also provide a decision table that clinicians can use to identify factors that suggest a high risk of violence in a patient's current status, history, and treatment response.

**IUCD liability.**  
Einstein M  
Br J Obstet Gynaecol ,Sep 1982, 89 (Suppl 4) p11-9.  
ISSN 0306-5456 Journal Code: AZC  
Languages: ENGLISH

In the UK the marketing and quality control of all  
intrauterine devices (IUCDs) is controlled by the Medicines  
Act (1968). Training is supervised by the Joint Committee of  
Contraception (JCC), and Trainers have to ensure that the  
trainee has acquired safe standards before the JCC certificate  
is granted. Patients must be adequately counselled and consent  
obtained. There is no unequivocal evidence of its mode of  
action in humans, which might limit its acceptability to  
certain individuals. There are a number of problem areas. How  
long should a copper-containing IUCD be retained when there is  
clinical evidence of continued effectiveness for more than the  
statutory 2 years? Perforation of the uterus and the resulting  
abnormal situation of an IUCD can be potentially dangerous.  
Sound technique minimizes its occurrence but if perforation  
occurs there must be defined and documented action. Because  
the IUCDs' primary intrauterine action is to prevent  
implantation, should pregnancy occur, there is an increased  
likelihood of ectopic gestation. Awareness of this, and  
appropriate early action, should prevent a disastrous outcome.  
There is clear evidence that ascent of organisms relates to  
the cervical thread. Perhaps tailless devices should be made  
available for women who are at risk of developing pelvic  
inflammatory disease? Other potential problem areas, where  
there might be legal liability involving practitioners,  
include the management of abnormal bleeding and difficult  
removals.

**Wrongful life: a misconceived tort.**

Minott GD; Zurzolo VP

Spec Law Dig Health Care (Mon) ,Dec 1982, 4 (10) p7-31,  
ISSN 0198-8778 Journal Code: UXP

Languages: ENGLISH

Recent advances in prenatal genetic counseling have expanded the scope of malpractice liability. Parents and children have both brought tort actions for negligent prenatal genetic counseling. The child's "wrongful life" claim is a unique and difficult moral and legal issue. This comment examines wrongful life and the parents' "wrongful birth" action, and suggests a model of recovery for wrongful birth that avoids the insoluble problems inherent in a wrongful life claim while providing for the needs of the disabled child.

Within the physicians' services industry, doctors of osteopathy are the only "full line" competitors of medical doctors. Given the current interest in merger of the two schools of practice, this Article examines the benefits of having an independent osteopathic school. These benefits include: (1) reduction of the monopoly power of medical doctors in malpractice litigation, fee negotiations with third party payors and the formulation of health policy; (2) greater satisfaction of consumer desires; and (3) diversity and innovation in physicians' training and methods of practice. The Article concludes that society has an interest in discouraging merger of the two groups; osteopathy should be maintained as an independent school of practice. To this end, society should carefully consider the impact of legislation and regulatory policies that may have the unintended effect of eliminating osteopathy as an independent competitor.

**Error, malpractice, and the problem of universals.**

Minogue BP

J Med Philos ,Aug 1982, 7 (3) p239-57, ISSN 0360-5310

Journal Code: IZD

Languages: ENGLISH

This article begins with a criticism of McIntyre and Gorovitz's account of medical error. Their theory implies that error, at least sometimes, is a necessary consequence of the inductive character of medical inquiry. The counter intuitive consequences of this account suggest that the issues surrounding induction may not be the most fertile area for developing a coherent interpretation of medical error. Given these shortcomings, I develop a new theory which assumes that the best philosophical soil for constructing a theory of medical error is the problem of universals. I then explain the problem and how the medical universal functions within arguments concerning diagnosis and treatment. A Wittgensteinian solution to the problem is presented which emphasizes the "borderline" character of some, if not many, medical judgments. Next, an argument is offered to establish that questions of medical error are not purely professional questions. This is because the theories used to make such professional judgments permit borderline cases even under the best circumstances. Finally, while there are a number of legitimate responses to this situation, I recommend one which involves legislative action.

The potential for clinical pharmacy services to reduce the liability of institutions and the personnel who practice in them is presented. Several studies are reviewed that identify the characteristics of patients who are at a high risk of developing complications. Based on these data and data gathered on drug-related malpractice claims, pharmacists can concentrate their efforts on those patients who have the greatest liability implications to the institution. Pharmacists' efforts to reduce the liability of their institutions can also provide a justification for their clinical services.

In the current litigious milieu much can be done by office personnel to forestall the occurrence of a claim or to diminish the probability of the plaintiff succeeding if it should occur. Among the important factors are a friendly, courteous attitude, no matter how trying the circumstances, and proper training of the personnel in handling of emergencies, failures or cancellations of appointments, requests for refills of prescriptions, malfunctioning of equipment, and confrontation with attorneys.

**Responsibility and accountability in provider-patient relationships.**

Blumstein JF

Circulation ,Nov 1982, 66 (5 Pt 2) pIII91-9, Journal

Code: DAW

Languages: ENGLISH

Coronary artery bypass surgery (CABG) is no longer an experimental procedure. Nevertheless, much remains controversial about it. From the legal perspective, general principles of accountability and responsibility apply readily to the CABG context. Issues concerning the proper standard of care and the obligation to obtain informed consent, generic problems in the law of medical malpractice, have direct application to CABG. Similarly, there are reasonably standard questions of accountability for individual practitioners and institutional providers. Although the application of general principles of accountability to CABG will undoubtedly raise interesting nuances, the law of medical malpractice appears to be sufficiently developed to encompass the specific issues of CABG within its structure.

**Use of the countersuit by pharmacists who have been groundlessly sued for malpractice.**

Brushwood DB

Contemp Pharm Pract ,Spring 1982, 5 (2) p95-101, ISSN  
0162-3761 Journal Code: DQ9

Languages: ENGLISH

Attorneys for patients who have been injured by adverse reactions to drugs often name as defendants the prescribing physician, the drug manufacturer, and the pharmacist. In many jurisdictions neither the law of warranty nor the law of strict liability will support a cause of action against a pharmacist who has done nothing more than correctly dispense a drug which was correctly prescribed. If the lawsuit against the pharmacist can be shown to have been filed for no other reason than to coerce a nuisance settlement or just to be cautious, the pharmacist may have available a remedy in the form of a countersuit. Malicious prosecution is one cause of action which might be maintainable as a countersuit. The elements of the cause of action are: 1) the initiation of a lawsuit; 2) lack of probable cause; 3) malice; 4) termination in favor of the pharmacist; and 5) damages. Lack of probable cause and malice are interrelated and are the two most difficult elements to prove. Abuse of process is another possible cause of action. The elements are: 1) an illegal, improper, or perverted use of the process; 2) an ulterior motive or purpose; and 3) damages. Other causes of action which have been considered by attorneys for groundlessly sued health professionals are barratry, defamation, attorney negligence, prima facie tort, and violation of a disciplinary rule.

**Physicians' legal responsibilities in managing ski trauma.**

Ferguson CG

Am J Sports Med ,Jul-Aug 1982, 10 (4) p206-10, ISSN  
0363-5465 Journal Code: 3YR

Languages: ENGLISH

Orthopaedic specialists and family physicians practicing in skiing communities are faced with unavoidable, stringent, and expanding legal responsibilities to properly manage ski trauma. Their legal obligations apply to each component of clinical case management: (1) diagnosis; (2) treatment; and (3) rehabilitation. Neither medically nor legally is any one aspect less critical than another. Concomitant with accelerating rates of participation in sports, it is clear that the law is demanding more from specialists and also primary care physicians whose practice is increasingly involving musculoskeletal athletic injuries. The legal responsibilities and liabilities of both generalists and specialists are extensively reviewed in this report. The principles apply to the management of all athletic trauma by physicians.

This Article discusses potential legal liability for adverse effects resulting from reuse of disposable hemodialysis equipment. After explaining the dialysis process and the health risks involved with the reuse of dialyzers, the Article outlines possible theories of recovery for injured dialysis patients. The Article describes the possibility of recovery under a negligence theory against either the treating physician or the institutional provider, and includes a discussion of applicable statutory law. The remainder of the Article discusses possible recovery under the theory of strict liability.

Klin Monatsbl Augenheilkd ,Jul 1982, 181 (1) p46-53,  
ISSN 0023-2165 Journal Code: KWA

Languages: GERMAN Summary Languages: ENGLISH

There is some uncertainty among doctors and lawyers about the form and content of presurgical medical enlightenment of the patient. Presurgical enlightenment is of increasing significance with respect to malpractice suits. Current jurisdiction has developed principles of enlightenment that are often difficult for the doctor to handle. For routine procedures in major hospitals a standardized, pragmatically designed consent form is therefore necessary. At Wurzburg University Eye Hospital the results of glaucoma and cataract surgery have been documented for years by using computer-readable forms. On the basis of these large-scale results from many thousands of procedures a written consent form was developed and tested for its suitability. Two hundred and twenty-two patients were questioned on their expectations as to proper enlightenment. The results of these broadly scattered interviews are summed up and presented. Especially with glaucoma patients, the best method of enlightenment, satisfying both medical and legal requirements, is an information booklet designed for lay people together with verbal information furnished by the doctor. Nearly all of the patients interviewed found the preoperative enlightenment complete and sufficiently clear. The majority of them could repeat the contents of the enlightenment form four to six days after the operation. This speaks well for the adequacy of the enlightenment. As a rule, the written consent form was supplemented by verbal enlightenment from the operating physician immediately before hospitalization of the patient. A psychological investigation of preoperative anxiety with enlightened and non-enlightened patients revealed that the enlightenment form did not increase preoperative anxiety.

Surgical ophthalmology lends itself to a written consent form more readily than other surgical disciplines, because diseases with poor prognoses for life are fortunately rare.

**The legality of using hand-over-mouth exercise for management of child behavior.**

Bowers LT

ASDC J Dent Child ,Jul-Aug 1982, 49 (4) p257-65, ISSN 0022-0353 Journal Code: HXZ

Languages: ENGLISH

The objective of this article has been to delineate the possible legal grounds upon which a dentist may base his use of HOM and HOMAR for child behavior management. It has been pointed out that the use of HOM will not subject the dentist to liability to the patient when HOM is used properly and parental consent to treat the child is obtained. Such parental consent need not specifically identify the prospective use of HOM, because HOM is an inseparable component of the treatment of certain children. Parental consent to the treatment is informed consent to the necessary use of HOM. The use of HOMAR is more nearly objectionable legally and may result in liability of the dentist practicing in some jurisdictions, unless express parental consent to its use is obtained in advance of treatment. It must be emphasized that no reported decision of any court has indicated the legal standing of the use of HOM or HOMAR. It is hoped that this article may also be of some guidance to courts faced with the issue of the legality of a dentist's use of HOM or HOMAR. Until a court rules on the legitimacy of the use of HOM and HOMAR, there will be some uncertainty how a court will view its use. And of course, the dentist cannot avoid liability, if the dentist utilizes HOM or HOMAR in a manner inconsistent with the standard of the dental profession. Yet, despite such uncertainty, the dentist who uses HOM or HOMAR in accordance with the standard of the ordinarily prudent dentist in the locality and who obtains the requisite consent to treatment should not fear liability for battery or for malpractice. The dentist has done all his profession and his society can ask of him. (83 Refs.)

The medical malpractice problem has been a major contributor to the inflationary trend in healthcare costs. Arbitration, as an alternative to litigation, can be effective in alleviating

many of the problems associated with malpractice suits. Authors Corbett and Leap present the results of their study of arbitration, including an examination of existing medical malpractice arbitration panels and their effectiveness. The results of the study are encouraging as arbitration is seen to bring advantages to both the plaintiff and the defendant, as well as reducing the amount of litigation and insurance-related problems.

The forensic study of suicide should include prevention of suicide but also discuss on a large lethal dimension. Actual researches are centered into a genuine suicidology and are oriented toward the study of determination of exact causes of death, improvement of statistics and information. Psychodynamics of suicide behaviors, discuss the concept of intentionality of death and consciousness of the act. Medical responsibility requires precisions according with the evolution of psychiatric techniques. This study will also discuss problems of traffic accidents, suicide post homicide. Ethics, agreement of care, post-traumatic compensation are also studied.

**[The medico-legal risk in obstetrics. What has been learned from studying 340 files on accidents (author's transl)]**

Le risque medico-legal en obstetrique. Les enseignements de l'etude de 340 dossiers d'accidents.

Soutoul JH; Chazara C; Froge E

J Gynecol Obstet Biol Reprod (Paris) ,1982, 11 (2) p285-300, Journal Code: IAZ

Languages: FRENCH Summary Languages: ENGLISH

The authors, from perusal of 340 files where accidents in obstetrics were reported, have classified the medico-legal risks in pregnancy, whether the accidents gave rise or did not give rise to claims for responsibility. These accidents occurred between 1950 and 1978 and they happened during and after delivery. The classification shows up the most dangerous situations for the specialist and points out the factors that increase this risk so that systematically a preventive attitude can be taken to avoid claims, whether they are made under criminal or civil procedures. Particularly detailed have been statistical risks which are increasing continuously in association with instrumental deliveries and with the large incidence of Caesarean operation. After they have listed all the clinical forms of medico-legal risk picked out by counsel so that they can be avoided or their effects reduced, the authors have attempted to define the responsibility that the gynaecologist-obstetrician takes at present in the midst of his team that is always increasing in number. Among these are paediatricians, anaesthetists and resuscitators, midwives, nurses who give anaesthetics and all the para-medical team who have specialised responsibility which depends more or less on the needs of the gynaecologist-obstetrician. The medico-legal risks which are linked with a deficiency in premises, numbers of personnel and quality and quantity of equipment have been singled out with a relatively small balance of the characteristics of those who carried out the procedures recorded in a large series of files which are already old and which for the most part have been docketed so that they could be used without revealing any professional secrets nor legal secrets.

Languages: ENGLISH

The interaction between physician and patient comprises aspects of communication common to any two human beings and other aspects peculiar to the roles exclusively adopted by physicians and patients. In this review, nonverbal and verbal elements of general communication are discussed, detailing important aspects of vocal tone, body postures, appearance, and verbal cues that may influence attributions made of physicians by patients. Role-related elements of physician-patient interactions are discussed in light of findings from research on interactions between physicians and patients. Developmental elements of general communication are discussed, relating stages that evolve in interactions to physician-patient interactions. Finally, an examination is made of how interpersonal skills are taught to physicians and medical students. Discussion of what skills are specified for teaching, whether they are effectively taught, and whether the

Languages: ENGLISH

The thermistor, a preferred temperature transducer, has a non-linear resistance vs. temperature characteristic. However, the non-linear characteristic of the Wheatstone bridge circuit in which thermistors are usually used can compensate for this, so that, over a selected range, quite accurate linear voltage outputs may be obtained. A selected set of bridge resistor and excitation voltage values are presented together with accuracy data. Comments concerning the application of these circuits include safety considerations.

**[Technical equipment in the offices of practicing physicians in Vaud and Fribourg]**

Equipement technique des cabinets des medecins praticiens Vaudois et Fribourgeois.

Lehmann P; Martin J

Soz Praventivmed ,Dec 1982, 27 (6) p278-84. ISSN 0303-8408 Journal Code: YF1

Languages: FRENCH Summary Languages: ENGLISH

In the framework of health services research sponsored by the Swiss National Science Foundation, a survey by questionnaire was undertaken among the practicing physicians in two Swiss cantons, Vaud and Fribourg (total population 700,000), in order to gather information on their personal and professional characteristics (including type of medical activity, personnel employed, and equipment). Out of 1121 physicians concerned, 60% answered. (The respondent group is representative for the relevant parameters.) This article presents the findings regarding the medico-technical equipment doctors have in their offices and gives also indications on the relationship between the presence of equipment and the auxiliary personnel employed. General practitioners and internal medicine specialists are usually equipped for laboratory analyses, with a photometer (69% of them) or more simply (24%), for X-rays (47% for chest and skeleton radiography, 22% with radioscopy); they also generally have an ECG apparatus (81%) and one or several physiotherapy appliances (52% of them). 42% of the generalists and 22% of the internists have all those four types of equipment. Rates of availability are much lower among other medical specialties. Pediatricians in particular are clearly less equipped technically than the other groups of primary care physicians. Surgeons are often well equipped for physiotherapy. The differences according to physician age are examined; this shows that younger generations are not much more equipped than older ones. The devices which we regrouped as "other diagnostic equipment" however tend to replace radioscopy in the equipment of younger physicians. These results constitute a new contribution to the knowledge on the ambulatory medical care system in Switzerland and should be useful in the present discussions on the medical coverage of the country.

Languages: FRENCH Summary Languages: ENGLISH

A national survey involving 131 centres was conducted in 1982 to assess the extent of use of data processing in angiology in both medical and surgical departments. Findings demonstrated the recent nature of its employ, this being for less than 2 years in 2 out of 3 teams. There was evidence for the need for data processing reporting forms in as compact a lay-out as possible. Each team should estimate its possibilities as a function of the personnel, time, and financial means available, and determine its objectives before discussing the data processing programme.

