FUNDACION W.K. KELLOGG

1983

## INTRODUCCION

Humberto de Moraes Novaes\*

Carlos Gamboa \*

Desde 1980 el Sub Programa de Educación para Administración de Servicios de Salud de la OPS, con apoyo de la Fundación W. K. Kellogg (1) (2) ha venido desarrollando una serie de eventos orientados a mejorar en calidad y cantidad los cursos responsables para la formación de personal para la gerencia de servicios de salud.

En 1979 América Latina y El Caribe contaban con 44 cursos y para 1983 aumentó a más de 60, con estructura curricular distinta pero con objetivos similares (3). En 100% de los programas hay una gran demanda para informaciones bibliográficas de apoyo a clases, investigaciones y publicaciones. Este hecho de falta de documentos en las instituciones de educación para administración de la salud no es un fenómeno específico de esta area sino una situación generalizada en las Ciencias de la Salud de Latino América donde 70% de escuelas no tienen más que 100 revistas en sus bibliotecas.

En el período comprendido entre 1980 y 1983 la OPS promovió reuniones en diferentes países de la Región (Costa Rica, Brasil, Barbados, Venezuela, Chile y Panamá) con el objetivo de recolectar publicaciones de disciplinas específicas de Administración de Salud, además de discutir los respectivos contenidos curriculares de temas como Comportamiento Organizacional (4); Economía, Finanzas y Control de Costos (5); Planificación y Evaluación (6); Investigación de Operaciones y Analisis de Sistemas (7) (8); Administración de Salud en Cursos de Enfermería (9); Administración Estratégica (10) y Epidemiología (11).

La realización de estos talleres reunió a más de 250 expertos, quienes concluyeron que en nuestra Región poco se hace en Investigación de

---

\* Asesor Regional para América Latina y el Caribe para Educación en Administración de Servicios de Salud, OPS/OMS

\*\* Asesor Regional de Información y Documentación, OPS/OMS

de Servicios de Salud y cuando ocurre o no se publica o se publica en revistas de circulación muy limitada.

Preocupados con esta situación el Sub-Programa de Educación en Administración de Salud comenzó a distribuir los documentos de trabajo utilizados en los talleres arriba indicados para todos los cursos, profesores y Ministerios de Salud de la Región como un paso inicial para fortalecer los programas y proyectos de Investigación de la Región.

Otro mecanismo fue buscar información básica de "PLANIFICACION Y ADMINISTRACION EN MATERIA DE SALUD" obtenida, empleando el servicio de Acopio de Información "DIALOG" \* en el banco de información MEDLINE\*\* a través de su Oficina de Información y Documentación en Washington, D.C., utilizando la conexión telefónica de una terminal conectada al computador ubicado en California, U.S.A.

La "PLANIFICACION Y ADMINISTRACION EN MATERIA DE SALUD", publicada por la Biblioteca Nacional de Medicina de los Estados Unidos, contiene referencias a publicaciones de carácter no clínico sobre todos los aspectos de la planificación, los establecimientos, el seguro de salud, la administración financiera y la general, la planificación, el otorgamiento de licencias y la acreditación del personal de atención sanitaria. Algunas referencias que aparecen en este documento se extraen de "MEDLINE"\* y del índice de publicaciones hospitalaria de la Asociación de Hospitales y de otros periódicos de especial importancia en el campo de la atención primaria de salud.

Son aproximadamente 15,000 referencias bibliográficas publicadas "circa" de 1982 distribuidas en capítulos ordenados alfabéticamente de "A" (Administración de Personal hasta "U" (Unidad Mobil). Las referencias anotadas con la señal • fueron microfichadas y se encuentran ordenadas numéricamente en el sobre en la caratula de este documento.

\* DIALOG (Lockheed Information systems)

\*\* MEDLINE (Medical Literature Analysis Retrieval System on line)

Esta innovación de enviar a los programas la copia microfichada de los documentos, fue la primera acción de ofrecer a los lectores copia de algunos artículos de la mayoría de los capítulos, ya que todos los países de la Región cuentan con aparatos para lectura de estas fichas. Además de las referencias bibliográficas se disponen también con copias de 854 artículos.

Determinados temas, por sus características aparecen en más de un capítulo, como es el caso por ejemplo de "Health Care in Poland" que entra en los capítulos de "calidad", "Medicina del Estado" y otros. De la misma forma artículos sobre Riesgo entran en el capítulo de Riesgo, Gerencia" y también aparecen en el de "Finanzas, Gerencia".

En la muestra de registro que figura a continuación se observa la colocación de los rubros clase.

Los datos que aparecen en el registro dependen del formato requerido y del tipo de registro.

Esta extensa revisión de las publicaciones "circa" de 1982 revelan dos grandes áreas de interés en la bibliografía mundial. Primero, los innumerables artículos que tratan directa o indirectamente de "control de costos" y segundo, la tendencia de estudios sobre "circuitos de calidad." en varios capítulos ("gerencia participativa", "enfermería", etc.)

En cuanto a los idiomas de los artículos, se nota que la gran mayoría son en inglés, seguidos a distancia del alemán, francés, danés, sueco y ruso. Los artículos que tratan específicamente de temas Latinoamericanos y del Caribe son raros. Para reparar este hecho esperamos en un futuro próximo desarrollar investigación bibliográfica sobre Administración de Servicios de Salud utilizando el Index Medicus Latinoamericano editado por la Biblioteca Regional de Ciencias Médicas y de la Salud (BIREME), la continuidad de los Cuadernos de Administración dentro de la Serie de Desarrollo de Recursos Humanos de la OPS (12-23) y principalmente, estimulando a estudiantes, profesores y sus respectivas instituciones a publicar en revistas de reconocimiento universal para cada vez más difundir conocimientos o experimentos implementados en América Latina y el Caribe.

Este documento no hubiera sido posible realizar sin la colaboración de la Señorita Sylvia Chavarry, paciente secretaria en todo momento, Sra. María Teresa Astroza, de la Unidad de Información y Documentación de la OPS, Washington, D.C. y Luis Toscano, responsable por la reproducción de los documentos, a quien extendemos nuestros agradecimientos.

The Army's aviator selection program began in the mid 1950's. The first Flight Aptitude Selection Test (FAST) was implemented in 1966 and remained in use until 1980 when changes in personnel, aircraft, and tactics necessitated an improved or revised FAST (RFAST). This paper presents an overview of 1) the composition of the FAST and RFAST; 2) the advantages of the RFAST; and 3) the predictive validity estimates for the FAST and RFAST. Also presented are examples of current research projects which show promise for increasing effectiveness and for broadening the scope of the Army aviator selection program.

Languages: ENGLISH  
We gave 51 male and 52 female Air Force Academy Cadets a battery of five cognitive and three perceptual motor tests before they were taught four basic flight maneuvers followed

by a complex chandelle maneuver. The results showed that the males were much faster in attaining the criterion level of performance on the flight tasks, and that some of the sex differences in the acquisition of task skills can be reduced by means of pretraining on specific cognitive and motor skills. In the prediction of trials to criterion (acquisition rate) of both the basic and the complex flight maneuvers, individually tailoring the regression equations by sex--as opposed to utilizing general overall regression equations--greatly enhanced the predictive capability.

The use of an Aircrew Psychomotor Test Device and the Air Force Officer Qualifying Test have been proposed for the selection of U.S. Air Force pilot training candidates. Random samples of the U.S. Air Force Academy's class of 1978 and the class of 1979 were given the proposed tests and followed through undergraduate pilot training. The results cast serious doubt as to the utility of these tests in selecting U.S. Air Force Academy cadets for pilot training.

**Patient classification systems: the ideal vs. reality.**  
Alward RR  
J Nurs Adm ,Feb 1983, 13 (2) p14-9. ISSN 0002-0443  
Journal Code: JEL  
Languages: ENGLISH

This author identifies a critical problem in the wholesale adoption of patient classification systems (PCSs) in nursing departments. She suggests that without attention to their reliability and validity for the specific institution's standards and practice, PCSs may frustrate, rather than assist, the nursing administrator's efforts to predict staffing needs. Here she describes an "ideal" PCS and compares it with the reality of today's systems. She then suggests ways that nursing administrators can move closer to this ideal system and make PCSs more useful management tools.

A management information system (MIS) is a tool for managing resources effectively. After reviewing some concepts and principles for effective data management, Hanson clearly applies the concepts to nurse staffing systems, which manage human resources. He defines a seven-step process for establishing an MIS, from defining the management objective to implementing the system. Pointing out that an MIS need not be computerized to be effective, Hanson presents a positive perspective and clarifies some often-misconceived notions about management information systems and the paper printouts they generate. In the next issue of JONA, a second article by Hanson will take a more detailed look at the variety, use, and usefulness of staffing statistics available from an MIS for staffing. These articles are based on material in a forthcoming book, Management Systems for Nursing Service Staffing, to be published by Aspen Systems Corporation, Rockville, Maryland.

Languages: ENGLISH

If a nursing service uses agency nurses to help cope with staff shortages, the nursing administrator must manage the cost and quality of care delivered by these nurses. The authors describe their hospital's system for using agency nurses. The components of their system--an orientation program, contracts with the agencies, and systematic performance evaluation--can be used or adapted in other institutions.

Languages: ENGLISH

This article demonstrates the usefulness of the Nursing Classification System (NCS) as an operational planning and control tool. Inherent in the NCS is sensitivity both to the quality of nursing care standards and to the variability in patient acuity levels. Consequently, the NCS provides a more effective basis for setting and monitoring productivity objectives in nursing service areas than cruder measures, such as full-time equivalents per patient day. Here the authors introduce and illustrate the concept of workload indexing, a means by which the NCS assists in defining staffing needs and monitoring workload and performance. The nursing administrator will gain insight into a simple and economical method of fiscal accountability for the personnel budget.

**Recruit from within: hospital nurse retention in the 1980s.**

Weisman CS

J Nurs Adm ,May 1982, 12 (5) p24-31, ISSN 0002-0443  
Journal Code: JEL

Languages: ENGLISH

Nursing administrators and nurse recruiters coping with staffing shortages can profit from some recent studies of the causes of nursing turnover. Research reveals that the problem lies not in the motivations or characteristics of individual nurses but the nature of hospital nursing jobs and incentive structures. Using the research findings as a basis for discussion, Weisman suggests target areas for administrative intervention in the design of hospital nursing jobs. Her insightful commentary provides stimulus for some basic rethinking of the nature of nursing jobs and the traditional employer-employee relationship between hospitals and nurses--as well as some specific suggestions for "recruiting from within" to retain those productive nurses in whom the hospital has already invested time and money.

After nursing administrators at one Boston hospital implemented a new system for weekend coverage, they surveyed the staff's response to the trial plan. Here the author explains their system, what they learned when they measured its effects, and how they used staff responses to improve it. They proceed to examine the new system's effects on recruitment and absenteeism. The experiences shared here should assist other nursing administrators who are looking at new scheduling approaches and their viability in resolving staffing problems.

Clinical staff at the lower levels of agencies are more likely to initiate and implement organizational changes if they operate from a sound conception of accountability. Change agents are in danger of becoming modern day Don Quixotes unless they focus on creating accountability systems that support agency efforts to change. Designing systems capable of changing is the challenge for all levels of staff.

**Pharmacist activities under alternative staffing arrangements.**

Dostal MM; Daniels CE; Roberts MJ; Giese RM  
Am J Hosp Pharm ,Dec 1982, 39 (12) p2098-101, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

The proportions of time pharmacists spent in professional and nonprofessional activities is compared under alternative staffing arrangements. Daily activities were observed in three pharmacy satellites each serving approximately 100 beds of a 730-bed hospital. Ten pharmacy administrators and residents recorded more than 8000 observations over a 14-day period, 24 hours per day. In each observation, basic functions were noted; these were chosen from a list compiled to include all pharmacy activities. A specific staffing pattern was identified in each observation. The observations were then categorized as professional or nonprofessional activities as predefined by the majority of the pharmacy staff. As staffing patterns varied, significant differences occurred in the ratio of professional to nonprofessional activities. The greatest percentage of professional activity was observed when one pharmacist worked with more than one technician; where the staffing pattern contained more pharmacists than technicians, a smaller percentage of the pharmacists' time was used in professional activity. Overall, pharmacists were engaged in activities considered professional in 52% of the observations.

Assuming that the most efficient use of pharmacy personnel involves a high ratio of professional to nonprofessional activity in the pharmacists' workload, the optimum staffing arrangement would include at least the same number of technicians as pharmacists. Factors other than staff mix affect efficient management of pharmacists' professional time.

**Critical job events, acute stress, and strain: a multiple interrupted time series.**

Eden D  
Organ Behav Hum Perform ,Dec 1982, 30 (3) p312-29, ISSN 0030-5073  
Journal Code: OK6

Languages: ENGLISH  
A critical job event (CJE) is defined as a time-bounded peak of performance demand made on the individual as an integral part of his job. Though such events are an important source of acute job stress and are amenable to longitudinal study, relevant research has been scant. In the present study, the effects of acute objective stress on subjective stress and on psychological and physiological strain were assessed among 39 first-year nursing students in an interrupted time series with multiple replications. Strain was measured five times, twice in anticipation of CJE interspersed by three low-stress occasions. The CJEs were providing the first comprehensive patient care and the final exam in nursing. A consistently confirmatory pattern of significantly rising and falling strain was found for anxiety, systolic blood pressure, and pulse rate; qualitative overload and serum uric acid changed as predicted four times out of five. CJE research can redress past overemphasis on chronic organizational stress and strengthen causal interpretation.

Martin TN  
Med Care ,Nov 1982, 20 (11) p1147-53, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

The simultaneous investigation of job, organizational, career, and community commitment on intent to leave is empirically tested in a study of 73 hospital personnel. Previous work on organizational commitment served as the proxy for definitional clarification and measurement development of a 44-item questionnaire for all commitment concepts. Three measures of the "importance" of correlated predictors are used to indicate the findings. Higher intent to leave was predicted by lower job commitment. Limitations of the study and implications of the results are discussed.

**Improving the selection of family medicine residents through development of multi-dimensional policy models.**

Parker BR; Skinner BD

Health Policy Educ ,Oct 1982, 3 (3) p229-47, ISSN 0165-2281 Journal Code: G2I

Languages: ENGLISH

The annual cost of training a single family medicine resident may now exceed \$50,000. This, together with the fact that normally only a small fraction of those applying for family medicine residency is selected for admission, creates a decision problem of enormous import to affected institutions. Despite these considerations, the applicant evaluation and selection process remains relatively subjective, with results often disappointing. In the current paper, a preference-based approach is proposed that first models the evaluation/selection process on the basis of well-defined cognitive and noncognitive criteria. It is suggested that validation of this model be based on future performance levels of both the accepted and rejected cohorts during and following their residencies. Discrepancies between future success levels and predicted outcomes may then be translated into appropriate control actions designed: (1) improve the definition/measurement of selection criteria; (2) enhance the evaluation/selection policies and decisions of the admissions committee; and (3) better inform potential applicants of the department's program and selection philosophies. The approach is applied to two recent, accepted cohorts of the University of North Carolina Department of Family Medicine. Preliminary results indicate that the procedure is capable of improving the in-residency success levels of selected applicants, and that these levels can be better predicted than when no formal, i.e., analytic, process is followed.

**National origin harassment in the work place: recent guideline developments from the EEOC.**

Hollon CJ; Bright TL  
Employee Relat Law J ,Autumn 1982, 8 (2) p282-93, ISSN  
0098-8898 Journal Code: EE9

Languages: ENGLISH

In December 1980 the EEOC published its revised "Guidelines on Discrimination Because of National Origin." The revised guidelines expand the definition of national origin harassment and declare it a violation of Title VII. According to the EEOC, the guidelines reaffirm the position the Commission has taken in earlier decisions. In the following article, the authors examine the EEOC's position on national origin harassment. Using the guidelines as a frame of reference, they look at both EEOC decisions issued prior to the guidelines and court decisions that may offer employers guidance regarding impermissible conduct and liability in this area.

**Legal obstacles to alternative work-force designs.**

Fasman ZD  
Employee Relat Law J ,Autumn 1982, 8 (2) p256-81, ISSN  
0098-8898 Journal Code: EE9

Languages: ENGLISH

Given the changing industrial realities we now face, more and more employers and their employees are becoming involved in cooperative work ventures such as work teams, quality circles, and joint employer-employee committees. Successful ventures of this sort minimize the adversary nature of the relationship between management and labor and enhance employees' sense of responsibility and authority. The result is better working relationships and increased productivity. In both union and nonunion settings, however, employers face legal obstacles to work-force redesign. In the following article, the author discusses these obstacles and offers some suggestions on how they may be avoided.

**Employer remedies for work stoppages that violate no-strike provisions.**

Gies TP  
Employee Relat Law J ,Autumn 1982, 8 (2) p178-97, ISSN  
0098-8898 Journal Code: EE9

Languages: ENGLISH

An employer faced with a work stoppage that violates a contractual no-strike provision has several alternatives: the employer can seek an injunction against the strike, discipline employees involved in the strike, or attempt to recover damages for violations of the collective bargaining agreement.

Each of these remedies, however, presents practical problems in terms of employer-employee relations as well as legal questions regarding the extent of relief available. In the following article, the author examines the remedies available

to an employer when employees engage in activity that violates a no-strike provision. He also examines the impact of recent cases on an employer's ability to enforce a no-strike pledge.

A national survey was conducted to determine how occupational therapists became interested in the field. Results from the study demonstrated that personal contact was the most effective technique for creating an interest in occupational therapy. However, books, magazines, aide and volunteer jobs, guidance counselors, and career days were adjuncts to the recruitment process. This study provides data concerning previous productive means that have been used in recruitment and suggests specific actions for future recruitment.

**Administrative decision making: staff-patient ratios (a patient classification system for a psychiatric setting).**

Schroder PJ; Washington WP

Perspect Psychiatr Care ,Jul-Sep 1982, 20 (3) p111-23,  
ISSN 0031-5990 Journal Code: OZT  
Languages: ENGLISH

In this article, we have described a patient classification system in use at the C.F. Menninger Memorial Hospital. It is a type of factor evaluation, in which we use critical indicators or descriptors of care as units of measurement. Each critical indicator represents a grouping of nursing activities rather than concrete time measurement of each activity. The ten critical indicators of patient care needs and nursing activities which were identified were divided into two major categories: routine and extra. Each category was then subdivided to reflect a range or variation of care levels. This type of patient classification systems appears to have an advantage over other classification systems when applied to psychiatric nursing. The factor evaluations are broad enough in scope to allow inclusion of patient assessment, documentation, and use of the nursing process, while providing a measurement of psychological and psychosocial needs of the patient which are frequently absent in other classification systems that rely on task measurements or acuity levels alone.

Because of its practicality it has been readily accepted by nurses working on psychiatric units, and the nurse administrator's effort to put a classification system in place has been made easier.

**Faculty development and human resources management in the academic medical setting.**  
Goldman JA  
J Med Educ ,Nov 1982, 57 (11) p860-5, ISSN 0022-2577  
Journal Code: J13  
Languages: ENGLISH

Faculty members of academic medical centers are resources of the institution, and their maturation is part of the academic medical center's program of human resource development. Although the individual is ultimately responsible for his own development, programs of human resource management should be developed for academic medicine. Four basic areas have been suggested for these programs: professional development, institutional development, curricular change, and organizational change. Professional development is the area of most activity but is limited mainly to assessing the faculty member's teaching ability. Research aimed at the evaluation of clinical teaching is a relatively new field. Medical student and house officer evaluation, the use of videotapes, and the enlistment of educational consultants and technologists have begun, but there is little continuing research using these techniques and others at most institutions. The evaluation material is used to help the medical educator but only if the

faculty member seeks out and uses the evaluation material to improve his teaching skills. As the educational process is linked more to the rewards system of the medical school, such as promotion, internal grants, and merit pay, motivation for improvement in instruction will be more universal. Medical academic human resource management will truly arrive only when the faculty members themselves perceive the need and desire it.

**Control of manual lifting hazards: II. Job redesign.**  
Ayoub MA  
J Occup Med ,Sep 1982, 24 (9) p668-76, ISSN 0022-3212  
Journal Code: JFR  
Languages: ENGLISH  
Job content and workplace components can be altered to assure that lifting stresses remain within the acceptable limits defined for the industrial population-at-large. The plan for redesign advocates (1) maintaining the weight handled within the recommended limits; (2) modifying the workplace to enhance postural stability and to avoid handling weights and excessive physical loading; and (3) increasing available job time by reducing frequency of lifts and/or introducing appropriate rest periods. Limits recommended by the National Institute for Occupational Safety and Health on acceptable loads are reviewed.

**A method of estimating nursing workload.**

Henney CR; Chrissafis I; McFarlane J; Crooks J  
J Adv Nurs ,Jul 1982, 7 (4) p319-25, ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH

A real-time nursing computer system operational on six medical wards allows the automatic data capture of all nursing procedures carried out for all patients. Each nursing procedure has been graded by an experienced nurse on a 5-point scale (Ninewells Index I), with grade 5 representing the greatest workload. A Delphi type survey was carried out by a questionnaire involving 115 medical charge nurses in Scotland who graded the same procedures on a 5-point scale (Delphi Index I). Good agreement with the two indices was found. The Delphi Index I was transferred from the original scale to an interval scale (Delphi Index II) to facilitate statistical handling of data and conversion to timings. The conversion of Delphi Index II to timings (Ninewells Index II) was achieved by using data from three extensive work studies. It is suggested that Ninewells Index II is a practical problem of staff allocation in medical wards.

**Motivational management: coping with burnout.**

Richardson M; West P  
Hosp Community Psychiatry ,Oct 1982, 33 (10) p837-40,  
ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Burnout, the emotional state that accompanies an overload of stress, generally has been ascribed to organizational or personal causes. Motivational management is an approach to identifying the causes of burnout among workers and determining ways to effectively intercede. The authors conducted workshops to help staff combat burnout at a public health agency, a small community hospital, and a preschool for handicapped children. During the first phase of the workshop participants generated a list of problems that contributed to their sense of burnout. They then assigned each problem a personal, organizational, or environmental cause. During the second phase participants decided who should accept responsibility for developing and executing strategies for change. The authors believe motivational management techniques can also be used to explore burnout in other roles such as those of parent, child, friend, or community member.

**Turnover benefits: the other side of the "costs" coin.**

Kesner IF; Dalton DR  
Personnel ,Sep-Oct 1982, 59 (5) p69-76, ISSN 0031-5702  
Journal Code: PAP  
Languages: ENGLISH

High levels of turnover have traditionally been viewed by human resources managers as having a negative effect on the organization. But the authors--Idalene F. Kesner, associate instructor in business policy, and Dan R. Dalton, assistant professor of administrative and behavioral studies, both at the Graduate School of Business, Indiana University--maintain that responsible levels of employee turnover may have both direct and indirect benefits for the organization. Such benefits include displacement of poor performers, an infusion of new knowledge in the organization, and the stimulation of changes in policies and practices. In addition, of course, there are opportunities for cost reduction and consolidation. Using data compiled from the experience of a California public utility, the authors show how to calculate the direct, hard-dollar value of the savings that can be realized in regular pay, overtime pay, pension contributions, earned but unused sick leave, and other areas.

Personnel ,Sep-Oct 1982, 59 (5) p60-8, ISSN 0031-5702  
Journal Code: PAP  
Languages: ENGLISH

In a productive organization, policies, programs, and job structures promote harmony in a racially diverse workforce and therefore utilize the talents and abilities of all its employees. But according to Ora D. Fant, vice-president and senior staff consultant with Goodmeasure, Inc., people of color are still often underutilized and isolated in the workplace, and this interferes with a true assessment of their contributions and value to the organization. Fant explains the dynamics behind such counterproductive treatment and offers both (1) organizationwide recommendations for effective workforce integration and (2) guidelines to help individual managers work more effectively with people of color.

**Social ecology of supervised communal facilities for mentally disabled adults: VII. Productivity and turnover rate in sheltered workshops.**

Melstrom MA  
Am J Ment Defic ,Jul 1982, 87 (1) p40-7, ISSN 0002-9351  
Journal Code: 3MA  
Contract/Grant No.: 10321  
Languages: ENGLISH

Turnover, reasons for termination, productivity, and number of hours worked as a function of demographic data, workshop settings, and measures of sociability for mentally disabled adults at six sheltered workshop settings were examined. An annual turnover rate of 48 percent was found, but only residence type and workshop setting were related to length of time in the workshop before termination. Physical attractiveness and sociability (as observed during free periods at the workshops) were positively related to productivity, but only workshop settings predicted number of hours worked. Clients who terminated from the agency for positive reasons were highest in sociability and desire for affiliation, whereas clients who terminated for negative reasons were lowest in sociability and desire for affiliation. Sex, age, IQ, diagnosis, and history of institutionalization were unrelated to vocational variables.

The purpose of this study was to determine the relative importance of personal and work-related factors in relation to job turnover in the physical therapy profession. A survey questionnaire was mailed to a nationwide sample of 820 physical therapists, and 567 responses (69%) were used in the data analyses. The two most important reasons for leaving a job were "desire to pursue a different area of physical therapy" and "insufficient salary to meet financial needs." Significant differences were found in the relative importance of job-turnover factors when the sample was stratified according to physical therapy education level, percentage of time in direct patient care, years in the physical therapy profession, and sex. A careful look at the factors contributing to job turnover will help physical therapy administrators retain staff members.

Journal Code: I4L

Languages: ENGLISH

This study elucidates the characteristics of the interview day preferred by medical students applying to family practice residencies. Interviews and informal meetings with residents were regarded as being the most helpful, followed by interviews with the director or faculty. Perceptions of other components of the interview day are also described. October was the month most students preferred, and two interviews each lasting 20 to 30 minutes were considered ideal. Group interviews were regarded negatively. The results of this survey are generalizable to other residency programs and could be helpful in planning the interview day.

Health Serv Res ,Fall 1982, 17 (3) p213-40, ISSN 0017-9124 Journal Code: G2L

Languages: ENGLISH

Three arrangements for structuring the work of professional participants in professional organizations are described, contrasted and evaluated. Arguments are illustrated by application to the organization of physicians within hospitals. The primary rationale, the support structures that have fostered its development, the key structural features and the advantages and disadvantages of each arrangement are described. The effect on these arrangements of structures and forces external to any particular professional organization is emphasized. (80 Refs.)

**Dilemmas of managing participation.**

Kanter RM

Organ Dyn ,Summer 1982, 11 (1) p5-27, ISSN 0090-2616 Journal Code: NQ2

Languages: ENGLISH

There are two reasons that current corporate efforts to achieve employee "participation" often seem fragile and temporary: unrealistic expectations about the appropriate use of participation and a failure to manage participation efforts for maximum success. Participation is most appropriate when, for example, expertise is diffused, issues are controversial, problems cut across existing roles, or the development of people is desired; autonomy and individual responsibility may be more appropriate under the opposite conditions. Kanter discusses six sets of dilemmas that must be resolved to ensure that participating teams work effectively for the organization: dilemmas around initiation, structure, issue choice, teamwork, links between teams and their environment, and evaluation/continuation. Kanter concludes that participation works best when it is well managed. Participation is best viewed not as a permanent "program" or a "formula" but as temporary episodes of high involvement alternating with a more routine everyday structure.

**Quality circles as a management tool for hospital pharmacy.**

Parness MI

Am J Hosp Pharm ,Jul 1982, 39 (7) p1189-92, ISSN  
0002-9289 Journal Code: 3IO

Languages: ENGLISH

A pharmacy department's experience with a quality circle program is described. The quality circle is a type of participative management where a group of employees within a department voluntarily meets on a regular basis to identify and research departmental problems and formulate alternative solutions for management. The pharmacy department formed one of the first five circles at the hospital. Each circle meets for one hour weekly on hospital time. The pharmacy quality circle includes three staff pharmacists, two support staff, and a pharmacy supervisor who serves as the leader. Through brainstorming sessions, the circle has identified problems within the department. The circle collects data to help define the problems, and specific solutions are presented to management. Among the solutions recommended have been: assigning a clerk as a receptionist at the pharmacy front window so that the pharmacist would not be interrupted; widening the front window to accommodate separate lines for inpatient and outpatient prescriptions; and instituting a double-ticket procedure to help retrieve employee prescriptions. Management accepted and instituted all of the circle's proposals. The quality circle has been a successful management tool in this pharmacy department.

**Efficacy of enforcement in an industrial hearing conservation program.**

Hager WL; Hoyle ER; Hermann ER

Am Ind Hyg Assoc J ,Jun 1982, 43 (6) p455-65, ISSN  
0002-8894 Journal Code: 3CI

Contract/Grant No.: 5 T01 OH 07049; 5 T15 OH 07104

Languages: ENGLISH

Relative efficacy of various levels of enforcement in the use of personal hearing protective devices was investigated among employees of a large industrial plant. The main variable was that each of four groups of employees worked during a different period of enforcement policy on the use of personal hearing protection. Analysis of variance of mean hearing levels using three different audiometric grading schemes with different levels of sensitivity, namely, the 0.5, 1, 2 kHz Hearing Level Index, the 1, 2, 3 kHz Hearing Level Index, and the 4000 Hz single puretone test indicate that the enforcement policy did have a dramatic effect on the efficacy of the hearing conservation program and should give similar results in other industrial settings. When and where the use of personal hearing protection was left to the employee it was found that hearing loss among the noise-exposed was very much in excess of that among a non-noise-exposed group. Mandatory use of personal protective devices was found to be much more effective in conserving hearing than the voluntary approach. Mandatory use of earmuffs exclusively proved to be less

effective than mandatory use of personal hearing protection when the employee was given a choice of earmuffs or earplugs. Enactment of the Occupational Safety and Health Act did not result in greater hearing conservation over the existing company mandatory hearing conservation program which is quite effective.

This study assesses the extent to which faculty turnover in dental hygiene programs is related to the type of educational institution. A questionnaire was mailed to 201 dental hygiene program directors; 175 responded (87 percent). Nearly 47 per-cent of the directors associated with programs in state colleges and universities indicated they had experienced some degree of difficulty retaining faculty in the past five years; less than 18 percent of those in community colleges and technical schools experienced similar problems. Faculty attrition due to personal reasons and job and salary dissatisfaction occurred to a slightly greater extent in state educational institutions than in community colleges and technical schools. Achieving tenure was perceived as a problem primarily by directors of programs in state colleges and universities. Although inadequate salary was a direct cause of attrition in some cases, the degree to which it influenced personal reasons for leaving was not determined.

Respondents to a mass media cardiopulmonary resuscitation (CPR) recruitment campaign in Harris County, Texas were more likely than non-respondents to be White, female, and under 45 years of age, to have had previous CPR training, experienced an incident in which knowledge of CPR might have been useful, or to have a friend or relative with a relevant medical history. The majority of the respondents were housewives, and professionals or technical workers, particularly in the health field. Findings can be used to identify audiences for future mass media CPR campaigns.

**Adaptation of a workload measurement system.**  
Toohey JB; Herrick JD; Trautman RT  
Am J Hosp Pharm ,Jun 1982, 39 (6) p999-1004, ISSN  
0002-9289 Journal Code: 3IO  
Languages: ENGLISH

An adaptation of a previously reported patient-care unit (PCU) system of workload measurement is described. A PCU is any distributive or clinical pharmacy activity related to patient care, and the PCU system of workload measurement relates the activity frequency and the usual time required to complete each activity. The key to the system is the weighting factor (usual time) for each PCU. The PCU system was modified by breaking each PCU into its various elements and determining the time required to complete each element. Several time units were available from references; other units specific for hospital pharmacy were measured. The modified PCU definitions, counting mechanisms, and weighting factors used at the study hospital are included in an appendix. The number of service hours, which is the product of the frequency of each activity and its weighting factor, is an indicator of personnel time devoted to each pharmacy activity. The cost per service hour can be computed and used to set fees for each pharmacy activity. Other practical applications of the PCU system include evaluation of staffing patterns, trend analysis, and documentation of clinical services. The modified PCU system provides a more precise measurement of weighting factors than previously described methods, and it can be adapted by other institutions.

Sanders GS; Malkis FS  
Organ Behav Hum Perform ,Aug 1982, 30 (1) p71-86, ISSN 0030-5073 Journal Code: OK6  
Languages: ENGLISH  
The present study examines the behavior of Type A coronary-prone subjects in group problem-solving sessions. Subjects discuss possible solutions to two problems in same-sex groups containing both Type As and Bs. As are much more likely than Bs to be seen as leaders and are rarely nominated as the least helpful member. Although A and B leaders are both seen as moderately likeable, A leaders' problem solutions are rated as lower in quality. Manipulations of problem importance and incentive for good solutions have similar effects on As and Bs. The results are discussed as being generally consistent with the proposal that Type As are primarily motivated by a need for control. Some indirect support is obtained for the idea that As are more susceptible than Bs to learned helplessness.

This study indicates that administrator attention and intervention can reduce high turnover in nursing homes. It also indicates a need to investigate the contributing factors in a specific organization, to select interventions based on this knowledge and for multiple but related actions that will support one another. Increased supervision of new employees, increased recruitment efforts, supervisory training, revised personnel policies, and avoidance of personnel pools seem to have particularly high impact on the reduction of turnover in nursing homes and are recommended as a place to begin. Languages: ENGLISH  
Foremost among the serious issues surrounding long-term care is the question of appropriate staffing for quality patient

care. The philosophy of personnel management in controlling the key factors of the institution's objectives will enhance the employee's capability and understanding. The approach in personnel management techniques should then be designed to involve management, supervisory personnel, and the employee. Employee efficiency, quality performance, and advancement of the overall goals are the desired end results. Employees should be constantly challenged to allow them to contribute their best efforts and achieve their potential. While both methods and the workforce are undergoing constant and dramatic changes, people continue to be management's greatest asset.

In 1974, Congress passed Public Law 93-516, the Vocational Rehabilitation Act, and in 1975, Public Law 94-142, the Education of All Handicapped Children Act. The spirit of both laws is to bring people with physical or mental impairments into the mainstream of American life. At school, dealing with a fear of disability and adjusting to the special needs of others is to become part of everyone's education. At work, the handicapped are to have a fair chance to do the jobs they are qualified for, and employers are to make reasonable accommodations to their handicapped employees' needs. Many companies have taken up the spirit of these laws. The authors describe how clear job descriptions and practical adjustments have made their rehabilitation and hiring programs work. The success of these programs offers encouragement to companies that are just starting out in such efforts.

**Personal characteristics of house staff candidates: a quantitative analysis of relative weights.**  
Greganti MA; McGaghie WC; Finn WF  
Ann Intern Med ,Jul 1982, 97 (1) p108-11, ISSN 0003-4819 Journal Code: 5A6

Languages: ENGLISH  
We surveyed the faculty, fellows, and residents of a department of medicine to determine the relative importance of each of eight personal characteristics evaluated during the interview of house staff candidates. A booklet containing all possible pairings of the eight characteristics was distributed to 219 participants who were asked which member of each pair should have greater weight for assigning an overall interview grade. Usable data were returned by 172 persons (79%) and analyzed by the psychometric scaling method of paired comparisons. The four characteristics with the greatest relative weights were professional attitude, maturity, enthusiasm and energy, and knowledge. The faculty, fellows, and residents were highly consistent in their judgments. However, three of the characteristics (motivation for clinical practice, knowledge, and verbal skill) significantly distinguished the three departmental groups. These results show that utility of the paired comparison method for identifying a department's weighting of variables for selection of house staff.

Oleen MA  
Am J Hosp Pharm ,May 1982, 39 (5) p814-7, ISSN  
0002-9289 Journal Code: 310  
Languages: ENGLISH

The development and use of a behavioral performance evaluation form for pharmacy technicians in a hospital-based training program is described. The behavior anchors for the evaluation form were derived from a task analysis of the technician position and a modified critical-incident technique. The appraisal factors were classified under six basic work areas: (1) procurement, (2) intravenous admixtures and sterile solutions, (3) automatic replenishment, (4) manufacturing and prepacking, (5) outpatient dispensing, and (6) inpatient dispensing or unit dose. Five rating categories ranging from exceptional to unsatisfactory were given point values. After an evaluation is completed, the supervising pharmacist reviews it with the trainees and sets objectives for the next appraisal period. The form can be used at regular intervals to assess the trainees' progress, and it can be used in the annual review of a technician's performance. The performance evaluation of technician trainees can determine the proficiency gained from a training program and identify areas where further instruction is needed.

**A study of job turnover among clinical laboratory personnel.**  
Karni KR; Studer WM; Carter SJ  
Am J Med Technol ,Jan 1982, 48 (1) p49-59, ISSN  
0002-9335 Journal Code: 3L0  
Languages: ENGLISH

A study of job turnover in clinical laboratories in the Minneapolis-St. Paul area was conducted in the years 1970, 1975, and 1980. Annual turnover rates for all laboratory personnel were 20%, 19% and 15% respectively. The groups with the lowest turnover were cytotechnologists, histologic technicians and clinical laboratory scientists (medical technologists). The highest turnover occurred among clinical laboratory technicians and "others," primarily supportive personnel such as phlebotomists, assistants, and aides.

**Improving supervisory skills in the management of unionized technicians.**  
Whalen FJ  
Am J Hosp Pharm ,Mar 1982, 39 (3) p450-2, ISSN  
0002-9289 Journal Code: 3IO  
Languages: ENGLISH

The development and implementation of a labor-relations program that was designed to improve staff pharmacist supervisory skills and work relations with unionized technician is described. This program of a large hospital pharmacy department was created at a time when the technician staff was being expanded substantially and the staff pharmacists lacked supervisory skills. The objective was to give both pharmacists and technicians an understanding of how job duties and responsibilities are integrated with the policies and procedures of the pharmacy and the hospital and with the requirements of the union contract. The program also provided the staff pharmacist with training in supervisory skills. A five-session course covered 20 labor-relations topics, including employee and management rights and responsibilities, employee relations, and discipline and grievance procedures. The program took a positive approach to improving interrelationships between the professional and technical staffs of the department.

Journal Code: JEL

Languages: ENGLISH

It must be emphasized that none of the steps described in this planning process emerged overnight. Rather, they were achieved through a process of evolution, sometimes through trial and error, and always with consultation and participation by many members of the hospital nursing staff. Participation by many in the process of planning for a workable staffing system has been essential to its success. Indeed, creative scheduling by the head nurse is possible because of the way in which the system has been organized. The fact that head nurses are responsible for staffing their own units makes it infinitely easier for them to see what they need to make their units operate effectively and efficiently. Creative scheduling includes the possibility of arranging nurses' hours outside the rigid three-shift schedule used by so many hospitals. Many El Camino nurses now report for work at different hours. In addition, the use of flexible work

weeks has proven valuable. Some head nurses now allow for a ten-hour, four-day work week; in emergency staffing situations there have, on occasion, been twelve-hour days. Even as this system evolves, it faces change. Just as the requirements for staff cannot be rigid, so must problem solving be flexible and constantly under review. The fact that El Camino believes in constant monitoring of its system is essential to its success.