**Minimizing the adverse effects of mass relocation among chronic psychiatric inpatients.**

Kelly GR

Hosp Community Psychiatry ,Feb 1983, 34 (2) p150-4, ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Recent studies have reported conflicting results on the impact of inpatient institutional relocation on chronic psychiatric patients. As part of a hospital renovation project, 82 patients were assessed over a period of eight months to determine the effects of mass transfer on physical, mental, and social functioning. Twenty-five staff members also assessed the social climate before and after the transfer. The author found that involuntary relocation of living quarters within the same institution did not significantly affect the functioning of the chronic psychiatric patients. He attributes the lack of disruption to continuity of care in a familiar environment and to a continuous schedule of supportive activities conducted outside of the ward.

Surveys were conducted to assess the computer use in 50 selected Canadian health care foodservice facilities and to determine the educational preparation for computer use in seven selected Canadian post-secondary education institutions which educate potential foodservice personnel. Both the foodservices and post-secondary educational institutions selected were represented at two workshops on computer-assisted foodservice management held in June 1980 and in May 1981. Only seven facilities used a computer for foodservice functions; nine foodservices planned to use a computer within the next two years. A list of applications in use, being planned and of future interest showed the priority areas for these foodservices. Only one post-secondary educational institution actually had an educational foodservice application for student use. The other six educational foodservice facilities covered the subject matter content by readings, lectures and discussions.

**Medicare and Medicaid; miscellaneous amendments--Health Care Financing Administration. Interim final rules with comment period.**

Fed Regist ,Oct 26 1982, 47 (207) p47388-94, ISSN 0097-6326 Journal Code: B58

Languages: ENGLISH

These regulations modify the rules pertaining to compliance with a Life Safety Code, participation of home health agencies (HHA's) in Medicare, and establishment and review of plans of treatment for home health services and outpatient speech pathology services. The changes are necessary to implement several provisions of the Omnibus Reconciliation Act of 1980. The intent of the statutory amendments is (1) to eliminate outdated Life Safety Code requirements imposed on skilled nursing facilities (SNFs); (2) to make it easier for providers of outpatient speech pathology (OSP) services to meet the plan of treatment requirement; (3) to expand the sources of home health services and foster competition; (4) to make it easier for HHAs to meet certification and plan of treatment requirements, while guarding against conflict of interest in the performance of those functions. The amended regulations extend the fire safety code provisions to all hospitals and SNFs under Medicaid as well as Medicare, and to intermediate care facilities (ICFs) under Medicaid. Our purpose is to keep Medicaid rules consistent with the Medicare rules in this area.

**Medicare program; access to books, documents and records of subcontractors--Health Care Financing Administration. Proposed rule.**

Fed Regist ,Oct 12 1982, 47 (197) p44750-6, ISSN 0097-6326 Journal Code: B58

Languages: ENGLISH

This proposal would implement section 952 of the Omnibus Reconciliation Act of 1980 (Pub. Law 96-499), which conditions Medicare reimbursement for the cost of services performed under certain contracts upon compliance with prescribed criteria. If a contract between a provider and a subcontractor covers services valued at or costing \$10,000 or more over a 12-month period, Medicare reimbursement cannot be made for the services unless the contract includes a clause allowing the Secretary of Health and Human Services and the Comptroller General and access to the contract and to the subcontractor's books, documents and records necessary to verify the costs of the contract. The clause in the contract must also permit similar access to any subcontract between the subcontractor and a related organization of the subcontractor when the subcontract is worth or costs \$10,000 or more over a 12-month period. This proposal specifies the criteria and procedures that the Department would use to obtain access to affected books, documents and records. The purpose of the legislation and these proposed regulations is to permit the Secretary and Comptroller General to make an accurate determination of the reasonable costs under these contracts.

**Neighborhood characteristics and hospital closures. A comparison of the public private and voluntary hospital systems.**

McLafferty S  
Soc Sci Med ,1982, 16 (19) p1667-74, ISSN 0277-9536  
Journal Code: UT9

Languages: ENGLISH

This paper analyzes the neighborhood distribution of hospital closures in New York City between 1970 and 1981. Discriminant analysis procedures are used to compare the social, economic and health status characteristics of neighborhoods in which hospitals have closed with those of neighborhoods in which facilities have remained open. The results show that overall hospital closures have had a substantial distributional impact, with facilities in low-income, high infant mortality neighborhoods having the highest rates of failure. Closures of voluntary hospitals occurred most frequently in disadvantaged neighborhoods; whereas municipal and proprietary hospital closures showed no differential neighborhood impact. Implications for the geographical accessibility to various groups to health care and for the efficiency and cost of hospital services are discussed.

Heller T  
Am J Ment Defic ,Jul 1982, 87 (1) p48-55, ISSN  
0002-9351 Journal Code: 3MA  
Languages: ENGLISH

Effects of relocation on 50 severely and profoundly mentally retarded and physically disabled children transferred from two facilities into a third one were examined. Social disruption, which referred to changes in daytime staff and programming, was manipulated 3 weeks after the move; the health and personal adjustment were measured prior to and 1 to 3 weeks, 4 to 6 weeks, and 11 to 13 weeks after the move. Relocation resulted in short-term decrements in positive behavior and in deterioration in health for all the groups. High staff disruption produced a short-term increase in abnormal behavior.

**Closure among U.S. community hospitals, 1976-1980: a description and a predictive model.**

Mullner RM; Byne CS; Levy PS; Kubal JD  
Med Care ,Jul 1982, 20 (7) p699-709, ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

Closure of U.S. community hospitals during the years 1976-1980 is analyzed by describing the distributional patterns of closings among hospitals classified by certain institutional characteristics: bed size, number of facilities and services, ownership, teaching status, location in a Standard Metropolitan Statistical Area (SMSA) or in a non-SMSA, and location in one of the nine United States Census Divisions. The method of Cox regression analysis is used to show that each of these institutional characteristics is independently, and significantly, associated with closure, and to estimate the strength of the association. On the basis of this analysis, a theoretic model is constructed for estimating the relative probability of closure for any community hospital with a given set of these institutional characteristics.

**Hospital ward layout and nurse staffing.**

Seelye A  
J Adv Nurs ,May 1982, 7 (3) p195-201, ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH

This literature review discusses the evidence that modern wards divided into small bedrooms or bays, require higher nurse staffing levels. Aspects of ward design and operation such as patient privacy, nursing efficiency, patient dependency and ward organization are outlined and methods for establishing staffing levels which take ward design into account are described. The majority of ward evaluation studies concerned with nurse staffing concentrate on two areas, the

use of the nurses' time (particularly in travel) and user opinion of wards. The conclusions drawn suggest that the two main measures of ward layout which relate to effective and efficient nursing care are short travel distances and features which facilitate the maximum contact between nurses and patients. Further, how these two principles are incorporated effectively into a ward will depend upon a number of other factors which effect nursing work viz, the number and characteristics of the patients and ward staff and the policies and practices of the nurses themselves. **The teen-tot clinic: an alternative to traditional care for infants of teenaged mothers.**

Nelson KG; Key D; Fletcher JK; Kirkpatrick E; Feinstein R  
J Adolesc Health Care ,Aug 1982, 3 (1) p19-23, ISSN 0197-0070  
Journal Code: HAM

Languages: ENGLISH

A comprehensive interdisciplinary clinic was established to provide health care for teenaged mothers less than 16 years old and their infants. Thirty-five mother-infant pairs using this clinic were matched with 70 mother-infant pairs who used "traditional" health care facilities. Significant differences in infant outcomes of immunization status at 6 months (91% versus 46% completed), and weight (97% versus 83% within "normal" range) and maternal outcomes of contraceptive use (91% versus 63%), enrollment in educational programs (86% versus 66%), and repeat pregnancy rate (16% versus 38%) were found between Teen-Tot Clinic participants and the control group. Coordination and consolidation of services for teenaged mothers and their infants appears to favorably influence their short-term outcomes.

competing successfully in the market and functioning efficiently often depend on a reassessment of the environment. Accordingly, upgraded convenience, comfort, and atmosphere have become major marketing mechanisms for hospitals. This article presents several examples of how hospitals have used design to provide marketing advantages.

**Is the decision to merge really a question of access to capital?**  
Cain DM  
Trustee ,Jul 1982, 35 (7) p30-2, 34-5. ISSN 0041-3674  
Journal Code: WG9  
Languages: ENGLISH  
Institutional mergers are not a panacea for hospitals with financial or operating problems, and the apparent advantage of multihospital systems does not lie in their access to capital and human resources. The critical disadvantage of independent hospitals may be the result of attitudes held by governing boards. This article suggests that boards adopt new business tenets, especially regarding accountability, risk, pricing, competition, regulation, innovation, resource management, and purpose.

Nonprofit institutions often find that their socially worthwhile primary missions generate deficits. The author proposes a strategy for funding these shortfalls that is a synthesis of the specialization and diversified portfolio strategies. Following the method of strategic piggybacking, an organization should acquire or develop a business that is new for the institution and that may be unrelated to the institution's primary mission. The purpose of this new activity is to subsidize, at least in part, the deficit-producing primary mission.

A method of assessing the potential of an inspection maintenance policy as opposed to an existing breakdown maintenance policy for a building complex is developed. The method is based upon information likely to be available and specific subjective assessments which could be made available. Estimates of the expected number of defects identified at an inspection and the consequential cost saving are presented as functions of the inspection frequency.

Sixty-one former patients were interviewed regarding their reactions to sharing a hospital room with a patient of the opposite sex. Patients under 30 years of age had more favorable responses upon initial exposure than did intermediate age (30 to 49 years) or older (50 and above) patients, but a positive shift occurred in all groups. By the time of discharge, 90% of all patients reported an overall positive reaction to the experience. The use of mixed sex rooms, by fostering a noninstitutional atmosphere, may be a useful therapeutic tool.

Languages: ENGLISH

Practices by agencies in assigning Level II fieldwork experiences to occupational therapy students were examined. Time-specific logs were collected from students and from agency personnel during a 3-month period. The data generated were used to answer questions about how effectively student time was used in meeting the stated purposes of the assignment. The focus was on "average" student fieldwork activities. The study suggests that more careful and systematic development and design of Level II fieldwork programs are needed to meet the established educational goals and to maximize educational opportunities during the allotted time.

This paper offers evidence to support the use of the Family APGAR as a reliable, validated, utilitarian instrument to measure a subject's satisfaction with five components of family function. Mean total Family APGAR scores for several population groups are reported along with associated validity and reliability studies. A study from Taiwan supports the use of the Family APGAR in student populations 10 years of age and older. Studies are now under way to examine the use of the Family APGAR to correlate family function satisfaction with utilization of medical facilities, somatization, compliance, and the outcome of health problems.

Specialized geriatric assessment units (GAUs) have been established across North America in response to the growing recognition of the many unmet needs of the frail elderly and the conviction that GAUs can have major beneficial impacts. Although their structures and objectives vary considerably, GAUs are generally designed to comprehensively assess elderly patients' medical and psychosocial problems, to determine optimal placement, and often to provide therapy and rehabilitation. We offer a framework for examining structural and outcome studies indicates that GAUs can provide important positive impacts on health care for the elderly, including more thorough diagnoses, improved levels of physical and

psychological functioning, and better placement decisions.

Eval Health Prof ,Jun 1982, 5 (2) p115-29, ISSN  
0163-2787 Journal Code: ENK  
Languages: ENGLISH

The purpose of this article is to discuss the validity and reliability of certification tests and evaluation instruments for pharmacists as drug prescribers. Under California Law AB 717, the University of Southern California is operating one of two pilot programs to train and evaluate prescribing pharmacists. Various instruments have been created and administered, and validity results are presented. The presentation is organized into two areas dealing with the development of the examination instrument and then the assessment of the prescriptions written by pharmacists. The reliability of the three sections of the certification examination as measured by internal consistency was as follows: clinical therapeutics (KR 20=.84), physical assessment (KR 20=.88), and law (KR 20=.84). The exam was given to a group of physicians (N=14) to establish a cutting score. Thirty pharmacists who took the exam did slightly

better than the physicians on clinical therapeutics, but the physicians performed better than pharmacists on physical assessment (p less than .01). A prescription evaluation form was constructed to evaluate the performance of the pharmacists as prescribers. The reliability of the form as measured by coefficient alpha was .84. Concurrent validity was explored by assessing the relationship between performance on the certification exam and judges' appropriateness scored on prescriptions for ambulatory hypertensive patients. These results indicate that the pharmacists, who passed the exam, can prescribe as appropriately as physicians.

Fed Regist ,May 27 1982, 47 (103) p23404-14, ISSN  
0097-6326 Journal Code: B58  
Languages: ENGLISH

These regulations would simplify and streamline the procedures by which a health care facility is approved for participation in Medicare and Medicaid. The changes are necessary because many of the current procedures have proved cumbersome and expensive for the Federal and State agencies to administer, and, in many aspects, either unnecessary or ineffective in ensuring the quality of health care services. The elimination or modification of those requirements that have been identified as unnecessary or ineffective would also eliminate any unnecessary burdens on providers. The procedures that have proved effective in the past in protecting the health and safety of patients would be retained. This would permit available resources to be targeted on facilities with compliance problems. These regulations also would implement a recent statutory amendment that removes the 12-month limit on provider agreement with skilled nursing facilities.

Languages: ENGLISH

Epidemiological and microbiological studies were conducted in a hospital room with carpet (CR) and in one with carpet (NCR). Microbiological profiles were determined with specimens obtained from patients admitted to these rooms. Patient records were reviewed to note infection status and other case identities. Eleven-millimeter cylindrical core samples of carpet were obtained, and swab template techniques were used on the bare floor for subsequent enumeration and identification of contaminating microorganisms. In each sampling period, higher microbial counts per square inch (1 in(2) = ca 6.452 cm(2)) were measured for the carpet than for the bare floor. Recovery rates of Enterobacter spp., Klebsiella pneumoniae, and Escherichia coli were higher from carpet samples than from bare floor samples. Typable organisms (such as E. coli, Pseudomonas aeruginosa, K. pneumoniae, and Staphylococcus aureus) obtained from patients were also more frequently recovered from the carpet than from the bare flooring. Patients who stayed in the CR were shown to be colonized with the same types of organisms as those initially recovered from the carpet. However, no statistically significant differences were found in patients in the CR versus NCR in colonization with all typable and nontypable organisms first found on the floor. Disease in patients was found not to be associated with organisms found as contaminants of the carpet or the bare floor. Air above carpeting contained more consistent concentrations of organisms than air above the bare flooring.

Languages: ENGLISH  
An interdisciplinary clinical neurosciences delegation representing the International Committee of the Congress of Neurological Surgeons visited the neurosurgical departments of major teaching hospitals in five cities of the People's Republic of China. This report describes the clinical and research activities observed, with reference to the unique social, political, economic, and cultural environment in China. Although facilities and equipment are limited, diagnostic accuracy and surgical technique are excellent. Results for certain disorders seemed comparable to those obtained in western neurosurgical centers. Given the clinical expertise of our Chinese colleagues and the large numbers of cases treated in Chinese medical centers, a significant

contribution to neurosurgical knowledge can be expected from the exchange of information and future collaboration that have now become possible.

A community hospital has developed a successful model for establishing affiliated primary care centers in semirural areas without the use of federal or foundation money. Unique features of the program include funding through community stock sales and ultimate control by a community board of directors. Additional features include the establishment of a for-profit, wholly owned subsidiary of the hospital; development of a complete range of planning, management, and recruitment services; retention of freedom of choice for referrals and hospitalizations by both patients with physicians; and a but-out provision for the physicians.

A survey was conducted to assess the computer use in 27 selected Canadian health care food service facilities and the educational needs in computerization of the corresponding foodservice administrators. The foodservices selected were represented by foodservice administrators at a workshop on computer-assisted foodservice managements held in June 1980. Only three facilities used a computer for foodservice functions: seven foodservices planned to use a computer within the next two years. A list of applications in use, being planned and of future interest showed the priority areas for these foodservices. The foodservice administrators identified their educational needs in computerization and demonstrated that a one to two day workshop was their preferred educational program format.

Stimulated by a variety of external pressures, managerial innovation is likely to become more common in health care organizations. Relatively little is known, however, about the phenomenon. This paper develops a framework for the analysis of managerial innovation in health care organizations, based on the premise that control is at the heart of effective managerial practice. Physician control over the production process in health care is likely to be increasingly challenged, partially as a consequence of the ascendancy of managerial ideology. Opportunities for managerial innovation will be created, but are likely to be successful only to the extent that physician expertise is incorporated into rather than excluded from the resulting changes.

Diarrhea of unknown cause is a particularly challenging diagnostic problem as it may be trivial and self-limiting or the presenting symptom of a life-threatening disorder. Antibiotic-associated diarrhea is a frequent complication of antimicrobial therapy, especially in the elderly. The more severe form, pseudomembranous colitis, is now known to be caused by a toxin produced in the colon by Clostridium difficile.