A key philosophical foundation of decentralization is that it must be subject to change. This is no less true in staffing than in other parts of the decentralization structure. By agreeing that change is constant and necessary and that participation is required at all levels of the staffing planning process, we have constructed the outlines of a system that will work in the future as well as it does in the present. Our system centers around the head nurses. It involves their planning; thus it also involves the support of those members of the nursing staff who can provide essential information. But the decisions about how to use the information remain with the head nurse. And that, as much as anything, is at the heart of the decentralized nursing structure.

**High medical consultation rates of lead workers after industrial dispute over lead effects.**

Araki S; Murata K; Yanagihara S; Ushio K  
Int Arch Occup Environ Health ,Feb 1982, 49 (3-4)  
p241-50, ISSN 0340-0130 Journal Code: GPN  
Languages: ENGLISH

Medical consultation rates were compared between a group of lead workers (346 males) and two groups of non-lead workers (317 and 329 males) in a newspaper company where a serious industrial dispute took place over health effects of lead three years before this study. The comparison was also made within the group of lead workers. Maximal blood lead concentrations (PbBs) ranged from 0.1 mumol/kg to 3.6 mumol/kg (74 microgram/100 g) with an average of 1.3 mumol/kg in the past three years. Ages averaged 35 years in lead workers, and 34 and 30 years in non-lead workers, the ranges being 19-55 years in all. The consultation rate of lead workers was significantly higher than that of both the non-lead workers (P less than 0.001), when the number of workers who consulted physicians or dentists once or more for a year per 100 workers (general consultation rate) was compared. Disease-specific consultation rates were also higher in lead workers for seven categories of diseases and injuries such as hypertensive disease and peptic ulcers. When lead workers were divided into three groups by PbB or erythrocytes delta-aminolevulinic acid dehydratase (ALAD) levels, however, no significantly high rate was found in the higher PbB groups not lower ALAD groups in terms of general and disease-specific consultation rates. It was concluded that the industrial dispute might have been a major cause of the high consultation rate of lead workers.

Information relating to sickness, accident, and work records in 45 people with epilepsy employed in the British Steel Corporation was obtained and compared with 38 matched control subjects. Fewer people with epilepsy were prepared to do shift work compared with controls, and prolonged absence from work due to sickness was more frequent in the epileptic group. There was no difference between the two groups in four out of five factors relating to job performance. Those in the epileptic group who had an associated personality disorder had significantly poorer job performance ratings.

At the center of the hardware in the clinical laboratory are people, and managing these people can be difficult for the resident who has had no management experience or instruction in management skills. Last month, in the first of the two part article, the author explained how a pathologist's administrative role differs from his role as a physician, reviewed management styles, and discussed management tools the laboratory director needs to organize and operate a laboratory. Here, he focuses on the orientation program for new employees, motivational factors, and the importance of personnel policies, job performance evaluation, counseling and disciplinary action, and proper delegation of responsibilities.

Dorsey DB

Pathologist ,Mar 1982, 36 (3) p137-40, ISSN 0031-3017  
Journal Code: PAG

Languages: ENGLISH

Long a neglected subject, management is increasingly recognized as a tool that allows an organization to function optimally. Because medical schools do not stress management training, the pathologist can encounter problems when immersed for the first time into the field of management. In the first of a two-part article, the author explains how a pathologist's administrative role differs from his role as a physician, reviews briefly the different management styles, and discusses important management tools the laboratory director needs to organize and operate a laboratory.

Hiring a medical director involves more than specifying the basic qualifications a candidate should have. The hospital board and administration should clearly delineate its policy toward practice privileges for the medical director and the reporting relationship desired. This article also examines how to begin a search, how to tailor a campaign to attract qualified candidates, and various compensation considerations.

**Hiring drug information personnel.**

Hatfield SM; Ifshin SL; Abramowitz PW  
Am J Hosp Pharm ,Feb 1982, 39 (2) p288-91, ISSN  
0002-9289 Journal Code: 3IO  
Languages: ENGLISH

An analysis of the functions performed at a drug information center (DIC) is described as the basis for hiring personnel. A functional job analysis demonstrated a division in the duties of DIC personnel. The workload demanded a drug literature specialist (DLS) to access, store, and retrieve drug information, and a practitioner in drug information (PDI) to analyze this information and make the appropriate clinical judgements. The DIC hired a DLS with a background in library science and experience with computer searching techniques to work with the PDI. It is suggested that the combination of a qualified librarian and a drug information pharmacist can provide the DIC with the optimal personnel. The analysis was a valuable tool in selecting personnel who possess the appropriate skills, job understanding, attitude, and innovative abilities.

**Job content and pharmacists' job attitudes.**

Quandt WG; McKercher PL; Miller DA  
Am J Hosp Pharm ,Feb 1982, 39 (2) p275-9, ISSN  
0002-9289 Journal Code: 3IO  
Languages: ENGLISH

The relationships between job content and hospital pharmacists' work attitudes are examined. A 152-item questionnaire was mailed to 507 hospital pharmacists in southeastern Michigan. The questionnaire included measures of job dimensions, psychological states, and personal and work outcomes. Mean scores for 34 subscales consisting of 2-5 related items were computed. Background characteristics were also assessed. Using factor analysis, the respondents were categorized as clinical, inpatient, outpatient, or generalists depending on their reported relative time spent performing 23 nonadministrative job functions. Analysis of variance was performed across the four groups for each subscale; the level of significance was set at 0.001. The response rate was 56%, representing 283 completed questionnaires. The clinical, outpatient, inpatient, and generalist pharmacist groups consisted of 43, 36, 70, and 134 respondents, respectively. There was a prevalent trend in the rank order in which pharmacists in the four groups responded to various subscales. The clinical group had the highest scores for 13 of the 14

subscales that were significantly different across pharmacist groups. Alternatively, in all but one of the significantly different subscales the inpatient group ranked lowest. Because pharmacists in the clinical group consistently scored higher than the other groups on scales measuring components of job enrichment, the authors concluded that the challenge of hospital pharmacy managers is to adapt the positive features of clinical practice to other areas of the profession.

**System to measure the use of pharmacy personnel.**

Hunt ML Jr; Tuck BA; Adams CT  
Am J Hosp Pharm ,Jan 1982, 39 (1) p82-5, ISSN 0002-9289  
Journal Code: 310  
Languages: ENGLISH

The development of a program to monitor the use of pharmacy personnel is described. The program is part of a hospital-wide Labor Information System developed to support requests for additional staff, to highlight opportunities for improved and allocation of manpower, and to serve as a conceptual model of the department from a manpower perspective when communicating with other members of the hospital organization. Nine major functions of the pharmacy department were identified. Detailed activities for each function were listed along with the type of personnel who performed each activity. Standards representing the amount of time spent on each activity were then developed. Variable, fixed, and open standards were used. Workload volumes are tabulated on a biweekly basis and entered into a computer. Payroll data covering the same period are simultaneously fed into the computer system. The resulting computer-generated report compares the service hours necessary to perform the actual workload (based on the predetermined time standards) to the available hours actually worked by each job category of pharmacy personnel. The ratio of service hours to available hours measures the use of personnel by functional activity. The system has been successfully applied to support requests for additional personnel, to forecast staffing needs for new programs, and to make operational improvements. In addition, the system has the capacity to accurately monitor personnel time for providing clinical services.

The nurse shortage can be seen as a symptom of the problems caused by the unwillingness of most hospital power groups to share their control of both resources and decision making. Nurses will continue to leave hospital work if hospitals persist in ignoring nurses' pleas for a share of the rewards and power that should be commensurate with the enormous contributions they make to patient care.

Contingency theory as a managerial perspective is conceptually elegant, but it may cause a number of unforeseen problems when applied in real work settings. Health care administrators can avoid many of these problems by using a hybrid contingency theory framework that blends the manager's own perceptions and experience with established contingency models.

**Behavioral evaluation of a state program of deinstitutionalization of the developmentally disabled.**

Walsh JA; Walsh RA  
Eval Program Plann ,1982, 5 (1) p59-67, ISSN 0149-7189  
Journal Code: EOB  
Languages: ENGLISH

The purpose of this study was to evaluate one phase of a statewide program of deinstitutionalizing developmentally disabled individuals. Forty adults who had spent a minimum of six months in community placements were evaluated with respect to changes in behavior associated with movement out of state institutions and into community settings such as group homes and day activity centers. Pre- and post-deinstitutionalization measures were taken with the Behavior Development Survey. Post-deinstitutionalization measures on Cataldo and Risley's Resident Activity Manifest were compared to the same measures obtained on 159 developmentally disabled individuals scheduled for deinstitutionalization. A consistent pattern of positive changes on both instruments favored deinstitutionalization, but changes could not be unequivocally attributed to movement out of the institutions per se.

**A method for using epidemiologic data to estimate the potential impact of an intervention on the health status of a target population.**

Morgenstern H; Bursic ES  
J Community Health ,Summer 1982, 7 (4) p292-309, ISSN  
0094-5145 Journal Code: HUT  
Contract/Grant No.: 5-DD4-AH-01759-03; 1-POI-CA-16359-05  
Languages: ENGLISH

A general method is proposed for estimating the potential impact of a prevention program involving risk factor modification on the incidence of specific diseases in a target population. An evaluative framework for comparing alternative intervention strategies is also presented. On the basis of results from epidemiologic studies, the user must specify certain parameters regarding the distribution of the risk factor that is to be modified in the population, the magnitude of the association between the risk factor and disease, and the total risk of disease in the population. A quantitative measure, called the potential impact fraction, is derived to estimate the proportion of expected new cases that may be prevented under intervention programs of varying success. Estimates of this measure are then used to assess the potential efficacy, effectiveness, adequacy, and efficiency of planned intervention strategies. The method is illustrated with published data relating relative weight and coronary heart disease among middle-aged U.S. men, comparing different strategies of weight reduction. Key assumptions of the method and interpretation of results are discussed.

**Effect of a WIC program on children's clinic activity in a local health department.**

Kotch JB; Whiteman D  
Med Care ,Jul 1982, 20 (7) p691-8, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

Two years' encounter data from a local health department in rural North Carolina are analyzed to determine the extent to which WIC increased the demand for health department services.

WIC clinic visits were found to contribute disproportionately to Children's Clinic activity. Nearly 80 per cent of the increase in total clinic encounters from FY78 to FY79 was attributable to WIC alone. Whereas in the first quarter of FY78 only 18 per cent of Children's Clinic encounters by infants were to WIC clinics, that number had risen to more than 58 per cent by the last quarter of FY79. The number of children on WIC as a percentage of all non-WIC encounters with public health nurses increased during the same period from 19 to 34 per cent. Finally, infants who came for the first time to the Children's Clinic to be certified for WIC contributed an increasing percentage of all infants seen in non-WIC clinics, from 0 per cent at the start of the study to almost 15 per cent by the final quarter. It is concluded that the presence of the WIC program in this local health department was responsible for substantial increases in non-WIC clinical activity that were not supported financially by WIC or any other source.

**Health care in Poland: from crisis to crisis.**

Millard LF  
Int J Health Serv ,1982, 12 (3) p497-515, ISSN 0020-7314  
Journal Code: GRJ  
Languages: ENGLISH

During its first twenty years the Polish health service represented a neglected sector of government activity, as the

development of heavy industry remained the predominant economic goal, with social policy regarded as a "nonproductive" sphere. When Edward Gierek came to power in 1970, the promise of reform extended throughout society to include health. However, despite a fundamental organizational reform, the health service has remained in a state of crisis, currently worsening as a result of mounting economic dislocation and political tension. Inadequate access to treatment, lack of continuity of care, poor quality of care, profound shortages of drugs and supplies, and the absence of preventive medicine are some of the manifestations of this crisis. Its main causes lie in the political weakness of the Ministry of Health, with consequent underfunding and the nonfulfillment of its plans. This situation is exacerbated by continuing organizational fragmentation, the neglect of primary care, the existence of conflicting aims in health policy, and the dominance of an ideology of clinical specialism.

**Health status and the development of health services in colonial state: the case of British Malaya.**

Leng CH  
Int J Health Serv ,1982, 12 (3) p397-417, ISSN 0020-7314  
Journal Code: GRJ  
Languages: ENGLISH

The health of a population and the development of health services in a country at a particular time in history are directly linked to the socioeconomic system. This paper discusses health and health services in Malay Peninsula during the time that it was a British colony. Economic production under British colonialism, which is basically a capitalist system, is organized primarily for the purpose of realizing profits. The health of the population is in direct conflict with and generally subordinated to this main objective. The pattern of health that emerges reflects this general framework. Moreover, health services under the colonialist system are developed primarily to serve the economic interests of the colonialists. Hence, the structure of health services is biased toward curative medicine and centered mainly in the urban areas.

Throughout the tropical world, in Africa, Asia and Latin America, the construction of water impoundments, for irrigation and other purposes, in areas of endemic water-related diseases, has inexorably intensified community levels of infection, and also created new areas of transmission. The clearest 'indicator' disease is a schistosomiasis, but other are involved such as malaria and the filariases. An assessment for the future suggests a worsening situation because of population growth, the demand for food production, and the increased technological capacity of the "bulldozer revolution" to effect earth impoundments. The typical sectoral dichotomy in which a department of agriculture creates a disease outbreak through its development activity, leaving its counterpart department of public health to cope on the curative basis, where possible, is strongly deplored. A policy position is offered whereby disease prevention measures are integrated with development projects from the beginning, and infrastructural investment and operational costs for health maintenance are identified and incorporated in the total benefit-cost analysis. The need for the communications network on ecological and health effects is

pointed out; and a typology for registration of dams is offered in support of policy implementation.

A critical overview of U.S. acupuncture regulation.

McRae G  
J Health Polit Policy Law ,Spring 1982, 7 (1) p163-96,  
ISSN 0361-6878 Journal Code: IBC  
Languages: ENGLISH

The ancient Oriental art and science of acupuncture, known in the U.S. for a decade, still is practiced here only to a limited extent and does not seem likely to spread. The primary reason, this article hypothesizes, is the stifling effect of acupuncture regulation, which typically prohibits trained nonphysician acupuncturists, mostly Orientals, from performing the therapy. Although all states permit licensed physicians to practice acupuncture with little or no training, few physicians have shown any interest in learning acupuncture and adding it to their practice. The result is that acupuncture services are scarce or unavailable in most states, and the public's newly recognized right to acupuncture treatment is therefore burdened or effectively denied. Current statutory and medical board regulation of acupuncture is described and evaluated from the standpoint of whether it encourages the practice of acupuncture by persons trained in the therapy. The article finds that both physician-limitation and supervised-practice regulations inhibit or eliminate acupuncture services, while acupuncture licensing laws foster availability of the therapy. The article recommends that states establish autonomous boards of acupuncture to license practitioners, and concludes that a coordinated national effort by acupuncturists and their lay and medical supporters will be necessary to achieve widespread adoption of licensing laws.

A survey of 1251 local health departments in 1980-81 (response rate 54 per cent) revealed that 74 per cent of those responding were headed by males, 96 per cent by Whites, 16 per cent by directors 60 or over. Forty per cent of the directors were physicians, a substantially lower percentage than that

reported a decade ago. Physicians and males were most prevalent in large departments. Two-thirds of the smallest departments were headed by women, usually nurses.

**Ideologies in the Swedish health sector today: the crisis of the social democracy.**

Diderichsen F

Int J Health Serv ,1982, 12 (2) p191-200, ISSN

0020-7314 Journal Code: GRJ

Languages: ENGLISH

Sweden has a long tradition of social democracy and corporate cooperation. Social problems are treated as technological questions that always should be solved through rational and neutral means. Today Sweden faces a crisis of economy as well as a crisis of medicine. In the spirit of consensus, the state has proposed a new health reform emphasizing the responsibility of the public health service to prevent disease and provide equal access to care. It is claimed that improved health planning, based on epidemiological knowledge on inequalities, can solve the crisis in medicine within an improved system of primary care and prevention. However, in the context of the current economic crisis, the struggle against health hazards and cuts in public spending has intensified and the gap between the ideology of technological rationalism and reality has widened.

**Applying management science in developing countries: ABC analysis to plan public drug procurement.**

Quick JD

Socioecon Plann Sci ,1982, 16 (1) p39-50, ISSN

0038-0121 Journal Code: UUV

Languages: ENGLISH

Despite the vital role of pharmaceuticals in the prevention and treatment of major causes of death and disability in the developing world, high costs and frequent shortages remain chronic problems for drug supply programs. Yet, management techniques developed to optimize the use of scarce resources have had limited application in the settings of greatest need. An important determinant of the cost and supply of drugs is the procurement pattern. This study reviews procurement patterns in selected public supply programs and, using management science techniques, compares alternative procurement patterns in terms of inventory costs and shortages. Using drug cost and quantity estimates from two countries, a simulated ABC analysis was performed. This analysis showed drug inventories to be typical of industrial inventories: Over 80% of the consumption in dollars was accounted for by less than 20% of the drugs. Procurement

patterns with more frequent purchasing or delivery of high usage drugs could reduce average inventories 20-50% over the commonly observed annual purchasing pattern. Sensitivity analysis of the results confirmed that variability in the delivery time and consumption pattern has a significant impact on the efficiency and economy of a procurement system. Closer supplier monitoring and better forecasting should reduce this variability.

**A framework for designing an MIS for health delivery system in rural India.**

Bhatnagar SC

Socioecon Plann Sci ,1982, 16 (1) p15-9, ISSN 0038-0121

Journal Code: UUV

Languages: ENGLISH

A framework for designing an information system for planning and monitoring of rural health services is proposed in the Indian context. For effective monitoring the framework emphasizes selection of a set of programmed and non-programme indicators on inputs, activities, efficiency and impact and their integration at the district level. For planning, a village level data base is proposed which will integrate environmental data with health programme data. Illustrative examples are provided for key features of the MIS and finally those elements of the information system which are either too complex or too voluminous to be handled manually are identified and the possibility of using computers for such analysis is explored.

It appears from available information that although nations  
such as Canada and the United States are making concerted  
efforts to come to terms with the linguistic and health  
requirements of their ethnic communities. Australia is leading  
the way in terms of having found an effective solution to the  
problem. The New South Wales Health Commission's scheme is  
comprehensive, covering all aspects of health care in public  
hospitals and in the community. We envisage that other states  
will soon follow the example set by New South Wales.

**Socioeconomic evaluation of a state-funded comprehensive hemophilia-care program.**

Smith PS; Keyes NC; Forman EN  
N Engl J Med ,Mar 11 1982, 306 (10) p575-9, ISSN  
0028-4793 Journal Code: NOW  
Languages: ENGLISH

To assess the effectiveness, cost, and socioeconomic gains associated with a comprehensive state-funded hemophilia program, we compared data from a three-year experience with such a program in Rhode Island with those from the preceding year. Self-treatment, integration of children into school, and achieving satisfying employment of adults are the main goals of the program. During the most recent year, 77 per cent of the patients with severe hemophilia in the state received total care through the Hemophilia Center. Twenty-eight of the 43 patients now treat themselves, the annual number of hospital days per patient has decreased from 12.6 to 3.5, and the number of visits to hospital facilities has fallen from 34 to 2.4, while the yearly cost of clotting factor per patient has remained about \$7,000. Altogether, this has saved more than \$10,000 each year for treatment, despite the cost of rehabilitative surgery. Numbers of days lost from school and work have decreased twofold and threefold, respectively. Best of all, comprehensive care has vastly improved the quality of life for patients with hemophilia in Rhode Island.

The Occupational Safety and Health Act of 1970 assigns to the federal government specific responsibilities for regulating safety and health in industry. At the same time, occupational health programs have traditionally been, and

continue to be, one responsibility of local and state health agencies. In California, local health agencies are required to provide occupational health services in larger jurisdictions. Professional level positions which may be required include: Occupational health physician, occupational health nursing consultant, industrial hygienist or occupational health sanitarians, industrial hygiene engineer, and industrial hygiene chemist. Frequently a local health agency may satisfy its occupational health requirements by training a registered sanitarian to become an occupational health sanitarian.

Quantitative noise analysis of a general surgical ward in a modern hospital showed that the level of noise was in excess of recommended levels and of sufficient intensity to disturb sleep. Individual noises in excess of 50 dB(A) were recorded in every area at all times of the day. Internal hospital sounds were responsible for most noise; staff and audible warning devices were the main sources of noise over 70 dB(A). Octave waveband analysis showed that both the general ward noise and the noise of the air conditioning were in excess of recommended levels.

**[Adverse effects of modern inhalation anesthetics. 2. Control of amounts and elimination of escaping anesthesia gases]**

Gesundheitsschaden durch moderne Inhalationsnarkotika. Teil 2: Beschränkung der Menge und Eliminierung überschüssiger Narkosegase.

Blaum U; Pfluger H

Fortschr Med ,14 Dec 1978, 96 (47-48) p2365-70, ISSN  
0015-8178 Journal Code: F62

Languages: GERMAN Summary Languages: ENGLISH

This paper presents a review on the pathological effects caused by acute or chronic exposure to the inhalation anesthetics halothane, methoxyflurane, or enflurane. Methoxyflurane has a dose-related nephrotoxicity due to its metabolic degradation with release of fluoride ions whereas suggested pathological renal effects of halothane or enflurane are still under discussion. As to the syndrome of halothane- (or enflurane-, methoxyflurane-) associated hepatitis no dose-dependent hepatotoxicity has been proven but interactions

with hypoxia, hypotension, drug-pretreatment, and perhaps genetic abnormalities should be kept in mind. Severe hematologic alterations are effected by prolonged exposure to N2O or halothane and alterations of tumor immunity caused by anesthetic agents are reported, too. From clinical studies and observations of pregnant animals, a correlation between the incidence of miscarriages or malformations and chronic exposure to low doses of inhalation agents may be stated. Nevertheless, an inhalation agent is easy to control because it can be eliminated quickly in the case of complications. Therefore, one would not like to miss these inhalation agents in clinical practice but the immission into the operating room should be limited. Moreover, the best way to keep the operating room clean from waste anesthetic gases is the installation of a scavenging system which is connected to suction.

**Risk factors for heatstroke. A case-control study.**

Kilbourne EM; Choi K; Jones TS; Thacker SB

JAMA Jun 25 1982, 247 (24) p3332-6, ISSN 0098-7484

Journal Code: KFR

Languages: ENGLISH

To identify risk factors associated with heatstroke, a case-control study in St Louis and Kansas City, Mo. was conducted during July and August 1980. Questionnaire data were gathered for 156 persons with heatstroke (severe heat illness with documented hyperthermia) and 462 control subjects matched by age, sex, and neighborhood of residence. A stepwise linear logistic regression procedure was used to identify factors significantly associated with heatstroke. Alcoholism, living on the higher floors of multistory buildings, and using major tranquilizers (phenothiazines, butyrophenones, or thioxanthenes) were factors associated with increased risk. Factors associated with decreased risk were using home air conditioning, spending more time in air-conditioned places, and living in a residence well shaded by trees and shrubs. Being able to care for oneself, characteristically undertaking vigorous physical activity, but reducing such activity during the heat, and taking extra liquid were also associated with decreased risk. Our findings also suggest effective preventive measures. During a heat wave, the greatest attention should be directed toward high-risk groups, and relief efforts should include measures shown to be associated with reduced risk.

**[The bacteria stop system of Meierhans-Weber as room air technical alternative to laminar-air-flow and its air hygienic effectiveness]**

Das Keimstoppsystem von Meierhans-Weber als raumluftechnische Alternative zum Laminar-air-flow und seine lufthygienische Wirksamkeit.

Thomas G; Thomas A; Meierhans R

Arch Orthop Trauma Surg, 1981, 98 (3) p173-81, ISSN 0344-8444 Journal Code: 8AD

Languages: GERMAN Summary Languages: ENGLISH

Statistics of wound infections demonstrate the linear dependence between postoperative wound infection and the quantity of bacteria in the air of operating theatres. In the most extensive examination series we have made as yet with a special work group of DGOT the quantity of bacteria in the air of non air-conditioned operating theatres and such fitted out with different aircleaning systems was determined. Non air-conditioned operating theatres proved so extremely infected that the risk of wound infection cannot be borne any more in the future. Also air-conditioned systems according to DIN 1946/4 with an average of 190 bacteria/m<sup>3</sup> are not sufficiently secure for bone and joint surgery. In Switzerland for such operations a value of 10/m<sup>3</sup> at the most is admissible. Such equivalents have been attained only with LAF until today. After extensive air tests the so-called "Keimstop"-system by Meierhans and Weber is to be considered the sole system suitable to supplement air conditioning DIN 1946/4. This combination yields the same effect as the expensive LAF systems.

**Bacterial fouling of a hospital closed-loop cooling system by Pseudomonas sp.**

du Moulin GC; Doyle GO; MacKay J; Hedley-Whyte J  
 J Clin Microbiol, Jun 1981, 13 (6) p1060-5, ISSN  
 0095-1137 Journal Code: HSH  
 Contract/Grant No.: GM15904  
 Languages: ENGLISH

During the summer of 1979 the air-conditioning system at a hospital in Boston deteriorated, and this led to total failure of some chilling units. Patient care and operating-room areas were affected. Investigation of the problem ruled out mechanical and electrical causes, but revealed a strain of Pseudomonas sp. biofouling heat transfer tubes of the closed chilled water system. The pseudomonads apparently were stimulated to grow by low concentrations of ethylene glycol antifreeze. The proximate source of these organisms was an expansion tank located in a 33 degrees C environment. The organisms probably originated from the potable water supply of the hospital. Fouling was eventually cleaned by prolonged and expensive treatments of the closed chilled water system. Pseudomonas sp. is frequently isolated from hospital-acquired infections at our institution (Beth Israel Hospital, Boston, Mass.); however, our studies with fluorescent dye tracers indicated that organisms were prohibited from entering patient areas via contaminated water from the chillers. Microbiologists must become cognizant of seemingly unimportant microbial environments within hospitals that may indirectly contribute to hospital-acquired infections.

**An investigation of operating theatre staff exposed to humidifier fever antigens.**

Cockcroft A; Edwards J; Bevan C; Campbell I; Collins G; Houston K; Jenkins D; Latham S; Saunders M; Trotman D  
 Br J Ind Med, May 1981, 38 (2) p144-51, ISSN 0007-1072  
 Journal Code: AXS  
 Languages: ENGLISH

Sixty staff working in a hospital operating theatre, where a case of humidifier fever had been identified, were studied together with 49 subjects working in other parts of the hospital. They each had a blood test for serology, a skin test, and a chest radiograph and completed a questionnaire. The theatre staff also had pulmonary function tests. The theatre humidifier was found to contain several organisms including amoebae and antigens cross-reacting highly with those implicated in previous outbreaks of humidifier fever. Of the 60 exposed subjects, 25 had developed antibodies, nine had probable symptoms of humidifier fever, and six possible symptoms. There was a strong association between symptoms and antibodies ( $p = 6 \times 10^{-5}$  by Fisher's exact test). The development of antibodies was also related to duration of exposure in the theatre ( $p$  less than 0.01 by X2 test for trend) and inversely to smoking ( $p = 0.0073$  by Fisher's exact test) but not to history of atopy. Because of the presence of antigens and because certain biocides added were ineffective

in controlling antigenic build-up the humidifier was switched off. Eight months later specific IgG levels in the theatre staff sera, estimated by an enzyme-linked immunosorbent assay technique, had fallen on average by 25%. Inhalation challenge with humidifier water was performed in eight subjects. Four subjects reacted to the challenge, including both those with antibodies and previous symptoms.

**Trace anesthetic vapors in hospital operating-room environments.**

Choi-Lao AT  
 Nurs Res, May-Jun 1981, 30 (3) p156-61, ISSN 0029-6562  
 Journal Code: D9K  
 Languages: ENGLISH

This study investigated concentrations of halothane anesthetic vapors in the operating rooms of two hospitals in the Ottawa, Ontario, Canada, area. Air samples, taken by active charcoal tubes and dosimeter badges, were analyzed by a gas chromatographic technique. Readings of 71 samples taken from hospital A and 65 samples from hospital B ranged from 1.0 to 29.4 parts per billion (ppb) for the active period and 0.1 to 3.8 ppb for the inactive period. All samples showed trace concentrations of halothane, but were well below the recommended maximal level.

**Investigation and control of an outbreaks of legionnaires' disease in a district general hospital.**

Fisher-Hoch SP; Bartlett CL; Tobin JD; Gillett MB; Nelson AM; Pritchard JE; Smith MG; Swann RA; Talbot JM; Thomas JA  
 Lancet, Apr 25 1981, 1 (8226) p932-6, ISSN 0023-7507  
 Journal Code: LOS  
 Languages: ENGLISH

Between December, 1979, and July, 1980, 12 cases of legionnaires' disease were recognised in a district general hospital. 11 of the patients probably acquired their infection within the hospital. Epidemiological and environmental studies indicated that the plumbing system and possibly also the air-conditioning cooling-tower exhaust in the new building of the hospital were the sources of infection. Chlorination of the cold-water supply and raising the hot-water temperature appeared to terminate the outbreak.

**Air conditioning systems.**

Lorenz R  
Acta Neurochir (Wien) ,1980, 55 (1-2) p49-61, ISSN  
0001-6268 Journal Code: 19C  
Languages: ENGLISH

There are some basic requirements for air conditioning systems in operating theatres. 1. Obviously the regulation of temperature and humidity is necessary, but cleaning of fresh air and circulating air is much more important. 2. Concerning cleaning, a high standard of filtration of air is demanded to avoid contamination of wounds. 3. So far only HEPA-filters, a technical description, give security and safety. They filter particles down to under 1 micrometer and have a filtration rate of more than 99.9%. 4. The ventilation rate is directly related to the germ concentration in the air. The higher the ventilation rate the cleaner the air during working. 5. To avoid turbulences unidirectional or uniform flow is necessary.

This technique has become popular as the laminar flow technique. To get such a flow an air flow velocity of 0.45 +/- 0.1 m/s is necessary. 6. The arrangement of the different working places in an operating theatre is very important. Instrument tables and the operation field itself have to be in the zone of first air. 7. One of the commonest germ dispersion sources is the human body. Proper dressing and behaviour have to be observed. The airflow behind a person (in laminar cross flow) or under a person (in laminar down flow for instance when the neurosurgeon bends his head over the operating field) has to be regarded as contaminated. 8. Hygienic controls must be made in the operation theatre when unused and also under working conditions, in a sophisticated manner. If all these points are respected a real clean room technique is possible with considerable lowering of the risk of infection for the patient. Obviously all the other rules of hygiene, i.e., asepsis and antisepsis, elaborated since the days of Lister, have to be strictly respected.

Helv Chir Acta ,Sep 1980, 47 (3-4) p493-504, ISSN  
0018-0181 Journal Code: G4P  
Languages: GERMAN Summary Languages: ENGLISH

In 4 operating theatres with 4 different air-conditioning equipments, the number of bacteria per m<sup>3</sup> circulating air in the neighbourhood of the open wound has been investigated. The testing has been performed on comparable aseptic operations. The worst results were obtained in 2 conventional theatres, equipped with a modern-up-to-date air-conditioning. The number of bacteria was ranging between 230 and 270 per m<sup>3</sup>. A much better results was obtained in a theatre, equipped with a so-called germ-stop-wall, dividing the theatre into 2 sections, separating the surgical team and the open wound completely from the anaesthetist and other staff. With this arrangement, 45 germs per m<sup>3</sup> were found. The best result with no bacteria at all is present in a vertical flow-enclosure with an exchange rate of 32 per hour. According to our 10-year experience, for aseptic surgery sterile air techniques should be adopted to improve asepsis and to decrease the risk of postoperative infection.

**The Leiden scavenging system: a simple and effective anti-pollution device.**

Spierdijk J; Burm AG; Reijger V; Stropkap H  
Acta Anaesthesiol Belg ,1980, 31 Suppl p217-21, ISSN  
0001-5164 Journal Code: 082  
Languages: ENGLISH

The Leiden scavenging system, a device to reduce air pollution by anesthetic gases and vapours in operating rooms, is described. The system can be used in combination with different suction sources (vacuum pipeline, injector, fan or pump, air conditioning system). A special disposal network, to be used in combination with the scavenging system, is also shown.

**[Investigations on the concentration of air-borne germs in conventionally air-conditioned operating theaters (author's transl)]**  
Untersuchungen über den Luftkeimgehalt in konventionell klimatisierten Operationssälen.  
Duvlis Z; Drescher J  
Zentralbl Bakteriologie [B] ,Feb 1980, 170 (1-2) p185-98, ISSN 0172-5602 Journal Code: Y5Q  
Languages: GERMAN Summary Languages: ENGLISH  
The factors influencing the concentration of air-borne bacteria during operations have been analysed. It was found that the concentration of air-borne bacteria depended primarily on the number of persons present in the operating theater, the air exchange rate per hour and the room volume. Persons with sterile dress were found to have much less influence than did persons with unsterile dress. A formula describing the relationship between the average concentration of air-borne germs in operating theaters, the number of persons in sterile and unsterile dress, the air exchange rate and the room volume was derived. In a total of 142 operations, the formula has been found to give reliable estimates of the concentration of air-borne germs. This equation can be used for testing whether or not the concentration of air-borne bacteria in an operating theater is within acceptable limits which have been defined.

A critical assessment of available waste anaesthetic gas scavenging devices was made by simulating the worst theatre conditions as well as ideal conditions. Only one of the scavenging devices tested proved to be unacceptable. However, the critical nature of suction flow rates was revealed and the ineffectiveness of air conditioning in the absence of adequate scavenging was highlighted.

In August and September 1978, an outbreak of Legionnaires' disease occurred in Memphis, Tennessee. Of the 44 ill, 39 had been either patients, employees, visitors, or passers-by at one Memphis hospital (Hospital A) during the 10 days before. Assuming an incubation period of between two and 10 days, the onset of cases correlated precisely with the use of Hospital A's auxiliary air-conditioning cooling tower. *L. pneumophila* was recovered from two samples of water from the tower. Infection appeared to have occurred both outside and within the hospital. A significant association was demonstrated between acquisition of Legionnaires' disease and prior hospitalization in those areas of Hospital A that received ventilating air from air intakes near the auxiliary cooling tower. Tracer-smoke studies indicated that contaminated aerosols from the tower could easily reach these air intakes, as well as the street below, where four passers-by had been before they contracted Legionnaires' disease. This represents a common-source outbreak in which the source of *L. pneumophila* infection and airborne transmission were identified.

Bull Physiotherol Respir (Nancy) ,Sep-Oct 1979, 15 (5) p699-705, ISSN 0007-439X  
Journal Code: BTF  
Languages: ENGLISH

Stimulated by an outbreak of measles that was spread throughout a school by the ventilating system, we looked into the possibility of preventing this hazard in air conditioned buildings. The amount of air recirculated by air conditioning systems increases as the temperature difference between indoor and outdoor air increases and often exceeds 70 per cent. Germicidal u.v. radiation in central supply ducts seems almost ideally suited for disinfecting recirculated air, being effective, safe, and cheap. The effectiveness of disinfecting recirculated air in blocking person to person transmission of airborne infection can be predicted to be great at the beginning of a potential outbreak and negligible during an established epidemic. Infection introduced by the air conditioning process, recently implicated in causing Legionnaires' Disease, might also be prevented. Air disinfection would supplement immunization in the control of respiratory infection and might be cost effective.

**Health problems encountered by pediatric nurse practitioners and pediatricians in ambulatory care clinics.**

Chen SP; Barkauskas VH; Ohlson VM; Chen EH; DeStefano LM  
Med Care , Feb 1983, 21 (2) p168-79, ISSN 0025-7079  
Journal Code: LSM  
Contract/Grant No.: 5R02 NU 00588  
Languages: ENGLISH

This study documents the health problems managed by pediatric nurse practitioners (PNPs) and pediatricians and examines the effects of setting and provider group on the distribution of health problems. Proportional samples by clinic were selected from a total of 11,968 patient visits to five ambulatory care clinics during an 18-week period in 1978.

A patient encounter form was devised and the ICD-9-CM was used as the coding system. Results indicated 1) distributions of health problems differed significantly between the PNPs and

the pediatricians in each clinic; 2) setting significantly effected the distributions of both types of health problems; and 3) provider group significantly affected the distribution of health problems with V codes but not frequently reported problems given a setting. The PNPs caseloads differ from pediatrician caseloads in diagnostic categories and wellness emphases. Community-based settings seem to be especially appropriate for nurse practitioner practice.

**The effect of algorithms on the cost and quality of patient care.**

Orient JM; Kettel LJ; Sox HC Jr; Sox CH; Berggren HJ; Woods AH; Brown BW; Lebowitz M  
Med Care , Feb 1983, 21 (2) p157-67, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

In a Veterans Administration ambulatory care facility staffed by experienced nurse practitioners, we observed the length of visits, time utilization for various activities, and the use of diagnostic tests before and after introducing algorithms for 12 common chief complaints. Charges for diagnostic tests decreased as much as 40 per cent, primarily because of reduced utilization of radiographs such as spine films. Nurse practitioner productivity was unaffected once the nurse practitioners became familiar with the algorithms. Outcome of illness did not change measurably, but the process of care improved as reflected by more complete data collection documented in the medical record.

**Impotence in medical clinic outpatients.**

Slag MF; Morley JE; Elson MK; Trencle DL; Nelson CJ; Nelson AE; Kinlaw WB; Beyer HS; Nuttall FQ; Shafer RB  
JAMA ,Apr 1 1983, 249 (13) p1736-40, ISSN 0098-7484  
Journal Code: KFR  
Languages: ENGLISH

One thousand one hundred eighty men in a medical outpatient clinic were screened as to the presence of impotence. Four hundred one men (34%) were impotent, and of those, 188 (47%) chose to be examined for their problem. After a comprehensive evaluation the following diagnoses were obtained: medication effect, 25%; psychogenic, 14%; neurological, 7%; urologic, 6%; primary hypogonadism, 10%; secondary hypogonadism, 9%; diabetes mellitus, 9%; hypothyroidism, 5%; hyperthyroidism, 1%; hyperprolactinemia, 4%; miscellaneous, 4%; and unknown causes, 7%. The mean age of the impotent patients was 59.4 years, and the prevalence of alcoholism was 7%. Luteinizing hormone, follicle-stimulating hormone, testosterone, thyroxine, triiodothyronine (T3), T3 resin uptake, and prolactin studies were necessary to diagnose individual cases. We conclude that erectile dysfunction is a common and often overlooked problem in middle-aged men followed in a medical clinic.

Bushong SC; Glaze SA  
Health Phys ,Jan 1983, 44 (1) p53-9, ISSN 0017-9078  
Journal Code: G2H  
Languages: ENGLISH

Observations of technique factors at 9 radiographic installations dedicated to orthopedic radiography have been made. Monthly area radiation measurements with thermoluminescent dosimeters were made at three of these facilities. The results of these observations and measurements suggest that current NCRP recommended assumptions utilized in protective barrier computations result in considerably more shielding than is necessary. We observed an average workload of 224 mA min/wk and a maximum weekly average of 670 mA min/wk. The use factor for the chest wall averaged 5%. That for all other vertical barriers was less than 1%. The average operating potential was 75 kVp. Room radiation measurements confirm the suggestion that at least two of the walls and the control booth barrier in an orthopedic radiographic facility may be considered secondary barriers.