Coble RJ; Sinnott SK; Walz TH

J Fam Pract ,Jan 1982, 14 (1) p77-81, ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

Four design criteria, home extension, personal extension, family centered environment, and patient education, are explored as guidelines for creating a therapeutic atmosphere in the family physician's office. They can be applied to the entryway, waiting and reception areas, hallways, examination rooms, nurses' station, laboratories, and the physician's private office. They are intended not to replace the traditional design criteria of efficiency, economy, safety, and convention, but to enhance their effectiveness. This occurs when the total environment, physical, administrative, and social, is consciously managed for the purpose of patient therapy and staff well-being. Attention to family centered design criteria facilitates this management and helps to ensure that many components of the health-care system benefit the patient.

**Office laboratory identification of Neisseria gonorrhoeae.**

Waldman CR; Gaydos JM; Synder FF

J Fam Pract ,Jan 1982, 14 (1) p35-7, ISSN 0094-3509

Journal Code: I4L

Languages: ENGLISH

Current literature is contradictory regarding what tests are necessary to establish an adequate presumptive diagnosis for office identification of Neisseria gonorrhoeae. This is especially true in light of recent reports of N meningitidis causing acute genital infection. This study was designed to look at the various criteria recommended and to establish guidelines for the office identification of N gonorrhoeae. Four hundred thirty-six isolates grown on Thayer-Martin selective agar were studied. Of these, 156 were found to be oxidase-positive. Gram stain of the isolates showed that 31.4 percent of the oxidase-positive isolates were gram-negative diplococci, 59 percent were yeastlike mole, and 9.7 percent were gram-negative bacilli. All of the gram-negative diplococci were confirmed to be N gonorrhoeae by sugar fermentation studies. No isolates of N meningitidis or saprophytic Neisseria were found. On the basis of this finding, it is recommended that office identification of N gonorrhoeae from genital or anal cultures should include (1) growth on Thayer-Martin (or comparable) medium, (2) positive reaction to oxidase reagent, and (3) identification of gram-negative diplococci on Gram stain of the Thayer-Martin isolate.

Traditional continuing medical education (CME) keeps physicians aware of the state of the art. It has limitations, however, as a quality-assurance tool: it is memory based, involves a group endeavor with diffuse goals, often unrelated to practice, is an inappropriate remedy for many problems in patient care, is hampered by poor-quality evaluation, and is governed more by market factors than educational outcomes. The self-study of practice and practice-linked CME offer rich potential for development. The physician's monitoring of his work, with appropriate improvements in performance, is valuable CME. Computers provide facts and guidance at the time and place the physician is developing diagnostic plans, diminishing reliance on memory. The next step in CME is for hospitals, societies, and medical schools to perfect methods of self-study of practice and practice-linked CME.

**Arthritis: preferred learning methods among Arizona therapists.**

Wickersham EA; Fike ML; Rousseau E; Boyer JT; Meredith KE; Clay CA  
Am J Occup Ther ,Aug 1982, 36 (8) p509-14, ISSN 0272-9490  
Journal Code: 305  
Contract/Grant No.: 1P60 AM20597  
Languages: ENGLISH

Arizona occupational and physical therapists were surveyed about their needs for education in arthritis. Responses to statements regarding attitudes, knowledge, willingness to learn, and preferred methods of learning were subjected to chi-square analysis. The results showed that a significant number of both occupational and physical therapists are deficient in knowledge about the disease and maintain negative attitudes about patients with rheumatoid arthritis. Both groups indicated a high interest in continuing education about arthritis. The preferred method of learning was self-study guides.

**The use of learning resource centers in the teaching of pulmonary medicine.**

Make BJ  
Chest ,Nov 1982, 82 (5) p639-42, ISSN 0012-3692  
Journal Code: DIC  
Contract/Grant No.: 1K07 HL00246  
Languages: ENGLISH

Learning resource centers (LRC) are areas designed for individual study which contain a variety of self-instructional materials. To evaluate the use of LRC in teaching pulmonary medicine, a survey was conducted of medical school pulmonary sections; responses were obtained from 30 sections with an NHLBI pulmonary Academic Award (PAA groups), and 21 sections without PAA (non-PAA group). LRC were established in 77 percent of the PAA group but only 14 percent of the non-PAA group. A higher percentage of pulmonary fellows than students used the resource center and student use was higher when the LRC was formally integrated into the curriculum. Textbooks and journals were more heavily used than materials utilizing audiovisual educational techniques. The results of this study suggest that pulmonary LRC use is modest, LRC cost is high, and LRC educational value may not be superior to general medical libraries.

**Building a structured learning package.**

Ferencz N  
Contemp Pharm Pract ,Winter 1982, 5 (1) p32-7, ISSN 0162-3761 Journal Code: DQ9  
Languages: ENGLISH

Pharmacists must become educators of patients and of pharmacy technical personnel. The literature cited in this paper has found that problems of patient compliance, personnel management, the high cost of medical care, and patient medical self-help may very well be solved in part through the application of competently written learning packages. One specific approach to learning package creation is illustrated in this paper, using the training of a unit-dose technician as an example. The subjects of student motivation, step-wise learning using subobjectives, learning feedback, material relevance, and student evaluation are discussed. Higher-level cognitive skills and readability are briefly discussed and illustrated to focus the readers' attention on the more difficult aspects of building learning packages.

**A self-instruction nutrition program for pregnant women.**

Daelhousen BB; Guthrie HA  
J Am Diet Assoc ,Oct 1982, 81 (4) p407-12, ISSN 0002-8223 Journal Code: H6F  
Languages: ENGLISH

The Prenatal Nutrition Program (PNP), a self-instruction program, consists of a videocassette and three pamphlets concerning nutrition during pregnancy. An evaluation study made PNP available to 52 white, middle-class, well-educated pregnant women in their physician's waiting room. PNP improved their knowledge but had no significant effect on their attitudes (initially very positive) or dietary behavior. On the basis of combined pre- and post-PNP program testing, significant correlations were found between the pregnant women's knowledge and attitudes and between their knowledge and dietary behavior. All subjects rated PNP very favorably. It is concluded that self-instruction programs offer a viable and less costly alternative to individual nutrition counseling.

**Cognitive learning in the health sciences: a case for self-instruction.**

Gould B  
Educ Med Salud .1982. 16 (2) p174-82, ISSN 0013-1091  
Journal Code: EDR  
Languages: ENGLISH

The health professions are faced today as never before with the need to find more effective ways of acquiring a growing volume of biomedical knowledge and of addressing the urgent concerns about learning processes--namely, the continued dependence on outmoded techniques of cognitive transfer. The author believes that greater incentives should be given for faculty and students to experiment with innovative approaches to cognitive learning while recognizing the need for increased emphasis on problem-solving skills in medical care. Proven self-learning techniques demand greater attention in curriculum and course design efforts. Finally, the author states that the process of educational planning must be viewed as continuous, dynamic, and never-ending if it is to best serve the needs of individual students, educational institutions, and the society to which both are ultimately accountable and committed to serve.

**Evaluation of a self-teaching program.**

Roberts CR; Hosokawa MC; Walts B; Mueller R  
Patient Couns Health Educ ,4th Quarter 1982, 3 (4)  
p161-5, ISSN 0190-2040 Journal Code: PAL  
Languages: ENGLISH

A self-teaching booklet on hypertension was evaluated in two populations: clients attending public health screening clinics and inpatients at a Veterans Administration hospital. Participants were randomized into an education or a control group. Evaluation consisted of measuring knowledge gained from the booklet immediately after reading it and retention of key concepts two weeks later. Men did better than women, and VA education participants did better than VA controls. No differences were detected between the public health education and control groups or the combined VA and public health education and control groups. The self-teaching booklet alone did not appear to yield a measurable amount of new knowledge. Health professionals, when educating patients and evaluating programs, should consider combinations of educational methods when using self-teaching programs.

With the increasing costs of education, for both practitioners and academic health centers, the time for a different format for continuing education has arrived. An educational resource department is the logical center to the development and management of a project as described in this paper. The educational resource department, the academic health center, and the practitioners can all benefit from turning attention outside academic walls.

**Teaching the patient with ischemic heart disease: a systemic approach to instructional design.**

Gregor FM  
Patient Couns Health Educ ,2d Quarter 1981, 3 (2) p57-62  
, ISSN 0190-2040 Journal Code: PAL  
Languages: ENGLISH

Does a systematic approach to the design of instruction for patients with ischemic heart disease (IHD) produce an effective educational product? One hundred patients, 67 men and 33 women with an average age of 57 years, who were hospitalized with IHD (myocardial infarction or unstable angina), were randomly assigned to an experimental or control condition and pretested to determine their knowledge of the disease and its treatment. Experimental subjects received a linear self-instructional program on the nature and treatment of IHD. Control subjects did not receive the program. Two days later a posttest was administered to experimental and control subjects; an average of 14 days after discharge a retention test was given to both groups. Individual test scores revealed that (allowing for a subject effect) patients who completed the program achieved significantly (P less than 0.001) higher posttest and retention test scores than those who did not. Also, patients who completed the program retained the information during the two weeks between the posttest and the retention test. Results of this study indicate that the instructional framework that was effective in the design of a health-education program for pregnant women can be applied to the design of instruction for patients with IHD.

A study was undertaken in planning for a project involving library support for formal continuing education programs. A questionnaire survey assessed faculty attitudes toward continuing education activities, self-instructional AV programs for continuing education, and self-instructional AV programs for undergraduate medical education. Actual use of AV programs in both undergraduate and postgraduate classroom teaching was also investigated. The results indicated generally positive attitudes regarding a high level of classroom use of AV programs, but little assignment of audiovisuals for self-instruction.

**Critical care nursing orientation: a comparison of teaching methods.**

Hansell HN; Foster SB  
Heart Lung ,Nov-Dec 1980, 9 (6) p1066-72, Journal  
Code: G2V

Languages: ENGLISH

In summary we have shown in this small group of 32 nurses that the PIM approach is as effective a method for critical care orientation as traditional classroom teaching. The savings in instructors' and orientees' time via PIMs result in dollar savings; but more importantly, the PIM was found by our orientees to be more satisfying. PIMs encouraged flexibility and individualized attention, and by self-pacing allowed several nurses to begin practice in the critical care setting earlier than usual. In light of the high cost of orientation, one finding that warrants further exploration is the orientee's uncertainty of remaining in critical care nursing. It is possible that as the orientee becomes socialized into the critical care setting, her values, attitudes, and commitment to remain may change over time. Future follow-up will help us to examine changing attitudes as these nurses become acclimated to the critical care setting. Head nurses and staff development instructors play a major role in preventing frustration and turnover and in creating a positive climate for growth.

Languages: ENGLISH

A number of self-instructional packages for students at the School of Librarianship, Leeds Polytechnic are described. The teaching packages have been written for use with a Hewlett-Packard HP2645A 'intelligent' terminal and cover the use of the terminal, access to the host (BLAISE) and information retrieval from MEDLINE. In addition a questionnaire is available on the terminal to test the students' understanding of the BLAISE system and the MEDLINE data-base, the students' responses are monitored automatically by the terminal. A preliminary evaluation of the teaching packages is included, the general reaction of the users to the packages being favourable.

 With the goal of introducing the dietetic student to the medical record and her role as a professional in the use of this document, a series of self-instruction modules was developed, evaluated, and revised. Field testing indicated that students attained a significant gain in knowledge after exposure to the modules. Further, students' comments indicated that the self-instructional approach was well received and quite helpful.

**Future development of primary medical care in New Zealand: a view from general practice.**

Seddon TD  
NZ Med J ,Feb 23 1983, 96 (726) p132-5, ISSN 0028-8446  
Journal Code: OBO  
Languages: ENGLISH

The primary health care committee's activities should be the starting point for a real change in direction of government-supported health care. It must endeavour to start a real and continuing dialogue between providers, planners and consumers. This should be at both central and local levels--its theme should be flexibility. Effort must be put into progressively reorientating medical education by using the material and energy available in primary medical care at both undergraduate and postgraduate levels. An active exploration of alternative methods of funding and delivery of care should take place, all being continuously evaluated. Increasing emphasis on primary medical care is so much more cost effective than our present system that health funds must be urgently redirected to facilitate this move. Any decrease in funding will be short-sighted and put off real economies and future improvements in medical care. Funds for primary medical care must be increased; in the present situation this may mean by diversion from those at present allocated to hospital boards. This should be used to: (a) increase GMS as a holding exercise; (b) fund educational suggestions; (c) fund research suggestions; (d) fund formation of local primary health care committees and their planning activities; (e) supply costs of supportive practices; (f) support more extensive dialogue centrally between NZMA, Health Department etc and locally with health services development as seen in the recent SACHO exercises.

**Assessment of health needs and willingness to utilize health care resources of adolescents in a suburban population.**

Marks A; Malizio J; Hoch J; Brody R; Fisher M  
J Pediatr ,Mar 1983, 102 (3) p456-60, ISSN 0022-3476  
Journal Code: JLZ  
Contract/Grant No.: 1-S08RR09128-03  
Languages: ENGLISH

We investigated whether adolescents living in a middle-class suburb believed that their health needs were being met, and the extent to which they were willing to utilize local health care resources for a range of problems. Self-administered,

anonymous questionnaires were completed by 649 students in grades 9 through 12. The mean age of respondents was 15.4 years; 52% were female, and 95% white. They had ready access to medical care: 90% used a specific private physician. From a list of 15 health problems, 60% indicated that they had seen a health provider for at least one of them, most often for stomach pains (22%), headaches (18%), and coughing (16%). From an identical list, 48% indicated that there was at least one problem for which they had never seen a health provider but would like to, most often for a weight problem (14%), birth control (10%), and emotional upset (9%). Although 20% regularly used illegal drugs, 24% were sexually active, and 38% thought they had a weight problem, only 1%, 4%, and 10%, respectively, had sought care for these matters. A majority of students would not choose to go to a private physician for care related to sexuality, substance abuse, or emotional upset, and would not be willing to seek care for these problems with their parents' knowledge. Ready access to private primary care did not assure attention to important health needs among these suburban adolescents.

**Uses of the 1980 census for Hispanic health services research.**

Giachello AL; Bell R; Aday LA; Andersen RM  
Am J Public Health ,Mar 1983, 73 (3) p266-74, ISSN  
0090-0036 Journal Code: 3XW  
Languages: ENGLISH

The 1980 Census data provide a valuable resource for health services research on Hispanics. Hispanics are the fastest growing minority group in the United States and yet there is a paucity of large-scale empirical research on their health care and access needs. This paper describes how the census can assist in: 1) estimating the overall health care needs of this group, 2) identifying target groups within the Hispanic population who may have special health care problems (e.g., children, elderly, pregnant women, etc.); and 3) using other data sources to improve the quality of studies carried out on Hispanics. It also discusses problems in using the census for Hispanic health services research and some strategies for dealing with these problems.

**Periodontal treatment need of the Finnish population aged 30 years and over.**

Markkanen H; Rajala M; Paunio K  
Community Dent Oral Epidemiol ,Feb 1983, 11 (1) p25-32,  
ISSN 0301-5661 Journal Code: DNF  
Languages: ENGLISH

A representative sample (n = 8000) was drawn from the population aged 30 years and over, registered as living in Finland. Periodontal disease status was recorded according to the modified Periodontal Treatment Need System (PTNS). Plaque retentions were examined separately. Of the subjects with four or more teeth 3.4% had a healthy periodontal status, while 10.2% of the jaw quadrants were healthy. Plaque retentions were found in 96.6% of the subjects and 90.9% of the jaw segments. Periodontal treatment need was calculated in three ways and was 195 +/- 111 (S.D.) min when the calculation was based on WHO recommendations (1978). Number of teeth, age, sex, caries and filling scores, and education explained about 30% of the treatment need when tested by multiple linear regression analysis.

Journal Code: UT9

Contract/Grant No.: 2-507-RR070805-16

Languages: ENGLISH

Recent changes in mental health policy and treatment have largely been attributed to a professional concern for patients' rights. This view is challenged by patients' rights organizations and their allies, such as legal advocacy groups.

These parties argue that psychiatric planners and providers are trying to coopt a popular movement and to use patients' rights as a convenient explanation for the mental health system's limited self-reform and fiscal limitations. A key issue here is the gap between planned policy and implemented practice. Patients' rights activists maintain that rights are only very sparsely implemented, while the mental health system believes that it has progressed quite far. A study of patients' rights attitudes held by the various involved forces can illuminate the conflicts in patients' rights policy and provide understanding of the potential for resolving these conflicts. Such an analysis also touches on some general themes concerning the relationships between health providers and social movements in the health field. This paper examines attitudes towards mental patients' rights on the part of mental patients rights groups, state departments of mental health, state hospitals and statewide mental health associations. One hypothesis was borne out: that patients' rights groups do not believe as much as does the mental health establishment that concern for patients' rights has played a large role in mental health policy. Further, the activist groups are more favorable than are the other respondents to abolition or sharp curtailment of intrusive psychiatric treatments. And, mental health officials and their lay supporters are less prone to accept patients' rights groups' initiative in reform efforts. The second main hypothesis, that the mental health establishment would be more antagonistic to patients' rights in states where patients rights groups existed, was not supported. One possible explanation for this is that patients' rights groups have had a nationwide impact, and that mental health officials face common problems throughout the country. Alternatively, or in conjunction, an antecedent variable of political liberalism may operate in some states, creating both activist groups and more liberal psychiatric professionals. The significance of these findings is discussed and suggestions are offered for future research in this area.

The Robert Wood Johnson Foundation Clinical Scholars Program was developed to allow selected physician clinicians to acquire certain skills which are not part of the usual physician's repertoire. Begun in 1969 with support from the Carnegie Corporation and the Commonwealth Fund, funding has been provided since 1973 by the Robert Wood Johnson Foundation. By June 1981, 309 physicians had completed their training as clinical scholars, and a majority were pursuing careers in academic medicine. This paper recounts the factors and forces which led to the initiation and development of the program, its successes and failures, the problems faced, the achievements of clinical scholar alumni, and the program's current status.

Cost of illness (COI) studies have grown in importance in the last decade. They are frequently used in funding decisions for selected health care programs. Cost of illness study proponents present their results as objective, unbiased analysis. Yet, there are severe conceptual and methodological difficulties with the technique. Given its methodological weaknesses, the singular use of COI analysis to reach policy decisions may be no better than the political decision process it was intended to replace.

**A measure of community health needs and actions in a rural area of Iraq. The Abu-al-Khasib experience.**

Joseph G; Sugathan TN; Ramankutty P; Alkafajei AM; Antony R; George A; Habib OS; Yacoub AA; Mahmood DA; Ajeel NA  
Trop Geogr Med ,1982, 34 (3) p279-86, ISSN 0041-3232  
Journal Code: WGJ  
Languages: ENGLISH

A longitudinal enquiry was carried out among randomly selected households in four villages in Abu-al-Khasib district of Iraq, to study health needs as perceived by the community and actions people take when the need arises. Almost three-quarters of the spells of sickness as perceived by the community were among mothers and children. Most of the morbidity was found to be within the scope of preventive services at the local health centre level. Health centre services were underutilised. Only half of the spells of sickness were reported to the local health centres for medical care; a reason for this phenomenon is the emerging preference for care at the hands of clinical specialists. The action the community takes when a health need arises depends on their perception and this is determined by rapid social and educational development. The need to increase demand for

normal care, especially that of mother and child, is stressed; this care may be strengthened through introduction of a domiciliary component.

Black N  
Soc Sci Med ,1982, 16 (20) p1801-6, ISSN 0277-9536  
Journal Code: UT9  
Languages: ENGLISH

Scientific approaches, such as operational research and health economics, have failed to resolve many of the problems confronting managers of health services. This is partly because of assumptions about the value-free nature of information and partly through paying little regard to power conflicts in care systems. The case-study method offers a means of understanding some aspects of these conflicts and could therefore improve the effectiveness of scientific methods in influencing decisions. An example of a case-study involving perinatal care in an English health district is described in an attempt to demonstrate the practical benefits that could accrue to managers hoping to see their macro-study findings effecting change.

In a national survey of family medicine university units and residencies, 549 MD and 135 PhD faculty pursuing family medicine research were identified. Resources available for research were assessed, as were practice data system characteristics. The practice base nationally of programs pursuing research included 2.6 million patients from 1 million families, making 5.1 million visits per year. Common major impediments to research reported by programs included lack of faculty time (78%), lack of funding for faculty (61%) or staff, equipment and supplies (48%), and lack of research skill (45%) and role models (43%). The annual amount of all research grants received for calendar year 1979 was \$3.4 million, of which \$2.6 million was from federal government sources. This represented 0.06% of the federal health research effort. Continued development of family medicine research will require increased funding support both for research and research training.

The Therapeutic Intervention Scoring System (TISS) introduced in 1974 has become a widely accepted method of classifying critically ill patients. In response to requests to update the system because of recent innovations in critical care, some items have been deleted, some have been added, and certain point scores have been adjusted. Explanations of items within the system and guidelines for the user are included. A comparison of the new 1983 system to the old 1974 system in 100 consecutive patients reveals no difference in total point scores. We hope this updated explanation will ease the task of assessing use of intensive care services.

**Health care accommodation in Scotland.**

Maclachlan J

Scott Med J ,Oct 1982, 27 (4) p325-30. ISSN 0036-9330

Journal Code: UJK

Languages: ENGLISH

The Medical and Nursing Advisers of the Scottish Health Service, Common Services Agency, Building Division, advise upon the planning of health care accommodation. The overall spread of beds by function is given in a review of existing health care buildings in the year 1981. The numbers of hospital beds and of various groups of staff in the hospital and community services are calculated per 100,000 population so that any unusual disparity can be ascertained. One of the parameters for health building planning is fiscal control and so the cost per hospital in-patient week is tabulated for eight groups of specialities. The appropriate responsibilities of the Regional Councils in Scotland in 1979 are considered along with the responsibilities of Health Boards because part of each Social Work Department's work is the provision of accommodation and social care for those in need as opposed to the National Health Service responsibility for the health care of those in hospital and in the community. An overall view of residential accommodation for those requiring medical treatment or social care is presented in tabular form. The views expressed are not necessarily those of the Common Services Agency.

**Needs and medicine.**

Willard LD

J Med Philos ,Aug 1982, 7 (3) p259-74, ISSN 0360-5310

Journal Code: IZD

Languages: ENGLISH

It is argued that human needs are not facts (properties, states, processes, relations) about people, but are values. The reasons presented for this position are (1) that needs are goal oriented and goals are things people value, (2) that 'need' functions as a basic motivational term, and (3) that disagreements about what people need are disagreements in attitude toward, and emotional attachment to, things variously considered to be valuable. If human needs are not facts, then, of course, health or medical needs are not. Viewing health or medical needs as discoverable facts, rather than values, engenders certain difficulties in the following areas of concern: (a) Deciding when surgery is necessary and when unnecessary; (b) Defining the concepts of health and disease; (c) Evaluating some consequences of the development of medical science and technology; and (d) Understanding the alleged conflict between patients' health needs and their human rights.

**Converting the need for care into demand for services.**

Davis P

Int Dent J ,Sep 1982, 32 (3) p271-80. ISSN 0020-6539

Journal Code: GPT

Languages: ENGLISH

Two strategies for converting need into demand are identified. One, a longer term programme, involves raising the level of 'want', or perceived need, through attitude change. The other has a more immediate impact and involves increasing the rate at which perceived needs are converted into demands by reducing organizational barriers. It is argued that, potentially, a quarter of the adult population is susceptible to demand expansion under the second strategy. Although racial and social class differentials in perceived need would be unaffected by such a programme, inequality in demand would be reduced. A number of quite specific initiatives are suggested. First, the retentiveness of the dental system can be increased, especially among marginal groups, through the establishment of a more egalitarian clinical relationship, by the exercise of human relationship skills, through behavioural strategies for increasing compliance and through improved access. Secondly, improved geographical access can be achieved through tapping the 'captive' populations present in two major institutional areas, the school and the work site. This requires mobility in deployment of resources and flexibility in negotiating the organization and financing of care. Finally, more rational visit schedules, organizational arrangements and payment systems need to be developed in the average dental practice.

**The concept of need in dental care.**

Sheiham A; Maizels JE; Cushing AM

Int Dent J ,Sep 1982, 32 (3) p265-70, ISSN 0020-6539

Journal Code: GPT

Languages: ENGLISH

The most commonly used methods of assessing need for treatment are based solely on clinical criteria. Recently, it has been recognized that a wider interpretation than that provided by clinically assessed need is required. Measures of need should include the impact of ill health upon individuals, the degrees of dysfunction and the perceptions and attitudes of patients. Although there is no generally agreed definition of need, the taxonomy suggested by Bradshaw (1972) is recommended. He divides need into normative, felt, expressed and comparative types. One of the major shortcomings of all methods of assessing need is that they do not assess the need and propensity for preventive care and health education. A more realistic assessment of treatment needs should include the functional and social dimensions of dental disease and an assessment of the social and motivational factors which predispose people towards dental ill health and influence the effectiveness of treatment and health education. Some dental needs are not very well assessed. In particular, the assessment of the need for treatment of malocclusion, whilst claiming to be objective, does not incorporate measures of lay perception or impact of the condition. Instead of relying only upon purely clinical methods of assessing needs, the development of sociodental indicators is required. This will encourage a shift in emphasis away from the mechanical to the behavioural aspects of treatment and the development of a health-orientated model of care in preference to the sickness model that dominates current dental services.

**Issues in studying ancillary services.**

Roos LL Jr

Soc Sci Med ,1982, 16 (17) p1583-90, ISSN 0277-9536

Journal Code: UT9

Languages: ENGLISH

This paper examines several approaches to studying ancillary services usage. The likely generalizability of results provides one criterion for picking site, study population and conditions studied. Breaking up such an aggregate figure as mean annual ancillary services charges per patient into its component parts helps identify the different contributors to high cost practice patterns. Potential differences in case mix are noted as providing the most severe threat to interpreting variation in ancillary services use across practitioners and practice settings. Strategies for dealing with case mix problems include: focusing on specific diseases and specific specialities, stratifying within diagnostic categories, using multiple comparisons and multivariate analysis, pairing of visits and episodes and applying small area techniques.

This study evaluates the determinants of demand for dental health in the context of an econometric model where dental health and dental care are jointly endogenous. The theoretical analysis is based on the application of economic theory to production activities occurring at the individual or household level. A number of hypotheses concerning the change in demand for home and market dental care with respect to price and income changes are posited and empirically tested. Additional hypotheses concerning the relation between dental care and dental health are also examined statistically while controlling for a variety of sociodemographic and economic factors. One of the key empirical findings is that the net price elasticity for dental services is quite low (-0.2) for this sample of individuals with high dental insurance coverage.

**[The effect of socio-cultural factors on the demand for psychiatric services]**

L'influence des facteurs socio-culturels sur la demande en soins psychiatriques.

Samitca DC

Schweiz Arch Neurol Neurochir Psychiatr ,1982, 130 (2) p159-77, ISSN 0036-7273 Journal Code: UDS

Languages: FRENCH Summary Languages: ENGLISH

Western psychiatrists observed during the last twenty years progressive changes of the morbidity. The classic neurosis became rare, the character pathology steadily increased, the non-psychotic depressions showed a marked increase and new categories of patients (both individual or collective) appeared. The only conceptual model which enables us to understand this phenomena is the "New Triangle". By this name the author designates a multisystemic application of Engel's bio psycho-social model to psychiatry. The interacting elements of the "New Triangle" are: the individual with his/her psychic structure and his/her history, the extra and/or intra-psychic stressors and the stress protective factors (social support systems). A modification of their equilibrium will result in a nonspecific (crisis situation) or specific, decompensation. The ways the particular sociocultural aspects of the post industrial society may modify an aspect or/and another of the "New Triangle" are described. It seems desirable to be no longer content with a nosological diagnosis, but to endeavour to establish a systemic situational one in which the interaction type and functional level of all elements of the "New Triangle" be evaluated.

**Meeting the mental health needs of the aged: the role of psychiatric emergency services.**  
Simson S; Wilson LB  
Hosp Community Psychiatry ,Oct 1982, 33 (10) p833-6, ISSN 0022-1597 Journal Code: GCJ  
Languages: ENGLISH

The mental health emergency service is a critical triage point for making decisions about the delivery of a variety of services needed by an increasingly large elderly population. This study explores the roles of two mental health emergency services in providing services and linking elderly clients with elements of the health, mental health, and long-term care systems. A data base was established by a retrospective review of 350 records of elderly clients treated at two urban mental health emergency facilities over a one-year period. Key findings are presented about the demographic characteristics of users age 60 and over, diagnoses, referral and disposition patterns, repeater usage, and emergency versus nonemergency usage. Recommendations are made on the future role of mental health emergency services in meeting the complex health and mental health needs of the elderly in the community.

**Mental health needs assessment: beware of false promises.**  
Royse D; Drude K  
Community Ment Health J ,Summer 1982, 18 (2) p97-106, ISSN 0010-3853 Journal Code: DNH  
Languages: ENGLISH

Needs assessment is considered by experts to be an essential part of mental health planning. Unfortunately, almost anything can pass for a needs assessment. This article briefly examines the methodological limitations of the diverse and unstandardized approaches as well as the conceptual problems associated with needs assessment. The authors suggest that needs assessments could become much more useful if policy-setting and funding bodies would more explicitly state their expectations, if there were greater use of standardized instruments, and if efforts could be directed towards the cataloging of known needs assessment instruments. Further, the state of the art would be advanced if an expert committee could be formed to develop national standards for needs assessments.

This study identified the health resources that rural consumers in DHHS Region V indicated they would use for mental health problems. Data were collected by survey research methods from a probability sample of 3057 rural residents. The study found that rural residents prefer to use primary care givers for mental health problems except in the case of serious mental illness.

**Special needs of low-income mothers of developmentally delayed children.**  
Eheart BK; Ciccone J  
Am J Ment Defic ,Jul 1982, 87 (1) p26-33, ISSN 0002-9351 Journal Code: 3MA  
Languages: ENGLISH

The needs that were created or intensified for 36 low-income mothers in the first years after learning that they were the parents of a developmentally delayed child were investigated, and intervention strategies to help these mothers get their special needs met were identified. Results suggest that the overwhelming need of these mothers was to learn how to cope with the many unknowns about their child's future and that an effective intervention strategy might be the establishment of groups run by and for parents in conjunction with early intervention programs for the children.

**Regression analysis in health services research: the use of dummy variables.**

Polissar L; Diehr P

Med Care ,Sep 1982, 20 (9) p959-66, ISSN 0025-7079

Journal Code: LSM

Languages: ENGLISH

Dummy variables frequently are used in regression analysis but often in an incorrect fashion. A brief review of examples in the medical care literature showed that the interpretation of dummy variable regression coefficients and their significance was often incorrect or unclear. This article shows how dummy variables can be used and assessed properly. The importance of testing for the joint effect of a group of dummy variables is stressed. It also gives a standard and useful extension of the dummy variable technique to testing for the effect of collections of variables.

**Quality assurance as a managerial innovation: a research perspective.**

Kaluzny AD

Health Serv Res ,Fall 1982, 17 (3) p253-68, ISSN 0017-9124 Journal Code: G2L

Languages: ENGLISH

Quality assurance is defined and concepts from innovation theory are applied to the study of quality assurance programs. Two distinct although not mutually exclusive perspectives on innovation are considered--the diffusion perspective, focusing on the innovation itself and its implementation, and the adoption perspective, highlighting factors characteristic of the adoption unit (i.e., the organization or individuals within it) that facilitate or impede the adoption process. Directions for future research are suggested.

Cordera A

Diagn Imaging ,1982, 51 (3-4) p183-6, ISSN 0378-9837

Journal Code: EAI

Languages: ENGLISH

A meeting was held in Mexico City in 1980 to discuss the situation of diagnostic radiology in Latin America. X-ray departments are part of the medical care system of each country, utilized mainly in diagnosis. There are various approaches to health care, some of which are political, but technology should be used for its own value only. Social needs must be defined and the availability and costs studied. Priorities must also be defined. 80% of the morbidity is related to socioeconomic factors. Resources cannot satisfy demand, but should be concentrated on the most common problems. This should be the beginning of an ongoing analysis searching for the solutions for diagnostic radiology in Latin America.

**Trauma in the rural areas of Western Nigeria and the need for basic radiological services.**

Makanjuola D

Diagn Imaging .1982, 51 (3-4) p139-45, ISSN 0378-9837  
Journal Code: EAI

Languages: ENGLISH

Trauma requiring radiological investigation in rural areas of Nigeria is mainly the result of road accidents and occupational or domestic injuries. The latter account for 21% of all trauma, and males are far more commonly affected. Treatment is often delayed because of the long distances which patients must travel to district hospitals where radiological facilities are available. These injuries often become heavily infected. Some go to traditional healers who do not require radiological investigation before treatment. The consequence is high mortality and morbidity. The delay in treatment also affects other medical problems which require radiological investigations at the primary care level. A basic radiological service in the primary care centres will indisputably improve the present situation and attract more doctors to work in these areas.

**Behaviorally caused loss of health and the use of medical care.**

Sindelar JL

Econ Inq ,Jul 1982, 20 (3) p458-71, ISSN 0095-2583  
Journal Code: EEF

Languages: ENGLISH

This paper extends the analysis of the demand for medical care to an aspect which has previously been ignored: variations in expected, as opposed to experienced, cause of losses of health and the current use of medical care. Losses of health which cannot be prevented by the prior use of medical care are hypothesized to decrease the use of medical care by reducing the rate of return to investments in health, ceteris paribus. The reduction in the rate of return occurs both because these losses curtail the length of the stream of benefits to the use of medical care and because prior use of medical care is not effective in reducing the occurrence of these types of loss. Empirical findings support this hypothesis. Results suggest that differences in expected losses may account for some of the differences in utilization of medical care by sex.