Costs and activities required for the provision of integrated clinical pharmacy services were examined in private family medicine centers in rural South Carolina. Work sampling and financial data for a one-year period were merged, yielding an average clinical service cost of \$1.65 per center patient

visit. Pharmacists in family medicine environments spent almost twice the amount of time in clinical activities as has been shown in studies of their colleagues in chain store environments, and one half as much time in prescription-dispensing activities. A greater proportion of the former's workday was also spent in communication with patients. Costs for prescriptions dispensed in these rural centers combined with the average national net profit per prescription yielded a total cost that was within a few cents of the national average. Hence, costs can be controlled to the extent that maintenance of a competitive prescription-pricing policy is possible. Integration of clinical pharmacy services in family practice centers appears to be an economically viable practice model.

**Appraisal of a newly developed self-collection device for obtaining cervical specimens.**

Noguchi M; Nakanishi M; Kato K

Acta Cytol (Baltimore) ,Sep-Oct 1982, 26 (6) p633-5,

ISSN 0001-5547 Journal Code: OLI

Languages: ENGLISH

The Kato self-collection method of obtaining cervical samples was used on 150 subjects who also had physician-prepared scrape smears performed for a comparative study of the cytodiagnostic results. Comparison of the cytologies on the two types of specimens showed total agreement as to whether a case was positive or negative; the only disagreements were in the degree of severity of some of the positive cases. If the apparatus is improved further, the Kato self-collection system may become useful for mass screening, particularly in medically remote or rural areas.

**Evaluation of an advertising program on sexually transmitted diseases.**

Labonte RN

Sex Transm Dis ,Jul-Sep 1982, 9 (3) p115-9, Journal

Code: U9G

Languages: ENGLISH

The Division of Venereal Disease Control in British Columbia

undertook a three-year, \$235,000 advertising campaign to increase demand for information on sexually transmitted disease, increase clinic attendance, and decrease the incidence of gonorrhoea. As a result of the campaign, demand for information increased, and 150,000 calls were received on the recorded Venereal Disease Information Line. Annual attendance at the province's main clinic in Vancouver rose by 4,500 visits (a 25% increase), and the increase was significantly related to radio advertising. The number of reported cases of gonorrhoea at the clinic dropped by 3.8%; the decrease was entirely within the female population. The campaign may have contributed to increased detection of nongonococcal infections, although lack of precampaign data does not permit full evaluation. The campaign was judged not to be cost-effective, and lack of integration with other services, especially expansion of clinic facilities and staff, led to early cancellation.

**Evaluation of the use of rural health clinics: attitudes and behaviors of primary care physicians in service areas of nurse practitioner clinics.**

Sharpe TR; Banahan BF 3d  
Public Health Rep ,Nov-Dec 1982, 97 (6) p566-71, ISSN  
0033-3549 Journal Code: QJA  
Languages: ENGLISH

In response to concerns of the directors of Rural Health Initiative projects in Mississippi, a study was conducted to examine factors related to use of rural health clinics. This report focuses on attitudes and behaviors of primary care physicians in the service areas of four clinics staffed by nurse practitioners. Data for this evaluation were obtained via mail questionnaires sent to 41 primary care physicians in the service areas of the clinics. Usable responses were received from 25 (61.0 percent) of the physicians. The data indicate that a majority of these physicians approve of the nurse practitioner concept. Although there is evidence to support a positive correlation between previous experience and knowledge concerning nurse practitioners and physician acceptance of the nurse practitioner concept, only about half of the physicians reported that anyone had ever contacted them to talk about the clinic. Only about a quarter of the physicians had ever visited the rural health clinic, but 60 percent indicated that they would like to do so. These findings indicate a need to develop closer working relationships with all primary care physicians in the service area of a rural health clinic. The data indicate that when such a closer relationship existed, physicians were satisfied with the outcome of interactions. Twelve (48 percent) physicians stated that they had patient(s) referred to them by the clinic. Among these physicians 77.8 percent were satisfied with the information that they had received on the patient's condition. Fewer physicians (8 or 32.0 percent) reported that they had received a call from the nurse practitioner clinic to consult about one of the physician's patients. The physicians were satisfied with the outcome of the consultation in each instance that was reported.

**The prediction of treatment outcome at a multidisciplinary pain center.**

Aronoff GM; Evans WO  
Pain ,Sep 1982, 14 (1) p67-73, ISSN 0304-3959 Journal  
Code: OPF  
Languages: ENGLISH

The purpose of this study was to determine if some commonly used admission variables could predict treatment outcome on a multidisciplinary pain center. Specifically, it was designed as a prospective study of an index proposed by Maruta et al. The subjects were 104 patients. The 4 outcome measures used were staff judgment, patient judgment, change in pain scores and change in mood. With the exception of a negative correlation with age, none of the other variables predicted outcome. The index of Maruta did not predict outcome.

**Nutritional status of women attending family planning clinics.**

Roe DA; Campbell C; Sheu CC; Hale-Wickham A; Jackson R  
J Am Diet Assoc ,Dec 1982, 81 (6) p682-7, ISSN  
0002-8223 Journal Code: H6F  
Contract/Grant No.: HSA 240-BCHS-106(6)DE  
Languages: ENGLISH

A study was carried out to define nutritional problems of women attending family planning clinics (FPCs). Methods of nutritional assessment were chosen to examine relationships between diet and biochemical measures of folacin, riboflavin, and vitamin A status. Findings showed that in the sample of 219 FPC women, 30 percent were obese, 75 percent were low or deficient in plasma folacin, 58 percent were low or deficient in erythrocyte folacin, and 39 percent were low or deficient in riboflavin status (by erythrocyte glutathione reductase assay). Monotonous diets, low plasma folacin, and obesity were characteristic of less well-educated women. Women on contraceptive steroids had slightly lower red blood cell folacin. Riboflavin status was not related to intake of contraceptive steroids but was related to ethnicity.

**Patterns of contraceptive use among female adolescents: method consistency in a clinic setting.**

Gorosh M  
J Adolesc Health Care ,Sep 1982, 3 (2) p96-102, ISSN  
0197-0070 Journal Code: HAM  
Languages: ENGLISH

Major changes in contraceptive use among adolescents in the United States have been documented through surveys and analysis of family planning program service statistics. While we know of the changes in the adolescent population as a whole and those served by organized family planning programs, little is known about the patterns of contraceptive use by individuals. This study examines patterns of contraceptive use among 547 clients of a new contraceptive and counseling service for adolescents in New York City. The principal concern is consistency of contraceptive method use as determined from clinic statistics. Findings show generally high degrees of method consistency, with new and current users displaying more consistency than prior users. Among clients who switch methods, two major patterns emerged: switching among the more effective methods and from less effective to more effective methods. Younger new users were the most consistent subgroup suggesting that a service designed for adolescents may have a positive influence on teenagers without prior contraceptive experience. Prior users were the least consistent subgroup suggesting that programs incorporate screening procedures to identify prior users and to develop new approaches to understanding their past contraceptive use patterns to improve their future use.

**Lowering broken appointment rates at a teenage health center.**

Neinstein LS  
J Adolesc Health Care ,Sep 1982, 3 (2) p110-3, ISSN  
0197-0070 Journal Code: HAM  
Languages: ENGLISH

In an attempt to increase physician efficiency by lowering the "no show" rate of adolescents in a teenage health center, the possible variables related to broken appointments were explored. A new triage system was implemented. While most of the variables studied did not differ between the "show" and "no show" adolescents, there were significant differences based on the chief complaint. Those teenagers seen for well adolescent care had a 55% "no show" rate, those with noncosmetic problems had a 37% "no show" rate, and those with cosmetic complaints had a zero "no show" rate. With the implementation of a new triage system which required parent/adolescent involvement, the "no show" rate fell by 50%, thus dramatically decreasing the waiting time for initial appointment and improving the utilization of physician and nurse time.

**Functional assessment: bridge between family and rehabilitation medicine within an ambulatory practice.**

Seltzer GB; Granger CV; Wineberg DE  
Arch Phys Med Rehabil ,Oct 1982, 63 (10) p453-7, ISSN 0003-9993 Journal Code: 88K  
Languages: ENGLISH

This study describes development of a functional assessment instrument used to screen ambulatory care patients who have difficulty performing daily activities. Sample selection occurred in 2 stages. In the first stage, an interdisciplinary team used clinical selection criteria in order to screen patients into 2 groups: group 1, those likely to have functional limitations; and group 2, those not likely to have functional limitations. Using clinical selection criteria for a 3-week period in an ambulatory primary care setting, it was found that 20% of the outpatients seen fell into group 1. In the second stage, a randomly selected subsample of 194 persons was used, with 97 in group 1, and 97 in group 2. The Functional Assessment Screening Questionnaire (FASQ) was tested using this second sample. The FASQ was found to discriminate between the 2 groups, with those in group 1 having a significantly greater number of functional difficulties than those in group 2. An analysis was conducted to investigate which diagnostic problems were more likely to be associated with patients reporting functional limitations. Fourteen diagnostic patient problems found to be significantly more limiting than for the total sample were identified. The factor structure of the FASQ was examined and a format for clinically integrating the FASQ factors was offered.

**Utilization and cost effectiveness of a family practice center.**

Farrell DL; Worth RM; Mishina K  
J Fam Pract ,Nov 1982, 15 (5) p957-62, ISSN 0094-3509  
Journal Code: I4L  
Languages: ENGLISH

In a prepaid group practice setting, a group of 45 Family Practice Center patients, carefully matched by age, sex, and employment, were compared with a group of 63 patients attending medical and pediatric clinics. Utilization rates for physician and nonphysician visits and costs of laboratory and x-ray services during a period of 33 months were examined. Despite a 25 percent greater prevalence of significant chronic medical problems, the family practice group used specialist care less than one half as much as did the matching group and made one extra physician visit per patient per year. Costs for laboratory and x-ray procedures did not differ significantly. Satisfaction expressed in responses to telephone interviews of both groups was found to be somewhat greater among the family practice patients. The findings of this study provide some support for greater cost effectiveness and patient satisfaction of family practice compared with alternative modes of primary care.

**Antimicrobial sensitivity patterns of hospital and non-hospital strains of Staphylococcus aureus isolated from nasal carriers.**

Paul MQ; Aderibigbe DA; Sule CZ; Lamikanra A  
J Hyg (Lond) ,Oct 1982, 82 (2) p253-60, ISSN 0022-1724

Journal Code: IEF

Languages: ENGLISH

The nasal carriage rate of Staphylococcus aureus was significantly higher in hospitalized persons (children, adult females and staff) - 53.8%, - than in similar persons at a local clinic - 29.8% (P less than 0.001) - in Ile-Ife, Nigeria. However, unlike studies carried out elsewhere, a higher proportion of S. aureus strains obtained from persons at the clinic were resistant to commonly used antimicrobial agents than were strains isolated in the hospital. This has been attributed to the ease at which these drugs can be obtained by the general population and used unsupervised and indiscriminately. Methicillin was the most effective antimicrobial agent against pathologic staphylococci (2.2% resistance), followed by erythromycin (16.5% resistance), co-trimoxazole (28.0% resistance), chloramphenicol (76.9% resistance), tetracycline (78.6% resistance) and penicillin and ampicillin (97.8% resistance). The widespread resistance of S. aureus to penicillin and ampicillin (and other antimicrobial agents) is of clinical significance in the treatment of post-operative infections, since carriers are reportedly more prone to such infections than are non-carriers.

**Pharmacy in the health care center: a model for health care delivery.**

Stark DC; Wertheimer AI  
Contemp Pharm Pract ,Winter 1982, 5 (1) p27-31, ISSN

0162-3761 Journal Code: DQ9

Languages: ENGLISH

Health care consumers use a plethora of services which are accessible on an ambulatory basis. These include the services of pharmacists, optometrists, nurses, dentists, audiologists, orthotics, and so forth. Since many of these services are provided in physically and financially separate facilities and often are not located in close proximity to one another, consumers may spend a large amount of time traveling between locations. Economic inefficiencies due to the size and dispersion of separate and independent facilities may produce an increase in the cost of ambulatory health care services.

Thus, the concept of a health care center, an ambulatory health care analog to the multispecialty shopping center, is proposed as a potential alternative and improvement in the delivery of these services. Space, location, personnel, and initial capital requirements for a model health care center are projected based on existing data for the establishment of each separate auxiliary health care facility. Projections are made to determine the appropriate and necessary site for the health care center's trade area. Potential revenues are calculated by examining some pharmacy operations which are beginning to pioneer these areas and utilizing revenue figures for the various individual services. The results indicate that the pharmacy, as a frequently visited health care facility, may be an excellent choice around which to develop the health care center concept in metropolitan areas.

This Article discusses potential legal liability for adverse effects resulting from reuse of disposable hemodialysis equipment. After explaining the dialysis process and the health risks involved with the reuse of dialyzers, the Article outlines possible theories of recovery for injured dialysis patients. The Article describes the possibility of recovery under a negligence theory against either the treating physician or the institutional provider, and includes a discussion of applicable statutory law. The remainder of the Article discusses possible recovery under the theory of strict liability.

**Salmonellosis at rural and urban clinics in Bangladesh: epidemiologic and clinical characteristics.**  
Blaser MJ; Huq MI; Glass RI; Zimicki S; Birkness KA  
Am J Epidemiol ,Aug 1982, 116 (2) p266-75, ISSN 0002-9262  
Journal Code: 3H3  
Languages: ENGLISH

The authors studied the frequency of diarrheal illness associated with non-typhi Salmonella at two clinics in Bangladesh for the years 1977-1979. Non-typhi salmonellae were isolated from 0.29% of fecal specimens or rectal swabs in an urban area and 0.26% of similar specimens in a rural area; the frequency of isolations peaked in the summer months. Isolations of Shigella and Vibrio cholerae were much more common than Salmonella. Only two of 50 Salmonella isolates were resistant to more than one antibiotic. None of 13 isolates tested produced an enterotoxin. S. java and S. virchow accounted for 64% of all the isolates. Patients with diarrheal illness associated with isolation of Salmonella frequency had vomiting (88%), watery diarrhea (78%), abdominal pain (61%), and fever (39%), but the clinical features of the illnesses and the socioeconomic backgrounds of the patients could not be distinguished from those of matched controls who were attending the same clinic. The infrequency of Salmonella infection in an area where several other bacterial and viral enteric diseases are hyperendemic requires further investigation.

**Psychosocial factors affecting adherence to medical regimens in a group of hemodialysis patients.**

Cummings KM; Becker MH; Kirscht JP; Levin NW  
Med Care ,Jun 1982, 20 (6) p567-80, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

The present research was designed to identify psychosocial correlates of adherence among patients receiving hemodialysis at two outpatient clinics. The 116 participants were interviewed concerning their knowledge of treatment, health beliefs, treatment history, social support, personal characteristics, and adherence to the medication, diet and fluid-intake aspects of the regimen. In addition, medical record data were obtained on serum phosphorus and serum potassium levels, and on between-dialysis weight gains. The magnitude of relationships between predictors and adherence measures varied, depending on the method used to measure adherence. For the self-report measures, beliefs concerning the efficacy of the behavior and barriers to the behavior, along with reported family problems, proved to be consistent predictors. Other beliefs and characteristics did not contribute significantly. For the medical chart information, however, the predictive factors were less consistent. In general, situational factors seem to be the major contributors to patient adherence, and adherence itself is seen as a complex and multidimensional phenomenon.

**Dilatation and evacuation procedures and second-trimester abortions. The role of physician skill and hospital setting.**

Cates W Jr; Schulz KF; Grimes DA; Horowitz AJ; Lyon FA; Kravitz FH; Frisch MJ  
JAMA ,Aug 6 1982, 248 (5) p559-63, ISSN 0098-7484  
Journal Code: KFR  
Languages: ENGLISH

Some clinicians have hesitated to perform dilatation and evacuation (D & E) procedures at 13 weeks' gestation or later because D & Es are more difficult to perform safely than suction-curettage procedures. Moreover, many clinicians still believe all second-trimester abortion procedures should be performed in a hospital. To evaluate these concerns, we analyzed 24,664 abortion performed between 1973 and 1978 by four physicians associated with a large outpatient abortion facility; 3,711 (15%) of the abortions were second-trimester procedures. Dilatation and evacuation was associated with a lower rate of serious complications per 100 procedures (0.23) than instillation of either dinoprost (prostaglandin F2 alpha) (1.28) or hypertonic saline (2.26). In addition, D & E had lower rates for most other specific complications. We conclude that D & E, while requiring more operator skill than earlier suction-curettage procedures, can be learned by gynecologists familiar with suction-curettage, can be performed more safely than the alternative instillation procedures, and can be safely practiced in selected ambulatory settings.

Diagnostic flow charts have been adapted for the training of primary health care (PHC) nurses in a rural area of South Africa. We designed a randomized controlled trial to assess whether nurses' clinical competence differed if they were trained using flow charts or using conventional patient-centered teaching. Although clinical competence improved during the training programme, this improvement did not differ significantly according to which of the two training methods was used. The nurses in this trial had considerable earlier experience and some training in primary care. Before the trial they had a high level of clinical competence and may already have developed their own diagnostic strategies. We therefore cannot make inferences from our study about whether or not flow charts will be a valuable addition in PHC. Flow charts need to be adapted to take into account where, by whom, and for what purpose they will be used. They must then be tested to ensure that they only rarely result in incorrect diagnosis and treatment. A decision on the use of flow charts in the training of PHC nurses should be based on further educational trials and long-term follow-up of trained health workers. Nurses should participate in educational trials at the start of their careers in PHC. The additional value of flow charts in the auditing of competence and assessment of educational needs should also be explored.

This paper presents details of a computer program, BP, designed for use with an outpatient clinic. The program is implemented on a PET4000, microcomputer and is intended principally for a hypertension follow-up clinic, although it could be easily adapted for other clinics. It allows for initial patient data entry, the entry of data acquired at subsequent visits, the alteration of data, list of all data or a pre-determined subset, and a data sort and tabulation facility. The program is intended to be run by staff who have little experience with computers.

**Utilization of specialized ambulatory care by the elderly. A study of a clinic.**

Ingman SR; Lawson IR  
Med Care ,Mar 1982, 20 (3) p331-8, ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

Specialized ambulatory geriatric care remains an understudied topic. This article analyzes the organization of one special clinic that was established in an apartment block of elderly housing. The findings indicated that as the number of nurse practitioners and case workers' visits rose steadily during the first four years of the clinic's existence, visits to the clinic physicians declined by approximately one visit per client per year. The clinic population utilized less inpatient hospital care than other nonusing residents, and less than other residents of similar age in Connecticut. There was reduced usage of intermediate nursing home care (as opposed to skilled nursing care). Hence, how geriatric ambulatory care is delivered affects institutionalization. In the interests of general well-being and economy, more attention should be paid to this extramural phase of medical care of the elderly.U

**Cost-effectiveness analysis of computerized ECG interpretation system in an ambulatory health care organization.**

Carel RS  
J Med Syst ,Apr 1982, 6 (2) p121-30, ISSN 0148-5598  
Journal Code: IZM

Languages: ENGLISH

The cost-effectiveness of a computerized ECG interpretation system in an ambulatory health care organization has been evaluated in comparison with a conventional (manual) system. The automated system was shown to be more cost-effective at a minimum load of 2,500 patients/month. At larger monthly loads an even greater cost-effectiveness was found, the average cost/ECG being about \$2. In the manual system the cost/unit is practically independent of patient load. This is primarily due to the fact that 87% of the cost/ECG is attributable to wages and fees of highly trained personnel. In the automated system, on the other hand, the cost/ECG is heavily dependent on examinee load. This is due to the relatively large impact of equipment depreciation on fixed (and total) cost. Utilization of a computer-assisted system leads to marked reduction in cardiologists' interpretation time, substantially shorter turnaround time (of unconfirmed reports), and potential provision of simultaneous service at several remotely located "heart stations."

**An ecological and behavioral approach to outpatient dialysis treatment.**

Tucker CM; Mulkerne DJ; Ziller RC

J Chronic Dis ,1982, 35 (1) p21-7, ISSN 0021-9681  
Journal Code: HQV

Languages: ENGLISH

A treatment-research program is described which was implemented in an outpatient dialysis treatment unit to facilitate patients' psychosocial adjustment and quality of life. The program's theoretical framework and multifaceted treatment approach are based on an ecological-behavioral model of community intervention research. The effects of the program were evaluated from (1) pre- and post-measures of patients' and nurses' self-esteem and level of hope, (2) behavior changes, and (3) program evaluations from patients, nurses and doctors. These indices suggest that the program resulted in positive psychosocial consequences for patients and nurses.

**Exposure to the operator and patient during short wave diathermy treatments.**

Stuchly MA; Repacholi MH; Lecuyer DW; Mann RD

Health Phys ,Mar 1982, 42 (3) p341-66, ISSN 0017-9078  
Journal Code: G2H

Languages: ENGLISH

Short-wave diathermy is one of the most popular treatment modalities used to relieve pain through localized heating. In Canada its use in hospitals is as frequent as that of ultrasonic therapy devices and about 10 times more popular than microwave diathermy. Intensities of the electric and magnetic fields around applicators of 7 different diathermy units were measured at the operator position and at various untreated areas of the patient during 11 treatment regimes using 5 types of applicators. Exposure to the operator in the normal operating position, behind the device console, usually does not exceed the limits recommended by the Canadian Federal Government. The intense fields around the applicators and the cables extend up to 0.5 m and are a source of potential overexposure to the operator.

**Special clinics for hypertension--the role of the hypertension detection--and follow-up programme.**

Kass EH

Br J Clin Pharmacol ,Jan 1982, 13 (1) p81-6, ISSN 0306-5251 Journal Code: AU9

Languages: ENGLISH

The hypertension detection and follow up programme of the National Heart, Lung and Blood Institute has been briefly described, the basis given for dividing the participants into two groups, one referred to the conventional care system (referred care) and the other referred to intensive care in special clinics in which treatment was administered according to protocol in a series of graded steps in response to the therapeutic effect observed with the preceding steps (stepped care). Substantial reductions in mortality from all cardiovascular causes, including acute myocardial infarction, stroke, and other major evidences of mortality and morbidity were observed. The effect was uniform for all groups, irrespective of presence or absence of target organ damage and irrespective of race, age, and sex. Although a certain number of anomalies exist in the data, as might be expected from a study involving some 11,000 participants, the overall implication that a carefully graded and carefully developed programme of therapy confers major benefits to a population, in terms of morbidity and mortality, seems warranted. The degree to which the conventional care system can provide similar care to the hypertensive population, and experience similar benefits, represents a major challenge for the immediate future.

**Experience of the Checkerboard Area Health System in  
 planning for rural health care.**

Reid RA; Smith HL  
 Public Health Rep ,Mar-Apr 1982, 97 (2) p156-64, ISSN 0033-3549  
 Journal Code: QJA  
 Languages: ENGLISH

The design of rural health care delivery systems often is based on concepts obtained from urban models. The implicit planning premises of successful urban models, however, may be inappropriate for many rural systems. An alternative model planned and implemented in the checkerboard region of rural northwest New Mexico has proved to be successful. This experience may be helpful to health care policymakers and planners confronted with environments that are not congruent with typical urban settings. The checkerboard region presented a challenging health planning environment characterized by formidable geographic, population, economic, and health behavior constraints. The Checkerboard Area Health System (CAHS), designed to provide comprehensive services in an area dominated by these constraints, was formed around a central diagnostic and treatment facility with six satellite clinics. The CAHS used an innovative administrative structure, extended the productivity of traditional providers by extensive use of mid-level and ancillary personnel, and created an effective referral network. These features are distinctly different from those of urban health care models. Overall, the CAHS attained a high rate of inpatient use. Additionally, the performance of the outpatient program indicates that traditional ambulatory care can be integrated with other health services that are more oriented toward health promotion and disease prevention. Finally, the emergency room at the central facility has attained an impressive record that, like the inpatient and outpatient areas, is responsive to the needs of the target population.

**Efficacy of desipramine in depressed outpatients. Response according to research diagnosis criteria diagnoses and severity of illness.**

Stewart JW; Quitkin FM; Liebowitz MR; McGrath PJ; Harrison WM; Klein DF

Arch Gen Psychiatry ,Feb 1983, 40 (2) p202-7, ISSN 0003-990X Journal Code: 72C

Contract/Grant No.: MH 30906-03

Languages: ENGLISH

The efficacy of desipramine for mild depression was tested in a double-blind, placebo-controlled study of outpatients with scores below 19 on the Hamilton Rating Scale for Depression (HAM-D). Of 103 such patients, 23 dropped out and 16 improved during a ten-day placebo period. Among 64 patients completing the randomized portion of the study, significantly more improved with desipramine than with placebo. The Research Diagnostic Criteria (RDC) category of major depressive disorder largely accounted for the drug-placebo response difference found for the entire sample. Patients with intermittent depressive disorder improved significantly less frequently with desipramine than patients with major depressive disorder. Independent of RDC diagnosis, severity of illness correlated with outcome. Thus, patients with pretreatment HAM-D scores at or above the median demonstrated significant drug effect, while patients with lower pretreatment HAM-D scores did not.

Application of the Gunderson-Kolb Diagnostic Interview for Borderline to a population of psychiatric outpatients

suggested two complicating factors in diagnosing borderline conditions in an ambulatory setting: the reduced level of borderline symptoms and the confounding presence of recompensated psychotic patients. Overlap between the Gunderson and Kernberg borderline constructs, which is relatively high in the inpatient setting, is diminished in the outpatient setting. Contrary to expectation, distinguishing borderline patients from patients with other personality disorders was not a source of difficulty.

Languages: ENGLISH

Seventeen areas of psychosocial distress were evaluated in 87 university hospital internal medicine clinic patients by a self-administered questionnaire and a psychiatric interview. These patients' internists then predicted the patients' distress level in each area. Their predictions correlated significantly with their patients' self-reports of distress-level problems in only 3 of the 17 areas. Even when the internists felt that they had sufficient information to make an accurate prediction, their perceptions were often erroneous, including evaluations of such areas as suicidal ideation and drug use. These data suggest the need for active psychiatric education components in internal medicine training programs.

**Prediction of child abuse in an ambulatory setting.**

Rosenberg NM; Meyers S; Shackleton N

Pediatrics ,Dec 1982, 70 (6) p879-82, ISSN 0031-4005  
Journal Code: DXV

Languages: ENGLISH

A prospective random study was performed on 476 patients, up to 2 years of age, by full-time registered nurses in the emergency room. The parent (caretaker) and child were assessed in an effort to predict child abuse. The incidence of abuse rose from 2.5% to 15.2% if one or more abnormal features were present in parent or child (p less than .0003). Abuse developed in 19% of unkempt children and 28% of children with abnormal bruises, burns, or bites. The incidence of abuse increased to 42% (P less than .002) when these factors were present together. An unkempt child with an abnormal parenting pattern and a 30% chance of being abused (P = .007).

**Predicting rural health care utilization with archival data.**

Wright DD; Kane RL; Kronhaus A; Woolley FR; Altman D

J Community Health ,Summer 1982, 7 (4) p284-91, ISSN 0094-5145  
Journal Code: HUT

Languages: ENGLISH

This study explored the usefulness of archival data in predicting rural health care utilization. A regression model was used to see how well observed utilization for local populations could be predicted by calculating expected values in advance from age- and sex-specific national rates applied to local age and sex profiles. Although the correlation between observed and expected utilization was reasonably high (r = 0.92), an attempt was then made to improve prediction by considering other data that do not require independent

collection. These archival data included indicators of historic utilization (local Medicaid payments, the percentage of births to county residents occurring in the mother's county of residence, percentage of children immunized, and infant mortality) and services already available. Observed utilization data were obtained by surveys in eight rural counties, and the predictor was tested on three additional rural communities. A predictor equation that added to the expected utilization only one variable (the percentage of births to county residents occurring in the mother's county of residence) was found to account for approximately 95% of the variance in observed utilization. This predictor is recommended for planners who need convenient, low-cost market feasibility estimates for proposed project sites and a way to establish intermediate goals or incentives during early project development.

**Outpatient treatment of prescription opioid dependence: comparison of two methods.**

Tennant FS Jr; Rawson RA

Arch Intern Med ,Oct 1982, 142 (10) p1845-7, ISSN 0003-9926  
Journal Code: 7FS

Languages: ENGLISH

Twenty-one patients dependent on prescription opioids were treated by 21-day detoxification followed by psychotherapeutic counseling (D/C), and 21 patients were detoxified 21 days and provided opioid maintenance if detoxification was unsuccessful (D/M). Only five of 21 (23.8%) patients in the D/C group compared with 20 of 21 (95.2%) in the D/M group completed three weeks of treatment. No patient initially perceived that chronic pain due to a medical condition would be an impediment to withdrawal from opioids, but pain that was masked by opioid dependency and that emerged during detoxification proved to be an insurmountable barrier to total withdrawal in the majority of patients. Treatment of outpatients with dependence on prescription opioids is best provided by opioid maintenance therapy and adjunctive pain therapy.

**A comparison of hospitalized and nonhospitalized borderline patients.**

Koenigsberg HW

Am J Psychiatry ,Oct 1982, 139 (10) p1292-7, ISSN

0002-953X Journal Code: 3VG

Languages: ENGLISH

The author compared 14 hospitalized borderline patients with 24 nonhospitalized patients given the same diagnosis. Twenty-nine clinical features of borderline patients were examined using the semistructured Diagnostic Interview for Borderlines. Although a few specific differences emerged in such areas as drug abuse, self-mutilation, and psychotherapy experience, both hospitalized and nonhospitalized patients manifested characteristic borderline traits of disturbed impulse-action patterns, psychotic experiences, poor regulation of affect, and disturbed interpersonal relationships. These findings are consistent with those of other studies and suggest that hospitalized and nonhospitalized borderline patients represent the same diagnostic entity.

**A walk-in and telephone inquiry service: a function of a hospital social work department.**

Horn B; Manuele GM; Olvany BF

Soc Work Health Care ,Spring 1982, 7 (3) p47-56, ISSN

0098-1389 Journal Code: U95

Languages: ENGLISH

This article describes a study undertaken to evaluate the Walk-In and Telephone Inquiry Service provided by a social work department in a general hospital division of a large, voluntary, metropolitan teaching hospital. The major social work function provided in such a service is information and referral; to provide this service, a psychosocial evaluation and counseling are essential. This service is valuable to and utilized by many individuals, professionals and community agencies. It can become the point where individuals enter the health care system. Issues related to policy making, institutional costs and cost benefits are discussed.

**Evaluation of educational methods in a comprehensive cost-containment project in ambulatory care.**

Chilton LA; Applegate WB; Bennett MD; Skipper BE; White RE

South Med J ,Oct 1982, 75 (10) p1251-5, ISSN 0038-4348

Journal Code: UVH

Languages: ENGLISH

The cost of medical care in the United States is a matter of great concern to many health policy makers and physicians as well as to the seekers of care. At the University of New Mexico, a comprehensive cost-containment education program was devised and put into effect with residents from three primary care disciplines. In addition to documenting the effectiveness

of the educational package in reducing patients charges, we asked house staff to state which parts of the package were of most use. Wall posters displaying charges for commonly ordered tests, procedures, and prescription items and the distribution of sample bills for patients seen by the individual resident were rated most highly. A test of knowledge of charges to patients did not show resident improvement after education. Cost-containment education can be effective in reducing patient charges, even if physicians do not internalize the actual charge data. We recommend the inclusion of cost-containment education in all primary care training programs, as these physicians play such an important role in the generation of patient charges.

**Effectiveness of an ambulatory care telephone service in reducing drop-in visits and improving satisfaction with care.**

Stirewalt CF; Linn MW; Godoy G; Knopka F; Linn BS

Med Care ,Jul 1982, 20 (7) p739-48, ISSN 0025-7079

Journal Code: LSM

Languages: ENGLISH

The purpose of this research was to determine whether a specialized telephone service could cut down on unscheduled visits to ambulatory care and improve satisfaction with care. Patients who were to receive care (N = 561) were assigned randomly to a specialized telephone service or a control group. They were measured with regard to satisfaction with care before being assigned and 6 months later. The number of scheduled and unscheduled visits also were monitored for a 1-year follow-up period. The telephone service, which provided a triage system for referrals as well as a source of central contact for scheduling or for complaints, helped to improve satisfaction and reduce the number of unscheduled visits within 6 months. Such a service also may have application in other problem areas in the delivery of quality ambulatory care.

**The teen-tot clinic: an alternative to traditional care for infants of teenaged mothers.**

Nelson KG; Key D; Fletcher JK; Kirkpatrick E; Feinstein R

J Adolesc Health Care ,Aug 1982, 3 (1) p19-23, ISSN

0197-0070 Journal Code: HAM

Languages: ENGLISH

A comprehensive interdisciplinary clinic was established to provide health care for teenaged mothers less than 16 years old and their infants. Thirty-five mother-infants pairs using this clinic were matched with 70 mother-infant pairs who used "traditional" health care facilities. Significant differences in infant outcomes of immunization status at 6 months (91% versus 46% completed), and weight (97% versus 83% within "normal" range) and maternal outcomes of contraceptive use (91% versus 63%), enrollment in educational programs (86% versus 66%), and repeat pregnancy rate (16% versus 38%) were found between Teen-Tot Clinic participants and the control group. Coordination and consolidation of services for teenaged mothers and their infants appears to favorably influence their short-term outcomes.

**Visits to physicians by Asian/Pacific Americans.**

Yu ES; Cypress BK

Med Care ,Aug 1982, 20 (8) p809-20, ISSN 0025-7079

Journal Code: LSM

Languages: ENGLISH

The purpose of this paper is to disseminate some of the findings from the 1979 National Ambulatory Medical Care Survey (NAMCS) where, for the first time in its history, data are available on the characteristics of visits to office-based physicians by Asian/Pacific Americans. The NAMCS Program is the only source for such data which is based on a national probability sample survey of physician-patient encounters. Among the findings are: 1) no significant difference was observed between Asian/Pacific Islanders and the white majority with regard to the patient's sex, return-visit ratio, or the kinds of diagnostic and therapeutic services rendered by the sampled physicians. 2) Children appear to be the major utilizers of ambulatory medical care among Asian/Pacific Americans. 3) In every age group, the visit rate to office-based physicians is lower for Asian/Pacific Americans when compared with white Americans. 4) A significantly smaller percentage of Asians or Pacific Islanders, in contrast to other specified race/ethnic groups, had visited a physician for injury or poisoning, and a substantial proportion of their visits were apparently made for preventive care. 5) Significantly fewer visits were made by Asian/Pacific Americans to the office of a surgeon or a psychiatrist. The demographic antecedents and cultural underpinnings of these findings are discussed.

**Use of illness-related ambulatory physician services in Finland.**

Kekki P

Med Care .Aug 1982, 20 (8) p797-808, ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

The total utilization rate of ambulatory illness-related physician services in Finland is higher in big urban health center areas than in rural areas. When only the health center physician utilization rates were studied the finding was opposite. A notable finding related to the impact of the national health planning were the surprisingly equal average utilization rates of public sector health services (health center physician and general hospital outpatient services combined) in both areas. In fact, use of cheaper public services was greater in rural than in urban areas. The difference in total use rates was almost entirely due to the larger use of more expensive private physician services in urban areas. At present, there is a great pressure for increasing the supply of health center services in urban areas to the same level as in rural districts. One of the fundamental questions seems to be the pricing of the two service sectors--public and private.

**A review of methods for ambulatory medical care evaluations.**

Palmer RH; Nesson HR

Med Care .Aug 1982, 20 (8) p758-81, ISSN 0025-7079  
Journal Code: LSM

Contract/Grant No.: 5 R1BHS03087-02

Languages: ENGLISH

Medical Care Evaluations (MCEs) are in widespread use in hospitals in the United States as a means of evaluating and improving the quality of patient care. Increasingly, MCEs are required or used in ambulatory care facilities, particularly group practices. Mandatory quality assurance programs require internal review subject to monitoring by external reviewers. For internal self-evaluation, multiple simple task-oriented evaluations prove more feasible than the complex multifaceted all-in-one evaluations often used by external reviewers. A detailed review of methods for designing such focused, internally conducted evaluations of medical care is presented, covering the following issues: identification of problems for evaluation; use of process versus outcome data; choice of data source, topics and criteria; indices for case identification; units of care to be studied; and feedback interventions. **Intensive ambulatory treatment of insulin-dependent diabetes.**

Felig P; Bergman M  
Ann Intern Med ,Aug 1982, 97 (2) p225-30, ISSN  
0003-4819 Journal Code: 5A6  
Languages: ENGLISH

The therapy for insulin-dependent diabetes has been changing in the last 3 years with the increasing application of intensive ambulatory treatment programs involving self-monitoring of blood glucose levels by the patient. Insulin is administered either as multiple manual daily injections or as a continuous subcutaneous infusion delivered by a portable pump. We discuss the implementation, efficacy, complications (including recent reports of deaths in pump-treated patients), and cost of such programs. The potential effectiveness in preventing the long-term complications of diabetes warrants offering a program of self-monitoring of blood glucose levels combined with multiple manual daily insulin injections as a routine treatment option to virtually all patients with insulin-dependent diabetes. Additional observations on safety and efficacy are needed before insulin pump treatment can be considered a routine option. Furthermore, whether intensive treatment involving either manual or pump administration of insulin alters the risk of hypoglycemia as compared with conventional management remains to be established.

**Out-patient detoxification of patients addicted to sedative-hypnotics and anxiolytics.**

Hawthorne JW; Zabora JR; D'Lugoff BC  
Drug Alcohol Depend ,Apr 1982, 9 (2) p143-51, ISSN  
0376-8716 Journal Code: EBS  
Languages: ENGLISH

Due to the risk of seizures and other potentially life threatening complications, it has been accepted practice to detoxify patients addicted to sedative-hypnotics or minor tranquilizers in an in-patient setting. Using the procedures

for patient selection and management described below, we have been able to detoxify as out-patients approximately two-thirds of 69 patients who were found to be in need of detoxification.

Out-patients experienced no serious complications during or immediately following detoxification and were not significantly less likely than in-patients to complete treatment. We present here some guidelines which will assist practitioners in identifying patients who are appropriate for out-patient detoxification and describe approaches to patient management that have proven effective.