**The Kentucky elderly need assessment: concurrent validity of different measures of unmet need.**

Murrell SA; Brockway JM; Schulte P

Am J Community Psychol ,Apr 1982, 10 (2) p117-32, ISSN 0091-0562 Journal Code: 3FV

Languages: ENGLISH

The purpose was to examine the concurrent criterion-based validity of different measures used in a statewide in-home need assessment survey of a representative sample of 570 older persons. Need was measured and defined in four different ways in six problem areas. The criterion measure was a life satisfaction scale. The set of four need measures yielded a significant multiple R, indicating that the set would generally be related to life satisfaction in older persons. Individually, three of the four need measures made significant contributions. The set of six problem areas also yielded a significant multiple R, with four (Mental Health, Health, Income, Nutrition) making significant individual contributions. Implications for need assessment measurement included: that problem-focused measures are strongly and generally related to need satisfaction, whereas service-focused measures have problems; that both evaluative and descriptive measures appear to be related to need satisfaction; and the clear value of a multilineed conception for measurement and for application to program planning and resource allocation. Suggestions for improvement in measures were made and cross-validation called for.

**Survey approach to estimating demand for physician assistants.**

Scheffler RM; Gillings DB

Soc Sci Med ,1982, 16 (10) p1039-47, ISSN 0277-9536 Journal Code: UT9

Languages: ENGLISH

A national probability sample of physicians was surveyed by mail to provide an estimate of the number of job openings for physician assistants (PAs). The responses were used to undertake an empirical analysis of the factors which influence a physician's decision to hire a PA. Estimates were adjusted to account for survey non-response. This approach may be useful for estimating the employment demand for other types of health workers employed by physicians. It was found that in 1976 there was an unconditional demand for 20,338 PAs and a further conditional demand for 3417 PAs. This contrasts sharply with the fact that as a March 1977 only 4845 PAs had graduated from training programs. Approximately 53% of this employment demand was from physicians in the primary care specialties (general/family practice, Obstetrics/gynecology, internal medicine, and pediatrics). Of note was the finding that physicians expected to pay PAs a lower salary than was being received in the market place. Further, 27% of physicians not willing to hire PAs indicated lack of knowledge about them as the main reason for not hiring.

**Physical therapy manpower planning. Projection models and scenarios of 1985.**

Breegle GG; King E  
Phys Ther ,Sep 1982. 62 (9) p1297-306. ISSN 0031-9023  
Journal Code: P6W  
Languages: ENGLISH

Faced with the difficult task of coordinating statewide health education, the Kentucky Council on Higher Education is using several manpower projection statistics as one component of their decision-making process. These manpower data are essential when considering the establishment, expansion, continuation, or termination of health-related academic programs. Three models were used to project manpower requirements for licensed physical therapists in Kentucky. The models were 1) manpower:population ratio, 2) trend analysis based on time series, and 3) the American Physical Therapy Association's health-needs method. Four variants of the manpower:population ratio model are discussed and presented: population ratio based on 1) national ratio, 2) Kentucky ratio, 3) weighted national ratio, and 4) weighted Kentucky ratio. The trend analysis model is presented and discussed. The health-needs approach, based on expert opinion and health-related variables, identifies the quantity and quality of services required to provide the Kentucky population with the best possible care. The paper concludes with three brief scenarios describing the possible effects of the three models and physical therapy in Kentucky. The scenarios unfold from differing assumption about the effects of manpower production on health care. Scenario A is a "current arrangement" scenario. Scenario B considers the effects of predicting future manpower requirements and resources based on the past. Scenario C projects the effects of a comprehensive plan on the goal of producing the best possible care for all Kentuckians.

Contract/Grant No.: GM-14231; AM-30582; HRA 231-77-0116

Languages: ENGLISH

Cardiac catheterizations and cardiac operations were evaluated in the population of Olmsted County, Minnesota, from 1973 through 1980, and trends in this region were compared with nationwide trends based on data from several sources. The rates of coronary arteriography and coronary-artery bypass operations in Olmsted county have increased over time, but overall, the rates of catheterization and operation appeared to be leveling off. For the country as a whole, the data appear to show similar trends, but there are wide differences among regions in the rates of operation and catheterization. In 1980 40 per cent of hospitals with cardiac-catheterization laboratories and 55 per cent of those with facilities for open-heart surgery were doing fewer than the suggested minimum numbers of these procedures necessary to achieve optimum results. The data support the view that further growth in the number of cardiac centers should be avoided. We believe there is a need for continued evaluation of the use of cardiac services if quality is to be protected and costs controlled.

**Validation of a patient satisfaction scale: theory, methods and practice.**

Hulka BS; Zyzanski SJ  
Med Care ,Jun 1982. 20 (6) p649-53. ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

This communication discusses more than a decade of developments in the measurements of attitudes toward physicians and medical care. Particular emphasis is given to a scale first reported in 1970 and to a 1981 publication attempting to validate this scale. The analytic strategies proposed as validation techniques are reviewed with respect to their technical properties, underlying assumptions and interpretability. Constraints on each of these features are noted. The most restrictive feature of these analyses is the presumption that validity can be achieved only through a unidimensional framework. Attitudes toward medical care are based on a diversity of substantive issues, and they are influenced by individual experiences and psychological characteristics as well as the circumstances surrounding scale administration. We propose that validation of patient attitude scales be based on a more generous conceptualization of their content and some consideration of their purpose and uses.

**Prevalence of dental caries and demands for services among Israeli kibbutz youth.**

Anaise JZ; Mann J  
Community Dent Oral Epidemiol ,Jun 1982, 10 (3) p161-2,  
ISSN 0301-5661 Journal Code: DNF  
Languages: ENGLISH

The purpose of the present study was to assemble information regarding caries prevalence among adolescent residents of kibbutzim in Israel. A total of 465 teenagers in 10 kibbutzim were examined for dental caries experienced. The DMFT figures derived in the study were almost double the values recorded for a comparable kibbutz age groups in the later 60's. Mean DMFT values were found to increase with age. The mean number of decayed teeth (D) showed a similar distribution. The proportion of teenagers free of caries was 1.5% and only 2.3% did not require any treatment. Despite the overwhelming need for dental care noted among kibbutz youth, only 21.6% were receiving care of their dental needs. Since physical blocks to access to dental care are almost non-existent in the kibbutz, it was suggested that the reason for the high rates of unmet needs, could, at least partially, be attributed to fear of pain and anxiety about the treatment.

Languages: ENGLISH

This paper evaluates the demographic impact of the Family Planning-Health Services Project in Matlab Thana of rural Bangladesh. The project was begun by the International Centre for Diarrhoeal Disease Research, Bangladesh in October 1977. Contraceptive services--including pills, condoms, IUDs, sterilization, and injectables--are supplemented by oral rehydration, tetanus toxoid, and other services. About 33 percent of eligible couples are using contraception. Impact is evaluated by direct measurement of birth rates in the treatment and comparison areas. An overall fertility decline of about 25 percent is observed, concentrated among older women. The impact is two-to-three times that of an earlier project that included fewer methods and used lesser trained workers. The study shows that intensive family planning efforts can affect fertility in the absence of socioeconomic changes.

services. The evidence reviewed here supports the hypothesis that variations occur to a large extent because of differences among physicians in their evaluation of patients (diagnosis) or in their belief in the value of the procedures for meeting patient needs (therapy). This hypothesis, which we call the professional uncertainty hypothesis, is germane to current controversies concerning the nature and extent of supplier influence on the demand for medical services. It is also important because of its implications for health regulatory policy. Our plan is to (1) review the relevance of the hypotheses for the supplier-induced demand controversy; (2) review the epidemiologic evidence on the nature and causes of variation; (3) examine patterns of use of common surgical procedures to illustrate the importance of supplier influence on utilization; and (4) consider some of the implications of the professional uncertainty hypotheses for public policy.

**Social psychological determinants of patient satisfaction: a test of five hypothesis.**

Linder-Pelz S  
Soc Sci Med , 1982, 16 (5) p583-9, ISSN 0277-9536  
Journal Code: UT9  
Languages: ENGLISH

Five hypothesis regarding the social psychological determinants of patient satisfaction were tested among patients attending the primary care clinics of a university medical center in Manhattan. The social psychological variables operationalized here were expectations, values, entitlement and perceived occurrences; the three dimensions of satisfaction studied were doctor conduct, convenience and general satisfaction. The social psychological variables together were found to explain only a small proportion of the variance in satisfaction, although their contribution varied with the dimension of satisfaction. Expectations consistently explained most of the variance in satisfaction ratings; particularly noteworthy was the direct effect of prior expectations of the doctor's conduct on subsequent satisfaction with that dimension of the care received. Values had little independent effect on satisfaction, and the combination of values and expectations (their interaction) was unrelated to satisfaction. Feelings of entitlement were also unrelated to satisfaction ratings. There was some support for the discrepancy model, which holds that the greater the discrepancy between perceived occurrences and prior expectations the less the satisfaction. The importance of carrying out further methodological studies aimed at developing reliable measures of these constructs is stressed.

**A model of the demand for medical and health services in Peninsular Malaysia.**

Heller PS

Soc Sci Med ,1982, 16 (3) p267-84, ISSN 0277-9536  
Journal Code: UT9

Languages: ENGLISH

This paper provides an empirical analysis of the determinants of the demand for medical services in Peninsular Malaysia. After elaborating a theoretical model of household demand for medical care in Section II an econometric model is specified and estimated in Sections III, IV, and V. The results indicate that total medical demand, as measured by the absolute volume of outpatient and inpatient consumption, is highly inelastic to the cash price and to the cost in time of utilization. Total medical demand is also inelastic with respect to income. Yet consumers are clearly responsive to the relative prices of alternative sources of medical care. Consumers are also sensitive to the way in which the time of utilization is spent, with high travel and treatment time causing reduced demand for services.

Discriminant Analysis and other related statistical techniques are frequently used to sort patients into those most likely and those least likely to benefit from a certain intervention. Considerable data analysis and computation are often required to arrive at the best-fitting mathematical model which translates discriminating variables or indicants into probability predictions regarding the presence or absence of disease or the likelihood of a favourable outcome. Attempts to judge how well discriminant analysis performs or to determine why it does not perform better are hampered by not knowing what is the greatest degree of discrimination theoretically possible in a data set. In this paper we describe a method of calculating the maximum discrimination attainable in a data set and show how it can be used (1) to decide whether further model building is worthwhile, and (2) if so, to judge the discriminatory performance of any such models. We apply this tool to two previously published studies of radiologic utilization; the results provide reassurance that, at least on the basis of the presenting indicants, the patients were being adequately selected for the studies in question.

**Quality measurement and control in physician decision making: state of the art.**

Anderson DW; Shields MC

Health Serv Res ,Summer 1982, 17 (2) p125-55, ISSN

0017-9124 Journal Code: G2L

Languages: ENGLISH

The status of the concept of controlling the quality of physicians is reviewed as are studies that have been done on methods to measure and improve quality. The conclusions are dismal given the rhetoric and actions on attempts to measure and control quality of physician decision making. Massive attempts are being made, for example, mandating PSROs to monitor quality before there is a methodology. Cost and quality reviews have, at most, a marginal impact and do not deserve the expenditures to conduct them. Studies on utilization review show minimal impact on reducing utilization. Administrative reviews reduce utilization for certain specific, narrowly defined procedures such as injections. There is no operational definition of "unnecessary" utilization. The tendency is to regard the lowest levels as optimal, presumably because they result in lower expenditures. Bureaucratic reviews do not provide incentives to decision makers the way various types of HMO delivery types do from current evidence. Hence, HMOs, deductibles and coinsurance, and competition have greater promise for limiting expenditures than do utilization reviews.

Quality audits are also marginally effective because of limited promise of changing provider behavior given current methods of doing so. They miss the organizational aspects in which incentives are generated. Research is needed, therefore, on alternative forms of quality and cost control such as HMOs, physician risk sharing, competitive models, and deductibles and coinsurance. Until the much needed research has been done, the amount of resources spent on review should be minimized. In the meantime, the review processes should concentrate on extreme variations of very narrowly defined criteria of proven validity while improving the review methodology by systematic research on quality monitoring. **Traumatic amputations and the need for a replantation service in Finland.**

Viikki SK; Goransson H

Ann Chir Gynaecol ,1982, 71 (1) p2-7, ISSN 0355-9521

Journal Code: 51N

Languages: ENGLISH

The authors review a series of 290 upper extremity amputee patients injured between 1974-79 from a 400,000 population area of one central hospital. Among these amputation injuries were 55 cases which were considered "serious", i.e. effecting seriously the function of the hand. Calculations were extrapolated to obtain reliable numbers for the need of a replantation service in Finland within a population of 5 million. According to the available data 90-160 patients annually would need a replantation service for their amputation injuries in the country. Some conclusions were also drawn about the results obtained with or without replantation surgery among the "seriously injured" group. The results obtained with the replantation service were clearly superior to the results achieved without replantation.

**Increasing efficiency in evaluation research: the use of sequential analysis.**  
Howe HL  
Am J Public Health ,Jul 1982, 72 (7) p690-7, ISSN 0090-0036 Journal Code: 3XW  
Languages: ENGLISH  
This paper describes Wald's sequential analysis and briefly reviews the history of its applied use. Two public health applications are presented as examples of how the method helped overcome two common problems associated with evaluation research. In one case, the sequential technique reduced dramatically the workload in an evaluation project where hospital records were being reviewed. In the second case, prompt feedback of data to a breast screening program was facilitated by the sequential method allowing program administrators to refocus their efforts on problem areas before the end of the funding period. On the average, Wald's sequential method results in a savings of 50 per cent in observations as compared to classical sampling procedures. The sample sizes will always terminate with a finite number and will rarely exceed three times the average sample size for any single sample.

**The continuing undersupply of neurologists in the 1980s: impressions based on data from three studies.**

Dyken ML  
Neurology (NY) Jun 1982, 32 (6) p651-6. ISSN 0028-3878  
Journal Code: NZO  
Languages: ENGLISH

Current unmet needs for neurologists were estimated on the basis of a survey of the directors of all academic neurology programs in the United States and Puerto Rico, by a study of the state of Indiana, and a review of potential needs by the Veterans Administration Hospitals. The number of neurologists in 1990 were predicted from residency positions filled, the membership of the American Academy of Neurology, and the AMA Master File. From these analyses, the author concludes that a shortage of from 1,214 to 5,418 neurologists may exist in 1990.

The study population consisted of 1174 intermediate Saudi schoolchildren; 601 girls and 573 boys, aged 13, 14 and 15 years. periodontal disease was assessed by the method recommended by WHD and data were computerized by using IBM 3033. SAS package. Boys had significantly higher debris, calculus deposits and intense gingivitis counts than girls by sex and age. But for advanced periodontal involvement, the result shows no significant differences by sex and age. There was a position correlation between debris, calculus and periodontal diseases. There was a highly significant difference between girls and boys. The results of this study suggest the need for an oral health program for the entire community.

**Educational needs of hysterectomy patients.**

Neefus MS; Taylor ME

Patient Couns Health Educ ,4th Quarter 1982, 3 (4)  
p150-5, ISSN 0190-2040 Journal Code: PAL

Languages: ENGLISH

This exploratory study determined specific educational needs of hysterectomy patients. The study population consisted of patients who had successfully undergone hysterectomies performed by four gynecologists within the two years prior to the study. A questionnaire was developed, tested, revised, and subsequently returned by 146 women. Most questions were designed to elicit information on (1) what patients wanted to know, (2) when they wanted the information, and (3) whether this information was obtained. Data regarding the first two questions were examined in relation to the demographic variables of age, education, occupation, pregnancy outcomes, and employment. Results showed that hysterectomy patients wanted more explanation of all topics. The topic most often (92%) rated very important was physical effects of the surgery. Women between 31 and 40 years of age valued as most important was the sexuality topics. Ninety-four percent indicated they most wanted the information before hospitalization. Twenty percent reported receiving no information about possible psychological or sexual problems. Conclusions drawn from this study are that there is an urgent need for structured patient education about hysterectomy; that patients have a need for information on the physical, psychological, and sexual aspects of hysterectomy; and that this information is needed before entering the hospital, pre- and postsurgery, and after returning home.

Nurs Res ,May-Jun 1982, 31 (3) p163-9, ISSN 0029-6562

Journal Code: 09K

Contract/Grant No.: 5R02 NU 00588

Languages: ENGLISH

The effects of specialty, setting, and provider group on the distributions of health problems managed by nurse practitioners and physicians in obstetric-gynecology, adult medicine, pediatrics, and family practice specialties are studied. Proportional samples by clinic were drawn from a total of 39,243 patient visits made to 16 ambulatory care clinics during an 18-week period. A Patient Encounter Form was used as the instrument and the ICD-9-CM was used as the coding system. Distributions of health problems differed between nurse practitioners and physicians in each clinic. Specialty affected the distributions of health problems managed by both provider groups. Setting affected the distributions of health problems for all specialties except the distributions of health problems not related to diseases or injuries (V codes) in family practice. Provider group effects were inconclusive. Community-based settings seem especially appropriate for nurse practitioner practice.

Languages: ENGLISH

Task delegations among different nursing skill levels (RNs, LPNs, NAs) are empirically measured in this study by performing a nursing activity analysis. Instead of relying on conventional techniques of time study and work sampling, this study incorporates Nominal Group Process and specially designed questionnaires for analyzing nursing activities. Approximately 100 nurses from a 193-bed short-term general hospital participated in the study. The resulting task delegation rates are compared with hospital policy, and a comparison is also made between different nursing units.

**Estimating the effects of nosocomial infections on the length of hospitalization.**

Green MS; Rubinstein E; Amit P

J Infect Dis ,May 1982, 145 (5) p667-72, ISSN 0022-1899

Journal Code: IH3

Languages: ENGLISH

Increased length of hospitalization due to nosocomial infections has generally been calculated from the arithmetic mean of the differences in hospital stay of persons with nosocomial infections and their matched control patients. This method may yield estimates inflated by a few extreme values. Data from a prospective study of nosocomial infections in patients hospitalized in surgical and orthopedic services in a large hospital in Israel are used to illustrate a modified statistical approach to this problem. The geometric mean of the ratio of length of hospitalization of 57 patients with nosocomial infections to matched control patients was determined. The increased mean hospital stay was estimated at 4.5 days for urinary tract infection, 11.9 days for surgical wound infection, and 25 days for "double infection." These figures were lower than those derived from calculation of the arithmetic mean of excess hospital stay and suggest that this modification should be incorporated in future studies of this nature.

**Health education needs assessment in an HMO: a case study.**

Howard DM

Health Educ Q ,Spring 1982, 9 (1) p23-41, ISSN

0195-8402 Journal Code: G20

Languages: ENGLISH

Potential health education services for HMO subscribers are numerous and varied, ranging across the entire wellness to sickness spectrum. Because of cost consciousness and limited educational resources, careful needs assessment and selection of priorities are vital to the success of HMO health education efforts. The results of utilizing six needs assessment methodologies are presented in this case study. Consumer and provider involvement in the needs assessment process revealed five top priority health problems or opportunities for health education: membership education needs; overweight/obesity; self-care needs; hypertension; and smoking. These recommendations did not include perinatal and pediatric health education services as top priority needs, an outcome at variance with the results of the other needs assessment

methodologies. This variance emphasizes the importance of employing multiple techniques in the needs assessment process. Problems in implementing various needs assessment methodologies are discussed as well as implications for health education practice.

General agreement exists on the utility of and need for more widespread applications of health system performance indicators measured on a per capita basis. This article contains a discussion of certain methodological issues in per capita measurement and provides recommendations to facilitate applications and future advances. The two basic approaches to per capita measurement are summarized and the need for methodological research is emphasized. Illustrative per capita measures that would be of assistance in applied settings are presented in the context of a tabular display of health and demographic data for a hypothetical state.

**Estimating the local prevalence of persons needing community support programs.**

Szymanski HV; Schulberg HC; Salter V; Gutterman N

Hosp Community Psychiatry ,May 1982, 33 (5) p370-3, ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

As Community Support Programs for the chronically mentally ill expand, it becomes increasingly important to determine the number of individuals qualifying for these services. Although national prevalence data are currently available, they have only limited usefulness for program planning at state and local levels. Given the distinctive circumstances affecting each community's chronically ill population, their number, and their need for services, the authors propose identifying a patient cohort that approximates the local prevalence of persons needing Community Support Programs by using one of three methods. The first method identifies persons who have been hospitalized previously and who currently require outpatient psychiatric care. The second identifies persons previously hospitalized who require another hospitalization during a specified period of time. And, the third method identifies persons who are currently in outpatient treatment with a diagnosis of schizophrenia. choice of method depends on definition of chronic mental illness, type of data available, local treatment philosophies, and health care system structure:

Among the several methods of assessing need for health services, the social indicator and the rates under treatment approaches utilize routinely available data. A well designed community survey, considered by many as the criterion of need within an area, is costly, difficult to mount, and requires considerable expertise. Therefore, it would seem reasonable to attempt to limit the need to utilize this approach. Presented here is a schema which utilizes the social indicator and rates under treatment approaches for an entire catchment area, reserving the survey approach only for those areas in which the two readily available need assessments are at variance, suggesting questionable validity for one or both approaches. Within a suburban middle-class county containing pockets of small town poverty, a social area analysis was undertaken to characterize need for mental health services. Inpatient rates under treatment were developed to measure demand. Key informant and survey approaches were undertaken to study selectively those census tracts which were discordant as to need and demand. This resulted in reducing the size of the population to be surveyed to 25 per cent of the total county, thus more efficiently using the limited resources available for needs assessment purposes.

Languages: ENGLISH

Epilepsy is a common disorder, affecting more than two million people in the United States. For the majority of these people, medications control seizures and permit them to lead nearly normal lives. But the Commission for the Control of Epilepsy and its Consequences estimates that at least 200,000 Americans suffer seizures more than once a month. The National Institute of Neurological and Communicative Disorders and Stroke has established comprehensive Epilepsy Programs to stimulate clinical research on all aspects of epilepsy, including prevention, diagnosis, and more effective management.

Problems of defining equity and equality of access are not trivial; there are fundamental disagreements about the nature of health care as a social good and about other principles of distributive justice. Presuppositions about equity underlying several current proposals for reform of health care "markets" are considered. Issues of equity--and theories of justice--arise also in contexts other than disputes about access. (42 Refs.)

Bachrach LL  
Hosp Community Psychiatry ,Mar 1982, 33 (3) p189-97,  
ISSN 0022-1597 Journal Code: GCJ  
Languages: ENGLISH

This article analyzes the periodical and "fugitive" literature concerned with an emerging psychiatric service entity, young adult chronic patients. The increasing prominence of a young adult patient population results from the confluence of two primary forces: deinstitutionalization policies and demographic factors. The author discusses the clinical diversity and program requirements of these patients. Young adult chronic patients are best served when their uniqueness as a patient population is acknowledged and heeded and when special services for them are integrated into the total system of care, the author concludes.

J Fam Pract ,Feb 1982, 14 (2) p301-9, ISSN 0094-3509  
Journal Code: I4L  
Languages: ENGLISH

Before morbidity or utilization rates can be legitimately compared across practices or within a practice over time, it is necessary to know the number and age-sex distribution of individuals who are served by the practice in question. Estimating this "population at risk" has been referred to as the "denominator problem." Although a variety of methods for estimating practice denominators were proposed more than six years ago, none has been shown to be satisfactory, and no new ones have materialized. One method, however, has never been evaluated, and evidence is presented which suggests that this method may be capable of providing satisfactory estimates of practice denominators. Data from the US Health Interview Survey, the British National Morbidity Study, and other sources suggest that it may be possible to derive age- and sex-specific correction factors which, when applied to the age-sex distribution of visiting patients, would provide reasonable estimates on the practice denominator. This "correction factor method" would require only that practices maintain age-sex registers of their visiting patients. Further investigation is required before this method can be considered

a satisfactory means of estimating practice denominators.

Interest in health care policy research has grown significantly over the past decade. This paper makes a number of suggestions for improving the quality of health care policy research and its influence on policymaking. These include suggestions for: 1) improving the way in which problems are identified and defined; 2) merging qualitative and quantitative approaches to study design, data collection, and analysis; 3) developing more integrative strategies for disseminating research results; 4) changing the reward structure to encourage health policy research; and 5) developing a stronger standby research capability. Specific examples of each of the above are presented. Throughout, the need for greater interaction among researchers, analysts, policymakers and practitioners is emphasized, along with specific suggestions for ways of bringing this about.

**Future requirements for and supply of ophthalmologists. What do the forecasts show?**  
Trobe JD; Kilpatrick KE  
Arch Ophthalmol ,Jan 1982, 100 (1) p61-6, ISSN 0003-9950  
Journal Code: 830  
Languages: ENGLISH

Forecasts of the requirements for and supply of ophthalmologists in 1990 have produced conflicting results because of varying assumptions about the future utilization of eye care services, incidence and prevalence of ophthalmic disease, physician productivity, and availability of residency training positions. A typical "utilization-based" models, founded on present consumer behavior, predicts a substantial 1990 surplus of ophthalmologists at current rates of residency training. Two "need-based" models, founded on ideal rather than actual use, reach different conclusions because of varying use of a fragile data base and the need to rely heavily on the subjective judgment of experts with regard to norms of care. The 1980 Graduate Medical Educational National Advisory Committee forecasted a surplus, while the 1978

American Academy of Ophthalmology predicted a deficit. Utilization-based models may slightly underestimate future ophthalmologist requirements. However, analysis of the factors that will influence future use suggests that need-based models are likely to overestimate the requirements. It is risky to accept the need-based model projections because of the high cost of a surplus, which include not only the expenses of training unneeded ophthalmologists but also the cost of their decreased exposure to disease and of declining physician morale, acumen, and thresholds for surgical procedures. Because free market mechanisms are ineffective in governing the supply of health providers, it will be necessary for the profession itself to review the current and projected supply and to set limits on the number of persons in training.

**The need for dental health screening and referral programs.**  
Rebich T Jr; Kumar J; Brustman BA; Green EL  
J Sch Health ,Jan 1982, 52 (1) p50-3, ISSN 0022-4391  
Journal Code: K13  
Languages: ENGLISH

School-based dental health screening and referral programs can have a tremendous impact on a community. They provide examinations to children, some of whom have never seen a dentist, and refer those in need of treatment. When coordinated with other dental health activities, these programs can also raise the overall consciousness about oral health and need for health care in children and parents alike. By their concern for dental health and encouragement to the children to participate in the screening programs and follow through on referrals, school officials can serve as role models to the children and further reinforce the importance of dental health. By conducting the screenings on a local level, the problem is seen as a community one, and is more likely to be meaningfully addressed. School officials, health personnel and teachers are instrumental in initiating and conducting these programs and are thus responsible for the benefits the children derive from the screenings.

**Ethical issues in informed consent. Research on medical cost containment.**

Mahler DM; Veatch RM; Sidel VW

JAMA .Jan 22-29 1982. 247 (4) p481-5. ISSN 0098-7484

Journal Code: KFR

Languages: ENGLISH

The decision to contain medical costs, which is a political and social decision, entails restriction of medical services. To guide public policy, research on the impact of such restriction must be carried out, but this type of research differs significantly from most other medical research. Difficult issues concerning informed consent arise, with potential conflicts among principles of maximization of good and minimization of harm to the patient, the patient's right to self-determination, and the utilitarian goal of maximization of collective welfare. We have discussed these principles in the context of relationships between patient and physician and between subject and investigator. Approaches considered include emphasis on retrospective studies, use of statistical techniques to formulate clinical decision-making rules on the basis of available data, three-celled randomization designs, and the role of the primary-care physician in maximizing patient autonomy and minimizing the potentially threatening aspects of informed consent for such studies.

**Developing marketing strategies for university teaching hospitals.**

Fink DJ

J Med Educ ,Jul 1980, 55 (7) p574-9, ISSN 0022-2577

Journal Code: J13

Languages: ENGLISH

University teaching hospitals face increasing competition from community hospitals, expanding regulation of health care, a rising tide of consumerism, and in many cases a declining urban population base. These problems, which may threaten the teaching hospital's ability to continue tertiary care, teaching, and research functions, may be solved with the aid of new marketing strategies. In developing its marketing strategy, a hospital must assess its strengths and weaknesses, specify its goals in measurable terms, implement tactics to achieve these goals, and evaluate its marketing program. The strategies should be directed toward achieving better relationships with institutions, practitioners, and surrounding communities and increasing patient, visitor, and employee satisfaction. A wide variety of programs can be used to reach these goals and to help teaching hospitals meet the competitive challenges of this decade.

Restrictions on advertising about services performed by professional groups have recently been questioned by the government and consumerists. The purpose of this study was to determine physicians' attitudes about the use of advertising in their profession and also to compare these results with responses from dentists, attorneys, and accountants. While a survey of these groups in three metropolitan areas indicate mild support for advertising in general, there was a definite negative reaction to advertising in the respective professions. Participants also reported their attitudes about the effects of advertising on prices and fees, quality of services, and public expectation and governmental regulations. The concepts of social marketing and informative advertising are suggested as approaches that may meet the requirements of both the government and the professions.

**Who chooses prepaid medical care: Survey results from two marketings of three new prepayment plans.**

Roghmann KJ; Gavett JW; Sorensen AA; Wells S; Wersinger R

Public Health Rep ,Nov-Dec 1975. 90 (6) p516-27. ISSN

DQJA-0000 Journal Code: QJA

Languages: ENGLISH

Employees joining or not joining three newly marketed prepayment plans were surveyed during the first marketing period and during another open enrollment period 18 months later. In the 1973 survey the respondents were 149 subscribers (family contracts covering 568 persons) to the new plans and 224 nonjoiners (a total of 802 persons in their families)--all employees of Rochester's largest industry. In the 1975 survey the respondents were employees of several companies. They included 326 joiner families (1,101 persons) and 145 nonjoiner families (483 persons). There were no significant differences in previous out-of-pocket health expenditures between joiners and nonjoiners. Their self-reported health ratings did not differ; disability over the last 2 weeks was about the same. Physician utilization rates and inpatient rates were similar, except for the spouses of subscribers to one plan. However, the joiners were younger, had lived in Rochester for a shorter period, and had made less use of physicians in private practice. The three prepayment plans appealed to different population groups. The Network joiners were young, low-income families, mostly from the city. The Group Health joiners were young families with few children who especially valued availability, accessibility, and comprehensiveness. Health Watch joiners were older couples who preferred to use the traditional avenues to health care.

In the beginning, the preparations and doing the graphics will take time, and the process will appear to be slow and tedious. Good graphics take time. However, the time will be lessened considerably when you have more hands-on experience. Graphics must be direct, simple, clear, and accurate. Preview and proof your graphics before production. For quick legibility preview, view your graphic at a distance of eight times the width of the graphic image. If you cannot read it, the audience will not be able to either. Be sure all lines are solidly inked and in proportion to the intended visual. Master one technique before expanding to others. Learn to visualize the end result of a rough draft. This will save you many redos and fewer changes later on. Finally, condition yourself to accept constructive critiques on your work, especially from graphics professionals and co-professionals. It may be an excellent way to improve the quality of your future presentations.

Photography is a major educational and documentary tool in  
dental specialty training. The requirements of a dental  
clinician's photographic equipment and supplies have been  
outlined. Photographic documentation of the oral structures in  
health, disease, and the various stages of therapy offer  
unequaled opportunities for keeping accurate records and  
conveying information to students, faculty, colleagues, and  
patients.

the Nutrition Services Project Committee.**  
Public Health Rep ,Jan-Feb 1983, 98 (1) p7-20, ISSN  
0033-3549 Journal Code: QJA  
Languages: ENGLISH  
The contribution of nutrition in preventing disease,  
prolonging life, and promoting health through organized  
community effort is well recognized. While many gains have  
been made in public health nutrition, it is clear that the  
American population continues to exhibit nutrition problems.  
Rene Dubos has said that no community will find it possible to  
deal simultaneously with all of the health problems inherited  
from the past and with those brought about by modernization  
and change. The challenge lies in determining priorities and  
making difficult choices in the face of shifting  
responsibilities among levels of government, reduced  
resources, and increased competition. The purpose of this  
guide is to help public health officials appreciate the  
important role nutrition services play in meeting the health  
needs of their communities. The recommendations for nutrition  
programs are sensitive to the social, economic, and political  
forces that are shaping the future of public health. How well  
public health officials meet the challenge of providing  
nutrition services in their communities will be a significant  
factor influencing the health status of the American  
population in the 1980s and beyond.

**Clinical algorithms for prehospital cardiac care.**

Cayten CG; Oler J; Staroscik R; Morganroth J; Walker K; Cole L; Evans W; Murphy J

Med Care ,Feb 1983, 21 (2) p147-56, ISSN 0025-7079  
Journal Code: LSM

Contract/Grant No.: 5-R18-HS-02418-03

Languages: ENGLISH

Algorithms for the prehospital management of cardiac arrhythmias were developed and their use by and value to paramedics evaluated. The algorithms, in booklet form, were distributed to half of the Philadelphia paramedic platoons; paramedics in the other platoons followed a narrative protocol that reflected identical contents. An arrhythmia recognition test given 18 months after the algorithm booklets were introduced showed that paramedics who received the booklets scored significantly higher in identifying life-threatening arrhythmias ( $p = 0.029$ ) than did their counterparts without the booklets. Survival data for 459 patients in ventricular fibrillation treated by paramedics were collected 1 year before and 7 months after the introduction of the algorithm booklets. The paramedics using the algorithms improved their survival rate from 11.25 to 15.1 per cent, while the survival rate for patients treated by paramedics using the narrative protocols decreased from 12.4 to 7.7 per cent. The likelihood of obtaining a ratio of survival odds of this magnitude when there is no true difference is 0.092. Time-to-death was significantly different ( $p = 0.04$ ) for the two groups of patients. Thus, the use of algorithm booklets as an inexpensive educational aid for paramedics is recommended.