**A comparative trial of home and hospital psychiatric treatment: financial costs.**

Fenton FR; Tessier L; Contandriopoulos AP; Nguyen H;  
Struening EL  
Can J Psychiatry ,Apr 1982, 27 (3) p177-87, ISSN  
0706-7437 Journal Code: CLR  
Languages: ENGLISH

The financial costs of community-based treatment, stressing home treatment, were compared with the cost of hospital-based treatment during one year. Of 155 patients destined to receive inpatient treatment, 76 were randomly assigned to home treatment, 79 to hospital treatment; the two groups were similar as to important social, demographic, and clinical characteristics. The principal differences between the two treatments concerned the focus of treatment, the locale of treatment, the degree to which continuity of treatment was maintained, and the roles of the respective treatment staffs. Manpower and operating costs, measured in dollars, were estimated in two ways. Either way, hospital-based treatment was more expensive during the year: 64.1% more expensive (+3,250 vs. +1,980 per patient) in the first instance, 108.9% more expensive (+6,750 vs. +3,230 per patient) in the second. With two exceptions during the first month of treatment, the proportions of patients and families receiving either treatment who incurred other costs of treatment were low, and the differences between groups were not significantly different. A higher proportion of patients and families receiving home-based treatment defrayed the cost of the patient's psychotropic drugs; second, a higher proportion of families of patients receiving hospital-based treatment defrayed transportation costs. The proportions of patients and families incurring costs of the consequences of illness were low, and the differences between treatment groups were not significant. We compared this study with similar studies, discussed the generalizability of the results of this study and similar studies, and identified issues for future research.

**Suprapubic bladder puncture in a private pediatric practice.**  
Simon G  
Postgrad Med ,Jul 1982, 72 (1) p63-4, 66, ISSN  
0032-5481 Journal Code: PFK  
Languages: ENGLISH

Suprapubic bladder puncture was performed 185 times in 126 girls in a private pediatric practice. Cultures of urine obtained by aspiration confirmed symptoms as indicative of urinary tract infection in 59% of instances and confirmed positive cultures of urine obtained by voiding in 57% of instances. Since suprapubic bladder puncture avoids the problem of contamination, it enables a certainty in diagnosis that voided specimens cannot. The procedure was easily accomplished in the office and was readily accepted by parent and child. No complications were observed.

Kennedy DL; Forbes MB  
Pediatrics ,Jul 1982, 70 (1) p26-9, ISSN 0031-4005  
Journal Code: DXV  
Languages: ENGLISH

Little data are available on the use of drugs in children on an outpatient basis. Therefore, the present study investigated national patterns in the prescribing of drugs for children by office-based physicians during 1979, in order to describe the most commonly encountered pediatric drug therapies. The data are presented as descriptive norms of drug therapy by office-based physicians in two pediatric subgroups, 0 to 2 years old and 3 to 9 years old. Anti-infective drugs and cough and cold preparations accounted for approximately 50% of drugs used. Tetracycline and its congeners continue to be used in pediatric patients. Despite apparent advantages of amoxicillin, ampicillin is still widely used.

A program has been developed for the outpatient administration of parenteral antibiotics. To date, more than 150 patients with osteomyelitis, septic arthritis, pyelonephritis, endocarditis, and other infections have been treated. Antibiotic solutions were prepared in the hospital pharmacy and given to the patient to be kept refrigerated at home until used. Patients administered their own antibiotics by means of a heparin lock, which was replaced every four days or when necessary. Complications were infrequent. Many patients were able to return to work while receiving therapy; others enjoyed the comfort of being at home. Cost reductions were substantial, calculated to be at least \$142 a day, or the charge for a semiprivate room in 1981. In addition to the cost savings, critically needed hospital beds were freed for more acutely ill patients.

Languages: ENGLISH

The cross-sectional and longitudinal patterns of lithium side effects were surveyed in a prospective 12-month study. The use of other psychotropic medication (antidepressants, neuroleptics) in addition to lithium was associated with a higher frequency of complaints. The presence of noneuthymic mood was not associated with changes in the incidence of side effects. Persistent side effects were not related to current age, age at onset of illness, severity of illness, or duration of lithium therapy. The chronicity of lithium therapy was not specifically associated with the presence or absence of any of the 23 side effects surveyed.

Journal Code: CLZ

Contract/Grant No.: CA-15936

Languages: ENGLISH

Fifty-seven adult patients receiving chemotherapy were treated with a total of 133 infusions using portable user-worn infusion pumps, the Autosyringe AS\*2F Cormed ML6-4, and two earlier versions of the latter, the Sigmamotor ML6-2 and ML6-3. Ninety-eight infusions were given on an ambulatory basis. Fourteen infusions were given through peripheral venous catheters, 115 through central venous catheters, and four intra-arterially. Of 127 evaluable infusions, 65 were completed within 5% and 87 within 10% of the planned rate; results are similar for both inpatient and outpatient infusions. The Cormed ML6-4 pump was equal to the Autosyringe AS\*2F in reliability but superior to the latter in patient preference. There were no instances of dangerously rapid administration of the drug. The only serious catheter complications were a pneumothorax after insertion of a subclavian catheter in one patient and cellulitis in a leukopenic patient with a Broviac catheter. All but three patients preferred outpatient therapy to hospitalization. Outpatient therapy costs about \$300 per day less than in-hospital treatment.

An approach is presented using interactive microcomputers for the development of diagnostic decision aids applicable to some complaints encountered in ambulatory care. The central feature of the descriptive phase of the approach is the use of the underlying (and perhaps dynamic) state of patient health. The central feature of the prescriptive phase of the approach is quick, simple assessment which produces a set of nondominated diagnostic tests, the selection of which is biased by the subjectively determined disease(s) that the

diagnostician wishes to rule out or confirm. We present an application of the approach to the complaint, "diarrhea of recent onset in adults," discuss the hardware/software implementation, and summarize preliminary evaluation results.

**Hospital expansion of ambulatory-care services: implications for pharmacy.**

Kushner D

Am J Hosp Pharm ,May 1982. 39 (5) p863-4. ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

Implications for hospital and community pharmacists of the hospital industry's increased involvement in ambulatory care are discussed. There will certainly be competition between hospital and community pharmacists for the right to provide pharmaceutical services to ambulatory patients. Various developments are encouraging hospitals to expand their ambulatory services, and these will increase the competition and add urgency to minimizing confrontation between the two groups. The need for a forum within pharmacy to discuss difficult issues such as this is emphasized.

**Trends and initiatives in hospital ambulatory care.**

Burns LA

Am J Hosp Pharm ,May 1982, 39 (5) p799-805, ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

Changes in the financing and delivery of hospital ambulatory care are discussed. Ambulatory care encompasses a wide spectrum of clinical services provided to patients who are not confined overnight to an institutional bed as inpatients. There are a large and growing number of ways hospitals and physicians cooperate to provide ambulatory-care services. Technological advancements, which have spurred changes in other sectors of medicine, have also changed patterns of medical practice in ambulatory care. Some of the reasons why hospitals develop and expand ambulatory-care programs relate to the changing demand for health services, the shifting preferences of third-party payers and regulators, competitive influences, diversification of risk, and use of such programs as feeders for inpatient services and as teaching and research settings. Although outpatient revenues are a small portion of total hospital revenues, they are growing more rapidly than inpatient revenues. Changes in the health industry that offer opportunities to hospitals are described, such as the increasing physician supply and the formation of group practices, the climate of cost consciousness and price competition, and the trend toward new corporate structures for hospitals. These changes portend changes for hospital pharmacists and give them the opportunity to increase their clinical roles in providing ambulatory care.

Fifty asymptomatic normal male volunteers, mean age 44.6 years (range 35 to 59), were prospectively studied to ascertain the prevalence and magnitude of S-T segment and T wave changes detected during continuous ambulatory electrocardiographic monitoring. Transient S-T segment depression of 1.0 mm or more was recorded in 15 (30 percent) of the subjects, and labile T wave inversion of up to 3 mm occurred in an additional 18 (36 percent). The presence of ST-T changes during monitoring did not correlate with age, daily activity status or heart rate. There was also no correlation with the S-T segment response or work performance during treadmill exercise testing. It is concluded that S-T segment depression and T wave inversions are commonly observed during ambulatory electrocardiographic monitoring of normal men. Therefore, similar changes observed in patients with coronary artery disease should be interpreted with caution.

**Evaluation methodology for ambulatory care information systems.**

Simborg DW; Whiting-O'Keefe QE

Med Care ,Mar 1982, 20 (3) p255-65, ISSN 0025-7079

Journal Code: LSM

Contract/Grant No.: LM03590; HS03582

Languages: ENGLISH

The central purpose of an ambulatory care information system is to communicate information to the practitioner to facilitate clinical decision making. The clinical decision can be considered the dependent output variable in a process in which the information system, the patient, clinician characteristics and the environment are the independent input variables. Evaluation methodologies must consider these relationships. Approaches using patients outcomes are problematic because of indirect relationship between the information system and patient outcomes, which limits both sensitivity and validity. A process measure technique that focuses on the clinical decision directly as the measure of output could be appropriate if the represented a generic sampling of clinical decisions made in ambulatory care. A new method under development based on an information theory concept may be more widely applicable than currently available methods.

**Episode-based efficiency comparisons for physicians and nurse practitioners.**

Salkever DS; Skinner EA; Steinwachs DM; Katz H  
Med Care ,Feb 1982, 20 (2) p143-53, ISSN 0025-7079  
Journal Code: LSM

Contract/Grant No.: HSO0427; HSO1964

Languages: ENGLISH

Most previous studies comparing the efficiency of new health practitioners with that of physicians have used the visit as the basic unit of output. Several researchers have noted, though, that the episode is a conceptually superior output unit in several respects, although it is more complex to deal with methodologically. This study demonstrates the application of episode-based methods for comparing the efficiency of physicians with that of nurse practitioners. Data are drawn from the information system of the Columbia Medical Plan and from observations of provider time inputs. The analysis is confined to care episodes for otitis media and sore throat in the Department of Pediatrics. Results indicate that per episode costs with nurse practitioners as the initial provider are approximately 20 per cent below the costs of episodes in which physicians are the initial provider. Examination of a limited amount of data on patient-reported measures of effectiveness indicates that while nurse practitioners' care is less costly, it is not less effective. These findings are particularly interesting in light of recent doubts expressed about cost-savings from using new health practitioners, and particularly nurse practitioners, in group practice settings.

**Physician performance in a prepaid health plan: results of the peer review program of the Health Insurance Plan of Greater New York.**

Deuschle JM; Alvarez B; Logsdon DN; Stahl WM; Smith H Jr  
Med Care ,Feb 1982, 20 (2) p127-42, ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

A peer review program to evaluate the quality of medical care was established by the Health Insurance Plan of Greater New York in 1973. Physician performance is assessed through application of explicit process criteria to medical care as recorded in the patient record. A total of 6,788 records were reviewed in terms of the clinical management of acute otitis media, hypertension and breast lesions. Follow-up procedures to bring about positive changes in delivery of health care were integrated into the program at the time of the initial audit. Reaudit of 715 records were used to measure change in physician compliance with medical care standards. Results of this audit/reaudit process demonstrated statistically significant improvement in quality of clinical practice as measured by the assessment parameters.

**Alcoholism, morbidity and care-seeking. The inpatient and ambulatory service utilization and associated illness experience of alcoholics and matched controls in a health maintenance organization.**

Putnam SL  
Med Care ,Jan 1982, 20 (1) p97-121, ISSN 0025-7079  
Journal Code: LSM

Contract/Grant No.: 5H84-AA-02210

Languages: ENGLISH

The issue of whether outpatient treatment of alcoholism is cost-advantageous, in the long run, for health maintenance organizations (HMOs) depends in part on whether alcoholics represent a relatively heavy burden on the health care delivery system. To clarify this issue, the paper asks whether alcoholics utilize HMO services at higher rates and in different ways than do other HMO members, and whether alcoholics experience more illnesses and injuries associated with their service utilization. The study subjects were alcoholics, identified during one year as new clients of an HMO's counseling department, which houses an alcoholism treatment component. Study subjects were matched with controls on the basis of sex, age, date of HMO enrollment, type of membership and family size. HMO medical records provided data on service utilization and associated morbidities during the three-year study period. Alcoholics were found to have utilized about 50 per cent more of all HMO services studied than did their matched controls. Alcoholics were especially high utilizers of more expensive, inpatient services. Psychosocial problems and problems classified as accidents, poisonings and violence were much more likely to underlie alcoholics' hospitalizations, and, to a lesser extent, their outpatient non-counseling utilization, than was the case for controls. Some tendency was noted for more chronic illnesses to be associated with alcoholics' service utilization, and more acute illnesses with controls' utilization.

**Use of nutritional supplements in an ambulatory elderly population.**

Hale WE; Stewart RB; Cerda JJ; Marks RG; May FE  
J Am Geriatr Soc ,Jun 1982, 30 (6) p401-3, ISSN  
0002-8614 Journal Code: H6V

Languages: ENGLISH

The use of nutritional supplements by 3,192 ambulatory elderly participants in a health screening program is described. The 2,009 women used vitamin (45.5 per cent) and mineral (22.4 per cent) products with significantly greater frequencies than did the 1,183 men (34.0 per cent and 15.0 per cent, respectively); chi-square, P less than 0.01. The most commonly used vitamin products were multiple vitamins, multiple vitamins with minerals, vitamin E, and vitamin C; for minerals, the ranking was potassium chloride, calcium salts, and ferrous sulfate. Eighty-two participants (2.5 per cent) reported the use of four or more supplements. Many older Americans are spending a great deal of money for nutritional supplements, whereas it would seem that the money could be better spent to improve the quality of their diet.

**An infra-red reflectance system for ambulatory characterization of left ventricular function.**

Brown TR; MacGregor J  
J Biomed Eng ,Apr 1982, 4 (2) p142-8, ISSN 0141-5425  
Journal Code: K6K  
Languages: ENGLISH

An optical method of detecting the arterial pulse is described. The system employs an infra-red light emitting diode (LED) and phototransistor arranged to operate in the reflectance mode and sited over the superficial temporal artery. The LED is pulsed and the signal recovery system performs a synchronous sample-and-hold function on the phototransistor output. This arrangement improves peak light output relative to ambient light and extends battery life. The transducer, used at its site of application over the temporal artery produces an arterial pulse-wave relatively resistant to motion artefact, and is thus suitable for ambulatory monitoring applications. The pulsewave can be used to obtain measurements of left ventricular ejection time with the accuracy required for clinical systolic time interval investigations.

**A randomized controlled trial of complete bed rest versus ambulation in the management of proteinuric hypertension during pregnancy.**

Mathews DD; Agarwal V; Shuttleworth TP  
Br J Obstet Gynaecol ,Feb 1982, 89 (2) p128-31, ISSN  
0306-5456 Journal Code: AZC  
Languages: ENGLISH

Forty patients participated in a randomized controlled trial of complete bed rest versus ambulation as desired in the management of proteinuric hypertension during pregnancy. Daily increases in serum human placental lactogen and oestriol concentrations were greater in the rested group. An especially 'at risk' group of 10 patients with both hyperuricaemia and severe fetal growth retardation was identified. Strict confinement to bed in these cases seemed to encourage the development of the premonitory symptoms of eclampsia, but was associated with a better prognosis for the fetus.

**Tardive dyskinesia in psychiatric outpatients: a study of prevalence and association with demographic, clinical, and drug history variables.**

Mukherjee S; Rosen AM; Cardenas C; Varia V; Olarte S  
Arch Gen Psychiatry ,Apr 1982, 39 (4) p466-9, ISSN  
0003-990X Journal Code: 72C  
Languages: ENGLISH

We examined 153 psychiatric outpatients, on a maintenance regimen of neuroleptics, for tardive dyskinesia (TD) and parkinsonism. Demographic, clinical, and drug history data were collected to assess whether any of these factors were significantly associated with TD. After initial univariate screening, significant variables were analyzed by multivariate statistical methods. Tardive dyskinesia was significantly associated with the use of high-potency or high-dosage neuroleptics and depot fluphenazine, whereas low-potency neuroleptics were negatively correlated with moderate TD. Age, but not sex, correlated significantly with TD, as did histories of incoherence, grandiose delusions, and teeth or denture problems. Parkinsonism and TD were strongly associated. Although the prevalence of TD was quite high, there were no severe involvements of any of the Abnormal Involuntary Movement Scale body areas.

**Pathophysiologic evaluation of chronic venous stasis with ambulatory venous pressure studies.**

Schanzer H; Peirce EC 2d  
Angiology ,Mar 1982, 33 (3) p183-91, ISSN 0003-3197  
Journal Code: 4UA

Languages: ENGLISH

Seven normal controls and 51 lower extremities with venous insufficiency in 45 patients were studied with ambulatory venous pressure. Measurements were done at rest and during 15 seconds of exercise without a tourniquet and with 1 or 2 tourniquets at different levels of the extremity. The decrease in pressure during exercise and the time to return to standing levels were used to calculate a venous sufficiency index. Six pathologic categories were identified in patients with chronic venous stasis. Incompetence of perforators was present in 17 cases. A combination of long saphenous vein and perforator incompetence was detected in 10 cases. Thirteen cases had a pattern of regurgitant deep vein incompetence. Two cases had incompetence of the saphenous system. A deep vein obstruction pattern was present in 3 other patients. Ascending and retrograde phlebography was done in 30 of these cases. There was an 83.3% correlation between the venous pressure and phlebographic tests. Contrast studies were found to be complementary and added extra-anatomical information. Based on these special studies, a rational approach to the treatment of venous insufficiency has evolved. The early results are encouraging.

**Cardiac catheterization in infants and children can be an outpatient procedure.**

Cumming GR  
Am J Cardiol ,Apr 1 1982, 49 (5) p1248-53, ISSN  
0002-9149 Journal Code: 3DQ

Languages: ENGLISH

Many cardiac catheterization procedures in infants and children can be performed on an outpatient basis. This has been the practice in a pediatric hospital for 18 years. Over the last 12 years 1,355 of 2,133 catheterization procedures were performed on an outpatient basis. Excluding newborns, 45 percent of infants under 1 year of age having catheterization procedures were studied as outpatients. After age 1 year, 83 percent of the patients were studied as outpatients. Many of the patients admitted to the hospital would have been suitable for outpatient study. There were no significant complications related to the outpatient program. The main advantage would seem to be a reduction in anxiety concerning the test for children and their parents.

**Long-term hemodynamic and clinical efficacy of captopril therapy in ambulatory management of severe chronic congestive heart failure.**

Awan NA; Amsterdam EA; Hermanovich J; Bommer WJ; Needham KE; Mason DT

Am Heart J ,Apr 1982, 103 (4 Pt 1) p474-9, ISSN  
0002-8703 Journal Code: 3BW

Contract/Grant No.: HL 14780

Languages: ENGLISH

The 6-month extended vasodilator efficacy of the oral angiotensin converting enzyme (ACE) inhibitor, captopril (CPT), was evaluated by sequential cardiac catheterization, nuclear scintigraphy, echocardiography, treadmill exercise, and symptomatology in nine patients with severe chronic left ventricular (LV) failure (CHF). CPT lowered LV filling pressure (from 23 to 14 mm Hg acutely (p less than 0.001) and to 14 mm Hg (p less than 0.01) with continuous 6-month therapy; concomitantly CPT raised cardiac index from 2.03 to 2.46 L/min/m<sup>2</sup> initially (p less than 0.02) and to 2.33 L/min/m<sup>2</sup> (p less than 0.02) at 6 months. Simultaneously CPT raised LV ejection fraction from 0.21 to 0.25 acutely (p less than 0.01) and to 0.30 (p less than 0.001) and to 60 mm (p less than 0.001) at 6 months. These beneficial actions of CPT on LV pump function raised treadmill exercise duration (from 339 to 426 seconds initially (p less than 0.05) and to 499 seconds (p less than 0.05) at 6 months, while considerably reducing CHF symptomatology (p less than 0.001). Thus ACE inhibition by CPT provides markedly beneficial sustained hemodynamic and clinical improvement in advanced LV failure without fluid accumulation or late vasodilator drug tolerance.

Journal Code: HQV  
Languages: ENGLISH  
Physician response to, as well as outcome, cost and health effectiveness of the alkaline phosphatase component of an automated chemical screening panel in the primary medical care setting were studied. Out of 118 unexpected deviations, only one new diagnosis resulted--type A viral hepatitis. Because only one new diagnosis was made during the study period, estimates are tentative; however, when compared to other tests, the alkaline phosphatase component has a low health effectiveness (0.0298 Discounted Well-Years) and a low cost-effectiveness (\$85,400 per Discounted Well-Years) and does not appear to be an economic way to make new diagnoses of therapeutically responsive diseases in the primary care setting.

**Resident preferences for the clinical teaching of ambulatory care.**

Stritter FT; Baker RM  
J Med Educ ,Jan 1982, 57 (1) p33-41, ISSN 0022-2577  
Journal Code: J13  
Languages: ENGLISH

The content and teaching behaviors of clinical teaching in ambulatory care and, in particular, in family practice centers are important to residents as they attempt to learn the varied aspects of patient care. This paper is based on a study of family medicine residents' preferences for the content areas of family medicine emphasized by those attending physicians perceived by the residents as the "best" clinical teachers in their respective centers. Also included in the study were the specific teaching behaviors of those same clinical teachers. A statistical analysis of the preferences of residents provided an indication of the dimensions of clinical teaching in resident education. Further, certain individual characteristics of residents were found to influence their perceptions. It was concluded that selected content areas should receive more emphasis and that the human aspects of clinical teaching are more important than technical teaching skills. These perceptions were helpful in suggesting ways of improving the teaching of residents and faculty development.

**Parasuicide. A review of treatment interventions.**

Hirsch SR; Walsh C; Draper R

J Affective Disord ,Dec 1982, 4 (4) p299-311. ISSN

0165-0327 Journal Code: H3V

Languages: ENGLISH

From review of studies of treatment intervention in parasuicide it is concluded that: (1) Suicide prevention centres do not lower the incidence of suicide. (2) Retrospective follow-up studies of patients self-selected for treatment or no treatment find that patients who attend for treatment have a lower repeat rate of parasuicide. This may have nothing to do with treatment. (3) Intensive domiciliary follow-up for 3-6 months after inpatient treatment in a specialised unit for parasuicide is no better at preventing further parasuicides than conventional follow-up in outpatient department or via the GP. (4) A multidisciplinary outreach programme was effective in one study but not three others. (5) Behaviour therapy was no better than insight oriented psychotherapies when administered intensely over 10 days for inpatients with a previous history of overdose. (6) Medication in the form of depot flupenthixol, 20 mg every 4 weeks was significantly better than placebo for chronic repeaters (3 or more attempts) but Mianserin 30 mg/d was not. (7) There was no relationship between improved symptoms, improved social circumstances or the repeat rate for parasuicide. In a controlled trial conducted by the authors in parasuicides, Mianserin 60 mg/d reduced depressive symptoms significantly more rapidly than Nomifensine or placebo but there was no difference by 6 weeks and the risk of repeat was not affected.

**Deinstitutionalization and the private general hospital inpatient unit: implications for clinical care.**

Schoonover SC; Bassuk EL

Hosp Community Psychiatry ,Feb 1983, 34 (2) p135-9. ISSN

0022-1597 Journal Code: GCJ

Languages: ENGLISH

Deinstitutionalization has led to a rapid shift from reliance on state hospitals to use of community-based inpatient psychiatric services. While these inpatient units were initially envisioned as an integral part of the community mental health system, a number of sociopolitical and clinical pressures have caused general hospitals to respond to their new responsibilities in different ways. The authors review trends in deinstitutionalization, the diverging interests of public and private general hospitals, and problems in patient care that result. Based on a discussion of how Beth Israel Hospital, a nonprofit private general hospital in Boston, has dealt with such issues, they describe adaptive responses in four areas: admission criteria, patient management approaches, aftercare planning, and staff training.

**Admission of whole families.**

Dydyk B; French G; Gertsman C; Morrison N

Can J Psychiatry ,Dec 1982, 27 (8) p640-3, ISSN

0706-7437 Journal Code: CLR

Languages: ENGLISH

This is a program description of a short-term residential unit in which whole families are assessed and treated. This unit provides an alternative treatment format for exploring situations where removal of the child appears to be the only remaining option. It also provides an in-depth consultation for agencies who are "stuck" in their treatment of family systems and allows for the teaching of family systems intervention techniques in a non-threatening way. It also allows an opportunity for an external system to reframe, what are, to the involved clinician, impasses with clinical problems. The program, because of its structure, introduces anxiety and tension into systems with chronic mental health problems. It, therefore, serves as, not a panacea, but as an adjunct to more traditional treatment for rigid and resistant systems.

**[Results of a clinico-experimental evaluation of suicide prevention programs]**

Ergebnisse der klinisch-experimentellen Evaluation von suizidprophylaktischen Versorgungsprogrammen.

Kurz A; Moller HJ

Arch Psychiatr Nervenkr ,1982, 232 (2) p97-118, ISSN

0003-9373 Journal Code: 8DE

Languages: GERMAN Summary Languages: ENGLISH

With regard to methodological shortcomings and heterogeneity of the outcome of experimental studies in the field of suicide prevention only tentative conclusions can be drawn from the results. Suicide prevention programs where contact to patients is actively established and maintained seem to be more effective in reducing the rate of further suicide attempts than passive strategies which leave it to the patients to initiate and continue a therapeutic relationship. This advantage emerges more clearly when patients are repeatedly or even continually motivated to utilize advice and treatment facilities. The intensity of outpatient aftercare services may also have a considerable influence on the effectiveness of suicide prevention.

Die Nachsorge des Ovarialkarzinoms aus der Sicht des Radiologen.

Atzinger A; Wagner RK

Strahlentherapie ,Nov 1982, 158 (11) p668-73, ISSN

0039-2073 Journal Code: VIZ

Languages: GERMAN Summary Languages: ENGLISH

During a radiotherapy of ovarian carcinomas and other gynecologic tumors, special attention must be given to the reaction of the organs of urinary excretion as well as of the small and large intestine, especially if the irradiation is applied by the moving strip method or as an abdominal bath with an irradiation field comprising the whole abdominal and diaphragmatic region. The early and late radiogenic reactions of our great number of patients were routinely examined. A continuous control of the urinary excretion conditions before, during and after radiotherapy is absolutely necessary. These examinations are also of high relevance with regard to the early recognition of recurrences. An additional control of the rectum and sigmoid region is necessary with respect to late lesions. Regular ultrasonic or CT examinations are important in order to early recognize metastases in the preferred regions of formation of metastases which are hardly accessible by other methods (intraperitoneal dissemination with ascites, surface of the diaphragm, local extension, retroperitoneal lymph nodes, and transdiaphragmatic extension to the interpleural lymph nodes). Finally the authors present their first experiences with the NMR technique in radio-oncology and discuss the value of tumor markers in case of ovarian carcinomas.

**Who receives the aftercare? Utilization of services by discharged in-patients.**

Keane P; Fahy TJ  
Psychol Med ,Nov 1982, 12 (4) p891-902, ISSN 0033-2917  
Journal Code: QER  
Languages: ENGLISH

A prospective one-year follow-up of 216 in-patients showed that utilization of aftercare was significantly associated with certain clinical and social factors in the year after discharge from hospital. Rural domicile, a diagnosis of schizophrenia, long dependence on services, and ease of access to care comprised an aftercare dependency syndrome with substantial predictive power. Alcoholic and personality disordered patients were light users of services. Staff-patient relationships and attitudes of staff and patients to the need for aftercare were important. Depot neuroleptics were associated with high levels of aftercare for patients with chronic schizophrenia. The findings reveal the steady silting up of a new area service for the adult mentally ill by patients with a combination of social disadvantage and severe chronic psychosis. Family doctors played very little part in the delivery of aftercare. Some implications of the findings for the future development of community-based psychiatric services are discussed.

Epidemiologische Grundlagen für die Organisation der Nachbetreuung beim Mammakarzinom der Frau in der Hauptstadt der DDR-Berlin in der Periode 1968 bis 1980.

Panzer D

Arch Geschwulstforsch .1982, 52 (5) p407-22, ISSN 0003-911X Journal Code: 746

Languages: GERMAN Summary Languages: ENGLISH

The basis for a scientific aftercare are such characteristics as recurrence and metastasis rates, lethality classified according to age-groups and duration of observation. Comparable data like 5-years-lethality by age-groups in 1968 and 1973 (female patients with cancer of the breast diagnosed in the capital of the G.D.R., Berlin), causes of death, cumulative relative survival rates, excess mortality are of importance for the follow-up intensity directed to this group of patients by the cancer centre, the general-practitioner and the out-patient oncological department. The most important task will still be early diagnosis of malignant tumours, because detection of curable stages will have better results and such patients need less intensive aftercare.

Sieberth E  
Onkologie, Aug 1982, 5 Suppl p64-6, ISSN 0378-584X  
Journal Code: OHR

Languages: GERMAN Summary Languages: ENGLISH

The follow-up cancer care has to be based on pathophysiological and psychological principles. Follow-up treatment and rehabilitation must be applied individually. Between these two pillars of follow-up cancer care we find the psychic care and the psychological guidance of the patients--factors of high importance. In all cases of follow-up cancer care, as detailed here, in the last time we find a new group of people approaching us: the self-help groups. In spite of hardly any experience, it seems to be certain that these self-help groups can do a lot in the follow-up cancer care, considering how much there is to do in the vast field of medicine and psychology.

The optimal length of hospitalization for psychiatric patients: a review of the literature.

Mattes JA

Hosp Community Psychiatry, Oct 1982, 33 (10) p824-8,  
ISSN 0022-1597 Journal Code: GCU  
Languages: ENGLISH

In recent years, several controlled studies have evaluated the value of different lengths of psychiatric hospitalization and of alternatives to hospitalization. The author reviews such studies, noting that most findings suggest that longer stay does not decrease subsequent hospitalization, and does not clearly improve social adjustment or diminish psychopathology. Longterm hospitalization may increase the patient's commitment to continued psychiatric care, but short stay with optimal aftercare planning may be just as beneficial. Long-term hospitalization is necessary clinically for some patients, but the evidence is consistent and convincing in indicating that hospitalization should be kept as short as feasible. (49 Refs.)

**[Care of patients after attempted suicide: tasks, problems and possibilities of improvement]**

Versorgung von Patienten nach Selbstmordversuch - Aufgaben, Probleme und Verbesserungsmöglichkeiten.

Moller HJ; Torhorst A; Wachtler C

Psychiatr Prax ,Jul 1982, 9 (4) p106-12, ISSN 0303-4259

Journal Code: QCK

Languages: GERMAN Summary Languages: ENGLISH

Inpatient and post-inpatient psychiatric/psychotherapeutic treatment of suicides poses a considerable number of problems which have to be handled by the institutions concerned: These problems are formidable because of the high incidence of attempted suicides and the considerable amount of work necessarily involved in caring for such persons. Care should by no means be restricted to the acute crisis; attempts should also be directed by preventing relapses and at improving the overall psychopathological status and social readjustment. The present manner in which suicides are looked after has quite a number of drawbacks, e.g. insufficient attention is paid to the requirements of the inpatient; patients fail to refer to the hospital during the period of their post-suicide attempt care; the incidence of "dropouts" during outpatient aftercare is very high; there is insufficient cooperation between the persons and institutions involved in the care programme. Improvements are presented which have been successfully tried out in practice.

Leber Magen Darm ,Apr 1982, 12 (2) p80-4, ISSN

0300-8622 Journal Code: L3P

Languages: GERMAN Summary Languages: ENGLISH

137 patients, who had had surgery of the pancreas, were followed up postoperatively; 72 of these had had resection of pancreas, 65 patients had organ preserving surgery. Diabetes occurred in 44% of the total group. Control of diabetes was adequate only in 19%. 89 patients had an insufficient exocrine pancreatic function; substitution with pancreatic enzyme products was not adequate in 39 patients in this group. 65% took up work again, the working ability being reduced by less than 33%. 14% of the whole group retired immediately after operation from working life, 6% remained jobless for longer periods of time. After surgery of the pancreas patients should be encouraged to active work; granting pensions too generously will increase the relapse rate of alcoholism. In 6 cases of subtotal surgery and in 21 cases of organ preserving surgery operation had to be done for a second time. A classification is proposed for evaluation of postoperative results.

Languages: GERMAN Summary Languages: ENGLISH

After surgery of the colon 3 types of sequelae may be observed: 1. Acute intra- and postoperative complications, as insufficiency of the anastomosis, ileus, and rebleeding; sequelae of these acute complications may be stenosis of the stenosis and intraabdominal adhesions. 2. Chronic postoperative syndromes like blind-loop syndrome, diarrhoea and/or continence problems, problems arising from an anus praeter, disturbances of sexual and bladder function. These symptoms occur rather rarely after partial resection of the rectum or amputation of the rectum. 3. Recurrence of the main disease, especially cancer disease, be it a local recurrence or metastasis. A well organized follow-up of cancer patients may increase survival time only in a few cases, but it definitely may improve quality of life by different means.

Dtsch Med Wochenschr ,Jun 11 1982, 107 (23) p890-5, ISSN 0012-0472 Journal Code: ECL

Languages: GERMAN Summary Languages: ENGLISH

In two years 359 patients with breast cancer were evaluated in a cooperative follow-up programme in which the organisation and documentation were done in hospital, the medical care and investigations by the family doctor. 72% of 316 evaluable patients remained in regular control. 63% chose the family doctor for follow-up while the others preferred hospital. In the first year 71-80% attended their appointments, in the second year 60-74%. Statistically significant parameters for detection of metastases were the following: general condition, local signs, palpable lymph nodes, markedly increased ESR, alkaline phosphatase, chest radiograph, and bone scan. Cumulative freedom from recurrence in the whole group diminished from 1.0 to 0.631 in 25 months, cumulative survival from 1.0 to 0.876 in 20 months. In both groups there were significant differences between stages I, II and III. Forty patients (16%) out of 250 developed a recurrence within 2.25 years, in five (2%) a second carcinoma developed. There was a high proportion of local recurrences (20 out of 40) and these often led to generalised disease (11 out of 20).

Languages: ENGLISH

The goal of perinatal care can no longer focus only on the medical management of mother and infant, but instead must take a more global approach and focus on the entire family. One aspect of family care is to provide comprehensive nursing follow-up to the high-risk family at the time of the mother's and infant's discharge. To meet this need, a program was developed to educate all interested community nurses to the specific needs of the high-risk family. Evaluation indicates that the program helped nurses to provide consistent comprehensive care to these families, who were very grateful for home visits by a community nurse.

**Assessing patient satisfaction with state hospital and aftercare services.**

Bene-Kociemba A; Cotton PG; Fortgang RC  
Am J Psychiatry ,May 1982, 139 (5) p660-2, ISSN  
0002-953X Journal Code: 3VG  
Languages: ENGLISH

To assess patients' satisfaction with state hospital and aftercare services, the authors administered an open-ended interview to 22 former state hospital patients. The patients expressed marked dissatisfaction with their treatment in the hospital, but 78% said they were helped by the aftercare services. Important components of their satisfaction were feeling helped, feeling understood, and feeling that the aftercare worker was available when needed. Frequency and length of meetings and types of assistance were not related to satisfaction. The patients reported that the psychotherapeutic and task-oriented assistance were equally helpful.

**Long-term social prognosis after hip fractures.**

Jensen JS; Bagger J  
Acta Orthop Scand ,Feb 1982, 53 (1) p97-101, ISSN  
0001-6470 Journal Code: 1GD  
Languages: ENGLISH

A long term follow-up study of 518 patients with hip fractures was undertaken 2.5 years after the operation. The

total mortality was 35 per cent (180/518). The risk of social deterioration for patients admitted from home was 47 per cent (132/281). A statistical analysis showed this risk to be determined primarily by the age of the patient and secondarily by the placement of the patient on discharge from hospital. A thorough description of these factors is presented.

**[Health education and group work during in-patient rehabilitation following myocardial infarction (author's transl)]**

Gesundheitserziehung und Gruppenarbeit in der Rehabilitation von Patienten mit Herzinfarkt im Rahmen der Anschlussheilbehandlung.

Herzog M; König K; Maas A; Neufert R  
Rehabilitation (Stuttg) ,Feb 1982, 21 (1) p8-12, ISSN  
0034-3536 Journal Code: R3P

Languages: GERMAN Summary Languages: ENGLISH

Starting from the usual in-patient rehabilitation measures for myocardial infarction patients and based on the authors' clinical experiences, a working model is presented concerning the health educational care of patients undergoing rehabilitation procedures immediately following infarction or bypass operation. The new concept is based on a psychosomatic view of the cardiovascular diseases, and uses group-dynamic elements in its methodological approach. The rehabilitational tasks of health education are understood as therapeutic strategies and are aimed at achieving changes on the attitudinal and behavioural level.

**Failure to thrive.**  
Goldbloom RB  
Pediatr Clin North Am ,Feb 1982, 29 (1) p151-66, ISSN  
0031-3955 Journal Code: OUM  
Languages: ENGLISH

Reviewing the chronological evolution of our understanding of why some children fail to thrive without obvious organic cause permits us to develop a rational contemporary approach to diagnosis and management. Originally recognized as a phenomenon of children living in institutions, it later became clear that it could occur in children living with their families. While emotional deprivation was at first emphasized as the principal determinant of growth failure, it is now apparent that the major mediating mechanism is insufficient caloric intake. Thus prior to nutritional recovery it may be difficult to segregate whether emotional symptoms in the child reflect the causes or effects of malnutrition. With rare exceptions, an etiologic diagnosis can be suspected on the basis of history, physical examination, and family assessment. Nonspecific investigative screening of such children has proved to be without value. Successful management depends on recognition of the supernormal caloric intake required to induce rapid catch-up growth. Aggressive hyperalimentation combined with intensive emotional stimulation and often with active family participation offer the best chances of a successful outcome.

**Physician practice in the management of patients with uncomplicated myocardial infarction: changes in the past decade.**

Wenger NK; Hellerstein HK; Blackburn H; Castranova SJ  
Circulation ,Mar 1982, 65 (3) p421-7, Journal Code:  
DAW

Languages: ENGLISH  
To determine changes in the patterns of care between 1970 and 1980 for patients with uncomplicated acute myocardial infarction, questionnaires were sent to almost 6000 physicians in 1979 and responses were compared with those of a similar survey taken in 1970. Almost all physicians in 1979 reported the availability and use of an intensive care/coronary care unit facility with continuous electrocardiographic monitoring. Progressive-care facilities are also becoming more widely available. The median length of hospitalization has decreased markedly. Early ambulation and an earlier return to work are more common. There is a high level of informal patient and patient-family counseling about myocardial infarction and its management, both during and after hospitalization, and wider use of educational materials. Most physicians continue to recommend progressive physical activity after hospitalization. The routine prescription of anticoagulant therapy during hospitalization has declined, while prescription of prophylactic antiarrhythmic agents has increased. Nitrate drugs and tranquilizers are routinely prescribed by a large percentage of physicians for their patients with uncomplicated myocardial infarction. Use of standard exercise tests has increased among all physician specialties. The treadmill test is most often used, and testing is typically done 6 weeks after infarction. A significant increase in the availability of and familiarity with exercise testing is characteristic of all medical specialties. Symptoms of new chest pain and palpitations are now considered important enough to warrant the recommendation to report immediately to an emergency room. Other current findings include the routine use of coronary angiography by a large percentage of physicians to evaluate the need for surgical intervention, and the routine posthospitalization prescription by only a small percentage of physicians of aspirin and of nitrate drugs for patients with uncomplicated myocardial infarction.

**Fluphenazine vs placebo in patients with remitted, acute first-episode schizophrenia.**

Kane JM; Rifkin A; Quidkin F; Nayak D; Ramos-Lorenzi J

Arch Gen Psychiatry .Jan 1982. 39 (1) p70-3. ISSN 0003-990X Journal Code: 72C

Contract/Grant No.: MH 21337-03

Languages: ENGLISH.

Twenty-eight patients who had recently recovered from an acute-onset, first-episode schizophrenic illness were randomly given fluphenazine hydrochloride or decanoate or placebo for a one-year period in a double-blind study. Seven of 17 patients (41%) receiving placebo experienced a psychotic relapse, whereas none of 11 drug-treated patients experienced a relapse. Eighteen (69%) of the 26 patients available for follow-up (mean interval, 3.5 years) experienced a second psychotic relapse either during the study or afterward, and 50% (14/28) of the original sample experienced a third episode.

**A survey of pain relief clinics in the South Western Region.**

Alexander JI

Health Trends ,Aug 1981, 13 (3) p65-6, ISSN 0017-9132

Journal Code: EJN

Languages: ENGLISH

All the district general hospitals in the South Western Health Region have a pain relief service in existence or planned for the immediate future. Almost all are recognized by the allocation of anaesthetic consultant sessions. In most cases, this allocation is less than the time required for pain relief. All the consultants concerned work in single disciplinary clinics and accept both in-patient and out-patient referrals. They provide an advisory and therapeutic service to patients in the care of other clinicians and give tuition, mainly to junior anaesthetists. Most also undertake domiciliary assessment and treatment. In most clinics the Pain Relief Service is hampered by inadequate facilities. The minimum facilities for a basic efficient service are here reviewed.

**Effects of a formalized diabetes education.**

Karlander SG; Kindstedt K

Acta Med Scand ,1983, 213 (1) p41-3, ISSN 0001-6101

Journal Code: 14G

Languages: ENGLISH

A previous study of patients attending a diabetic out-patient clinic indicated that their metabolic control was inadequate and their knowledge of diabetes and diabetes management was generally low. In an attempt to improve the situation, we organized a five-day education programme comprising formal lessons about diabetes, diet and nutrition. Altogether 83 patients completed the course. The test scores before and one year after the course indicated that the patients' knowledge had improved. Metabolic control, however, was essentially unchanged at the follow-up.

**Time series analysis of out patients at Urban Health Centre, Suraj Kund, Meerut.**

Garg BS; Singh JV; Gupta SC

Health Popul Perspect Issues ,Oct-Dec 1981, 4 (4) p260-5

Journal Code: G2G

Languages: ENGLISH

Time series analysis of out-patients at Urban Health Centre, Suraj Kund, Meerut, was done using the out-patient attendance of last five years, with the aim to find out the values to help in coping up with the problem of health administration and management. The least square method and ratio-to-trend method were adopted for calculating the secular trend and seasonal variations respectively. There was an increasing trend in out-patients attendance indicating the increasing popularity of the Urban Health Centre. It was found that in second and third quarter of the year the out-patient attendance increased extraordinarily due to various reasons. The two more aspects of time series, i.e. cyclical trend and irregular fluctuation could not be analysed due to their insignificant impact over the health management system.

**The response of out-patient opiate addicts to the provision of a temporary increase in their prescribed drugs.**

Gossop M; Strang J; Connell PH  
Br J Psychiatry ,Oct 1982, 141 p338-43, ISSN 0007-1250  
Journal Code: B1K

Languages: ENGLISH

Addicts who use illicit drugs despite receiving a maintenance prescription present a difficult management problem for drug dependence clinics. This study looks at a small group of such addicts and at their response to the provision of a temporary increase in their prescribed opiates. The results indicate that this increase led to a reduction in illicit drug use and to improvements in social functioning. These and other findings are discussed. It is suggested that clinics should be more prepared to consider such temporary increases, but the need for careful monitoring and for the involvement of more than one member of the treatment team is stressed.

**Assessment of the outcome of an educational programme of diabetes self-care.**

Beggan MP; Cregan D; Drury MI  
Diabetologia ,Sep 1982, 23 (3) p246-51, ISSN 0012-186X  
Journal Code: E93

Languages: ENGLISH

The efficacy of our current educational programme for diabetic patients was assessed. Cognitive and behavioural tests were administered to 75 Type 1 (insulin-dependent) diabetic patients, aged less than or equal to 30 years attending the Diabetic Clinic of the Mater Misericordiae Hospital, Dublin, Ireland. An overall deficiency in knowledge was evident. Fifty-one patients responded incorrectly to greater than 20% of the items tested. Twenty-nine patients lacked the ability to communicate a simple understanding of diabetes. Whereas most (70 +) correctly identified the methodology of urinalysis, uncertainty was evident concerning appropriate action needed in response to such tests. Forty-nine did not know the significance of thirst and polyuria and 20 were unaware that hyperglycaemia could progress to coma. The ability to modify insulin dosage was poor as was the ability to use exchanges. Of patients aged greater than or equal to 20 years, those from the Dublin region scored better than did those from surrounding towns or rural areas, ( $r = 0.5$ ;  $p$  less than 0.01). Regular out-patient attenders scored less well than non-attenders ( $r = 0.24$ ;  $p$  less than 0.05) but had better glycosylated haemoglobin levels ( $r = 0.3$ ;  $p$  less than 0.01). Glycosylated haemoglobin showed no significant correlation with level of knowledge held.

**Patient stress and the computer in the consulting room.**  
Cruickshank PJ

Soc Sci Med ,1982, 16 (14) p1371-6, ISSN 0277-9536  
Journal Code: UT9

Languages: ENGLISH

This study assesses patient reactions to the use of diagnostic computers by doctors. The setting was a hospital out-patient clinic, and the patients were new referrals with dyspeptic symptoms. Patient reactions were measured through a mood questionnaire of stress and arousal, and a questionnaire on attitudes to the medical use of computers. Patient self-reported stress was more likely to have increased after the consultation if the computer had been used ( $P$  less than 0.05). There was a trend for computer patients to show attenuation of the typical post-consultation drop in stress. However, patients who had experienced the computer being used had more favourable attitudes towards medical computer use than inexperienced patients (as assessed by a subsequent postal survey;  $P = 0.007$ ). Multiple regression showed that while experience of the computer was a determinant of attitudes, patient stress after the consultation was extremely significant ( $P$  less than 0.001) with highly-stressed patients being the least welcoming to medical computers, whether or not they had experience of the computer. It is suggested that doctors planning to use computers should take care to preserve their 'human touch' particularly for nervous patients.

**[Community mental health in Israel]**

Sektorisierte Psychiatrie in Israel.

Muller K; Muller P

Psychiatr Prax ,Jul 1982, 9 (4) p113-8, ISSN 0303-4259  
Journal Code: QCK

Languages: GERMAN Summary Languages: ENGLISH

The current state of mental health care in Israel is described, considering the historical and sociodemographic background. Predominating are community out-patient clinics and cooperation of out-patient and in-patient services, whereas the number of beds and the size of wards is comparatively small. The country is consequently divided into catchment areas with a flexible adjustment according to the geographical characteristics and practical means. Generally the centres are richly staffed instead of expensive buildings.

In a short amount of time and by comparatively small means, a modern and humane psychiatric and psychotherapeutic care has been established, fairly meeting the needs of the patient concerned.

**A comparison of cephazolin sodium and co-trimoxazole as prophylactic antibiotics in out-patient urinary tract endoscopy.**

Hart AJ; Houston DR; McAllister TA  
Br J Urol ,Aug 1982, 54 (4) p417-20, ISSN 0007-1331  
Journal Code: B3K

Languages: ENGLISH

Five-hundred patients were entered into a study to compare intramuscular cephazolin sodium with intramuscular co-trimoxazole in reducing the incidence of post-endoscopy rigor in out-patients. Urine cultures were carried out immediately before, immediately after, and 24 h after endoscopy and the incidence of post-procedure symptoms was elicited by pre-paid reply post cards. Similar rigor rates (9%) were obtained in the 2 groups. The incidence of sensitivity of the significant cultured organisms to the 2 antibiotics was high, but no correlation was found between the presence of infected urine and rigor, and possible reasons for this are discussed. Patients found intramuscular administration of co-trimoxazole to be painful and the 10% incidence of rigor is no improvement on the 8% rigor rate obtained in those who received cephazolin.

**Simplified computerization of data-base for diabetic patients.**

Carandente G; Dossi G; Luzzana M; Brown B; Berger DL; Pozza G  
Ric Clin Lab ,Apr-Jun 1982, 12 (2) p395-400, ISSN 0390-5748  
Journal Code: TEA

Languages: ENGLISH

A computerized data-base for the management of the out-patient clinic for diabetes and of the hospital diabetic patients has been developed by means of low cost commercial microcomputer. The program is able to supply lists of sets of patients chosen from user-defined characteristics. The system also allows the selected listin of recall letters for periodic examinations, the printing of registers for medical and administrative use and for statistical analysis. The system is easy to learn and easy to use. The operator-computer interaction is colloquial through the use of a video-terminal, permitting the use by nominally-trained staff.

**Community psychiatric nursing for neurotic patients: a controlled trial.**

Paykel ES; Mangen SP; Griffith JH; Burns TP  
Br J Psychiatry ,Jun 1982, 140 p573-81, ISSN 0007-1250  
Journal Code: B1K

Languages: ENGLISH

Seventy-one neurotic patients requiring follow-up were randomly assigned to routine psychiatric out-patient care or to supportive home visiting from community psychiatric nurses as their main treatment agents and were assessed every six months for 18 months. No differences were found between effectiveness of the two modes of service on symptoms, social adjustment or family burden. Patients seeing community psychiatric nurses reported greater satisfaction with treatment. Community psychiatric nursing resulted in a marked reduction in out-patient contacts with psychiatrists and other staff, more discharges, and a small increase in general practitioner contact for prescribing. Care of such patients by community psychiatric nurses is a valuable alternative mode of deployment within the psychiatric team.

**A Patient Satisfaction Instrument: precision by replication.**

Hinshaw AS; Atwood JR  
Nurs Res , May-Jun 1982, 31 (3) p170-5, 191, ISSN  
0029-6562 Journal Code: 09K  
Languages: ENGLISH

The Patient Satisfaction Instrument (PSI) was developed over a series of five clinical and administrative studies during a period of eight years, with a total of 600 patients, primarily medical-surgical inpatients and outpatients. The process illustrates measurement precision by replication. The PSI is a Likert-type summated rating scale with three dimensions of patient satisfaction: technical-professional care, trust, patient education. It was adapted for use with inpatients from Risser's out-patient instrument. Internal consistency estimates appear satisfactory and stable across the various studies; for example, alpha coefficients for the Technical-Professional subscale average .79, Education coefficients average .78, and Trust coefficients average .88. Interitem, item-subscale, and interscale correlations corroborate the alphas. Construct validity estimates were made via convergent/discriminant technique, discriminance, and predictive modeling. Empirical correlations moderately substantiated the multiple, convergent/discriminant predictions. Discriminance was strongly documented for all but the Education subscale, which had modest support. Predictive modeling produced moderate to strong validity estimates. Overall, the PSI has acceptable levels of validity and reliability with refinements indicated.

**Prognostic factors determining response to antidepressant drugs in psychiatric out-patients and general practice.**

Tyrer PJ; Lee I; Edwards JG; Steinberg B; Elliott EJ;  
Nightingale JH  
J Affective Disord , Sep 1980, 2 (3) p149-56, ISSN  
0165-0327 Journal Code: H3V  
Languages: ENGLISH

The outcome of antidepressant drug treatment was measured in 200 patients, 145 seen in psychiatric out-patient clinics and 55 in general practice, after 4 weeks of therapy. The results of the 200 patients taken together suggested that prognosis was largely determined by factors dependent on the natural history of the disorder and that clinical symptoms were unimportant, but when the results for patients in each drug group were analysed separately symptoms were more important than natural history factors. We conclude that clinical symptoms are only important predictors of response to antidepressant drugs when the patients studied are homogeneous with regard to natural history factors, particularly duration of illness.

**An assessment of default and non-compliance in tuberculosis control in Pakistan.**

Sloan JP; Sloan MC  
Trans R Soc Trop Med Hyg , 1981, 75 (5) p717-8, ISSN  
0035-9203 Journal Code: WBU  
Languages: ENGLISH

Rates in particular for default from clinics and to a lesser degree non-compliance to treatment for patients with pulmonary tuberculosis have rarely been described quantitatively in the literature. In this report we describe studies in which an outpatient population in rural Pakistan was found retrospectively to have a default rate of 66%, and a non-compliance rate of 53% for P.A.S. and 60% for isoniazid measured by objective pharmacological tests. Suggestions are made for a change from the established out-patient approach, to intermittent high dose chemotherapy administered by health workers in the community.

**The efficacy of cognitive therapy in depression: a treatment trial using cognitive therapy and pharmacotherapy, each alone and in combination.**

Blackburn IM; Bishop S; Glen AI; Whalley LJ; Christie JE

Br J Psychiatry ,Sep 1981, 139 p181-9, ISSN 0007-1250

Journal Code: BIK

Languages: ENGLISH

We report an extensive study which compares cognitive therapy, antidepressant drugs and a combination of these two, in depressed patients seen either in general practice or an out-patient department. One-hundred and forty patients were screened for primary depression and 64 patients completed the trial. All were rated on seven measures of mood, including independent observer-rated and self-rated depression and scales of anxiety and irritability. Patients were randomly assigned to cognitive therapy, antidepressants or a combination of the two. The antidepressant drug group did less well in both hospital and general practice and combination treatment was superior to drug treatment in both hospital and general practice. In general practice, cognitive therapy was superior to drug treatment. The presence of endogenous features did not affect response to treatment. The results are discussed in terms of Beck's cognitive theory of depression and factors of presumed causal importance of depression in general practice.

**Characteristics of depressive patients contacting psychiatric services in four cultures. A report from the who collaborative study on the assessment of depressive disorders.**

Jablensky A; Sartorius N; Gulbinat W; Ernberg G

Acta Psychiatr Scand ,Apr 1981, 63 (4) p367-83, ISSN

0001-690X Journal Code: 1VY

Languages: ENGLISH

The paper is a report on results obtained in the course of a multi-centre international study on depressive disorders in four countries, which was sponsored and co-ordinated by the World Health Organization. A screen form was developed and tested in order to select depressive patients among psychiatric in-patient and out-patient populations. The patients selected in this way were assessed clinically by experienced investigators using the WHO schedule for Standardized Assessment of Depressive Disorders (SADD). A total of 53 patients were evaluated in the five research centres, and the data were utilized in uni- and multivariate statistical analyses aiming to establish whether similar cases of depression could be found in different cultures, to describe their characteristics and to ascertain the extent to which diagnostic concepts and classification categories could be applied in different settings. The results point to a considerable degree of similarity in depressive symptomatology across the cultures if particular selection criteria are applied, and suggest that broad diagnostic groupings such as 'endogenous' and 'psychogenic' depressions could be used consistently by clinicians working in different cultures.

**Psychiatric interviewing techniques V. Experimental study: eliciting factual information.**

Cox A; Rutter M; Holbrook D  
Br J Psychiatry, Jul 1981, 139 p29-37, ISSN 0007-1250  
Journal Code: B1K

Languages: ENGLISH

Four experimental interview styles, each recommended by experts in the field, were compared for their efficiency in eliciting factual information during the initial diagnostic interviews with the mothers of children referred to a psychiatric out-patient clinic. If encouraged to talk freely, mothers tended to mention most (but not all) key issues without the need for standardized questioning on a pre-determined range of topics. However, systematic questioning was essential in order to obtain good quality factual data. Better data were obtained when interviewers were sensitive and alert to factual cues and chose their probes with care. Clinically significant factual information, idiosyncratic to the family and outside the range of standard enquiry was common, but was obtained satisfactorily with all four styles. No one style was generally preferred by informants. The advantages of systematic questioning for obtaining factual information were not associated with any disadvantages with respect to the eliciting of emotions and feelings.

**[Prevention of hypertension of the city borough of Schwedt/Oder--results to date of a regional intervention program]**

Hypertoniebekämpfung im Stadtkreis Schwedt/Oder--bisherige Ergebnisse eines territorialen Interventionsprogramms.

Grafner L; Fischer H; Knappe J; Heinrich J  
Z Gesamte Inn Med, Aug 1 1981, 36 (15) p520-4, ISSN 0044-2542 Journal Code: XUY

Languages: GERMAN Summary Languages: ENGLISH

More than 1,100 women and about 1,400 men, detected as being hypertensives in population screenings for cardiovascular diseases and coronary risk factors on 30-59 year-old females and 30-64-year-old males 1975 and 1976, respectively, in Schwedt - participation rate in both screenings 78 per cent (6,514 females and 7,137 males, respectively) - underwent an intervention programme carried out by all the general practitioners, physicians for industrial medicine and internists, working in the out-patient clinics of the territory. But in 1979 only 500 of these women and approximately 800 of these men were under continuous control. These registration rates after both the screenings as well as after the first follow-up in women 1977, therefore, have to be considered as unsatisfying. That lack in registration is mainly up to the enormous fluctuation of patients - and inhabitants at all-, being a characteristic feature of the population of the newly built town of Schwedt. In order to overcome these effects of migration within the territory and to improve supervision in hypertensives, a new control system

regarding the peculiarities of Schwedt was established. In contrary to the falling registration an efficient lowering of blood pressure levels was achieved in those patients cooperating well, revealing normotensive diastolic mean values and systolic mean values, ranging from normotension to the lower borderline pressures. In women who showed a more impressive effect of treatment than men, the effective lowering could be maintained over a 4-year-follow-up period up to now.

**[Multiple admission to hospital of diabetic patients (author's transl)]**

Les diabétiques multihospitalisés.

Schrub JC; Courtois H; Vuillermet P

Nouv Presse Med, Sep 19 1981, 10 (33) p2723-6, ISSN 0301-1518 Journal Code: Q5Q

Languages: FRENCH Summary Languages: ENGLISH

Within an 8 years' period, 29 insulin-dependent diabetic patients were admitted to hospital on more than 5 occasions, which represents 177 admissions for a total of 3407 days. In almost 70% of the cases loss of control of diabetes was the only reason for admission, and in 33% there was no urgency. Diabetes was unquestionably severe in all patients and truly unstable in 6, but socio-economic reasons accounted for at least one admission in 17 patients and for all admissions in 8. The remaining 64 admissions for uncontrolled diabetes were mostly due to the patients' carelessness. Twelve patients totalling 97 admissions never attended the out-patient clinic.

Such carelessness seems to have arisen partly from reactive depression and partly from personality disorders, but the physicians' responsibility cannot be dismissed. In order to reduce the number of unnecessary admissions, diabetologists should provide improved patients' training, pay more attention to their psycho-affective problems and demand regular out-patient attendance.

**[Experiences with rehabilitation of children after severe head injuries (author's transl)]**

Praktische Erfahrungen in der Rehabilitation von Kindern nach schwerem Schadel-Hirn-Trauma.

Piorreck S

Z Kinderchir ,Jul 1981, 33 (3) p221-8, ISSN 0174-3082  
Journal Code: YF2

Languages: GERMAN Summary Languages: ENGLISH

In the Federal Republic of Germany, there are at present too few centers which are responsible for the rehabilitation of children and adolescents who receive severe head injuries. Up to now, attempts have been made to seek out the institutions responsible and to tabulate the rehabilitation opportunities they offer. Furthermore, the typical follow-up grades after severe head trauma will be mentioned and the necessary methods of treatment in each case ordered accordingly. The opportunity for clinical rehabilitation should first of all be accessible to all children and adolescents who suffer from such injuries; this can later be converted into out-patient rehabilitation. Time spent on the wards during this period in hospital varies, depending on the grade of retardation, ranging approximately from 6 weeks to 1 year for the less severe cases up to 4 years and occasionally longer for the severely retarded.

**Gamma-glutamyltransferase, aspartate aminotransferase and alkaline phosphatase as markers of alcohol consumption in out-patient alcoholics.**

Gluud C; Andersen I; Dietrichson O; Gluud B; Jacobsen A; Juhl E

Eur J Clin Invest ,Jun 1981, 11 (3) p171-6, ISSN 0014-2972 Journal Code: EN3

Languages: ENGLISH

Serum activity of gamma-glutamyltransferase, aspartate aminotransferase and alkaline phosphatase were determined in 316 patients attending an out-patients clinic for treatment of alcoholism. The activity of gamma-glutamyltransferase was raised in 34% and that of aspartate aminotransferase and alkaline phosphatase in 18% and 7%. Neither the activity of gamma-glutamyltransferase, aspartate aminotransferase nor alkaline phosphatase showed any significant (P greater than 0.05) correlation with the history of alcohol consumption. The activities of gamma-glutamyltransferase and aspartate aminotransferase were raised significantly more often in patients with recent alcohol consumption than in patients who had abstained for more than 9 days. The concentration of alkaline phosphatase was not significantly (P greater than 0.05) different in these groups. The predictive value of raised and normal activities of gamma-glutamyltransferase, in deciding whether a patient had had recent alcohol consumption or not, was not superior to the predictive value of raised and normal activities of aspartate aminotransferase.

**Coordinated out-patient management of chronic pain at the University of Virginia Pain Clinic.**

Carron H; Rowlingson JC

Natl Inst Drug Abuse Res Monogr Ser ,1980, 36 p84-91, ISSN 0361-8595 Journal Code: NR9

Languages: ENGLISH

The Pain Clinic at the University of Virginia Medical Center is a comprehensive facility providing a coordinated team approach to the management of chronic pain syndromes. The Clinic is primarily an out-patient facility, although in-patient therapy in clinic-assigned beds is available for special problems. Approximately 1,500 new patients are seen annually in the Clinic's own facilities, resulting in approximately 3,500 patient visits. All diagnostic facilities are readily available, and all somatic modulation and psychotherapeutic techniques are utilized for pain management.

Referrals are accepted only from physicians and then only after all medical records, the Clinic's Patient Assignment Inventory Narrative (a screening brochure), and special studies are reviewed. The initial evaluation includes, as well, history taking, physical examination, psychological testing and interview, special studies, specialty consultations, and family interview. A therapeutic plan is then developed and discussed with the patient and family members. The Clinic's philosophy is to encourage the patient to assume responsibility for all aspects of the treatment program including drug detoxification, activity and exercise programs, and functional performance.

**Children and Huntington's disease: some clinical observations of children-at-risk.**

Kosky R

Med J Aust ,Apr 18 1981, 1 (8) p405-7, ISSN 0025-729X  
Journal Code: M26

Languages: ENGLISH

Six children who were at risk for Huntington's disease were independently referred to a child psychiatry out-patient clinic. The clinical findings are presented. It was concluded in five cases that the symptoms could not be explained in terms of emotional reactions and that the children in these cases had evidence of cerebral dysfunction. The implications of this conclusion are discussed. The management of the children and their families and the progress of the children are also discussed.

**Vaginal administration of 15-methyl-PGF2 alpha methyl ester for preoperative cervical dilatation. Task force on prostaglandins for fertility regulation. The World Health Organization.**

Contraception ,Mar 1981, 23 (3) p251-9, ISSN 0010-7824  
Journal Code: DQN

Languages: ENGLISH

A multicentre clinical trial under the auspices of the World Health Organization's Task Force on Prostaglandins for Fertility Regulation involved 1001 primigravidae patients, 8-12 weeks pregnant, randomly treated either with 1.0 mg of 15-methyl-PGF2 alpha methyl ester in a vaginal suppository or a placebo suppository. Vacuum aspiration was undertaken three or twelve hours following insertion of the suppository. The results show that sufficient cervical dilatation can be achieved with a prostaglandin suppository which allows easier vacuum aspiration with less operative bleeding a fewer short-term complications. Diarrhoea and vomiting were more common in the treated group. The twelve-hour prostaglandin treatment period resulted in more dilatation up to the 10th week of pregnancy but also caused a higher incidence of side effects. If maximal dilatation is aimed for by twelve hours, pretreatment is preferable. If out-patient management is required, the three-hour schedule may be more convenient.

**Arterial surgery: research and principles of treatment during 20 years at the Seraphimer Hospital.**

Koyamees A

Acta Chir Scand [Suppl] ,1980, Suppl 500 p53-5, ISSN 0301-1860  
Journal Code: OKC

Languages: ENGLISH

At the Seraphimer Hospital the main interest in the vascular surgical basic research has been microangiography, clinical physiological diagnostic methods, isotope clearance techniques and metabolic changes in ischemic tissues. Clinical vascular

surgical research has mainly been reconstructive arterial surgery in patients with ischemic gangrene, deep femoral artery reconstruction, treatment of arterial embolism and the use of sympathectomy blocks. Walking exercises have been supervised by physiotherapists and all patients have been recommended to stop smoking. Anticoagulants have been reserved for prophylactic treatment of patients who postoperatively still have other critical stenoses. Regular post-operative examinations have been performed at the vascular surgical out-patient department.

**WHO collaborative study: assessment of depressive disorders.**

Sartorius N; Jablensky A; Gulbinat W; Ernberg G

Psychol Med ,Nov 1980, 10 (4) p743-9, ISSN 0033-2917  
Journal Code: QER

Languages: ENGLISH

In the context of an ongoing WHO research programme in depression, a total of 573 patients consulting psychiatrists in Canada, Iran, Japan and Switzerland were assessed with the WHO/SADD schedule which proved to be a simple and reliable instrument for standardized recording of clinical data. The results indicated that the "average" depressive patients seeking care in culturally different settings have many clinical features in common. A screening instrument, developed in the same study, has been shown to be effective in selecting depressive patients among in- and out-patient populations.

**Childhood autism and social class: a question of selection?**

Wing L

Br J Psychiatry, Nov 1980, 137 p410-7, ISSN 0007-1250  
Journal Code: B1K

Languages: ENGLISH

Children with typical autism, other early childhood psychoses and severe mental retardation without autistic behaviour were identified in an epidemiological study in an area of South East London. The social class distribution of their fathers was examined and no significant differences were found between the groups, nor in a comparison with the general population of the area. Fathers of children with autism and related conditions referred to an out-patient clinic with a special interest in autism, mostly at their own request, and fathers joining the National Society for Autistic Children, were of higher social class than both the average for England and Wales and the fathers of the study children. Joining the NSAC during its early years, and keeping up membership were also linked with higher social class. The findings supported the view that reports of a social class bias in autism may be explained by factors affecting referral and diagnosis.

**A modern burns unit.**

Thomsen M; Sorensen B

Ann Chir Gynaecol, 1980, 69 (5) p173-7, ISSN 0355-9521  
Journal Code: 51N

Languages: ENGLISH

In the year 1961 a special Burns Unit was opened in the old Municipal Hospital. As it was decided to build the new Hvidovre Hospital it was planned also to move the Burns Unit to this large University hospital which contained all other specialities. The department for plastic surgery and the Burns Unit consists of 35 beds, 7 of which are part of the intensive care unit. The Unit also runs an extensive out-patient service both for patients with burns and plastic surgery cases. Patients with acute burns are admitted to a special room in the emergency ward with facilities for flushing burns and corrosions. The plan of the Unit and the principles of treatment are discussed. Most of the admitted patients come now from parts of Denmark other than the City of Copenhagen, so according to its tradition the Unit continues to function both as a centralized and a specialized Burns Centre.

**Comparison of complications between in-hospital patients and out patients for aesthetic surgical procedures: a ten-year study.**

Klein DR; Rosenberg A

Plast Reconstr Surg, Jan 1981, 67 (1) p17-9, ISSN 0032-1052  
Journal Code: P95

Languages: ENGLISH

On the basis of the clinical evidence and the statistical analysis of the 10-year survey, this study would confirm our hypothesis that in the surgical procedures performed-rhytidectomy and augmentation mammoplasty-there is no significant difference in the rate of serious complications between the inpatient group and the outpatient group. It would seem appropriate that further studies should be undertaken to evaluate other procedures and other complications. If we are to embark further on the course of out patient aesthetic surgery, we must strive for greater statistical knowledge in the area of complications and risk factors to evaluate our results better, keeping in mind our ultimate goal of continually improving our art.

**[Continuous ambulatory peritoneal dialysis (author's trans)]**

La dialyse peritoneale continue ambulatoire.  
Nouv Presse Med ,Nov 8 1980, 9 (42) p3153-63, ISSN  
0301-1518 Journal Code: 05Q

Languages: FRENCH Summary Languages: ENGLISH  
Continuous ambulatory peritoneal dialysis (CAPD) required rapid technique and high quality material. This paper describes the material prepared and supplied by the Central Pharmacy of Paris Public Hospitals and the results obtained with this material in the Nephrology Department of the Pitie-Salpetriere Hospital. The peritoneal catheter, introduced under local anaesthesia, is the double-cuffed Tenckhoff catheter. The two dialysates routinely used mainly differ in glucose concentration (83 and 250 mmol/l respectively). The plastic bags are made of polyvinylchloride; those for adults have a capacity of 2.8 l and contain 2 l of dialysate; smaller bags are available for children and adolescents. The patients are trained in an independent out-patient unit opened from 8 a.m. to 9 p.m. The average duration of training is 10 days, and audio-visual aids are widely used. Between August, 1978 and February, 1980 forty-seven patients were accepted for training. Their mean age at the start of treatment was 65 years, and the follow-up was 308 patient-months. During this period there were 5 deaths, only one of which could be blamed on the dialysis technique. There was one peritonitis per 7.5 patient-months, and the mean duration of hospital treatment for all complications was 15 days per patient-year. In view of the patients' age and of the deliberate selection of high-risk patients (including 8 diabetics), these results are very encouraging. However, a longer follow-up is needed to determine the exact place of CAPD among the various treatments of end stage renal failure.

**[Drug monitoring in psychiatry (author's trans)]**

Drug Monitoring in psychiatrischen Kliniken. Bericht der Arbeitsgruppe für Medikamenten-Überwachung in der Psychiatrie.  
Rüther E; Benkert O; Eckmann F; Eckmann I; Grohmann R; Helmchen H; Hippus H; Müller-Derlinghausen B; Poser W; Schmidt L; Stille G; Strauss A; Uberla K  
Arzneimittelforsch ,1980, 30 (8) p1181-3, ISSN  
0004-4172 Journal Code: 91U

Languages: GERMAN Summary Languages: ENGLISH  
The Study Group for Drug Surveillance in Psychiatry (AMUP) has been working since July 1978 as a task force group of the "Arbeitsgemeinschaft für Neuropsychopharmakologie und Pharmakopsychiatrie" (AGNP). A protocol was designed for the initiation of drug monitoring in psychiatric hospitals. With support of the Bundesgesundheitsamt, Berlin, the first part of this project was started as a practicability study in the psychiatric hospitals of the Universities of Berlin, Göttingen, and Munich and in the municipal hospital of Schleswig. The study includes 7650 in-patients. It is based on

the following methods: intensive drug monitoring, organized spontaneous monitoring of adverse drug reactions and registration of drug applications. This drug monitoring system in psychiatry will be expanded to other psychiatric hospitals, and eventually to out-patient clinics as well as private practices within the next two years.

**The influence of supervision and endogenous insulin secretion on the course of insulin-dependent diabetes mellitus.**

Deckert T  
Acta Endocrinol [Suppl] (Copenh) ,1980, 238 p31-8, ISSN  
0302-9522 Journal Code: ONF  
Languages: ENGLISH

In order to study the importance of out-patients' supervision on survival, a prospective study of 1061 juvenile diabetics was performed. After the first hospitalization at the Steno Memorial Hospital 5.3 +/- 4.5 years after the onset of diabetes, this population of diabetics was divided into two comparable groups by their own practitioners. One group (n = 525) was referred for further out-patient supervision to the out-patient clinic, the other group (n = 536) was not. 96.7% of the patients were followed at least 25 years. A highly significant increased survival was seen in patients seen in 4-5 times a year at the diabetic out-patient clinic. Death from ketoacidosis, hypoglycemia, and suicide was significantly higher in the group not referred for further out-patient control, and death in uremia occurred earlier in this group. Juvenile diabetics with long-standing diabetes and persisting endogenous insulin secretion evaluated on the basis of C-peptide examination had significantly less severe retinopathy and nephropathy than comparable patients without endogenous insulin secretion, and survival of juvenile diabetics with clinical indications of persisting endogenous insulin secretion seems not to be different from non-diabetics.

**Attendance failure at paediatric medical outpatient clinics.**

Kellaway GS; Brown SA

NZ Med J ,Jul 9 1980, 92 (663) p15-7, ISSN 0028-8446

Journal Code: DBQ

Languages: ENGLISH

Failure in attendance at medical out-patient clinics at Princess Mary Paediatric Hospital occurred in 46 percent of patients. This was due to patient error, administration error and patient non-compliance. Failure in attendance by Polynesians was due to error and non-compliance; caucasians mainly non-compliance. Hospital administrative errors accounted for default in 6 percent of all patients. Methods of reducing the problem of failure in attendance at out-patient clinics are considered. The aim of this study was to determine the incidence of failure in attendance at Princess Mary Paediatric Hospital (PMH) medical out-patient clinics (OPC) and to establish the reasons for default.

**Metabolic control of diabetes mellitus during routine management at an out-patient department.**

Karlander SG; Alinder I; Hellstrom K

Acta Med Scand ,1980, 207 (6) p475-81, ISSN 0001-6101

Journal Code: 14G

Languages: ENGLISH

The current study comprised 376 living and 140 deceased diabetic patients. A majority of the patients had received oral hypoglycemic agents (tablets) or insulin, while a modified diet alone had been prescribed for a minority. The mean age of the tablet-treated patients (67 and 73 years for those now alive and deceased, respectively) was in general 6--10 years higher than that of insulin-treated patients. The mean morning blood glucose level ranged between 8.3 and 10.5 mmol/l. A considerable number of the tablet-treated patients were overweight and hypertriglyceridemic. About one third of the patients in both groups were considered to be in a fairly good state of metabolic control, arbitrarily defined as a urinary glucose excretion of less than 110 mmol/24h, a relative body weight of less than 115% and a serum triglyceride level below 2.0 mmol/l. Cardiovascular disease was the cause of death in 60--70% of the patients. Patients with clinical evidence of atherosclerosis did not differ from age-matched pairmates without signs of macroangiopathy with regard to hyperglycemia and hyperglucosuria. However, the prevalences of hypertriglyceridemia, hypertension and overweight tended to be higher in the former. It is concluded that factors of importance for development of atherosclerosis in a non-diabetic population should be considered in the treatment of diabetes mellitus.

[A psychiatric survey of a metropolitan district. An analysis of the out-patient-service of the Rheinische

**Landesklinik Köln-Merheim (author's transl)]**

Psychiatrisch-epidemiologische Patientenstatistik innerhalb einer Grossstadtregion. Eine Untersuchung der Ambulanz der Rheinischen Landesklinik Köln-Merheim.

Jakumeit U; Nehls C

Psychiatr Prax ,Aug 1980, 7 (3) p133-54, ISSN 0303-4259

Journal Code: OCK

Languages: GERMAN Summary Languages: ENGLISH

In the last years there has been an increasing interest in psychiatric surveys as basis of epidemiologic studies and morbidity investigations. Numerous statistics from hospitals, from general psychiatrists and general practitioners have been referred to and constitute the basis for the 'Enquete zur Lage der Psychiatrie in der Bundesrepublik Deutschland'. The out-patient-service of the Rheinische Landesklinik Köln-Merheim is operating in line with the recommendations of the Enquete committee as one of the first psychiatric establishments in the BRD and as the first in Nordrhein-Westfalen. It consists in a community psychiatric service closely attached to a psychiatric clinic, which is in charge of the overall psychiatric assistance for a municipal district of 500.000 inhabitants. The present study outlines the frequency and categories of psychiatric diagnosis in the psychiatric out-patient-service during a period of 9 months. The case register of ICD underlies the classification of mental diseases. By evaluating a rating scale which had been established for every patient it was possible to demonstrate correlations between diagnosis, age, sex, social status, marital status and nationally. Almost all diagnosis groups demonstrate a prevalence of the female sex except for alcoholism, drug addiction and gerontopsychiatric troubles. Neurotic diseases come at the first place, followed by schizophrenic illnesses. Compared to an evaluation of 1975 there has been an increase of schizophrenia. This fact reveals a modification of concept which puts more stress on after care of ancient in-patients. This group of patients will probably represent the greatest share of out-service patients in future.

**[Frequency and time of diagnosis of congenital heart defects in an out-patient clinic (author's transl)]**

Häufigkeit und Zeitpunkt der Diagnose von angeborenen Herzfehlern in der Praxis.

Friedl G; Rautenburg HW

Dtsch Med Wochenschr ,Jul 4 1980, 105 (27) p954-8, ISSN 0012-0472 Journal Code: ECL

Languages: GERMAN Summary Languages: ENGLISH

The frequency of different forms of congenital heart disease was obtained from among a group of 1066 patients seen in a paediatric-cardiological out-patient clinic, the diagnosis being confirmed by cardiac catheterisation and (or) angiocardiology. Also recorded and analysed was the time the various defects, subsequently confirmed by other methods, were first diagnosed in an out-patient clinic. It became clear that cyanotic lesions and acyanotic ones with a large left to right shunt as well as additional pulmonary stenosis were diagnosed earlier than atrial septal defect, persistent ductus arteriosus, coarctation of the aorta, aortic stenosis or pulmonary stenosis--some of which were first noted by their murmur during examinations in the nursery school.

**Anaesthesia for day-care surgery: a symposium (IV). Anaesthesia for paediatric out-patients.**

Steward DJ

Can Anaesth Soc J ,Jul 1980, 27 (4) p412-6, ISSN 0008-2856 Journal Code: CG7

Languages: ENGLISH

Out-patient surgery for infants and children offers the advantages of minimal emotional upset, less risk of infection, and fiscal economy. Many different operations can be done in the out-patient department and most children can be accepted for general anaesthesia for these operations. Preparation of the child is similar to that required for in-patient surgery. Premedication is unnecessary and contraindicated. A variety of techniques may be selected for induction of anaesthesia without unduly prolonging recovery. General inhalation anaesthesia with halothane is preferred for maintenance. Careful tracheal intubation should be utilized whenever indicated. Regional analgesia has many advantages over narcotic analgesics in the treatment of post-operative pain. A follow-up service should be provided. (14 Refs.)

**[Medical rehabilitation in the Netherlands (author's transl)]**

Medizinische Rehabilitation in den Niederlanden. Stand Sommer 1979.

Schmidt-Kessen W

Rehabilitation (Stuttg) ,Aug 1980, 19 (3) p133-8, ISSN 0034-3536 Journal Code: R3P

Languages: GERMAN Summary Languages: ENGLISH

The present state-of-the-art in "Revalidation" in the Netherlands is described, where the term is used to denote medical rehabilitation including prevocational assessment of physically disabled persons. Sample surveys in 1971/72 revealed insufficient awareness and under-use of existing rehabilitation services. Since then, special emphasis has been placed on out-patient rehabilitation (clinics), with facilities and services being organised so as to serve a region of appr. 300,000 persons each, or an area within a radius of 30 kms from the facility. Organisation and staff schedules of rehabilitation facilities are discussed. Recently, marked preference of the "active" therapists can be noted. As in other countries, further development of the Anglo-Saxon team concept has, in the Netherlands too, given rise to a number of problems which are discussed more fully.