**Linking health screening to health education learning modules for elementary school students: a feasibility study.**

Feuerstein P; Galli N

J Sch Health ,Jan 1983, 53 (1) p10-3, ISSN 0022-4391  
Journal Code: K13

Languages: ENGLISH

The purpose of this study was to develop and assess an elementary health education curriculum based upon health screening procedures. A modular format was used which enables students to progress at a self-determined pace. Mastery of subject matter is insured, since progression to other modules is based upon satisfactory completion of preceding packets. A total of 60 fourth grade students from two classes were selected by a block randomization process to participate in the study. An experimental and control group were designated and pre-tested. The experimental group was subjected to the prototype curriculum, while the control group was exposed to the traditional health screening program routinely implemented in the district. Upon completion of their respective units, both groups were post-tested to assess gains in achievement. No significant ( $p$  less than .01) pre-test differences existed between each group of students. While both groups made gains in health knowledge on post-test scores, the experimental group scored significantly ( $p$  less than .01) higher than the

control group. It appears the prototype curriculum is a more effective approach in teaching health than the traditional approach at this grade level. The authors suggest that this study be replicated on a larger scale and include the entire complement of modules.

**Skin cancer comic book: evaluation of a public educational vehicle.**

Putnam GL; Yanagisako KL  
Cancer Detect Prev ,1982, 5 (3) p349-56, ISSN 0361-090X  
Journal Code: CNZ  
Contract/Grant No.: N01-CN-75399  
Languages: ENGLISH

A 16-page 4-color comic book was developed as part of a multimedia public education campaign designed to improve skin cancer knowledge and prevention/detection behavior. A concentrated comic book distribution to each of 8,000 households in a predominantly Caucasian area was preceded and followed by personal interviews with 300 residents randomly selected from this area. In households reading the comic book (N-122), respondents reported the following changes as a direct result of readership--avoidance of sun exposure between 10 am and 2 pm (44.3%), use of sunscreens with SPF 8 and over (38.5%), skin self-examination (34.4%), and use of protective clothing (29.5%). To a lesser extent nonreaders also showed positive increases, suggesting exposure to other educational efforts of the skin cancer campaign. Over 90% of the readers felt that the comic book was easy to read, easy to understand, and interesting. The comic book appealed less to males and to those above the age of 50 years.

**A simple teaching device for examination of the arterial and venous pulse.**

Kreitenberg A; Karliner JS; Engler RL; Marchand ER  
Am J Cardiol ,Dec 1982, 50 (6) p1391-3, ISSN 0002-9149  
Journal Code: 3DQ  
Languages: ENGLISH

A simple teaching device is described for examination of the cervical arterial and venous pulses. It is a mechanical device that simultaneously generates a visible jugular venous pulsation and a palpable carotid arterial pulsation to train medical students, physicians, and paramedical personnel. Changing of cams allows the observer to appreciate these pulsations in the normal or in a variety of abnormal states. Graphic tracings of wave forms demonstrate the accuracy of reproduction of physiologic tracings. In a test of the device, cardiologists performed significantly better than medical students in the identification of unknown pulsations. The instrument is readily accepted, simple to operate, and fully portable.

A program in Health Sciences Education at McMaster University, centered on the undergraduate M.D. program in particular, has changed the educational methodology used in teaching and learning to a different approach than the traditional method. The emphasis on individualized instruction in the morphological disciplines has resulted in the need to develop new facilities. One-hundred modules or units have been produced for self-study in the Department of Anatomy. Audiovisual personnel, illustrators, and laboratory technicians have worked in collaboration with subject experts on the development of these devices; they have shown the value of utilizing different learning modalities to achieve efficient learning outcomes.

**Sex roles in instructional materials: testing the stereotypes.**

Zimmerman ML; Casanova ME; Stern DP; Auman SS

Stud Fam Plann ,Aug-Sep 1982, 13 (8-9) p262-70, ISSN

0039-3665 Journal Code: V52

Languages: ENGLISH

This special report discusses the significance and potential benefit of portraying men in nontraditional sex roles within pictorial instructional print materials on health and child care. It is based on the cognitive and behavioral findings of a comparative research study conducted in selected rural and periurban areas of Mexico on the use of two versions of an ORS pictorial pamphlet. Major findings of the study were: (1) portraying nontraditional sex roles for men in the ORS pamphlet did not reduce the credibility of technical information contained in the pamphlet; (2) a significantly greater number of subjects preferred the version that portrayed the father figure as co-caretaker of a sick child. These unexpected results have important implications for instructional and motivational communication and health education projects throughout the developing world.

**Microfiches as an aid to teaching histology.**

Williams L

Med Educ ,Sep 1982, 16 (5) p269-72, ISSN 0308-0110

Journal Code: MZ3

Languages: ENGLISH

A set of six colour microfiches and an atlas of black-and-white prints of the photomicrographs used in the microfiches have been prepared by the author and have been used for teaching an Histology course to medical students for 4 years. Students reaction to them and their use has been

gauged by voluntary questionnaires. Of students who responded, 78% found the microfiches made the course easier for them; 76% like the microfiches because they can use them for home study; 77% find them useful for class discussion; 62% like them because of their colour reproduction. A small group of fifteen students, who failed the Histology course the year prior to the introduction of microfiches and subsequently repeated the course, felt they could revise better with the help of the microfiches. Also they felt the course was clearer. Comparison of the examination results of the students for the 4 years preceding the introduction of microfiches with those of the 4 years since, shows an improvement in mean percentage achieved together with a decrease in the standard deviation (s.d.).

**The use of learning resource centers in the teaching of pulmonary medicine.**

Make BJ

Chest ,Nov 1982, 82 (5) p639-42, ISSN 0012-3692

Journal Code: D1C

Contract/Grant No.: 1K07 HL00246

Languages: ENGLISH

Learning resource centers (LRC) are areas designed for individual study which contain a variety of self-instructional materials. To evaluate the use of LRC in teaching pulmonary medicine, a survey was conducted of medical school pulmonary sections; responses were obtained from 30 sections with an NHLBI pulmonary Academic Award (PAA groups), and 21 sections without PAA (non-PAA group). LRC were established in 77 percent of the PAA group but only 14 percent of the non-PAA group. A higher percentage of pulmonary fellows than students used the resource center and student use was higher when the LRC was formally integrated into the curriculum. Textbooks and journals were more heavily used than materials utilizing audiovisual educational techniques. The results of this study suggest that pulmonary LRC use is modest, LRC cost is high, and LRC educational value may not be superior to general medical libraries.

**An evaluation of a workshop on educational methods for health science teachers in Lagos, Nigeria.**

Bamisaiye A; Akpata ES

Med Educ ,May 1982, 16 (3) p161-5, ISSN 0308-0110 Journal Code: MZ3

Languages: ENGLISH

A workshop on educational methods held at the College of Medicine, University of Lagos in 1980 was evaluated by means of questionnaires. The workshop was favourably received and enhanced the teaching practices of participants. As a result of the workshop, most participants wrote instructional objectives, used more audiovisual aids and adopted new methods of teaching and assessment of clinical skills. Although the session on the production of self-instructional packages (SIPs) was rated highly at the workshop, relatively few participants had completed a programmed text at time of follow-up. Similarly, most participants had set MCQs but few had calculated either the facility or discrimination index. The participants themselves suggested that future workshops should be tailored to the particular educational needs of different disciplines. The authors suggest that intensive short-term workshops may be useful for content areas which require more time than an extensive workshop permits.

**An instructional resource center in a senior dental clinic.**

Berrong JM; Hendricson WD; Evans JJ

J Dent Educ ,Aug 1982, 46 (8) p479-84, ISSN 0022-0337 Journal Code: HY7

Languages: ENGLISH

This paper describes the development of an instructional materials resource center designed specifically for senior dental students. The resource center is located on the clinic floor near the students' operatories. Development of the resource center began with a needs assessment involving 60 dental students and faculty from the General Practice Department. A pilot series of six slide-tape programs, developed to determine the best format for subsequent materials, was field-tested with senior dental students. The students exceeded the field test minimum competency level of 80 percent on each of the pilot programs. Students using a self-instructional format outperformed students who received a version without standard self-instructional elements on five of six tests; the differences were statistically significant on three tests. Cost-effective production techniques have reduced the development cost of subsequent programs to below a hundred dollars per program. Twenty programs were completed in the 1981-82 academic year.

**Dental health: testing the readability of educational materials.**

Blinkhorn AS

Int J Health Educ ,1982, 24 (3) p200-3, ISSN 0020-7306

Journal Code: YEE

Languages: ENGLISH

Dental practitioners have an important role in the dissemination of information to their patients and their advice is often reinforced with written health education literature. Unfortunately, this material is often of limited value because of its level of readability. This study covered two aspects of the problem: first, a group of 140 secondary school children were asked to explain the meaning of a selection of words commonly used in dental education and second, the readability of some health education literature was assessed and compared with that of texts in magazines and newspapers. Many of the words were not understood by the children: for instance, over 80% were unsure of the meaning of fluoride tablets, gum disease, gingivitis and oral hygiene. As for readability, the test showed that the material reflects the reading capacity of the designers rather than the ability of the potential target group. These findings pinpoint the need to ensure that dental health education literature is not unduly complex and, for dentists, to take more time explaining the dental vocabulary in lay terminology. The methods used in the study can easily be extrapolated to other areas of health.

**Primary health care nurse training in Kwazulu. An evaluation of diagnostic flow charts versus a conventional training method.**

Solarsh G; Irwig LM; Reinach SG; Muller EJ

S Afr Med J ,Jul 17 1982, 62 (3) p100-4, ISSN 0038-2469

Journal Code: U4R

Languages: ENGLISH

Diagnostic flow charts have been adapted for the training of primary health care (PHC) nurses in a rural area of South Africa. We designed a randomized controlled trial to assess whether nurses' clinical competence differed if they were trained using flow charts or using conventional patient-centered teaching. Although clinical competence improved during the training programme, this improvement did not differ significantly according to which of the two training methods was used. The nurses in this trial had considerable earlier experience and some training in primary care. Before the trial they had a high level of clinical competence and may already have developed their own diagnostic strategies. We therefore cannot make inferences from our study about whether or not flow charts will be a valuable addition in PHC. Flow charts need to be adapted to take into account where, by whom, and for what purpose they will be used. They must then be tested to ensure that they only rarely result in incorrect diagnosis and treatment. A decision on the use of flow charts in the training of PHC nurses should be based on further educational trials and long-term follow-up of trained

health workers. Nurses should participate in educational trials at the start of their careers in PHC. The additional value of flow charts in the auditing of competence and assessment of educational needs should also be explored.

**Population education in the schools.**

Sherris JD; Quillin WF

Popul Rep [M] ,Mar-Apr 1982, (6) pM201-43, Journal

Code: QCP

Languages: ENGLISH

Formal population education is designed to teach children in school about basic population issues and, in many cases, to encourage them eventually to have smaller families. Some programs include specific units on human reproduction and family planning, while others do not. National population education programs began during the 1970s in about a dozen countries, mainly in Asia. These include Bangladesh, India, Indonesia, South Korea, Malaysia, the Philippines, Sierra Leone, Sri Lanka, Singapore, Thailand, Egypt, Tunisia, and El Salvador. A strong case can be made for including an important contemporary issue like population in the school curriculum. Nevertheless, educational innovation is a difficult and long-term process. As a rule, it takes 5 to 10 years before new material can be fully incorporated in a school curriculum.

Curriculum changes must be carefully planned, thousands of teachers trained, and appropriate materials prepared for classroom use. Moreover, differences of opinion over the need, acceptability, goals, content, methods, and other aspects of population education have held back programs in some countries. Where population education programs have been implemented, student knowledge of population issues increases, but it is not yet clear whether in-school education has a measurable impact on fertility-related attitudes or behavior.

As stated at the outset, the review of the two systems was not intended to determine which approach to provide dental services is better. Rather it has provided an opportunity for both systems to learn from the activities of the other. Thus, the continuing decrease in dental caries rates in the United States, no doubt associated with the extensive fluoridation programs, provides direction for efforts in England and Wales. Similarly, the pronounced changing attitudes to extractions and "wedding present dentures" in England and Wales offer our country some understanding of the needs to change general population attitudes if we are to expand dental services in this country to increasing segments of the nation.

Cost-benefit analysis is fast becoming--if it is not already--an essential tool in decision making. It is, however, a complex subject, and one in which few doctors have been trained. This paper offers practical thoughts on the art of cost-benefit analysis, and is written for clinicians and other medical specialists who, though inexperienced in the techniques of accountancy, nevertheless wish to carry out their own simple analyses in a manner that will enable them, and others, to take effective decisions.

**Peer appraisal in Leicestershire Community Dental Service.**  
Baxter JA

Community Dent Oral Epidemiol ,Feb 1983, 11 (1) p12-7,  
ISSN 0301-5661 Journal Code: DNF  
Languages: ENGLISH

During the period 1976 to 1980 inclusively a form of staff appraisal amongst dental officers was introduced into the Community Dental Service in Leicestershire. The aim was to observe and review the output performance and potential of individual dental officers. In practical terms it was noticed that during this period there was a distinct change in work output and treatment patterns. Routine fillings and extractions showed a marked downward trend; the number of crowns per operator, the number of orthodontic appliances fitted, the number of root treatments performed, the patients radiographed and, above all, the total visits per full time equivalent dental officer all showed a noticeable and at times a highly pronounced increase. Although the downward trend in fillings and extractions reflects what now appears to be the overall tendency in developed countries, it is felt that the increase in other items was, to a large extent, due to peer appraisal.

Fowkes FG; Page SM; Phillips-Miles D  
Br J Surg ,Feb 1983, 70 (2) p114-6, ISSN 0007-1226  
Journal Code: B34

Languages: ENGLISH

The availability and use of surgical manpower and beds and certain measures of surgical workload were examined in the NHS in England and Wales from 1967 to 1977 using routine health statistics. Amongst the surgical specialties, there was no consistent relationship between changes in levels of manpower and beds and operating output. For example, ENT surgery and cardiothoracic surgery had more staff and fewer beds in 1977 than in 1967, but operating output in ENT surgery decreased by 18 per cent and in cardiothoracic surgery increased by 28 per cent. Although the efficiency of bed use may have improved (average length of stay was 10.5 days in 1967 and 8.8 days in 1977), the overall use of available beds in most specialties may have decreased. The number of operations performed in each specialty per consultant surgeon was less in 1977 than 1967 except for traumatic and orthopaedic surgery. Although interpretations of routine health statistics are rarely conclusive, the results of this study suggest the possibility of a less than optimum use in 1977 compared to 1967 of surgical beds and surgeons' operating potential which might be due to lack of other resources such as usable theatre time.

Scientific approaches, such as operational research and health economics, have failed to resolve many of the problems confronting managers of health services. This is partly because of assumptions about the value-free nature of information and partly through paying little regard to power conflicts in care systems. The case-study method offers a means of understanding some aspects of these conflicts and could therefore improve the effectiveness of scientific methods in influencing decisions. An example of a case-study involving perinatal care in an English health district is described in an attempt to demonstrate the practical benefits that could accrue to managers hoping to see their macro-study findings effecting change.

Health care for the elderly in the United States remains fragmentary and noncomprehensive despite concern for the needs of an expanding elderly population and a new emphasis on geriatrics. Model health care programs for the elderly have been few and not generally applicable to central city populations. A model health care program has been designed to offer a continuum of comprehensive, multidisciplinary health care to Milwaukee elderly. An acute care unit for the elderly, rehabilitation-oriented nursing home, outpatient clinic, home care service, outreach clinics, rehabilitation day hospital, Alzheimer's Disease Day Care program, and acute geriatric psychiatric unit have been developed and integrated into one continuum of care. The program serves chiefly the frail elderly, who are demonstrated to be markedly impaired physically, mentally, and socially, requiring the services of multiple professionals to enable the patients to achieve maximum independence. Alternatives to institutionalization are emphasized, and geriatric education and research programs are part of the model program.

Medical expenditure within the National Health Service (NHS) is based upon an arrangement whereby doctors share in common resources provided by the Health Authority. This arrangement is unsatisfactory when resources are contracting and leads to social regulation of medical activity. If doctors within the district work-group do not response to the challenge of cost-containment by internal organisation, more and more externally imposed regulations will result to the detriment of patients and doctors. The continual redevelopment of organisation to permit the optimal mix of internal and external regulation should be a subject of long-term enquiry and action for doctors in each district.

**Measuring the benefits of screening for open neural tube defects.**

Henderson JB

J Epidemiol Community Health .Sep 1982. 36 (3) p214-9.

ISSN 0143-005X Journal Code: IIP

Languages: ENGLISH

Evaluation of the costs and benefits of public sector programmes is necessary to plan the optimum uses for society's resources. Here the benefits of screening for open neural tube defects are examined, and the most appropriate methodological approach to their valuation is discussed in the context of the possible provision by the National Health Service of a routine prenatal screening programme. It is argued that, in measuring the benefits of screening, previous evaluations have adopted an approach that is rather unsatisfactory from the standpoint of economic methodology. An attempt is therefore made here to show the effect that adopting a more appropriate approach would have on the estimated value of the benefit of routine screening. The effect is found to be a substantial increase in its estimated value.