**[Comparison of hospitalized hypertensive patients and those consulting in a specialized unit. Initial clinical state and patient compliance]**

Comparaisons des hypertendus hospitalises et consultants dans une unite specialisee. Etat initial et observation des conseils medicaux.

Froment A; Milon H; Gallavardin P; Gosset S; Gravier C

Arch Mal Coeur ,Oct 1979, 72 (10) p1137-45, ISSN

0003-9683 Journal Code: 7SM

Languages: FRENCH Summary Languages: ENGLISH

This study is based on a series of 1919 hypertensive patients examined consecutively either in hospital or in the out patient clinic between 1969 and 1977 and reviewed in February 1977 by a postal questionnaire. The initial presentation of in-patients and out-patients differed very significantly in the same specialised department: the patients hospitalised were seen at a more advanced stage of their hypertensive illness. Neither group was truly representative of the general population of hypertensive patients. The percentage of patient compliance was only slightly lower in the out-patients. The mortality rate observed did not differ significantly from the expected mortality rate in out-patients; despite treatment it remained over 200% greater in the hospitalised group. It would seem desirable to develop out-patient rather than in-patient hospital facilities for the treatment of hypertension, despite the foreseeable practical difficulties.

**Evaluation of a decentralized system for chronic disease care: seven years of observation.**

Miller ST; Zwagg RV; Joyner MB; Runyan JW Jr

Am J Public Health ,Apr 1980, 70 (4) p401-5, ISSN

0090-0036 Journal Code: 3XW

Languages: ENGLISH

Observations of a publicly-financed system for the medical

care of a large number of persons with chronic diseases have been made over seven years. The system combines decentralized, nurse-staffed neighborhood clinics, operated by a public health department, with a central referral clinic for consultations and the management of complicated problems. After seven years in the chronic disease program 55% of 1,004 patients with diagnoses of diabetes mellitus, hypertension, and cardiac diseases were still receiving care, 19% had died, and 26% had been lost to the program. In the seventh year, the mean diastolic blood pressure in hypertensives was 84 mm Hg and the mean serum glucose in diabetics was 203 mg/dl. For the group under care, hospital days/1000/year were 74% of the rate during the year before referral to the program and out-patient visits/1000/year were approximately the same as before referral. However, two-thirds of the visits, formerly made to a public hospital, were now being made to neighborhood clinics. The system appears to be an effective method of providing medical services for persons who formerly used the public hospital as their source of outpatient care.

**Psychiatric illness in a neurological out-patient department in North East England. Use of the General Health Questionnaire in the prospective study of neurological out-patients.**

Kirk CA; Saunders M

Acta Psychiatr Scand ,Nov 1979, 60 (5) p427-37, ISSN 0001-690X Journal Code: 1VY

Languages: ENGLISH

342 patients referred to a neurological out-patient department in North East England between November 1975 and November 1976 were studied prospectively using two methods of psychiatric case identification, by clinical interview and by use of the General Health Questionnaire. The population of psychiatric patients identified by clinical techniques is different from that identified by the GHQ and it is concluded that GHQ cannot be used for routine screening in the neurological clinic. Clinical data were compared with a previous retrospective study. Clinical assessment revealed 27% with psychiatric disorders whilst GHQ showed a probable psychiatric morbidity of 48% with a cut off score of 11/12 and 21% with our best cut off score of 26/27. Statistical problems with this method are discussed and the results of this study compared with others using the same questionnaire. Aspects of organic and psychiatric disorder in a neurological clinic are discussed.

**[Psychological care for diabetic children, adolescents and their parents (author's transl)]**

Psychologische Betreuung diabetischer Kinder und Jugendlicher und ihrer Eltern.

Hurter H; Hurter P

Monatsschr Kinderheilkd ,Jan 1980, 128 (1) p11-5, ISSN 0026-9298 Journal Code: NHO

Languages: GERMAN Summary Languages: ENGLISH

A model of the psychological care for diabetic children, adolescents and their parents is presented. The model was developed from experiences gained in an out-patient clinic for diabetic children, based on individual, family and group discussions. It proved necessary to start psychological care immediately after the manifestation of diabetes. The psychological problems of diabetic children and adolescents as well as their parents vary with age. This calls for a grouping according to the age of the individual patient. The aim of the psychological care is to help the patients and their parents to accept the fact of diabetes, and to allow a more conflict-free adjustment to the new burden involved. A further aim is to prevent the development of neurosis. The clinical manifestation of neurosis in diabetic children and adolescents is characterized by symptoms specific to diabetes.

**Therapy improvement in two out-patient mental health clinics.**

Johansson SL; Silverberg R; Lilly RS

J Community Psychol ,Jan 1980, 8 (1) p34-44, ISSN 0090-4392 Journal Code: HUU

Languages: ENGLISH

This study describes clients, therapists, treatment characteristics, and therapy outcomes for 551 consecutive, first-time clients at two out-patient mental health clinics. Significant improvement was found on target problems, global outcome ratings, and Hopkins Symptom Checklist scores for clients who mutually terminated therapy. The target problem and outcome ratings remained higher for this group than for dropouts at a six-month follow-up interview. Clients who improved most were those who were initially most uncomfortable and disturbed. Improvement was also strongly related to the number of therapy sessions. The implications of these and other results are discussed.

**[Access to medical care of patient with hypertension: influence of socio-professional categories (author's transl)]**

L'accès de l'hypertendu aux soins: influence des catégories socio-professionnelles.

Degoulet P; Devries C; Wolf JP; Plouin PF; Menard J

Nouv Presse Med ,Jan 5 1980, 9 (1) p15-9, ISSN 0301-1518 Journal Code: 050

Languages: FRENCH Summary Languages: ENGLISH

An analysis of socio-professional categories was performed in 712 active hypertensive men, referred between January 1st 1976 and December 31st 1977 to the hypertension out patient clinic of the Saint-Joseph Hospital, Paris. The percentages of senior executives, middle executives and patients with liberal professions, were higher than those calculated in the whole French population. In contrast, the percentages of craftsmen, shopkeeper, employees and manual workers were lower. Furthermore, blood pressure levels obtained by history and those found at first consultation were higher in employees and manual workers than in patients from a higher socio-economic level. The social differences which are observed may be related to known data concerning mortality, morbidity and drug consumption according to socio-professional categories. They should lead physicians and health care administrators to seek more effective and egalitarian methods of prevention.

**Sexual and marital problems in a psychiatric out-patient population.**

Swan M; Wilson LJ

Br J Psychiatry ,Oct 1979, 135 p310-4, ISSN 0007-1250 Journal Code: B1K

Languages: ENGLISH

The study aimed to identify those patients referred to a psychiatric out-patient clinic who had sexual or marital difficulties and who could be offered help with these problems, although none of the patients had been referred primarily for sexual or marital therapy. The methods of assessment formed a series of filtering devices for screening the sample, and possible reasons for discrepancies in the results are discussed. Twelve per cent of the sample had sexual or marital problems and were offered treatment, and it is suggested that this proportion may be an underestimate of the 'true' frequency of such problems in the sample. Implications of this finding for the provision of treatment resources in the psychiatric out-patient setting are considered.

**Efficiency of address cards, experienced health visitors and motivated registry clerks in obtaining the home address of urban patients in South India.**

Radhakrishna S; Satagopan MC; Krishnaswami KV; Tripathy SP; Fox W

Tubercle ,Sep 1979, 60 (3) p151-7, ISSN 0041-3879  
Journal Code: WH9

Languages: ENGLISH

The address card, a card on which the patient's home address is asked to be recorded by the local postman, or by a knowledgeable and literate neighbour, relative or friend, was investigated for acceptability and efficiency in 4 tuberculosis out-patient clinics, in an urban community with substantial levels of illiteracy in Madras City. In the 4 clinics combined, 96% of the patients who reattended returned the completed card. Letters posted to the address on the card were received by 85% of 419 patients, while 5% were returned by the post office as undelivered and a further 4% were, in all probability, not delivered; no information was available about the remaining 6%. A formal comparison in 392 of the above patients demonstrated the address card method to be significantly more efficient than interrogation by experienced health visitors. A retrospective comparison suggested that the efficiency of experienced health visitors was slightly better than that of highly motivated registry clerks, the proportions of letters received being 72% and 65% respectively.

0137014 80065422

**Aspects of the patient intake process in a psychotherapy clinic.**

Tyson RL; Reder P  
Br J Med Psychol ,Dec 1979, 52 (4) p309-20, ISSN

0007-1129 Journal Code: AYD

Languages: ENGLISH

Recent interest in psychotherapy services in the National Health Service has raised questions regarding the availability of existing psychotherapy facilities. In attempting to answer some of these questions, a study was made of aspects of the referral and assessment segments of the intake process of 180 patients referred in 1975 to the Paddington Centre for Psychotherapy Adult Out-patient Department. Of this group, 137 were referred for individual psychoanalytically oriented psychotherapy, 82 of whom were offered assessment interviews, 45 offered treatment and 40 actually began treatment during the study period. An additional seven patients originally assessed for group therapy were offered and began individual treatment. Some characteristics of the referral population, the referring agencies, the effects of a waiting list, and the phenomenon of dropouts are discussed and compared with findings from other Centres.

**Protocols in ambulatory care.**

Komaroff AL; Ervin CT; Pass TM; Sherman H  
Public Health Rev ,Jan-Jun 1978, 7 (1-2) p135-55, ISSN  
0301-0422 Journal Code: Q10

Languages: ENGLISH

Protocols offer a mechanism for bringing together two major trends in outpatient care. The first trend is the delegation of certain clinical tasks and responsibilities to health workers other than physicians, and to patients themselves. The second trend is the movement toward standard-setting, peer review, audit and quality assurance, and cost-effectiveness of medical practices. Most of the studies of the use of protocols have been with nurse practitioners, physician assistants, office nurses, and health workers. These studies indicate that non-physicians using protocols - in comparison with physicians using traditional methods - give care that is equally thorough, and that leads to comparably accurate diagnosis treatment, and appropriate referral to physicians. Additionally, health workers guided by protocols achieve relief of patients; symptoms and patient satisfaction, and provide care that is efficient in terms of practitioner time, medication, and test ordering. Consequently, health workers using protocols can reduce the cost of care. Protocols have been developed for use in out-patient areas in both developed and developing nations. Protocols can also be easily audited as part of a quality assurance program, effecting even further saving in costly provider time. (39 Refs.)

**A video-recording system for evaluating the clinical interview--a simple, inexpensive method.**

Russell ML; Insull W Jr  
Med Prog Technol ,Jun 15 1979, 6 (3) p141-5, ISSN  
0047-6552 Journal Code: M9H

Languages: ENGLISH

A simple, inexpensive video-recording system was designed to provide raw data for the evaluation of therapist interview behaviors in the out-patient clinic. The system uses a combination of commercially available cameras, lenses, and recording equipment which do not require technical audio-video expertise to operate. Video-cassette recordings are produced that contain full-face, head-and-shoulders images of both the therapist and the patient. An automatic search control terminal rapidly locates any point on the video-cassette for review. Using normal clinic lighting and little space, the system is easily installed in any existing clinic examination room. A description of the system's use in examining the counseling and interviewing skills of a medical clinic staff is presented.

**Nutritional care in pregnancy: the patient's view. III. Perceived need for advice and effectiveness of advice received.**

Orr RD; Simmons JJ  
J Am Diet Assoc ,Aug 1979, 75 (2) p136-40, ISSN  
0002-8223 Journal Code: H6F  
Languages: ENGLISH

Interviews were conducted with ninety-two pregnant women who attended the out-patient clinic of a major obstetrical teaching hospital. Information was obtained on the patients' perception of their need for dietary advice during pregnancy and selected demographic, nutritional, and medical care characteristics, as well as their response to, and satisfaction with, the dietary advice and treatment they received. The patients' perceived need for dietary advice appears to be an important factor in the apparent effectiveness of prenatal dietary counseling. Patients who expressed a need for dietary advice were more likely to consider diet important during pregnancy, to have positive feelings toward nutrition services, to have visited the dietitian, and to report making changes in their diet because of the advice received. Little association was observed between demographic and medical care characteristics of patients or more objective measures of need for dietary advice and the patients' own perception of need. It is suggested that patients whose expressed need for counseling is at variance with objective measures are a group requiring special attention.

**Nutritional care in pregnancy: the patient's view. II. Perceptions, satisfaction, and response to dietary advice and treatment.**

Orr RD; Simmons JJ  
J Am Diet Assoc ,Aug 1979, 75 (2) p131-6, ISSN  
0002-8223 Journal Code: H6F  
Languages: ENGLISH

Ninety-two pregnant women attending the out-patient clinic of a major obstetrical teaching hospital were interviewed. Information on their perception of diet during pregnancy, response to dietary advice, and satisfaction with the type and amount of dietary information given was collected. Almost all subjects considered diet to be important during pregnancy. Prenatal dietary advice was perceived as somewhat restrictive,

and for approximately a third of the subjects, compliance with dietary advice was a serious concern. Most subjects indicated making some dietary changes during pregnancy, usually as a result of the advice received. Poor compliance was reported with iron supplementation, and many of the women attributed adverse symptoms to this medication. Subjects appeared more satisfied with the amount than the type of dietary advice received, and negative or noncommittal attitudes toward nutrition services were expressed by half of the subjects. Feeling of guilt, attitudes of other professionals, and perceived difficulties of complying with dietary instructions were the major reasons given for these negative feelings. Rescheduling and better integration of nutrition services in the prenatal visit are suggested to improve patient satisfaction with dietary counseling.

0124844 79217276

**Nutritional care in pregnancy: the patient's view. I. Amount, type, and sources of dietary advice and treatment.**

Orr RD; Simmons JJ  
J Am Diet Assoc ,Aug 1979, 75 (2) p126-31, ISSN  
0002-8223 Journal Code: H6F  
Languages: ENGLISH

Interviews were conducted with ninety-two pregnant women who attended an out-patient clinic of a major obstetrical teaching hospital. All were between thirty-four and thirty-eight weeks pregnant when interviewed. Information was obtained on the amount, type, and sources of professional dietary advice; current dietary treatments; and the patterns and nature of the patients' contacts with dietitian. The dietitian was the major source of prenatal dietary advice. Only one-third of subjects received additional advice from other professionals, usually the nurse. Physicians were rarely identified as a source of dietary advice. Approximately one-third of subjects reported receiving dietary instructions to restrict intakes of calories and/or sodium. Physicians instituted these restrictions more frequently than did nurses. Few patients were referred to the dietitian for advice on these diets. Multivitamin and iron supplements were prescribed routinely. Three-quarters of subjects made at least one visit to the nutrition service, generally early in their prenatal care. For most subjects, this was their first experience with a dietitian. Nurses made considerably more referrals to the dietitian than did physicians. There would appear to be a need to educate other health professionals, especially physicians, on the advantages of more liberal diets and weight gain in pregnancy and on the special skills of the dietitian in promoting sound nutritional habits.

**[Trends in some treatment-criteria of patients of a dermatological children-ward (author's trans!)]**

Entwicklungstendenzen im Patientengut einer dermatologischen Kinderstation.

Kussatz I; Barth J; Gast W  
Dermatol Monatsschr ,Apr 1979, 165 (4) p264-9, ISSN 0011-9083 Journal Code: E2J  
Languages: GERMAN Summary Languages: ENGLISH

In comparative studies on some treatment-criteria of patients of a dermatological children-ward between 1967, 1969, 1971, 1973, 1975 and 1977 we found a tendency to increased out-patient-treatment, a reduction in period of clinical sojourn and a significant increase in patients drug consumption. Most important reasons of this development are the following: Temporary decrease of birth rate in GDR; increased capacity of out-patient-treatment in the Leipzig-area; application of more effective drugs; improvements in management of clinical treatment. About 50% of treated in-patients are 0 to 3 years old. The great importance of a qualified dermatological treatment for success of clinical sojourn on a children-ward is underlined.

**Chemotherapy of advanced head and neck cancer with methotrexate, bleomycin, and cis-diamminedichloroplatinum II in an effective outpatient schedule.**

Vogl SE; Kaplan BH  
Cancer ,Jul 1979, 44 (1) p26-31, ISSN 0008-543X  
Journal Code: CLZ  
Languages: ENGLISH

Thirty-one patients with advanced cancer of the head and neck, twenty-six of whom had failed prior irradiation, were treated with an out-patient chemotherapy regimen combining methotrexate, bleomycin, and cis-diamminedichloroplatinum (II). The overall response rate among evaluable patients was 61%, with 22.5% complete remission. If 6 additional patients not completing 3 weeks of treatment are included, the response rate was 51.4%. The median duration of partial remission was 3 months, but none of the complete remitters has relapsed with a follow-up of two to twenty months (median six). Response rate was not dependent on performance status, prior irradiation, or primary site. Toxicity was mild. The remission rate and duration suggest that this regimen may be superior to single agents, and as effective as more complicated and toxic

regimens using higher doses of the same drugs.

**Depressive symptomatology in patients attending a hospital-based general out-patient clinic.**

Jegede R  
Afr J Med Med Sci ,Dec 1978, 7 (4) p207-10, ISSN 0309-3913 Journal Code: 29G  
Languages: ENGLISH

The prevalence of depressive symptomatology was estimated in 154 patients attending a general out-patient clinic for the first time. The instrument used was Zung's Self-rating Depression Scale (SDS). The mean score on the SDS fell within the range of scores obtained by mildly depressed patients in previous studies. Even though many patients obtained scores corresponding to moderate or severe depression, non of the patients was referred to the psychiatric out-patient clinic located in the same hospital. The findings are discussed with respect to their diagnostic significance and the role of the general practitioner in the management of patients with psychiatric disorder.

**Psychological stress, ego defenses, and cortisol production in children hospitalized for elective surgery.**

Knight RB; Atkins A; Eagle CJ; Evans N; Finkelstein JW; Fukushima D; Katz J; Weiner H  
Psychosom Med ,Feb 1979, 41 (1) p40-9, ISSN 0033-3174  
Journal Code: QGR  
Languages: ENGLISH

This study was designed to investigate the relationship between the effectiveness of coping mechanisms and physiological indicators of distress in children faced with the experience of hospitalization and surgery. Twenty-five children between the ages of 7 and 11 were studied in the out-patient department, 2 weeks before surgery, and again during their hospital stay. Effectiveness of defenses and defense style was measured by a clinical interview and by the Rorschach test. Cortisol production rates were measured by the analysis of 24-hour urine collections at home and again in the hospital. Ward adjustment was also rated by a ward questionnaire. The results indicated no relationship between defense effectiveness and cortisol production rates in the out-patient department and an inverse relationship between cortisol production and defense effectiveness under the stress of hospitalization. Defense style was found to correlate with coping under stress. Four different groups of children emerged, suggesting four different types of reaction to the hospital experience.

**[Intra-femoral artery injections in a hospital angiology clinic]**

Les injections intra-arterielles femorales en consultation hospitaliere d'angiologie.

Griton P

Phlebologie ,Jan-Mar 1979, 32 (1) p47-52, ISSN 0031-8280 Journal Code: P66

Languages: FRENCH Summary Languages: ENGLISH

Intra-arterial injections of vasodilators are due to Henri Reboul. After a recent disfavor, the modern equipment together with a simple and detailed technique make it possible to easily do repeated injections. The only accidents are hematomas due to insufficient compression. Use of anticoagulants is the main counter-indication. Lidocain hydrochloride or pure scylocain 1% are the safest drugs. The antispasmodic papaverine, various vasodilators, antibiotics and heparin can be added. In out patient clinics, the rate of injections is one to three per week for a series of 10 injections at the most. Stage II arteritis is the ideal situation and successes are also found in stages III and IV. During the first visit for a acute phlebitis intra-arterial injection of scylocain with 100 mg. heparin makes it possible to start the necessary therapy with anticoagulants. The simple post-phlebitis venous edema seems a case in which the technique should be used.

**The prognosis of insulin dependent diabetes mellitus and the importance of supervision.**

Deckert T; Poulsen JE; Larsen M

Acta Med Scand [Suppl] ,1979, (624) p48-53, Journal Code: 14K

Languages: ENGLISH

1451 patients with IDDM, onset before 1953 and before the age of 30 were followed until death or until 1976. Survival with diabetes, relative survival and the influence of

supervision on survival were examined. It is shown that only 50% of the patients survived more than 30 diabetes years. The patients had an overmortality of more than 600% in relation to age and sex matched non-diabetics. Frequent supervisions in the out-patient clinic reduced as well the overmortality as the prevalence of severe complications significantly.

**A preliminary report of an out-patient systems study in Sri Lanka.**

Nimalasuriya A; Gafoor AL

Med Inf (Lond) ,Dec 1978, 3 (4) p327-31, Journal Code: LUG

Languages: ENGLISH

Out-patient medical clinics in Sri Lanka often have long queues of patients waiting to see a doctor partly due to a shortage of doctors. To apply operational research techniques to optimize the functioning of the clinic, an initial step is to determine the distributional pattern of patient arrival times and the doctors' service times. The results showed that the arrival times of patients were time dependent. However, analysis of half-hourly data of inter-arrival times showed a negative exponential distribution. The doctor's service time varied from doctor to doctor and whether new or follow up patients were being seen. Each of the service times seemed to fit into an Erlangian distribution.

**Comparison of oral sucrose and glucose electrolyte solutions in the out-patient management of acute gastroenteritis in infancy.**

Hutchins P; Matthews TH; Manly JE; Lawrie B; Walker-Smith JA  
J Hyg (Lond) ,Feb 1979, 82 (1) p15-9, ISSN 0022-1724  
Journal Code: IEF

Languages: ENGLISH

Seventy-three children under the age of 18 months presenting with acute gastroenteritis were given an electrolyte mixture with added sucrose or glucose in a randomized double-blind trial. The time taken to recovery in those successfully treated as out-patients was identical. However, of the 34 who received glucose, 11 (32%) required admission compared with 7 (18%) of the 39 who received sucrose. There was a wide range of osmolality of the made-up feeds, indicating inaccuracy in diluting the solutions as prescribed, but this did not in general correlate with need for admission. Sucrose-electrolyte solution is at least as effective as a glucose-electrolyte solution for the out-patient management of acute gastroenteritis in infancy. The cheapness and easy availability of sucrose commends its use in developed and developing countries.

**A controlled comparative study of the use of porcine xenograft in the treatment of partial thickness skin loss in an occupational health centre.**

Chatterjee DS  
Curr Med Res Opin ,1978, 5 (9) p726-33, ISSN 0300-7995  
Journal Code: DUX

Languages: ENGLISH

Twenty-eight patients with partial thickness skin loss of the limbs, mainly due to burns, were treated on an out-patient basis in an occupational health centre. Thirteen patients were treated with porcine skin graft and the other 15 by the conventional method with paraffin gauze. The results showed that the median healing time was 13 days in the porcine skin graft group and 28 days in the control group. Other than healing time, the effects of porcine xenograft in reducing pain, infection and sickness absence were far greater than those with conventional treatment. From a comparison of total dressing costs, it was estimated that for lesions of comparable size the cost of treatment with porcine xenograft was approximately one-third of that using paraffin gauze.

**Experience with a sustained-release formulation of oxprenolol in the management of angina pectoris in hospital out-patient departments.**

Forrest WA  
Curr Med Res Opin ,1978, 5 (9) p669-74, ISSN 0300-7995  
Journal Code: DUX

Languages: ENGLISH

One hundred and two patients with angina pectoris under treatment with beta-receptor antagonists prescribed on a multi-dose basis were openly switched to treatment with once-daily sustained-release oxprenolol (160 mg per tablet). Eighty-eight patients were successfully managed on once-daily oxprenolol and 70% achieved significant benefit with a single morning dose of 160 mg. The mean number of anginal attacks and the mean glyceryl trinitrate consumption were both significantly reduced. It is concluded that once-daily treatment with oxprenolol in sustained-release form offers the advantage of reduced tablet ingestion without symptomatic detriment in the management of angina pectoris.

The data on the care of children with CNSLD obtained from pediatricians working at out-patient departments in 15 districts of the Rostock and Neubrandenburg counties (in the north-eastern region of the GDR) are analyzed in a pilot study. This survey shows that there are 6 standard bronchitis dispensaries and an additional dispensary with highly specialized diagnostic equipment (Pediatric Clinic of the University of Greifswald) in 7 of the districts. In the remaining districts care of these children is provided within the framework of general medical outpatient care. 2% of the children having CNSLD only 36% receive medical treatment, which is a rather low percentage. This situation will be improved on the basis of better cooperation with the family doctors and the out-patient departments for lung diseases.

**Anaesthesia for ambulatory surgery.**

Dechene JP

Can Anaesth Soc J ,Nov 1978, 25 (6) p512-6, ISSN  
0008-2856 Journal Code: CG7

Languages: ENGLISH

Most surgeons and hospital administrators now recognize that many surgical procedures can be done on an out-patient basis and anaesthetists have been instrumental in developing and implementing the practice of short-stay surgery. It is our opinion that general anaesthesia using enflurane and Alfathesin will increase the safety of ambulatory surgery.

**MMPL-differences between fee-paying and non-fee-paying psychotherapy clients.**

Brown JB; Dunbar PW

J Clin Psychol ,Oct 1978, 34 (4) p953-4, ISSN 0021-9762  
Journal Code: HTJ

Languages: ENGLISH

Compared the MMPI profiles of 23 randomly selected fee-paying clients (FP group) of an out-patient psychiatry clinic to those of 23 clients who left unpaid bills (NFP group). All Ss had been terminated at least 2 months. No differences between groups were found on age, education, income, fee level, number of therapy sessions, sex, or marital status. The NFP group scored significantly higher on the F, Paranoia, and Schizophrenia scales. Additionally, the NFP group endorsed significantly more critical items and generated a greater number of mean scale scores over 70. These results suggest a relationship between degree of psychopathology and non-fee-payment.

**Tricyclic antidepressants in the treatment of depressions. A double-blind clinical comparison of clomipramine (Anafranil) and amitriptyline.**

Kampman R; Nummikko-Pelkonen A; Kuha S

Acta Psychiatr Scand ,Aug 1978, 58 (2) p142-8, ISSN  
0001-690X Journal Code: 1VY

Languages: ENGLISH

The clinical efficacy of oral clomipramine and amitriptyline treatment (50--125 mg/day) was compared over a period of 2 months in 72 depressive patients visiting a psychiatric out-patient clinic. Both drugs were equally effective as measured by the Hamilton Rating Scale for Depression. According to a nurse's independent evaluation of 13 items the two drugs were equipotent in relieving depressive symptoms and no statistically significant differences between the treatment groups were found in the global evaluation by the investigator and the patient. A trend in favour of clomipramine was, however, seen in several parameters. The declines in the Hamilton Rating Scale scores and the nurse's evaluation scores were highly significant during the first 2 weeks of treatment (P less than 0.001) in both groups and the scores continued to decrease during the 2nd month of the study. The most common unwanted effects were dryness of the mouth and fatigue. The frequency of side effects was 51% in the clomipramine group and 43% in the amitriptyline group. The side effects were generally mild and transient and called for discontinuation of treatment in only one case in each group.

**[Preventive medicine in private medical practice]**

La medecine preventive au cabinet de consultation.  
Delachaux A

Soz Praeventivmed ,Jul 1978, 23 (3) p162-7, ISSN  
0303-8408 Journal Code: YF1

Languages: FRENCH Summary Languages: ENGLISH

The basis of preventive medicine for the individual is composed of health education, certain examinations and preventive treatments. A coherent approach is essential for efficiency of a program and avoidance of costly and nonessential expenditures. In the Swiss health system, the doctor's office could become more and more the center of preventive medicine for the individual. It would concern a large part of the population (in the United States, 80% of the men and 90% of the women consult a doctor at least once a year); offering a direct contact with the doctor of choice, advice specific for each case and the possibility of regular examinations by the same doctors. In many situations both public and private sources are involved in preventive medicine (public health services, doctors involved in the educational system, doctors involved in control of security of working conditions, out-patient clinics, various health organizations). A collaboration among these sources should be organized and a reasonable division of the work established. A list of examinations and preventive treatments is presented.

**Antihypertensive drug combinations: prazosin, hydrochlorothiazide and clonidine.**

Pitkajarvi T; Kyostila S; Kontro J; Mattila MJ

Ann Clin Res ,Oct 1977, 9 (5) p296-300, ISSN 0003-4762  
Journal Code: 53A

Languages: ENGLISH

Fourty-six men and 6 women aged 45 years and having arterial hypertension newly diagnosed at routine medical examinations were given out-patient antihypertensive treatment with prazosin, prazosin + hydrochlorothiazide, or prazosin + hydrochlorothiazide + clonidine. The mean values of blood pressure after the 3-week placebo period were 157/109 mmHg in the supine and 160/115 mmHg in the standing position. Treatment with prazosin (1--2 mg t.i.d.) produced normotension in 4/52 patients only, yet supine diastolic blood pressure and standing blood pressure were significantly lowered within 9 weeks. The addition of hydrochlorothiazide (25 mg daily) for 3 weeks to the regimen led to normotension in 12/46 patients. The remaining 34 patients still having an average supine blood pressure of 152/106 mmHg after prazosin + hydrochlorothiazide, responded well to low doses of clonidine added for 6 weeks to the treatment. Only 7 patients having initially high blood pressure still had a diastolic blood pressure greater than or equal to 100 mmHg at the end of the trial. The subjective side-effects were frequent but mild being roughly similar during placebo and active drug periods, except that fatigue and dry mouth due to clonidine were common, yet tolerable. No "first tablet reactions" to low initial doses of prazosin were

found.

**[CO2 laser coagulation of benign changes of the portio vaginalis in comparison with the endocoagulation technic (Semm's method)]**

Die CO2-Laserkoagulation gutartiger Veränderungen der Portio vaginalis im Vergleich zur Endokoagulationstechnik (nach Semm).

Riedel HH; Semm K

Zentralbl Gynakol ,1982, 104 (21) p1329-38, ISSN

0044-4197 Journal Code: Y5S

Languages: GERMAN Summary Languages: ENGLISH

The CO2-COHERENT laser was therapeutically used by the authors on 31 cases of extensive erythroplakia associated with recurrent and therapy-resistant fluor formation and on cases of highly vascularised transformation zones with contact bleeding. The benign nature of the findings first had been established by repetitive Pap smears and thorough colposcopic examination. The authors suggest that for the time being the CO2 laser is not suitable yet for the treatment of dysplasia or carcinoma in situ, since no material for histological testing is obtainable from that therapeutic approach, and the presence of microcarcinoma with invasive growth cannot be ruled out with absolute safety. CO2 laser treatment was undertaken without hospitalisation of patients, just as endocoagulation of the vaginal portio was carried out on an outpatient basis. Postoperative follow-up checks have been made one, three, and six weeks as well as three and six months from treatment. The therapeutic results obtained from CO2 laser therapy were compared with those recorded from patients who had undergone endocoagulation of the vaginal portio, with the view to checking the advantages claimed for laser therapy in the literature [1, 4, 11, 12, 23, 24], such as no need for anaesthesia, effective destruction of much of the pathological tissue, high-accuracy identification of tissue for destruction by means of colposcopy, low rate of postoperative complications, soon healing, and good haemostatic action. All these advantages were found to be obtainable just as well from

the technique of endocoagulation without the need for the great amount of technical input and equipment definitely required for laser therapy [16, 18, 19, 20, 21].

**Ambulatory serial excision of giant nevi.**

Feins NR; Rubin R; Borger JA

J Pediatr Surg ,Dec 1982, 17 (6) p851-3, ISSN 0022-3468  
Journal Code: JMJ

Languages: ENGLISH

Nevi over the size of a dime at the time of birth should probably be removed. Nevi this size often cannot be differentiated histologically from the true giant nevus that may cover over 50% of the body. Giant nevi have a 2%-30% malignant potential. In order to avoid the morbidity of split-thickness skin grafts when removing the larger nevi, we have been successful in serially excising many nevi as ambulatory procedures. Most moderately large nevi, regardless of their location, can be managed with this method.

**Medicare program; list of covered surgical procedures for certain ambulatory surgical services--Health Care Financing Administration. Final notice.**

Fed Regist ,Aug 5 1982, 47 (151) p34099-101, ISSN 0097-6326  
Journal Code: B58

Languages: ENGLISH

Under the final rules published elsewhere in this issue of the Federal Register, reimbursement will be available under Part B of Medicare for ambulatory surgical center (ASC) facility services in connection with certain surgical procedures. For those same procedures, physicians will receive 100 percent reimbursement for providing services in connection with the procedure performed on an ambulatory basis if certain requirements are met. This notice contains the initial list of the surgical procedures pertinent to these reimbursement provisions. Additional procedures will be added and published in the Federal Register, when appropriate.

**Medicare program; ambulatory surgical services--Health Care Financing Administration. Final rule.**

Fed Regist ,Aug 5 1982, 47 (151) p34082-98, ISSN 0097-6326 Journal Code: B58

Languages: ENGLISH

These regulations implement in part, section 934 of Pub. L. 96-499, the Omnibus Reconciliation Act of 1980, which adds to the benefits available under Part B of Medicare, facility services associated with certain surgical procedures provided in an ambulatory surgical center. That section also provides, under certain conditions, for 100 percent Medicare reimbursement to physicians (rather than the usual 80 percent) for services provided in connection with certain surgical procedures performed on an ambulatory basis. These regulations establish: (1) The standards an ambulatory surgical center must meet to be approved for participation in the Medicare program; (2) criteria for determining which surgical procedures will be included for purposes of reimbursing facilities and physicians under this provision; (3) the payment methodology and reimbursement procedures with respect to facility services; and (4) the requirements relating to agreements by the facility to furnish services under the program and by physicians with respect to accepting payments for procedures (agreements to accept "assignments"). The purpose of the legislation and these regulations is to encourage the performance in an ambulatory setting of certain surgical procedures that are now frequently furnished on an inpatient hospital basis.

Awojobi OA

Dis Colon Rectum ,Feb 1983, 26 (2) p95-7, ISSN

0012-3706 Journal Code: EAB

Languages: ENGLISH

Twenty-five patients with second- or third-degree hemorrhoids were treated on an outpatient basis using a modified form of pile suture of Farag. There were no postoperative complications such as acute urinary retention, hemorrhage, infection, or anal stenosis. After follow-up for 12 to 18 months, the method has relieved bleeding in all patients and anal prolapse in 96 per cent of them. The modified pile suture is useful in a tropical setting where excisional hemorrhoidectomy is a costly operation.

Sclera appears to be an appropriate grafting material because of its high density, high tensile strength, and low antigenicity. Preserved donor sclera has been used for myringoplasty in 125 cases over a 4 year period with an overall success rate for complete closure of the perforation of 96%. Several simple techniques for creating flanges to hold the graft in place were used. The size of the perforations ranged from several millimeters to 80% of the eardrum surface. Most of the cases have been done as outpatients, the adults with local anesthesia and the children with general anesthesia. The advantages of the procedure are: A. readily available graft material; B. high tensile strength of sclera maintains scaffolding effect for long periods of time; C. the flange technique holds the graft at the perforation site and prevents graft lateralization or medialization; D. the procedure can be performed as an outpatient health care costs.

Carcinomas of lower lips are common neoplasms of the muco-cutaneous junction. Surgical resection of these tumors has the advantages of permitting histologic examination of the margins, achieving excellent cure rates, and yielding good aesthetic and functional results. We present the fundamental surgical procedures for management of pre-cancerous and primary cancerous neoplasms of the lower lip with which the surgical dermatologist should be familiar. These procedures may be done with local anesthesia in an outpatient surgical office. The techniques and case examples we describe include vermilionectomy and mucosal advancement, V-wedge resection, pentagonal wedge resection, and vermilionectomy combined with wedge resection.

The results of subcutaneous lateral internal sphincterotomy for chronic fissure-in-ano were analyzed in a series of 60 patients operated upon over a period of two years. Immediate relief from pain with painless first bowel movement was accomplished in 97 per cent of the patients with very low morbidity rates. All patients were treated on an outpatient basis and had a minimum follow-up of two years without any recurrences. The incidence of sphincter dysfunction is very low and is usually only temporary.

One hundred sixty-one patients underwent hysteroscopic tubal occlusion with formed-in-place silicone rubber plugs over 8 months. In 86% bilateral plug placement was successful with the patient under local anesthesia in an office setting. There have been no pregnancies in 683 woman-months of sterilization to date. The procedure is seen as an effective alternative to current methods of female sterilization. The advantage of the procedure over laparoscopic sterilization is discussed.

**Alfathesin and etomidate for minor outpatient anaesthesia.**  
Morison DH; Dunn GL; de Graft-Johnson A

Can Anaesth Soc J ,Nov 1982, 29 (6) p622-6, ISSN 0008-2856  
Journal Code: CG7

Languages: ENGLISH

Etomidate was compared with alfathesin for induction and maintenance of anaesthesia in a double-blind fashion in 48 fit patients undergoing minor gynaecological operations as outpatients. The patients were randomized to receive either etomidate 0.3 mg . kg-1 or alfathesin 75 microliters . kg-1 as intravenous induction agents. All patients received fentanyl 1 microgram . kg-1 and breathed 70 per cent nitrous oxide in oxygen. Cardiovascular changes were minimal in both groups and there was less depression of minute volume with etomidate. The incidence of side effects including pain upon injection, involuntary movements, and postoperative nausea and vomiting was higher following etomidate. Recovery was equally rapid in both groups. No adverse reactions were seen. Alfathesin would appear to be preferable to etomidate as an induction and maintenance agent in unpremedicated fit outpatients undergoing minor gynaecological operations.

**Criteria for selection of ambulatory surgical patients and guidelines for anesthetic management: a retrospective study of 1553 cases.**

Meridy HW

Anesth Analg ,Nov 1982, 61 (11) p921-6, ISSN 0003-2999

Journal Code: 4R8

Languages: ENGLISH

The charts of 1553 patients who were anesthetized for ambulatory surgery were analyzed retrospectively to determine the effect of the type of surgery, the age of the patient, the use of premedication, the duration of anesthesia, and the anesthetic technique on the duration of recovery and the rate of complications. In a 4-month period in 1979, 1073 patients were treated, and another 480 patients were treated during a 2-month period in 1980. Aside from patients undergoing dental surgery, the surgical procedure and the extremes of age affected neither the duration of recovery (193 +/- 97 minutes) nor the rate of complications (2.45%). The use of premedicants other than narcotics did not prolong recovery. There was no relationship between anesthesia time and the duration of recovery. Patients who received local anesthesia had a significantly shorter recovery period than the whole population, and significantly fewer patients receiving local anesthesia had to be admitted to the hospital. Thus, arbitrary limits placed on the type of surgery, age of the patient, the duration of the procedure, and the use of certain premedication appear to be unwarranted.

**Preoperative starvation and blood glucose concentrations in children undergoing inpatient and outpatient anaesthesia.**

Jensen BH; Wernberg M; Andersen M

Br J Anaesth ,Oct 1982, 54 (10) p1071-4, ISSN 0007-0912  
Journal Code: AUD

Languages: ENGLISH

Blood glucose concentrations were measured in 82 children undergoing inpatient anaesthesia and in 46 children undergoing anaesthesia as outpatients. The children were aged between 6 months and 9 yr. Outpatients were fasted from bedtime, while inpatients were randomly allocated to two groups. In group A the children were fasted from bedtime, whereas in group B the children were fed 6 h before anaesthesia. There was no difference in mean blood glucose concentration between the fasted inpatients and outpatients nor between children younger than, or older than, 4 years of age. A blood glucose concentration of less than 40 mg dl<sup>-1</sup> was found in only one of the fasted children (1%). The mean blood glucose concentration was greater in group B than A, but only significantly so for children older than 4 yr. It is concluded that to minimize the risks of hypoglycaemia and inhalation of vomit on induction of anaesthesia children older than 6 months should be fasted overnight and operated on in the morning.

**Percutaneous release of the epicondylar muscles for humeral epicondylitis.**

Baumgard SH; Schwartz DR

Am J Sports Med ,Jul-Aug 1982, 10 (4) p233-6, ISSN  
0363-5465 Journal Code: 3YR

Languages: ENGLISH

This paper describes 44 percutaneous epicondylar releases performed on 34 patients with humeral epicondylitis. There were 35 instances of lateral epicondylitis and 6 of medial epicondylitis. Thirty-two of the lateral releases had an excellent result and 3 were unsatisfactory. Five of the medial procedures were rated as excellent and one unsatisfactory. Two of the three unsatisfactory lateral procedures were reoperated upon with an excellent result. The one unsatisfactory medial epicondylitis underwent reoperation and had excellent results.

In our experience, percutaneous release has a high rate of success, is simple to perform, does not require hospitalization, and has been without complication.

**Management of cervical intraepithelial neoplasia by carbon dioxide laser.**

Baggish MS

Obstet Gynecol ,Sep 1982, 60 (3) p378-84, ISSN  
0386-9792 Journal Code: OC2

Languages: ENGLISH

Between 1976 and 1981, 412 women with biopsy-proven cervical intraepithelial neoplasia (CIN) were treated by means of the carbon dioxide laser. A previous publication reported the author's initial therapeutic results with laser surgery for CIN, carried out between 1976 and 1978. This report includes data on 297 patients who were followed for 6 months to 5 years after laser vaporization and on 55 women treated by laser excisional cone. Major improvements in the technique of carbon dioxide laser vaporization evolved as experience was gained, and related to elimination of the entire squamocolumnar junction, to destruction of neoplastic tissue to a depth of 5 to 7 mm, and to utilization of power densities greater than 1000 watts/cm<sup>2</sup>. Cures were achieved in 285 of the 297 patients treated by vaporization, ie, the failure rate was 4% (52 of 55 women treated by excisional cone). Complications during this study were minor and usually correlated with delayed bleeding.

One patient developed cervical stenosis following laser excisional cone. No patient was found to have invasive carcinoma after laser surgery to the cervix. Because laser vaporization and laser excisional cone are best adapted for the outpatient setting, financial savings accruing to the patient are considerable. Rapid healing, minimal pain, and a general absence of noxious symptomatology also promote early return to work and daily routines.

Fifty men with hernias were operated on as outpatients: 42 went home the evening after surgery. The best results were obtained in patients with unilateral indirect hernias; those with direct hernias did not do quite as well. No patient required readmission to the hospital for complications. The cost was significantly less than that for adults operated on as inpatients. The outpatient approach is now being used for elective repair of inguinal hernias in all adult male patients.

This chapter is an overview of the management of a patient who has undergone a surgical procedure in an outpatient setting. It addresses the complications that are most common in this setting and their management. Without attempting a thorough discussion of every conceivable complication, this discussion seeks nonetheless to be reasonably comprehensive. Perhaps the most straightforward means of presenting this information is to follow chronologically the patient's experience from the moment the procedure has been concluded, through his recovery room care, and finally look at the patient's needs and experiences after leaving the ambulatory care facility.

Journal Code: Y5I  
Languages: GERMAN Summary Languages: ENGLISH  
This study is based on 632 outpatient and 1948 inpatient  
repairs of inguinal hernias. Outpatient organization, surgical  
technique, anaesthesia and after-care are described in detail.  
Complications, such as disturbed wound healing and  
recurrences also the time being out of work are dealt with.  
These data are compared with those patients who underwent the  
inguinal hernia operation as an in-hospital procedure. The  
authors postulate that outpatient surgery of inguinal hernia  
has many advantages over the inpatient operation.

Out patient surgery is becoming more and more popular with  
experience. A series of 7,250 operations performed during one  
year at Ste-Justine Hospital forms the basis of the  
presentation. A wide variety of procedures are now done by the  
pediatric surgical specialities on an out patient basis.  
Proper selection of patients, operations and families is  
mandatory. A low complication rate of 1.2% can be expected as  
well as high patient, family and staff satisfaction.

Under the proposed rules published elsewhere in this issue  
of the Federal Register, reimbursement would be available  
under the Medicare Supplementary Insurance program (Part B)  
for independent ambulatory surgical center (ASC) facility  
services in connection with certain surgical procedures. For  
those same procedures, physicians would be reimbursed at 100  
percent of their reasonable charges for providing services in  
connection with the procedure performed in a participating  
ASC, on an outpatient basis in a hospital or in a  
hospital-affiliated ambulatory surgical center (HAASC) if  
certain requirements are met. This notice contains the  
proposed list of the surgical procedures pertinent to these  
reimbursement provisions.

**Medicare program; ambulatory surgical services. Health Care Financing Administration. Proposed rule.**  
Fed Regist ,Mar 23 1982, 47 (56) p12574-90, ISSN 0097-6326 Journal Code: B58  
Languages: ENGLISH

These regulations would implement, in part, section 934 of Pub. L. 96-499, the Omnibus Reconciliation Act of 1980, which adds to the benefits available under Part B of Medicare, facility services associated with certain surgical procedures provided in an independent ambulatory surgical center. That section also provides, under certain conditions, for Medicare reimbursement to physicians of 100 percent of the reasonable charges (rather than the usual 80 percent) for services provided in connection with certain surgical procedures performed on an ambulatory basis. These regulations would establish: (1) The standards an independent ambulatory surgical center must meet to be approved for participation in the Medicare program; (2) criteria for determining which surgical procedures would be included for purposes of reimbursing facilities and physicians under this provision; (3) the payment methodology and reimbursement procedures with respect to facility services; and (4) the requirements relating to agreements by the facility to furnish services under the program and by physicians with respect to accepting payments for procedures (agreements to accept "assignments"). The purpose of the legislation and these regulations is to encourage the performance in an ambulatory setting of certain surgical procedures that are now frequently furnished on an inpatient hospital basis.

**Civilian Health and Medical Program of the Uniformed Services (CHAMPUS): Office of the Secretary, DoD. Amendment of final rule.**  
Fed Regist ,Feb 18 1982, 47 (33) p7220-1, ISSN 0097-6326 Journal Code: B58  
Languages: ENGLISH

This amends the CHAMPUS Regulation to implement Pub. L. 96-552. This public law allows CHAMPUS to extend benefits for outpatient surgery on the basis of inpatient cost-sharing rates for dependents of members of the uniformed services serving on active duty. This amendment changes the language in the Regulation to define ambulatory surgical centers as authorized CHAMPUS providers, provides for payment on the basis of reasonable costs and amends the cost-sharing provisions to apply the inpatient rate to certain ambulatory surgical services. The intended effect of the amendment is to encourage beneficiaries to obtain their surgical services in less expensive outpatient settings when medically appropriate to do so, by providing a more favorable cost-share formula.

**Outpatient orchiopexy.**

Caldamone AA; Rabinowitz R

J Urol ,Feb 1982, 127 (2) p286-8, ISSN 0022-5347

Journal Code: KC7

Languages: ENGLISH

Outpatient surgery in children has been recommended as a means to help contain the increasing cost of health care. In addition, the shorter the child's hospitalization the less psychologic trauma. This study examines the feasibility of performing outpatient orchiopexy based on preoperative evaluation, surgical success rate and cost-effectiveness. The records of 459 inpatient and 77 outpatient orchiopexies were reviewed with regard to patient age, medical history (including previous inguinal surgery), preoperative palpability and intraoperative location, anesthetic technique, complications, duration of hospitalization and hospital costs.

The results indicate that at least 68 per cent of orchiopexies can be performed as outpatient procedures. Overnight hospital stay from the ambulatory surgery unit was necessary in 5 per cent. Followup revealed that, despite same day ambulation and lack of postoperative restrictions, surgical success was in no way compromised by an outpatient procedure. Cost analysis shows that an average savings of 50 per cent per hospitalization can result from outpatient orchiopexy.

**Outpatient termination of pregnancy: experience in a family practice residency.**

Marshall JH; Bergman JJ; Berg AO; Leversee JH

J Fam Pract ,Feb 1982, 14 (2) p245-8, ISSN 0094-3509

Journal Code: I4L

Languages: ENGLISH

At the University of Washington Family Medicine Clinic, termination of pregnancy procedures were performed on 260 patients. Their records were reviewed, and an analysis was completed on demographic data, technical procedure parameters, and complication rates during and following the procedure. The majority of patients were not primigravida. Fifteen percent were between six and eight weeks of gestation. Following the procedure, 3.8 percent had excessive bleeding, and 2.7 percent developed endometritis at rates comparable to those found in the obstetrics and gynecology literature. No known perforations occurred. Outpatient termination of pregnancy performed on selected patients in a family practice setting can be a procedure of low morbidity.

**The choice of sterilization procedure among married couples.**

Markman LM; Frankel HA

J Fam Pract ,Jan 1982, 14 (1) p27-30, ISSN 0094-3509

Journal Code: I4L

Languages: ENGLISH

Surgical sterilization is playing a growing role in contraception among married couples. Both vasectomy and tubal ligation can be done as outpatient procedures. Neither procedure has overwhelming advantages over the other. This study sought to determine why one member of a couple, rather than the other, decided to undergo the sterilization procedure. There do not seem to be any significant demographic differences between those couples who choose vasectomy and those who select tubal ligation. Men may undergo vasectomy because they feel it is the easier procedure. A significant number of women also feel that vasectomy is easier, yet for various reasons they are motivated to undergo tubal ligation. In many couples, the choice is made because one partner will not consider becoming sterilized, and this is twice as likely to be the husband. Family physicians can play an important role in assisting couples to choose the best alternative.

**The cultural meanings and social uses of illness. A role for medical anthropology and clinically oriented social science in the development of primary care theory and research.**

Kleinman A

J Fam Pract ,Mar 1983, 16 (3) p539-45, ISSN 0094-3509

Journal Code: I4L

Languages: ENGLISH

Basic research that is conceptually and methodologically innovative and that fosters long-term research programs should play a role in the academic development of primary care, alongside more practical applied studies of specific clinical problems. A creative tension between the two has been a distinctive attribute of academic medicine and should be fostered in family medicine and other primary care disciplines. The biopsychosocial model offers a paradigm for the incorporation of clinically oriented social science research as one basic science approach in which primary care researchers can receive advanced training and pursue an academic career. The author briefly illustrates such a career with reference to studies (his own included) on the social uses and psychocultural meanings of illness. Somatization, a major problem in primary care, is illuminated by such a clinically applied social science research framework. Developing the scientific basis of an academic discipline involves intellectual education in systematic scholarship to create and critique concepts as much as it requires training in the application of rigorous research design and powerful

**The twice-born: 'Christian psychiatry' and Christian psychiatrists.**

Gaines AD

Cult Med Psychiatry ,Sep 1982, 6 (3) p305-24, ISSN

0165-005X Journal Code: DT5

Languages: ENGLISH

This essay introduces Christian psychiatrists into the growing literature on Western psychiatry and biomedicine. It seeks to describe specific beliefs and practices of Christian psychiatrists as a means of examining the reality of an ascribed corporate existence, i.e., 'Christian Psychiatry'. Beliefs and practices examined here include conceptions of therapeutic relationships and processes, conceptions of Divinity, Explanatory Models, notions of the nature and sources of healing, self identity, and role relationships of Christian psychiatrists vis-a-vis patients and the wider society. The data suggest that there is no 'Christian Psychiatry', but only Christian psychiatrists. Implications for patient care and the cultural basis of ideology and practice in psychiatry are also discussed.

**Models and practice in medicine: menopause as syndrome or life transition?**

Lock M

Cult Med Psychiatry ,Sep 1982, 6 (3) p261-80, ISSN

0165-005X Journal Code: DT5

Languages: ENGLISH

Biomedical knowledge, like scientific knowledge in general, is a product of a social and culture milieu. Moreover, in the analysis of biomedicine a distinction must be maintained between textual and clinical knowledge. Through examination of medical texts and of social science literature, the susceptibility of menopause to numerous interpretations is demonstrated. The generation of clinical models from current information available to physicians is examined and it is suggested that these can be thought of as folk models. Several current clinical models of menopause are presented and the implications for sociological analysis of the subject discussed.

**"Treat the patient, not the lab: Internal medicine and the concept of 'person'.**

Hahn RA

Cult Med Psychiatry ,Sep 1982, 6 (3) p219-36, ISSN 0165-005X Journal Code: DT5

Languages: ENGLISH

In different medical systems, notions of person, as patient and as healer, vary widely. An analysis of the talk of a practitioner of internal medicine in the U.S.A. reveals an understanding of patients as syndromes. The work of medicine is 'physiological integrity', distinct from personal and interpersonal integrity. It is suggested that the world view of this practitioner is consistent with the institutions of medicine in which he practices, and with historical movements in U.S. society and Western civilization more broadly.

**Implications for women of changing marriage transactions in Bangladesh.**

Lindenbaum S

Stud Fam Plann ,Nov 1981, 12 (11) p394-401, ISSN 0039-3665 Journal Code: V52

Languages: ENGLISH

Recent changes in marriage transactions in Bangladesh have led increasingly to a shift in the burden of marriage expenses from the groom's family of the bride. This reversal in the direction of wealth exchanges, which may not be in the best interest of the bride, reflects social and economic changes that have increased the income potential of the groom, which now surpasses previously valued attributes of the bride. In this paper, anthropologist Shirley Lindenbaum examines the effects of these changes on women and their implications for female fertility and mortality. An earlier version of this paper was presented to the New York Academy of Science on 25 February 1980.

**Fertility decline and differences in less-developed countries: an anthropological microstudy of some communities of West Bengal, India and Upper Khumbu, Nepal.**

Basu A; Bharati P; Mukhopadhyay B; Gupta R

Acta Anthropogenet ,1981, 5 (4) p209-34, Journal Code: AG6

Languages: ENGLISH

The role of socioeconomic and other cultural factors as determinants of fertility change has been widely discussed, with some scholars emphasizing an inverse relation between socioeconomic development and fertility, others suggesting that no such relation necessarily exists, and yet others indicating that by using data from various sources it is possible to "prove" that a given country's crude birth rate has declined, remained unchanged or increased. Demographic data are presented on age-sex structure, completed and total fertility rates, and age specific fertility rates by age cohorts of women, from several small, anthropological population units of West Bengal, India and Upper Khumbu, Nepal, exposed to various physical and cultural environmental stresses. The data show that fertility has declined in most of the populations/subpopulations studied and that the decline may, deductively, be attributed to economic development via greater family planning practices.

Are pseudo-patient studies justified?  
Bulmer M  
J Med Ethics ,Jun 1982, 8 (2) p65-71, ISSN 0306-6800  
Journal Code: JfD  
Languages: ENGLISH

Pseudo-patient studies are studies in which a medical sociologist or anthropologist masquerades as a patient. Medical treatment is sought without revealing that the 'patient' is really a covert research worker. When access has thus been gained to a medical setting--typically a hospital ward--social interaction between medical staff and patients is then observed over a period of days or weeks. Important studies have been carried out in this way of psychiatric treatment and of the care of the terminally-ill. Is the use of the method justified? What ethical problems does its use raise? How do the undoubted advantages of the approach compare with the clear drawbacks and objections which can be made to its use?

The low mortality rates of Chinese infants: some plausible explanatory factors.  
Yu E  
Soc Sci Med ,1982, 16 (3) p253-65, ISSN 0277-9536  
Journal Code: UT9  
Languages: ENGLISH  
The objectives of this paper are: (1) to describe the

differential infant mortality rates between Chinese and white Americans; (2) to identify and evaluate the commonly suspected factors for the low infant mortality rates observed among Chinese in the United States; and (3) to explore alternative explanatory factors for the low death rates of Chinese infants by drawing upon a body of current sociomedical research regarding the effects of smoking and drinking on fetal development, preterm delivery and low birthweight in non-Chinese populations. Anthropological studies on Chinese pre- and post-natal health practices--both in Taiwan and in the United States--are also discussed. The data come primarily from U.S. birth and death records. Where available, both published and unpublished data on Chinese infant mortality from Hong Kong Colony, Taiwan Province and Mainland China, are also presented for purposes of comparison.

Measuring social interaction of the urban elderly: a methodological synthesis.  
Sokolovsky J; Cohen CI  
Int J Aging Hum Dev ,1981, 13 (3) p233-44, ISSN  
0091-4150 Journal Code: GQF  
Languages: ENGLISH  
In general, the gerontological literature has characterized the inner-city elderly, especially those aged residing in single room occupancy hotels, as "isolates" or "loners". However, it is proposed that the notion of isolation is largely a myth and that many studies have been hampered by inadequate research instruments. This paper illustrates: 1) The severe limitations of the traditional measures of determining sociability; 2) How social network analysis can overcome many of the deficiencies of other methods; and 3) How a synthesis of the anthropological and sociological approaches to network analysis can optimize data collection and provide culturally meaningful information.

Languages: ENGLISH

In a combined anthropological and parasitological study in a rural Balinese village, two distinct sub-populations were identified on the basis of nutritional and health practices. A significant negative correlation between Ascaris burden and nutritional status (P less than 0.05) was apparent only in the subpopulation characterized by lower nutritional intakes and low utilization of health care facilities. The results of this study suggest that the relationship between Ascariasis and child malnutritional is a conditional one, dependent upon the interaction of multiple biomedical and behavioural factors.

0165-005X Journal Code: DT5

Languages: ENGLISH

Medical anthropologist spend most of their time eliciting and interpreting people's statements about sickness and health. For this task, they make certain assumptions about the importance of language and reason. In this paper I argue that their assumptions are tailored to fit an hypothetical Rational Man rather than real people. The concept of 'explanatory models of sickness' is used to illustrate this point. My critique begins by drawing attention to two non-cognitive determinants of people's statements: their degree of emotional arousal and their capacities for discoursing on medical subjects. These determinants are briefly discussed and then set aside, to make room for the paper's argument proper. This starts with the observation that medical anthropologists tend to overlook the fact that they have established a cognitive no man's land stretching between their informants' statements and the cognitive structures which are supposed to generate these statements. I survey this void, using a five-fold model of medical knowledge. People use one kind of knowledge to organize their medical experiences and perceptions. In Rational Man writing, this form of knowledge is considered equivalent to cognitive structures (e.g., causal models, classificatory schemes), but I argue that is also includes knowledge of prototypical sickness events and knowledge that is embedded in actions, social relations, and material equipment. The theoretical implications of the five-fold model are outlined. This is followed by an analysis of the reasoning processes in which people use medical knowledge to produce the statements whose meaning we wish to learn. I demonstrate the importance of being able to distinguish operational and monothetic forms of reasoning from pre-operational and polythetic ones. Rational Man writers are described as ignoring the latter pair. The concept of 'prototypes' is reintroduced to illustrate these points.

In assessing the contribution of anthropological investigation to health services, ethical review committees and health services personnel usually weigh the relationship between the risks to subjects from the research procedures and the benefits of the research results. While these reviews are important, attention should also focus on the benefits of the research process, itself. In rehabilitation settings, located at a Veterans Administration Medical Center, psychiatric-care facility, the anthropological research process benefits staff members and patients. Using the role of participant-observer, the anthropologist serves as an anonymous channel of communication and contributes to patient rehabilitation.

Gordon IR; David TJ

J Med Genet ,Aug 1981, 18 (4) p256-61, ISSN 0022-2593 Journal Code: J1F

Languages: ENGLISH

The Bristol Bone Dysplasia Registry was established in 1969. The panel included radiologists, paediatricians, orthopaedic surgeons, pathologists, a paediatric biochemist, an anatomist/anthropologist, a veterinary surgeon, dentists and oral surgeons, and a psychiatrist. The panel met every two months. Cases either entered the Registry directly if they were straightforward or after discussion by the panel if there was doubt about the diagnosis or a point of special interest. A total of 468 cases was collected, including 81 cases with miscellaneous bony disorders and 34 cases where the diagnosis was uncertain. The Registry provided a useful regional diagnostic service and promoted interest in body dysplasias. Some of the research aims have not yet been fully achieved. This paper explains how the Registry is run to help those whom it is hoped will set up similar registries elsewhere.

**Anthropology and nutrition: a perspective on two scientific subcultures.**

Harrison GG; Ritenbaugh C

Fed Proc ,Sep 1981, 40 (11) p2595-600, ISSN 0014-9446 Journal Code: EUV

Languages: ENGLISH

In the last several years serious collaborative efforts between nutrition scientists and anthropologists have begun to bear fruit. To encourage the development of such collaboration, it is useful to consider the professional scientific subcultures of each discipline and how these condition the ways in which we view research problems and methodology. Anthropologists and nutrition scientists share many values and assumptions by virtue of common membership in the larger culture and in the subculture of science. There are substantial differences, however, many of them rooted in the fact that anthropology is primarily an observational science while nutritional science has been primarily experimental in nature. Successful collaboration will result from the formation of long-term communicative relationships rather than from ad hoc utilization of the other discipline. We offer some suggestions for how this may occur, and submit that understanding our own professional subcultures is essential to interdisciplinary efforts.

**Human adaptability approach to nutritional assessment: a Bolivian example.**

Haas JD

Fed Proc ,Sep 1981, 40 (11) p2577-82, ISSN 0014-9446 Journal Code: EUV

Languages: ENGLISH

Recent interest in the functional correlates of mild to moderate malnutrition has provided an opportunity for anthropologists to collaborate in research with nutritional scientists. Physical anthropological studies of human adaptability have developed the methodology and theory to examine the importance of general and specific functional areas of individual and population adaptations. This anthropological approach to human adaptability corresponds well with the functional approach to nutritional sciences. Examples are presented from recent physical anthropological research on high-altitude adaptation to demonstrate how this integration of disciplinary methodology can contribute to a better understanding of human nutritional status. The functional areas of child growth and female reproductive performance are examined in relation to the multistress environment of the Peruvian-Bolivian high Andes. Knowledge of how nutritional variation affects the adaptability of high-altitude populations provides a better basis for the identification of protein-energy malnutrition during childhood and iron deficiency anemia during pregnancy.

Worrell J

South Med J ,Feb 1983, 76 (2) p216-7, ISSN 0038-4348

Journal Code: UVH

Languages: ENGLISH

I reviewed 100 consecutive radiologic examinations with particular attention to the clinical information included. The referring physician originated this clinical information in only 33% of cases. Other personnel, including nurses and aides, added information on the requisitions 57% of the time. When nonphysician personnel completed the requisitions, 46% of the cases were completed with either inappropriate or misleading clinical information. In 9% of the cases, there was no clinical information. Because all of the cases originated by physicians were appropriately completed, a strong plea is made for requiring physicians to originate radiologic

requisitions.

A study of the key wordings used by the doctors in medical

records in I.C.U. preceded this implementation, they constitute a thesaurus (2,700 strings) organized in two trees.

These strings are proposed along the dialogue which occurs between the microcomputer and the user; on these bases, several graphs allow to move in the tree by minimization of the pathway. The use of the thesaurus with the corresponding graphs necessitates only one automaton program. This medical data microcomputerized system is transparent for the user, thanks to a multilayers software. In the external layer the microcomputer provides access to the system by one of the following function keys: creation of a medical record, additional information on a medical record already known, research of a medical record, listing of the open medical records, printing of a medical record. Each one of these function keys provides access to the following five rubrics keys: identity, antecedents, reasons for admission, evolution, destiny; these rubric keys use parameterized procedures. This software is implemented on a low-cost microcomputer fitted with a dual drive disk (170 k. bytes each) and a printer (90 char/s).

Lustman F

Comput Programs Biomed ,Oct 1982, 15 (2) p125-31, ISSN 0010-468X Journal Code: D01

Languages: ENGLISH

A new database model is presented for patient information systems and clinical research database. Its main objective is to deal easily with the changing needs in data structure and organization and to make the model free of computing or programming related considerations. Based on the relational and entity relationship models, it allows the creation of records and files; records may belong to as many files as one wishes. Conditions introduced at the definition level make it very easy to define subfiles on selected criteria without the need to write an extraction program. A database modification step allows the reorganisation of an already existing database without any programming. Tested on several cases the model is presently at the development stage on a DEC VAX750 computer.

**An automaton computer program for a microcomputerized real-time (thesaurus based) abstract medical record.**

Huet B; Pourriat JL; Martin J; Cupa M  
Comput Programs Biomed ,Oct 1982, 15 (2) p117-23, ISSN  
0010-468X Journal Code: DOI  
Languages: ENGLISH

A study of the key wordings used by the doctors in medical records in ICU preceded this implementation; they constitute a thesaurus (2700 strings) organized in 2 trees. These strings are proposed along the dialogue which occurs between the microcomputer and the user; on these bases, several graphs allows movement in the tree by minimization of the pathway. The use of the thesaurus with the corresponding graphs necessitates only one automaton program. This medical data microcomputerized system is transparent for the user, thanks to a multilayered software. In the external layer the microcomputer provides access to the system by one of the following function keys: creation of a medical record, additional information on a medical record already known, research of a medical record, listing of the open medical records, printing of a medical record. Each one of these function keys provides access to the following 5 chapters: identity, antecedents, reasons for admission, evolution, destiny; these chapters use parameterized procedures. This software is implemented on a low-cost microcomputer fitted with a dual drive disk (170 kilobytes each) and a printer (90 characters/s).

**Surgical pathology reports with a portable microcomputer.**

MacDonald RA; Pechet GS; Lovenbury P  
Arch Pathol Lab Med ,Dec 1982, 106 (13) p666-9, ISSN  
0363-0153 Journal Code: 79Z  
Languages: ENGLISH

A microcomputer reporting system for gross and microscopic surgical pathology is simple and inexpensive, reduces the need for clerical personnel, and saves the pathologist's time in the preparation of reports. Gross descriptions are formatted. A dictionary of microscopic diagnoses is constructed and stored on disks. The diagnosis to be used for a case is selected by a pathologist by number. It is called to a video screen from disk storage by entering the number on the microcomputer keyboard. The diagnosis is edited or expanded for an individual patient while it is on the screen and is printed after changes are made. Each diagnosis contains preentered classification, coding, and filing information, as well as format, medical terminology, and spelling. The system has rapid retrieval and search capability and may be used for patients awaiting frozen-section diagnosis. The system requires fewer clerical personnel in surgical pathology than with free-form reporting.

**Response strategies for chart requests from psychiatric inpatients.**  
Bernstein RA; Andrews EM  
Hosp Community Psychiatry ,Oct 1982, 33 (10) pB41-3,  
ISSN 0022-1597 Journal Code: GCJ  
Languages: ENGLISH  
Of 452 patients seen during one year on a medical-school-affiliated general hospital psychiatric unit, 26 requested to see their charts. These patients tended to be younger, more likely to have character disorders, and less likely to have an affective disorder than patients who did not make chart requests. The apparent increase in the number of patients who ask to see their records may be linked to increasing medical consumerism. Rather than causing therapists to become defensive, record requests should provide an opportunity for education and treatment. The authors outline methods of interpreting and responding to chart requests.

**One year's evaluation of a system of on-line computerisation of anaesthetic records using a computer bureau.**  
Roessler P; Lambert TF  
Anaesth Intensive Care ,Aug 1982, 10 (3) p208-11,  
Journal Code: 4M5  
Languages: ENGLISH  
A system for the on-line computerisation of anaesthetic records using a computer bureau is described. The requirements of the system are a keyboard and video display unit appropriately linked to the bureau's computer. The system was cheap and easy to install. It required no programming expertise from department members. Disadvantages included the need to change between two screens for data entry, a delay of over 8 months before satisfactory reports materialised for individuals or the department, congestion at peak times for data entry, excessive time spent on data entry, reluctance of the bureau to alter the format of the screens once they had been generated. The cost of the system is felt to be justified by the information provided for both accreditation requirements and for department management.

**Humanising the computer.**

Paul J JD  
Anaesth Intensive Care ,Aug 1982, 10 (3) p191-6,  
Journal Code: 4M5  
Languages: ENGLISH

Many well-intentioned and potentially useful data handling computer systems fail to realise their potential because inadequate effort has been made to humanise the computer/operator interface. Programs are usually written by people who are logical thinkers, enjoy working with computers and who find satisfaction in writing their programs. Unfortunately those same programs often have to be used by people who are illogical, who fear computers and loathe having to work with them. Some suggestions for humanising the computer/operator interaction are made.

**Social and contextual factors in the analysis of mortality in end-stage renal disease patients: implications for health policy.**

Plough AL; Salem S  
Am J Public Health ,Nov 1982, 72 (11) p1293-5, ISSN  
0090-0036 Journal Code: 3XW  
Languages: ENGLISH

A sample of medical records of decreased End-Stage Renal Disease (ESRD) patients was reviewed by a panel of experienced clinicians. The panel's determination of cause of death was compared to that reported for these patients in the Health Care Financing Administration Management Information System. There was concurrence in only 25 per cent of the cases. The difference is attributable to increased awareness of psychosocial and behavioral antecedent factors surrounding the occurrence of death.

In this study of the delivery of outpatient psychiatric care to Medicaid patients at all 29 free-standing psychiatric clinics and at six hospital clinics in New York City, the authors found that nonphysician mental health workers provided much direct patient care: diagnosis and identifying data, necessary for reimbursement, were always included in records whereas mental status and medical history were poorly documented; and nonphysicians in hospitals generally surpassed physicians in the latter two areas. An additional observation was that attitudes of mental health workers toward certain diagnostic and ethnic groups may be inferred from the selective completeness of their psychiatric record keeping.

An interdisciplinary team of occupational health professionals and computer engineers at Digital Equipment Corporation have developed a computerized system for maintaining employee medical and exposure records. The Industrial Health Monitoring System (IHMS) was designed to meet the occupational and public health needs of employees engaged in semiconductor manufacturing operations where exposure to potentially hazardous chemicals and physical agents exists. The purpose of the IHMS is to systematically

retrieve and analyze data collected from industrial hygiene, health services, and clinical diagnostic testing in order to monitor the general health of the working community.

Languages: ENGLISH

A computerized data-base for the management of the out-patient clinic for diabetes and of the hospital diabetic patients has been developed by means of low cost commercial microcomputer. The program is able to supply lists of sets of patients chosen from user-defined characteristics. The system also allows the selected listin of recall letters for periodic examinations, the printing of registers for medical and administrative use and for statistical analysis. The system is easy to learn and easy to use. The operator-computer interaction is colloquial through the use of a video-terminal, permitting the use by nominally-trained staff.

Languages: FRENCH Summary Languages: ENGLISH  
The University Centre for Gynaecology and Obstetrics in Toulouse have been using a computerised record system for obstetrics since 1974. This makes it possible for a review for a review to be undertaken each year of the work carried out in the Service and has made it possible to study over six years the evolution of the characteristics of the population who have been followed, as well as the changes in attitudes and techniques adopted during pregnancy and labour. A study has been carried out on the factors associated with perinatal mortality and prematurity. Computerisation of 13,500 records has made it possible to draw curves of birth weights, according to the duration of the pregnancy, and characterising the service given. Finally the adoption of a prospective record system used in common by several teams and checked by people specialised in this work has improved the quality and quantity of retrieval and has made it possible to foresee cooperative studies between different departments.

**[Use of a microcomputer for simplified data processing of ENT case-records employing a commercial program (author's transl)]**

Micro-informatique : gestion simplifiée des dossiers ORL sur programme commercial.  
Garcin M; Brisac A; Ardaud B  
Ann Otolaryngol Chir Cervicofac ,1982, 99 (3) p89-96,  
ISSN 0003-438X Journal Code: 5QO  
Languages: FRENCH Summary Languages: ENGLISH  
Combined use of a microcomputer of sufficient capacity and a commercial program for data processing permits simple storage and exploitation of hospital case-records in an ENT department of moderate size. The principal advantages of the system reside in its permanent availability, the ease of communication with the computer due to the clear language employed, its large storage capacity (650 case-records per diskette), and the moderate cost involved. Programming time is reduced by the use of a particular nomenclature for questions and possible replies. The system is not static, and can be adapted to individual needs or modifications in pathology.

Optical Mark Reader forms have been used by the Cardiac Department at St Thomas's Hospital for six years to store clinical and haemodynamic data by computer. Forms are completed by clinical staff in outpatients and also for those patients undergoing cardiac catheterisation. Three documents are used to record the symptoms and signs at the clinical consultation, the results of relevant investigations, and the important findings at cardiac catheterisation. These documents are fed into a computer and data from them, together with a limited quantity of types information, are used to produce full clinical reports for our colleagues and the case notes. These reports have saved much secretarial and medical time. A variety of analyses is available for research and management purposes.

Languages: ENGLISH

Record-keeping is part of the proper practice of anaesthesia and a record should be able to be quickly and easily completed. Two types of information need to be recorded: clinical, for use both immediately or subsequently and epidemiological, for detailed study of a large number of anaesthetics. A design which answers both these aims is described.

Languages: ENGLISH

We performed a randomized clinical trial of the effect of immediately printed summaries of a computerized medical record on physician test ordering rates in an Emergency Room setting. The computerized medical record contained medication history, the results of most diagnostic studies, an outpatient problem list, and inpatient and emergency room diagnoses. Physicians were presented with a printed summary of the patient's computerized record for study but not for control encounters. All other patient information was equally available to both kinds of encounters. All results were provided for one period of the study, designated T1. Due to a program error, summaries were printed without recent data during a period of the study, designated T2. Two-thirds of the visits were cared for by internists, one-third by surgeons. During T1, internists ordered an average of 3.2 tests, costing \$34.91 for control visits, and 2.7 tests, costing \$29.94 for study control visits (p less than .026). Surgeons also ordered fewer tests during study visits as compared to controls (1.32 vs 1.54) but the differences were not statistically significant. There was no significant effect on either medical or surgical test ordering during time period T2.

The "Hautarztverfahren" (method of registering  
occupationally induced dermatoses at an early stage) can be a  
great help before a real occupational disease occurs. The  
limits of practising this desirable procedure are relatively  
small and are to be shown. Section 5 BeKVO (law of  
occupational diseases) is important for the medical  
proceedings in case of a well-founded suspicion of an  
occupational disease no. 5101. The consequences of the started  
procedures will be shown using examples. Figures will document  
that 50% of well-founded cases of suspicion concern  
occupationally induced dermatoses. Of these about 8% receive  
compensation. For those remaining, measures are normally  
carried out, according to Section 3.

**BP: a microcomputer program for use in a hypertension  
clinic.**  
Kelman AW; Reid JL; Rubin PC

Comput Programs Biomed ,Apr 1982, 14 (2) p185-9, ISSN  
0010-468X Journal Code: DOI  
Languages: ENGLISH

This paper presents details of a computer program, BP,  
designed for use with an outpatient clinic. The program is  
implemented on a PET4000, microcomputer and is intended  
principally for a hypertension follow-up clinic, although it  
could be easily adapted for other clinics. It allows for  
initial patient data entry, the entry of data acquired at  
subsequent visits, the alteration of data, list of all data or  
a pre-determined subset, and a data sort and tabulation  
facility. The program is intended to be run by staff who have  
little experience with computers.

The accuracy of operation codes on hospital activity  
analysis printouts has been compared with unit and patient  
records. Inaccurate information is being provided by the  
hospital activity analysis in a significant number of cases.  
The same mistake is often repeatedly made, suggesting  
deficient monitoring procedures. These lapses occurred despite  
a unit policy of medical staff entering the operation and  
diagnostic details on the HMRI(IP) sheet and the checking of  
all entries by a consultant.

This study described the influence of a computerized medical record summary system in three disease areas (hypertension, obesity and renal disease) observed in the course of a controlled, randomized and prospective study of 479

Northwestern University Clinic patients. Experimental patients, who had available automated record summaries, and control patients, who had available only the manual record, were compared on several medical tests and procedures whose yearly occurrence was considered good medical practice for this patient population, and were compared as well as several measures of outcome of medical care. Evidence suggesting better care and outcome of care among patients with computerized record summaries available is presented.

Languages: ENGLISH

Clinical investigations generate a spectrum of data and data relationships that no longer fit simple data structures. To build a data management facility sufficiently flexible to deal with this spectrum of structures is thus an important problem. A general table-based data structure is presented that provides the clinical investigator with a means of tailoring the data structure to the experimentally derived data. The use of such a general structure appears limited to settings where deletion of instances of data is infrequent. This restriction poses no serious constraint in most clinical investigations.

**The utility for audit of manual and computerized problem-oriented medical record systems.**

Stratmann WC; Goldberg AS; Haugh LD  
Health Serv Res ,Spring 1982. 17 (1) p5-26. ISSN  
0017-9124 Journal Code: G2L  
Contract/Grant No.: HRA 230-75-0204  
Languages: ENGLISH

Objective assessment of the delivery of care requires an unambiguous record of all related events and decisions in the care process. Both the handwritten Problem-Oriented Medical Record (POMR) and its computerized successor, the Problem Oriented Medical Information System (PROMIS) have been designed to facilitate audit of care delivery. In this study, a national sample of physicians was asked to determine which of these two record systems best serves the function of audit.

The study involves assessment of a sample of 69 matched pairs of patient records drawn from two different ward settings, one of which used the manual POMR, the other, PROMIS. No difference was perceived between the two records with respect to the reliability of information or the analytical reasoning of providers. Information in PROMIS records was judged to be slightly more thorough. The format of the manual record was judged better on the basis of conciseness, accessibility, and organization of record information.

Languages: ENGLISH

An experiment in the automatic encoding of English-language medical data is described. The encoding program has two stages. First, the free-text input is parsed and the information is arranged in a tabular format by a general-purpose natural language processor developed at New York University. Then a simple code-dependent subprogram assigns numerical values to the entries on the basis of the positions the input words occupy in the information format. Results of a blind test of the encoding program using the code employed at Roswell Park Memorial Institute for earliest symptoms of head-neck cancer are presented.

The dissemination of information about patients through computers and multidisciplinary teams involves departures from traditional tenets of confidentiality. This raises ethical problems, exemplified by current practices in child health. In multidisciplinary teams, problems may arise because different professions utilise different types of data. Some team members may not appreciate the extent to which data may be unscientific and judgmental. Children and their families may be labelled, without justification, preventing objective reappraisal. The ethical and legal implications are considered. Practice may not conform to principles of natural justice, for example when care orders are sought. Obligations to the State may also imperil the confidentiality of the doctor-patient relationship, and of medical records, the legal status of which is confused and requires clarification. Allowing patients access to their records could be a useful safeguard, and the medical profession should devise alternatives should it not be accepted.