In this paper, postgraduate and continuing medical education in Finland is described and analyzed. Especially, the contacts with health care policy of Finland are analyzed and presented. First, the roots of CME in basic medical education and its goals are shown. Secondly, the advanced professional medical education (specialization) is presented. Thirdly, the scientific postgraduate system of studies is analyzed. Finally, the system of continuing, complementary medical education and its organization is presented. It is stressed that the CME has close connections with the health care policy in a country. Some problems in this respect are presented.

This paper identifies the long run average British National Health Service screening costs in one particular screening clinic for various different regimes: mammography, thermography and clinical examination; thermography and clinical examination; and mammography and clinical examination; each of these having one or two clinical examinations and the option of single or double reporting of mammograms and thermograms. It then compares the cost-effectiveness of these different regimes where 'costs' are defined widely to include not only screening costs but also biopsy costs, anxiety costs for women biopsied, costs of false negatives, etc. By defining costs in this way, it was possible (if somewhat tentatively because of the small numbers involved) to identify mammography with single reporting together with a single clinical examination as 'the best buy'.

Directors of nursing services and their colleagues in the new units created by NHS restructuring face major challenges in developing effective management for the general nursing service. Emerging ideas within the profession on the organization of nursing work, severe pressures arising from financial constraints at a time of growing health care needs, and restructuring itself each demand a carefully planned response. Beginning from the basic management cycle involved in implementing the nursing process, this paper offers a redefinition of the main functions of nursing management as a whole in meeting these challenges and provides a check-list for reviewing existing management practice. The use of this check-list is then illustrated by a case study in one health district. In this example, managers sought external assistance in planning a programme of action to strengthen nursing leadership. Similar efforts elsewhere are likely to rely mainly on a range of self-help methods. This paper is intended to provide a tool for designing and implementing these local strategies of management development.

**Paediatric manpower.**

Liberian MM; Bellman MH

Arch Dis Child ,Sep 1982, 57 (9) p702-7, ISSN 0003-9888

Journal Code: 6XG

Languages: ENGLISH

Two investigations of paediatric manpower in England, Wales, and Northern Ireland were carried out, each using a different method. The first survey located registrars and senior registrars and checked on their occupational status 3 years later in order to see which ones had been promoted. Loss factors--such as emigration, retirement for personal reasons, part-time training, or transfer to general practice, community paediatrics, or other medical specialties--were examined closely. The second survey was a cross-sectional analysis of the entire paediatric establishment. It examined in particular the distribution of consultants and registrars. Using figures from survey 2 and loss factors from survey 1, a model of the paediatric career structure could be constructed. This showed that the present career pyramid would be unable to absorb the current number of registrars in training. There is an urgent need for a comprehensive registration scheme for registrars, especially those with honorary contracts, who are not currently included in official records. Paediatrics is unique in having a high proportion of women for whom there is little opportunity of reconciling career aspirations with family commitments.

**Health care in Poland: from crisis to crisis.**

Millard LF

Int J Health Serv ,1982, 12 (3) p497-515, ISSN

0020-7314 Journal Code: GRJ

Languages: ENGLISH

During its first twenty years the Polish health service represented a neglected sector of government activity, as the development of heavy industry remained the predominant economic goal, with social policy regarded as a "nonproductive" sphere. When Edward Gierak came to power in 1970, the promise of reform extended throughout society to include health. However, despite a fundamental organizational reform, the health service has remained in a state of crisis, currently worsening as a result of mounting economic dislocation and political tension. Inadequate access to treatment, lack of continuity of care, poor quality of care, profound shortages of drugs and supplies, and the absence of preventive medicine are some of the manifestations of this crisis. Its main causes lie in the political weakness of the Ministry of Health, with consequent underfunding and the nonfulfillment of its plans. This situation is exacerbated by continuing organizational fragmentation, the neglect of primary care, the existence of conflicting aims in health policy, and the dominance of an ideology of clinical specialism.

"Synergism" of two factors in the causation or prevention of  
an all-or-none event means the existence of instances in which  
both factors are needed for the effect, while "antagonism"  
means that at least one can block the solo effect of the  
other. The manifestation of such interdependences--or of their  
complement, independence--in terms of event rates is  
complicated by the correlation of the susceptibilities to the  
two factors. Thus, given the risk difference (RD) values  
representing the solo effects, the RD corresponding to the  
joint exposure has a range consistent with independence so  
that independence cannot be inferred even from very ample data  
without knowledge of the degree of correlatedness of the  
susceptibilities. The definition of this range is closely  
analogous for causal and preventive factors, respectively.  
However, when knowledge about interdependence is used in  
inference about the factors' interrelation in the mechanisms  
for the effect, sharp distinctions may have to be made between  
causal and preventive factors. In each case, the  
interdependence is a result of the interrelation of the  
actions of the two factors and/or interaction between them.  
Operational decisions, having to do with the wisdom of the  
joint exposure, can be guided by knowledge about the  
interdependence of the factors; however, knowledge of the  
risks corresponding to the various exposures is a sufficient  
guide, without any need for inferences about causal or  
preventive interdependence.

**Data requirements to measure progress on the objectives for  
the nation in health promotion and disease prevention.**

Green LW; Wilson RW; Bauer KG  
Am J Public Health ,Jan 1983, 73 (1) p18-24, ISSN  
0090-0036 Journal Code: 3XW

Languages: ENGLISH

The Reagan Administration has adopted the policy guidelines developed over the previous few years in the disease prevention and health promotion initiative of the Carter Administration. Broad national consensus had been sought in the formulation of 226 measurable objectives for the decade. We classify the prevention objectives according to their position in an implied causal chain: 1) improved programs, 2) increased public and professional awareness, 3) reduced risk factors, and 4) improved health status. Prior to 1980, the data systems and periodic surveys sponsored by federal agencies and national organizations covered only four of the 42 objectives in the public and professional awareness category, whereas at least half of the objectives in each of the other three categories were covered by available national data sources, mostly federal. Sample surveys are needed to measure the majority of the currently unmeasured objectives in all four categories. Private and state health interview surveys are needed to supplement the federal capacity, especially in the face of federal cutbacks in survey capacity.

Problem-based, student-centred learning at the Faculty of Health Sciences, Unilorin, Nigeria were incorporated in the overall objectives of producing students with a sense of service and a strong inclination toward broad community care and preventive medicine. The educational programme reflecting this concept was called COBES (community-based experience and service). Twice a year groups of between seven and fourteen students, each accompanied by two to three staff members, settled in a village or other community for 1 month. According to the Faculty's objectives, each group assessed the size of its community (population, areal map) at first. Malnutrition and infectious diseases were selected as the two health problems which were to be studied in depth during the first two COBES placements. Data were collected and analysed by the students from which deductions were made, and at the end of the placement a written report was required by the Faculty. Three learning situations and the experience gained from them by one group of students are reported: (1) What was our community? (2) The nutritional status of children, and (3) Guinea-worm infection. The educational benefits of the programme are discussed and the view of the students is brought out. A correct assessment of students' performances proved difficult. Other problems were related to the experimental situation of COBES, such as insufficient support of the programme by some staff members, the lack of programme structure and logistical shortcomings. The COBES programme, however, set a pattern of medical education which specifically suits Nigerian needs and probably those of other African countries.

**Improving physician compliance with preventive medicine guidelines.**

Cohen DI; Littenberg B; Wetzel C; Neuhauser D  
 Med Care ,Oct 1982, 20 (10) p1040-5, ISSN 0025-7079  
 Journal Code: LSM  
 Languages: ENGLISH

Similar general medical outpatient clinics with randomly assigned patients were used to evaluate the effectiveness of a program that was to increase house staff compliance with preventive medicine guidelines. Two clinics were designated experimental and two served as controls. In the experimental clinics, age-specific checklists of all recommended preventive procedures (drawn from the Canadian Task Force report on The Periodic Health Examination and American Cancer Society guidelines) were appended to each patient's chart. In addition, house officers were presented with a series of weekly seminars dealing with issues in screening, as well as the specific recommendations included in the checklist. House officers in all four clinics were tested for their knowledge and attitudes toward the preventive program before and after the intervention. Counts of immunizations and mammograms performed and the total populations eligible for these procedures were determined for all four clinics. As predicted, test scores as well as mammography and immunization rates increased significantly (from 2-40 per cent) in the intervention clinics as compared with controls. We conclude that this intervention was clearly effective in the short run. However, follow-up studies will be necessary to determine whether the desired long-term effect has been achieved.

**The effects of early treatment, lead time and length bias on the mortality experienced by cases detected by screening.**

Morrison AS  
 Int J Epidemiol ,Sep 1982, 11 (3) p261-7, ISSN 0300-5771  
 Journal Code: GR6  
 Contract/Grant No.: 1-PD1-CA06516  
 Languages: ENGLISH

This paper describes a means of analysing the effects that the benefit of early treatment, lead time and length-biased sampling (and other forms of prognostic selection bias) have on the mortality rate of cases detected in screening programmes. Both benefit and lead time reduce the mortality rate of screen-detected cases. A beneficial effect of early treatment will lead to a decrease in the number of deaths, the

numerator of the rate. The amount of person-time among screen-detected cases, the denominator, is increased by early diagnosis as a result of screening (lead-time) as well as by prolongation of life due to early treatment. The numbers of cases experiencing benefit and lead time can be estimated by comparisons of the numbers of deaths and numbers of diagnosed cases between the entire screened population, from which the series of screen-detected cases is drawn, and an otherwise comparable unscreened population. Benefit and lead time, as reflected in these numbers, can be removed from the mortality rate of cases detected by screening. The effects of benefit or lead time on prognosis then can be assessed by comparing the observed mortality rate of screen-detected cases to the rates with benefit or lead time removed. Prognostic selection bias (a tendency of screen-detected cases to be relatively benign or relatively malignant) can be evaluated by comparing the case-mortality rate, with both benefit and lead time removed, to the mortality rate of cases in an unscreened population. The relationships described are illustrated with data from a breast cancer screening programme.

Languages: ENGLISH

This final report from the cooperative manpower study of the University of Southern California and The American College of Obstetricians and Gynecologists describes the development of a female data file that outlines the care of women patients by all specialties. Obstetrician-gynecologists are compared to other specialists; they see 300,000 women per day in the United States and provide a wide range of care. Preventive care plays a larger role than in other major specialties, patient counseling and education are emphasized, and obstetric care is a major commitment. Nonetheless, acute and serious surgical and medical diagnoses are an important component of the practices of obstetrician-gynecologists.

**[Gerontology: topical chances of primary-preventive geriatrics (author's transl)]**

Gerohygiene: Aktuelle Chancen der primar-praeventiven Geriatrie.

Stormer A  
Aktuel Gerontol ,Jul 1982, 12 (4) p117-21, ISSN  
0300-5704 Journal Code: 32C  
Languages: GERMAN Summary Languages: ENGLISH

The present endeavour of geriatrics emphasizes systematic preventive actions before the appearance of a diseased state. Epidemiological studies demand the regard of risk-factors into the therapeutical conception. Public health work on the one side and health-education and health-training otherwise are fundamental conditions for all practical possibilities of the modern preventive geriatrics.

**Selective primary health care: is efficient sufficient?**

Berman PA  
Soc Sci Med ,1982, 16 (10) p1054-9, ISSN 0277-9536  
Journal Code: UT9  
Languages: ENGLISH

Developing countries are increasingly using economic evaluation methods to assess and plan their health services. Inappropriate application of these methods may lead to serious errors in developing primary health care strategies. In 'Selective Primary Health Care', Julia Walsh and Kenneth Warren present a logical approach to health planning based on cost-effectiveness techniques. Their paper is a timely example of the risks of using simple technical criteria to plan solution to complex public health problems. Cost-effectiveness is not a sufficient criterion for planning primary health care. Related issues are discussed in these comments. As an alternative, a multiple-objective approach is suggested.

**Concepts of illness causation and responsibility: some preliminary data from a sample of working class mothers.**

Pill R; Stott NC

Soc Sci Med ,1982, 16 (1) p43-52, ISSN 0277-9536  
Journal Code: UT9

Languages: ENGLISH

In recent years official policy in the U.K. has been marked by a shift in emphasis from curative to preventive medicine, with increasing stress being laid on the role of the individual in maintaining his/her health. However, we lack empirical data on the extent to which the concept of individual responsibility for health is accepted by various groups in our society and such data is essential before effective strategies for health education can be implemented. It is argued that readiness to accept responsibility for one's health depends partly on the views held about the aetiology of illness, and this proposition is explored using material on causation and the circumstances where blame is attributed, derived from semi-structured interviews with a sample of 41 working class mothers (Socioeconomic Group 9). Roughly half the sample held fatalistic views on the aetiology of illness and thought they were only morally accountable in very restricted circumstances. These women tended to be less well-educated than the rest of the group and they were less likely to be buying their own homes. The results are discussed in relation to current health education policies, consultation behaviours in primary medical care and consumer attitudes to the services provided by their doctors.

For the interested physician, the primary prevention of medical illness is often considered a luxury or an optional exercise. This report illustrates the position that physicians caring for the institutionalized elderly have a strong ethical and perhaps legal obligation to institute primary preventive strategies, in view of their responsibilities for total care of the patient. As an example related to cardiovascular mortality and morbidity, primary preventive strategies directed at cigarette smoking and immobilization appear to be clearly indicated. The absence of preventive strategies could be construed as acceptance of intervention designed to increase morbidity and mortality.

Many of the predisposing factors to current morbidity and mortality relate to societally approved behaviors. Attempts to intervene or change behavioral patterns after a chronic condition is clinically established are limited in effectiveness. Because health maintenance as a conceptual activity occurs outside the medical care delivery system, organizations committed to health maintenance must be active in the school, workplace, and the community if they are to be effective. The concept of prepaid health insurance has been extended in the HMO Act to include responsibility for the maintenance of health and the prevention of disease. This paper provides a three stage model for preventive and promotive activities in HMOs. The case is made that HMOs have a responsibility to provide health promotion and disease prevention services beyond the clinical setting.

**Public health training programs at the University of the West Indies.**

Standard KL; Pinnock M; Kumar AK  
 Educ Med Salud ,1982, 16 (1) p62-8, ISSN 0013-1091  
 Journal Code: EDR

Languages: ENGLISH

The Department of Preventive Medicine of the University of the West Indies was established in 1957 with the idea of improving undergraduate teaching facilities to enable medical students to study patients in their homes and social environment. The authors describe the two public health diploma programs available at the University and cite pertinent enrollment and geographic distribution statistics. Candidates for the Diploma in Public Health are registered medical practitioners who take a series of compulsory and elective subjects and have a period of supervised field training and research during the 12-month course. The Diploma in Community Health trains students in the health and diseases of man in his total environment. Students choose among three program options: the general program, specialization in health education, or specialization in health services administration/hospital administration. The general program is the most popular because it gives the student a rounded education suitable to the needs of small states. The 12-month diploma course features the interdisciplinary approach where students from various fields discuss important issues in community health. Comprehensive courses in these areas include health services administration, social sciences, environmental health, epidemiology and biostatistics, family health, communication science, and community mental health. The authors state that the candidate for the Diploma in Community Health is assessed on the basis of course and field work, a special project report, and a final written and oral examination.

Contract/Grant No.: N01-HD-6-2849; 223-76-3016

Languages: ENGLISH

To assess whether aspirin reduces the risk of a first myocardial infarction (MI) in young women, we evaluated data from a case-control study among women less than 50 years of age without a prior MI: 48 of 551 cases of MI and 67 of 896 hospital controls had taken aspirin regularly for at least 12 weeks immediately before admission. The relative risk estimate was 0.8 upon allowance for confounding factors but it was not statistically significant (95 per cent confidence interval, 0.5-1.4). These data alone do not provide evidence of protection by aspirin against a first infarction in young women.

Milbank Mem Fund Q ,Winter 1982, 60 (1) p1-16, ISSN

0026-3745 Journal Code: NOW

Languages: ENGLISH

Any national strategy of preventing disease and promoting health cannot ignore the implications of social deprivation. As social policy moves away from principles of universal provision and towards greater selectivity, there will be an onus on epidemiology to help identify those who are vulnerable--economically, chemically, and environmentally, as well as biologically. The uncertainty of current knowledge about lifestyles calls for new experiments, not merely observation and disputation.

**Pressure ulcerations.**

Elliott TM

Am Fam Physician ,Feb 1982, 25 (2) p171-80, ISSN 0002-838X Journal Code: 3BT

Languages: ENGLISH

Pressure sores are caused by multiple mechanisms. Preventive management requires relief of pressure, skin care, control of spasms, release of contractures and treatment of infection. Conservative treatment succeeds only when pressure on the ulcer site is relieved. Surgical treatment involves primary, secondary and tertiary procedures. Benefits of surgical closure include avoidance of protein loss, prevention of osteomyelitis and other infections, improved appearance and prevention of carcinoma and amyloidosis. A coordinated team approach, incorporating patient education, is effective.