The establishment of a clinical basis documentation has approved because of the co-operation with the service-computer-centre of the clinical administration by linking the administrative and clinical data of the patients. The most essential data like diagnosis, operation, complication, operating surgeon as well as the eventual case of death will be registered in a protocol by the ward physician. These data will be registered by a documentary assistant according to the international keys. The evaluation of the data is done by a SPSS-program. The present results demonstrate that this kind of computer assisted clinical documentation has been successful.

An anesthetic record system has been implemented using a micro-computer, rather than a larger computer system. The record system provides a wide range of functions, including record retrieval, random record processing, and the generation of graphical reports on the department's operating room performance. The steps taken in realizing this system are described, with emphasis on the preparatory decisions that must be made before computer programming can be undertaken. Adopting a modest straightforward design philosophy is shown to be an important pre-requisite to success.

Gentic is a computerized system for the storage, recall, and analysis of data collected by the Medical Genetics Center in Marseille, France. It is based on a standard case report file that includes a full clinical description of all patients, results of cytogenetic investigations, and details of the genetic counseling provided. GENTIC has been used since 1975, and data on more than 5,000 families are accessible for study. This system has improved the quality of consultations, follow-up, and research. It provides data for epidemiological studies and for syndrome identification. This system is maintained at an annual cost of \$3,000, salary costs not included, after an initial investment of \$40,000.

A rapid data retrieval system for blood banks is described based on a computer service generated index to microfilm records. Use of microfilm for the index and a reader/printer

for the microfilm permits "hard copy" of old records within minutes. This approach has resulted in more rapid and efficient access to back records with a substantial decrease in space requirements, and without computer hardware costs.

Languages: ENGLISH

In the clinical setting, it is imperative that the medical staff as well as certain support staff have ready access to patients' records and on-study data. Computerization of the clinical data must not deter non-computer-oriented data users from getting at the information they need. In fact, the computer system should be designed for ease of operation by all potential users so that it becomes a valuable and unobtrusive aid to the clinical environment. This paper describes the workings of a microcomputer system at the Vermont Regional Cancer Center.

0020-7101 Journal Code: GQQ

Languages: FRENCH Summary Languages: ENGLISH

The application of information processing to the study of the evolution of the patient's state requires the constituting of a file which contains the values of different items as functions of time. There are many methods for doing this and most of them appeal to the construction of a complex database.

The technique presented in the paper paper tries at first to constitute, for each patient, some records, of which every one corresponds to a determined "operation" (the term "operation" is taken in the wide sense; example: consultation, surgical intervention,...) then to link them according to the chronological order. It has the advantage of being easy so that it may be used even on minicomputers. Furthermore, the exploitation of the resultant data file is very easy. This method is well suited to problems such as the examination of the longitudinal investigations, the treatment of records of the patients who went through several operations, etc. The application presented here is the checking of the functioning of pacemakers. We wrote on a minicomputer MITRA 15/125 transferable general program (using FORTRAN IV exclusively), which allows one to carry out the linking and to exploit the resultant file. It is so designed that the addition of new procedures involved in new applications may be very easy.

At the Extended Care Unit of the Health Sciences Centre Hospital at the University of British Columbia, team participation in the care of 300 elderly patients includes the team's ability to facilitate use of the problem-oriented record (POR). The key to making the POR a functional communication tool was the development of a useful Problem List. In establishing this system, many difficulties arose. It was imperative to recognize that many staff members had not been trained in problem-solving techniques, and that they had varying degrees of knowledge about the data base. Active physician involvement was mandatory. Employment of a half-time POR Coordinator working with a supporting interdisciplinary POR Committee was needed to make the system work. Guidelines for defining problems were developed, and Problem Lists gradually acquired significance for the entire health care team. Examples are included. Concurrent continuing education was started in pathophysiology, problem-solving, and use of the POR.

**Privacy Act; notification of a new system of records. Public Health Service. Notification of a new system of records: 09-30-0039, "Drug Abuse Treatment Outcome Prospective Study (TOPS)".**

Fed Regist ,Jan 18 1982, 47 (11) p2508-10, ISSN  
0097-6326 Journal Code: B58  
Languages: ENGLISH

In accordance with the requirements of the Privacy Act, the Public Health Service (PHS) is publishing a notice of a new system of records entitled "Drug Abuse Treatment Outcome Prospective Study (TOPS," HHS/ADAMHA/NIDA, in the Alcohol, Drug Abuse, and Mental Health Administration (ADAMHA), National Institute on Drug Abuse (NIDA). We are also proposing routine uses for this system of records. The purpose of the system is to compile information (data base) for a long-term, large-scale followup study of clients entering drug abuse treatment programs. NIDA will analyze aggregate data to assess the effectiveness of drug abuse treatment programs and to obtain data on drug abusers' behavior and characteristics subsequent to their contacts with the programs.

**The effect of home respiratory therapy on hospital readmission rates of patients with chronic obstructive pulmonary disease.**

Roselle S; D'Amico FJ

Respir Care ,Oct 1982, 27 (10) p1194-9, ISSN 0730-8418

Journal Code: QZ3

Languages: ENGLISH

The South Hills Health System Home Health Agency, Homestead, Pennsylvania, studied the effect of home respiratory therapy on hospital readmission rates in 418 patients with chronic obstructive pulmonary disease (COPD). Respiratory therapists evaluated and followed referred patients in their homes. Oxygen, breathing equipment, and supplies were provided, and patients were educated in use, cleaning, and maintenance of equipment. Data for the study were taken from hospital records, home assessments, and discharge summaries. All patients studied had been hospitalized in the year prior to receiving home respiratory therapy. After 12 months of follow-up, 64% had not been rehospitalized. In the year prior to home respiratory therapy, the average number of hospital admissions per patient had been 1.28, with the average length of hospital stay being 18.25 days. During the home respiratory therapy study period of 12 months, the average number of hospital admissions was 0.48, with the average length of hospital stay being 6.09 days. These results indicate that home care provided by respiratory therapists can significantly reduce the rehospitalization of COPD patients. Prevention of rehospitalization in the study group resulted in estimated average hospital costs of savings of \$2,625 per per patient for the year. As a result of this study, two large local industrial employers, the Federal Black Lung program, and Blue Cross of Western Pennsylvania have added respiratory therapy to their home health benefits.

Languages: ENGLISH

The pharmacy department costs of a home parenteral nutrition (HPN) program were identified, and the patient charges for HPN were compared with the charges for hospitalization for parenteral nutrition. Ten patients were randomly selected from 55 patients active in the HPN program at the University of Washington Hospital. Cost identification included quantification of supplies, personnel, equipment, freight, miscellaneous, and indirect costs. Patient charges were identified through billing documents. Charges included clinic visits and laboratory tests. Inpatient charges were identified in a similar manner and included a standard daily hospital charge. Average yearly costs to the pharmacy department were nearly +9000 per HPN patient. Patient charges for HPN were +48.19 per infusion day compared with +205.68 per infusion day for the hospitalized patient. The cost savings of HPN to the patient and the hospital were clearly demonstrated.

**[Care of elderly chronically ill patients at home]**

Die pflege betagter langzeitkranker zu hause.

Stahelin HB; Bloch F; Jeker C; Bruppacher R

Soz Praventivmed ,Dec 1982, 27 (6) p326-7, ISSN

0303-8408 Journal Code: YF1

Languages: FRENCH Summary Languages: ENGLISH

In a survey of 261 chronically ill elderly 43 are found to be supported at home by family members. In comparison to institutionalised patients significantly more men are nursed at home. Members of lower socioeconomic groups are overrepresented in the home care group. Only close family members (spouse and daughter) contribute in significant numbers to home care. In addition formal support is necessary in the majority of patients (periodic hospitalisation in more than 50%). In the present situation, only a minority (mainly married men) is cared for at home.

**[Structure of work times of public health nurses: effect of the age of patients, nature of care given and location of contact]**

Structure du temps de travail des infirmieres de sante publique: effets de l'age des patients, de la nature des prestations fournies et du lieu du contact.

Paccaud F; Martin J

Soz Praventivmed ,Dec 1982, 27 (6) p315-21, ISSN

0303-8408 Journal Code: YF1

Languages: FRENCH Summary Languages: ENGLISH

In the framework of health services research sponsored by the Swiss National Science Foundation, a research was undertaken of the activity of the large majority of the public health nurses working in the Swiss cantons of Vaud and Fribourg (total population 700,000). During one week, 130 nurses gathered, with a specially devised instrument, data on 4165 patient visits. Studying the duration of the contacts, one has distinguished contact duration per se (DC), duration of the travel time preceding the contact (DD), and total duration in relation with the contact (DTC-addition of the first two). It was noted that the three durations increased significantly with patient age (as regard travel time, this is explained by the higher proportion of home visits in higher age groups, as compared with visits at a health center). Examined according to location of the visit, contact duration per se (without travel) is higher for visits at home and in nursing homes than for those taking place at a health center. Looked at in respect to the care given (technical care, or basic nursing care, or both simultaneously), our data show that the provision of basic nursing care (alone or with technical care) doubles contact duration (from 20 to 42-45'). The analyses according to patient age shows that, at an advanced age (beyond 80 years particularly), there is an important increase of the visits where both types of care are given. However, contact duration per se shows a significant raise with age only for the group "technical care only"; it can be demonstrated that this is due to the fact that older

patients require more complex technical acts (e.g., bladder care, as compared with simpler acts such as injection). A model of the relationships between patient age and contact duration is proposed: it is because of the increase in the proportions of home visits, of visits including basic nursing care, and of more complex technical acts that older persons require more of the working time of public health nurses.

Languages: FRENCH Summary Languages: ENGLISH

This is a descriptive presentation according to patient age (between 41 and 100 years of age) of data collected during an activity study among 130 public health nurses in two Swiss cantons (total population 700,000). Are increasing with age the proportions of home visits (as compared with health center visits), of requests for care coming from the family (rather than the patient), of basic nursing care (hygiene, mobilization) as the major motive for the care request, the number of basic care acts performed and of technical acts such as bladder care (catheter, instillation). Conversely, characteristics the frequency of which decreases with age are for example some technical acts such as injections and taking of blood samples, and proportion of visits after which no control is planned. Elements for which proportions remain similar across the five age groups considered include initial care request by a physician or a hospital, technical nursing acts as the major reason for the request, most of the activities called "help, detection/case study and prevention", and the referral rate to a physician. These results represent a general picture of the observed trends, which will be studied in detail elsewhere.

 This paper describes the community rehabilitation team's role in providing services which enable the elderly to remain in their familiar surroundings. The occupational therapist's contributions as a member of this team are outlined, including environmental modifications and adaptations, activities of daily living training, and use of activities to meet specific aims. Finally, the importance of the team members' attitude is discussed. A positive and understanding attitude is a determining factor in the success of intervention programs for the elderly.

These regulations modify the rules pertaining to compliance with a Life Safety Code, participation of home health agencies (HHA's) in Medicare, and establishment and review of plans of treatment for home health services and outpatient speech pathology services. The changes are necessary to implement several provisions of the Omnibus Reconciliation Act of 1980. The intent of the statutory amendments is (1) to eliminate outdated Life Safety Code requirements imposed on skilled nursing facilities (SNFs); (2) to make it easier for providers of outpatient speech pathology (OSP) services to meet the plan of treatment requirement; (3) to expand the sources of home health services and foster competition; (4) to make it easier for HHAs to meet certification and plan of treatment requirements, while guarding against conflict of interest in the performance of those functions. The amended regulations extend the fire safety code provisions to all hospitals and SNFs under Medicaid as well as Medicare, and to intermediate care facilities (ICFs) under Medicaid. Our purpose is to keep Medicaid rules consistent with the Medicare rules in this area.

This study explored the decision making process of physicians and parents in choosing between hospital and home care for children in the terminal phase of cancer. Data were gathered from hospital records of the children and from interviews with their parents. Discriminant function analysis of hospital record data suggested that the physician's influence over care and treatment choices remained the dominant influence into the terminal phase. Yet parents reported that they were most influenced by their child's and their own desires and beliefs about their ability to provide care. The possibility of a two-stage decision process is offered to explain this discrepancy.

Journal Code: LOS

Languages: ENGLISH

74 insulin-dependent diabetic patients with background retinopathy were randomised to continue with usual diabetic care (group U) or to a more intensive programme (group A) using ultralente insulin as basal cover and soluble insulin at mealtimes. Group A attended the clinic more frequently, received closer dietary supervision, and were taught home blood glucose monitoring. Group A had a significantly lower mean glycosylated haemoglobin level during the study, although the mean level also fell in group U towards the end of year 2.

Renal and sensory-nerve function were significantly better preserved in group A than in group U. Significant improvements were also seen in low-density-lipoprotein-cholesterol and whole-blood low-shear viscosity. The rate of progression of retinopathy was similar in both groups. It appears that a modest improvement in diabetic control, obtainable in most clinics, has been associated with a reduction in the progression of diabetic tissue damage.

Languages: ENGLISH

This study relates inpatient-treated prevalence of the three mental illnesses most often requiring inpatient treatment--schizophrenia, alcoholism, and affective disorders--to social class in a suburban area. Rates were developed for the total population, including those living in domiciliary care, for those living in households only, and for first-admission patients living in households. Log-linear models supported the finding that low socioeconomic status was related to a high prevalence of alcoholism and affective disorders. In contrast, socioeconomic status was not related to the prevalence of schizophrenia among those living in households or among first-admission patients living in households.

**Home care of the pediatric patient with a tracheotomy.**

Ruben RJ; Newton L; Jornsay D; Stein R; Chambers H; Liquori J; Lawrence C

Ann Otol Rhinol Laryngol ,Nov-Dec 1982, 91 (6 Pt 1) p633-40, ISSN 0003-4898 Journal Code: 5Q2

Languages: ENGLISH

Forty-seven infants and children with tracheotomies were cared for at home for a follow-up period of 1,581 months. There were two relevant fatalities which gave a death rate of 0.13 deaths per 100 months. The average age at the time of tracheotomy was 13 months and the tracheotomy was in place for an average of 33 months per patient. The ability to care for these children was provided through coordinated, intensive training and a home-care program in which the inpatient nurse, nurse practitioner, social worker, pediatrician, and otorhinolaryngologist worked as a team.

Journal Code: LSM

Contract/Grant No.: 5K07 AE 00060

Languages: ENGLISH

The challenge facing national policymakers is to provide health care that is comprehensive and cost-effective to our

nation's growing population of elderly people. A solution worthy of consideration is the use of health maintenance organizations (HMOs) in this capacity. An analysis of the services provided by a multidisciplinary health care system to 150 inner-city elderly, many of whom were "homebound," reversal 1) this population is not homogeneous with respect to severity of disease and service utilization, and 2) a total mean cost per individual per year of \$2,021.34 covers: physician, nursing, and social service home visits; visiting nurse, homemakers, home health aide, occupational therapy and physical therapy services; outpatient, laboratory and medication costs. These findings suggest that while costs for those over 65 are many times the per capita costs of younger enrollees, these costs may be significantly less than the costs of institutional care. Further investigation of the costs of maintaining low-income inner-city old, as well as other elderly populations, at home is vital to planning for future long-term care.

**Mortality in relation to the functional capacities of people with disabilities living at home.**

Warren MD; Knight R

J Epidemiol Community Health ,Sep 1982, 36 (3) p220-3, ISSN 0143-005X Journal Code: I1P

Languages: ENGLISH

The mortality experienced by a group of 1534 impaired people identified by means of a census-type survey of all households in the City of Canterbury is related to the degree of difficulty in carrying out selected self-care activities as reported by the impaired people. Although not entirely consistent, the findings in relation to people in their own homes agree with previously reported findings among patients in long-stay hospitals and residents in institutions that increasing difficulties in self-care (and therefore of dependency) are associated with increased mortality rates. These findings suggest that there is no clear boundary between some services for disabled people and those for terminal care, and that many severely handicapped people at home require co-ordinated and flexible care from nurses, social workers, and doctors.

Fischer DA; Prentice WS  
Chest ,Dec 1982, 82 (6) p739-43, ISSN 0012-3692  
Journal Code: DIC  
Languages: ENGLISH  
Some patients requiring long-term intermittent or continuous mechanical ventilation can be safely treated at home with less cost and greater patient and family satisfaction. This is supported by experience with restrictive or obstructive respiratory disease patients in a respirator home care program from 1973 through 1979; some were followed for over four years. Moreover, risk is low as judged by few medical complications and no deaths attributed to home care. When compared with their need for hospitalization in the preceding 12 months, patients in the home care program required fewer days in the hospital (restrictive, 88 percent; obstructive, 37 percent). Given proper organization and resources, home care can be a useful alternative to continued hospitalization for certain respirator-dependent patients.

Patientencompliance in Abhängigkeit von der Betreuungsform und vom Alter.

Dan J

ZFA (Dresden) ,Jul-Aug 1982, 37 (4) p273-6, Journal Code: XSR

Languages: GERMAN Summary Languages: ENGLISH

For the medical monitoring of selected groups of patients to be successful, it is necessary that the patients concerned cooperate in every respect. Our studies have shown that compliance was best (82 per cent) in the case of those locked after in their homes. Groups of specially selected patients came next with just under 80 per cent. Cooperation was least satisfactory (33 per cent) among those who were not given a definite appointment.

This article presents a review of issues in home health, including a discussion of current political philosophy and its impact on home care, an identification of problems and barriers in the home health field, and some approaches to resolve these difficulties. Among the issues explored are the administrative structure and financing of home health agencies; manpower considerations, with particular attention to the role of nursing; business practices, productivity and the industry's image, and finally, the relationship between long-term services and acute care.

Languages: ENGLISH

This article examines acute hospital discharge planning processes and the constraints imposed by external control, including third party payors and PSRO. Analysis suggests that availability of third party payment for services dominates the discharge plan. From the professional perspective, in-home services are often planned and provided only to the extent they meet the requirements of medical necessity; from the lay perspective, the services most required are those which preserve the social context. As a consequence, care providers, patients, and significant others become "caught" in regulations often unrelated to a reasonable plan of care designed to meet patient and family needs.

**Home health care and rapid rehospitalization.**

Schwartzberg JG

Home Health Care Serv Q ,Spring 1982, 3 (1) p25-37,

ISSN 0162-1424 Journal Code: GJ6

Languages: ENGLISH

Early release from the hospital of the elderly ill patient may lead to failure of the home care plan and rapid rehospitalization. Review of 330 consecutive admissions to a large urban home health agency in 1980 revealed that 43 patients (13%) were rehospitalized within 2 weeks of admission. This high risk patient population is contrasted with the average home care population in terms of living arrangements, ambulatory status, primary diagnosis, age, sex, medications, etc. Home care was probably the appropriate long-term placement if better coordination between discharge planners, PSROs, physicians and home care staff could have been established with the extension of the hospital stay by 1-2 days and/or the provision of more intensive supportive care in the home at the time of admission to the home care agency. Simple guidelines for medical/social discharge planning to provide safer transfer of ill elderly patients from hospital to home are listed.

**Postpartum home visits by maternity nursing students.**

Barrett JE

JOGN Nurs ,Jul-Aug 1982, 11 (4) p238-40, ISSN 0090-0311

Journal Code: KS2

Languages: ENGLISH

Fewer babies are being born; hospital postpartum days are being shortened; and many families are choosing home births: These facts have prompted nursing educators to seek maternity experiences for students outside the hospital setting. At the university where the student-visit program was implemented, faculty appreciated the need for follow-up home care and focused on more than the experiences in prenatal clinics and the acute-care setting. Rather than turning the family over to another community service or colleague when indicated, second and third home visits are being considered. These additional visits would assure a greater opportunity for primary prevention in the care of the total family. Hospital management and home-care maternity nurses have found that postpartum visits have decreased the need for parents to return to the emergency room or the hospital. Problems have been anticipated or assessed and nursing intervention provided on the home visit. This service gradually is becoming available to more families, with both physical and psychosocial needs being considered. It is hoped that it soon will be provided to all families. Postpartum families, nurses, and nursing students benefit from follow-up postpartum visits in the home. The families are assisted in their parenting roles and nurses gain satisfaction in providing continuity of care.

The philosophy of the FBC strengthens the concept of childbirth as a normal physiologic process. Couples are guaranteed a high level of quality nursing and medical care. Simultaneously, provisions are made to enhance the family's assertiveness in obtaining a satisfying experience in the hospital that extends to the home environment. With careful planning and decision making throughout the pregnancy, early discharge becomes a satisfying and safe alternative for families and provides a means to decrease the ever rising cost of health care.

The effectiveness of two social support strategies designed to lower hypertensive patients' blood pressure were compared to each other and to a control group (N = 63) receiving routine care in a randomized clinical trial extending over a period of two years. Group 1 (N = 99) received visits and had family members actively participate in their care through home blood pressure monitoring; Group 2 (N = 56) received home visits from nurses and pharmacists. All groups were predominantly Black. After the first year of the trial, the proportion of patients with uncontrolled diastolic blood pressure (greater than or equal to 95mm Hg) had declined significantly for all three groups; no group showed a statistically significant advantage. However, during the last six months of the second year (after visiting had ended), both Groups 1 and 2 demonstrated clear superiority in DBP control over Group 3, achieving borderline statistical significance (p = .07) when multivariable analysis was performed to control for potential confounders. Supplementing routine care with periodic home visits produced an additional 21 per cent of patients with well-controlled DBP, while involving family members plus visits produced a 17 per cent improvement in the percentage of patients with DBP less than 95mm Hg. However, neither support strategy was clearly more effective than the other over time. The efficacy of the interventions is discussed with respect to cost and feasibility of implementation.

The concept of symptom-avoidance behavior is discussed, with particular reference to home intravenous hyperalimentation (HIVH) patients. Symptom-avoidance behavior is explained as a combination of a health behavior model and an expectancy motivational theory leading to a basic outcome, which is satisfactorily avoiding the onset of symptoms. A systematic behavioral assessment method is presented, based on anecdotal cases; it is experimental in nature and can serve as a guide for practitioners who wish to initiate HIVH.

The effects of a home care program with 102 courses (2336 patient-days) of intravenous antibiotic therapy were evaluated. Home care nurses changed the intravenous cannula site every 3 days. The initial hospital stay averaged 11.8 days and the duration of home therapy averaged 22.9 days. The diseases treated included osteomyelitis, septic arthritis, endocarditis, cystic fibrosis and pneumonia, staphylococcal bacteremia, blastomycosis, actinomycosis and other soft tissue infections. All classes of commonly used antibiotics, including penicillins, cephalosporins, aminoglycosides and amphotericin B, were administered, alone or in combination. There were no side effects that necessitated discontinuation of home treatment or readmission to hospital. The average cost per patient-day was \$58, compared with an estimated \$193 for in-hospital therapy; in addition, 2336 hospital bed-days were made available. Most patients were able to resume many or all of their daily activities while receiving intravenous antibiotic therapy.

**Community psychiatric nursing for neurotic patients: a controlled trial.**

Paykel ES; Mangan SP; Griffith JH; Burns TP  
Br J Psychiatry, Jun 1982, 140 p573-81, ISSN 0007-1250  
Journal Code: B1K

Languages: ENGLISH

Seventy-one neurotic patients requiring follow-up were randomly assigned to routine psychiatric out-patient care or to supportive home visiting from community psychiatric nurses as their main treatment agents and were assessed every six months for 18 months. No differences were found between effectiveness of the two modes of service on symptoms, social adjustment or family burden. Patients seeing community psychiatric nurses reported greater satisfaction with treatment. Community psychiatric nursing resulted in a marked reduction in out-patient contacts with psychiatrists and other staff, more discharges, and a small increase in general practitioner contact for prescribing. Care of such patients by community psychiatric nurses is a valuable alternative mode of deployment within the psychiatric team.

**A trial of prophylactic mexiletine in home coronary care.**

Bell JA; Thomas JM; Isaacson JR; Snell NJ; Holt DW  
Br Heart J, Sep 1982, 48 (3) p285-90, ISSN 0007-0769  
Journal Code: ATS

Languages: ENGLISH

A double blind randomised study was undertaken comparing the effects of oral mexiletine and placebo given by general practitioners at home in the early stages of suspected acute myocardial infarction, and continued for six weeks. The study comprised 216 patients. In 59 the diagnosis of acute myocardial infarction was not confirmed. Of the 72 patients with confirmed myocardial infarction treated with mexiletine, 11 (15.3%) died, compared with 19 (22.4%) of the 85 patients given the placebo, and significantly fewer of the former compared with the latter had frequent ventricular ectopics or ventricular tachycardia recorded on 24 hour electrocardiograms. Numbers of patients transferred to hospital or withdrawn from the trial because of arrhythmia or heart failure were similar in the two treated groups. Ten (13.9%) of the patients taking mexiletine had the drug withdrawn because of side effects attributed to it, compared with three (3.5%) of the group taking the placebo. A further five patients (all on mexiletine) also had treatment withdrawn because of side effects but infarction was not later confirmed. The results indicate that oral mexiletine can be given safely to patients with suspected myocardial infarction at home by their general practitioners in the absence of a positive electrocardiographic diagnosis. The frequency of ventricular tachycardia is significantly reduced; but there is no evidence of reduced mortality.

Arch Dis Child, Jul 1982, 57 (7) p511-3, ISSN 0003-9888  
Journal Code: 6XG  
Languages: ENGLISH

A study was conducted to see if the discharge weight of preterm infants born at less than or equal to 2000 g could safely be reduced. A study group (21 infants) was discharged 'early' at a mean weight of 2010 g (1890-2190) provided there were no medical problems, weight gain was adequate, temperature control in room air was stable, all feedings were by breast, and the mother was ready to have the baby home. A control group (17 infants) was discharged at a mean weight of 2261 g (2200-2400). The duration of time in hospital for the 'early' group was shortened by 11.6 days. At expected date of delivery the weight of infants in each group was similar (3095 +/- 403 compared with 3146 +/- 453 g); length, head circumference, and haemoglobin concentration in each group were similar too. There was no morbidity or mortality in either group. Early discharge did not affect mothering confidence. This study shows that low birthweight infants can be discharged early (at 2000 +/- 100 g) provided appropriate criteria are met, home conditions are adequate, and follow-up is available.

Languages: ENGLISH  
A Long-term Care Program was introduced throughout British

Columbia, Canada, on January 1, 1978. This comprehensive community-based program emphasizes home care. A longitudinal study was started of all persons (N = 3518) admitted to the program that year in two health districts, one urban and one semirural. An examination of the relationship between acute-care hospitalization and long-term care (LTC) involved determining (1) the number of admissions (N = 364) to LTC directly from acute-care settings versus the number (N = 1287) entering directly from the community, (2) the number of LTC persons who were hospitalized at least once in the first 12 months after admission to LTC, and (3) the outcomes of these hospitalizations. Persons from the urban area who entered the LTC Program from an acute-care hospital were much more likely to be institutionalized than were those from the semirural area. In the LTC facility group, 388 persons (19.9 per cent) experienced at least one acute-care hospitalization during the first year of the program. More than 50 per cent of those transferred to an acute-care hospital for the first time returned to the same location and level of care afterward; 14 per cent died. These descriptive analyses may be of interest to health-care planners and to those who care for the LTC elderly either at home or in a facility.

**A VNA home health care program: predicting patients who refuse services.**

Legge JS Jr  
Eval Health Prof ,Jun 1982, 5 (2) p200-9, ISSN  
0163-2787 Journal Code: ENK  
Languages: ENGLISH

Many studies have been compiled which report patient characteristics and patterns in the utilization of health care services. Very little information is available on the characteristics of patients who refuse services in a particular program. This article employs a sample of 246 home health care patients to describe the characteristics of persons refusing services compared to a group "normally" terminating service. The method employed is discriminant analysis. The results of the study are substantively consistent with the theoretical and empirical literature on health care utilization. Those refusing service were less likely to be insured and tended to have multiple admissions to the program. They were less inclined to improve in functional status, despite a tendency toward a longer stay in the program. Curiously, fewer nursing visits occurred for these patients, despite their longer stays. Implications of the study for program management are discussed.

**Home apnea monitoring in 'near-miss' sudden infant death syndrome (SIDS) and in siblings of SIDS victims.**

Duffy P; Bryan MH  
Pediatrics ,Jul 1982, 70 (1) p69-74, ISSN 0031-4005  
Journal Code: DXV  
Languages: ENGLISH

Electronic monitors were used at home to detect apnea in 134 infants who were considered to be at risk for sudden infant death syndrome (SIDS). Seventy-two infants had idiopathic apnea at a mean age of 2.2 +/- 1.4 (+/- 1 SD) months. Of these, 31 subsequently had prolonged apnea (greater than 20 seconds) with the last spell occurring at 6.2 +/- 3.2 months of age. Fourteen infants required vigorous stimulation on at least one occasion and 14 had more than ten separate episodes.

Eighteen infants with awake apnea had a significantly smaller chance of subsequent spells (P less than .05). Ten additional term infants had apnea during the first week of life but none had subsequent episodes. Of 52 siblings of SIDS victims, only seven had had apnea before monitoring started. Sixteen had prolonged apnea while on a monitor; seven required vigorous stimulation on at least one occasion and one infant died despite cardiopulmonary resuscitation. The first documented spell in these 16 infants was at 2.6 +/- 2.1 months and the last at 7.2 +/- 2.7 months of age. Ten infants had more than ten subsequent spells. A tendency to clustering of spells was noted. Preceding events, especially a mild upper respiratory tract infection, were noted in 36 of the 47 infants who had apnea on the home monitor.

**Health visitor support for families with Down's syndrome infants.**

Cunningham CC; Aumonier ME; Sloper P  
Child Care Health Dev ,Jan-Feb 1982, 8 (1) p1-19, ISSN  
0305-1862 Journal Code: C9X  
Languages: ENGLISH

A health visitor was seconded to a university based research team studying intervention with families who have an infant with Down's syndrome. She was given a 3-week practical training and then provided a home-based service for 61 families, visiting every 6 weeks until 2 years of age. Infant development and parental satisfaction with the service were compared to previous findings of the research group. Parental satisfaction was found to be very high and the progress of the infants compared favourably to previous studies. Following this, two field health visitors were given the training and then provided a service in their local areas. The progress of the infants was monitored at 6-month intervals until 2 years of age, and parents were interviewed. Again no differences were found in the developmental progress of the infants and previous groups and parental satisfaction was high. The limitations of the training and some implications for practice were discussed.

Languages: GERMAN Summary Languages: ENGLISH

Rehabilitation requires the interplay of three essential factors, namely medicine, organization and humanity. The concept of entirety and permanency implies that rehabilitation must commence on the very first day of acute therapy and continue, with the aid of relatives, after discharge from hospital. Depression very frequently accompanies a stroke and requires expert handling both with psychopharmaceutical drugs and psychotherapeutical methods (including nursing staff and family) to overcome this hurdle to rehabilitation. Physiotherapy is of paramount importance, with particular emphasis on active movement. Therapeutic management with medicines must continue along the lines commenced in the acute stage. The therapy of stroke requires a considerable involvement of manpower, which must not be denied to this step-child of rehabilitation. Apart from medical considerations, it is salutary to remember that every fifteenth person is likely to be handicapped after a stroke at some time in his life.

Pediatrics ,Jun 1982, 69 (6) p703-7, ISSN 0031-4005  
Journal Code: DXV  
Languages: ENGLISH

Parent training was provided for 80 low-income, black teenage mothers during their infants' first six months. Half of the mothers were visited biweekly in their homes to be instructed in caregiving and in sensorimotor and interaction exercises, and half were trained as CETA (Comprehensive Employment Training ACT)-paid, teacher's aides in a medical school infant nursery that provided care for their infants and infants of medical faculty. Growth and development during the first two years were superior for the infants whose mothers received training, particularly those who received paid parent training as teacher's aides in the infant nursery. Repeat pregnancy rates were lower and return to work/school rates were higher for the infant nursery mothers, most of whom subsequently pursued nurse's aide training.

This chapter is an overview of the management of a patient  
who has undergone a surgical procedure in an outpatient  
setting. It addresses the complications that are most common  
in this setting and their management. Without attempting a  
thorough discussion of every conceivable complication, this  
discussion seeks nonetheless to be reasonably comprehensive.  
Perhaps the most straightforward means of presenting this  
information is to follow chronologically the patient's  
experience from the moment the procedure has been concluded,  
through his recovery room care, and finally look at the  
patient's needs and experiences after leaving the ambulatory  
care facility.

The Peterborough Hospital at Home Scheme had explored the possibilities of treating at home patients who, if it were not for the scheme, would be in hospital. The scheme has been enthusiastically received by patients, consultants, general practitioners, nurses, and other health care workers. It is difficult to compare costs. Nevertheless, the cost of Hospital at Home care cannot be regarded as too expensive compared with care in hospital. Establishment of such schemes elsewhere would affect future allocation of capital.

Geriatric in-patients often stay longer in hospital than  
would be necessary on medical grounds alone due to the lack of  
intermediate facilities and the paramount influence of social  
conditions. Day-hospital services contribute largely to an  
early return of geriatric and long-term patients. The  
potential amount of patients eligible for this kind of service  
is investigated by a 5% sample of all non-psychiatric  
in-patients age 65+ in Berlin (West). Social conditions at  
home and the number of patients to receive day services showed  
a significant relation. Based on the findings it is estimated  
that 15 day-hospitals will be needed in Berlin (West) to  
promote re-integration of geriatric patients into their  
familiar surroundings.

**A stochastic service network model with application to hospital facilities.**  
Hershey JC; Weiss EN; Cohen MA  
Oper Res ,Jan-Feb 1981, 29 (1) p1-22, Journal Code:  
OKC

Languages: ENGLISH  
This paper presents a methodology for estimating expected utilization and service level for a class of capacity constrained service network facilities operating in a stochastic environment. A semi-Markov process describes the flows of customers (patients) through a network of service units. We model the case where one of the units has finite capacity and no queues are allowed to form. We show that the expected level of utilization and service can be computed from a simple linear relationship based on (a) the equilibrium arrival rates at each unit which are associated with the case of infinite capacity, (b) mean holding times for each unit, and (c) the probability that the finite capacity unit is at full capacity. We use Erlang's loss formula to calculate the probability of full capacity, show this calculation to be exact for two cases, and recommend its use as an approximation in the general case. We test the accuracy of the approximation on a set of published data. In the discussion, we present a technique for analyzing collected patient flow data using the results of this methodology.

**Dissecting the hospital stay: a method for studying patient staging in hospitals.**

Sherman H; Flatley M  
Med Care ,Jul 1980, 18 (7) p715-30, ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

A methodology is proposed and tested for the staging of patients through a hospital stay. Measurements in a university-affiliated hospital and a community hospital in the Boston area showed similar staging patterns with about half of the sample having abnormal signs and symptoms while under treatment. The second-largest sample group in both hospitals, consisting of 11% of the sample, occupied beds although ready for discharge. The methodology indicated those patient-time units in the hospital which might be amenable to further reduction and gave upper bounds on that compression. Contrary to prior expectations, 90% of the patients sampled followed a well-defined sequence from admission to discharge with only 10% having complications of the admitting diagnosis, new diagnosis or iatrogenic illness.

**A needs-assessment method for planning alternatives to hospitalization.**

Fowler G

Hosp Community Psychiatry ,Jan 1980, 31 (1) p41-5, ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

A one-day caseload survey was conducted in Los Angeles County's public inpatient facilities in order to estimate needs for alternatives to hospitalization. According to the primary therapists of each client in the caseload, 43 per cent of the inpatients could, on the day of the survey, be served in alternative programs. Responses to questions about the kinds of living arrangements and medical-diagnostic services needed in community programs for those clients showed a high need for residential care with close supervision or locked wards or both. The author concludes that while a significant number of inpatient days could be eliminated through the use of minimal-supervision alternatives, a large decrease in hospitalization could be expected only if more intensive community programs were implemented.

Languages: ENGLISH

This article describes and evaluates the treatment effectiveness of a behaviorally oriented intermediate day-care

clinic for adults with psychiatric disturbances. The goals of the program included reducing the number of psychiatric hospital admissions and readmissions, providing a community-based controlled environment to assist patients in the modification of specific problem behavior, improving interpersonal relations with "significant others" in the natural environment, teaching patients how to use community resources, and preparing them for employment and/or continued outpatient treatment. The program was structured so that patients advance through a series of four achievement levels for a variety of extrinsic and intrinsic reinforcers. While in the program, patients were introduced to available community resources, and were gradually phased into follow-up services. Results showed that 79% of all patients thus far treated partially, if not completely, advanced through the levels. There was also a high probability that a patient would advance from any given level. Outside-clinic behavior showed sustained improvement, with the authors concluding that the day-care clinic offered promise for the future.

**Early retransfer: a method of optimal bed utilization of NICU beds.**

Zarif MA; Rest J; Vidyasagar D  
Crit Care Med ,Aug 1979, 7 (8) p325-9, ISSN 0090-3493  
Journal Code: DTF  
Languages: ENGLISH

To facilitate increased utility of Neonatal Intensive Care Unit (NICU) beds, we adopted a policy of early discharge (ED) of infants less than 2000 g to the hospital of their birth after recovery from acute illness and when the infant was breathing room air and taking adequate oral feedings. An inservice teaching program at the primary hospitals preceded such policy. In a 24-month period, 446 infants were referred to the NICU. 111 of 446 died; 335 infants survived. 114 of 335 infants were less than 2000 g at birth; 42% (48 of 114) of them were discharged early to the hospital of their birth (ED); 58% were discharged late (LD) to their homes. 59.7% of the ED and 46.3% of the LD required assisted ventilation. Gestational age, birth weight, and final weight at discharge from hospitals were the same in both groups. None of the ED infants developed complications at the hospital of birth after retransfer. The length of NICU stay for LD was significantly higher 40 +/- 6 (p less than 0.001) than the ED; 20 +/- 2.2 days. In addition, a 15% increase in bed utilization was also noted because of ED. We conclude that ED of infants from the NICU 1) increases utilization of beds; 2) decreases the cost of health care; and 3) increases the participation of primary physicians.

A model is developed for determining an appropriate policy for referral or discharge of patients from the different modes of care in a progressive patient care facility. The objectives of the model are to achieve a high probability that the average patient recovers and to provide care at a low cost. Previous results concerning multichain semi-Markov processes are used in conjunction with vector maximum in order to generate all nondominated solutions to the problem.

**Hospitals in the 1980s: service, training, and research.**

Glick ID; Hargreaves WA

Hosp Community Psychiatry ,Feb 1979, 30 (2) p125-8,

ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Several factors press for change in the psychiatric hospital of the 1980s, including knowledge obtained from recent controlled studies of outcome of different approaches and length of hospital stay, changes in the social-political-economic climate, and new methods of organizing the delivery of services. In the proposed model of inpatient treatment, the primary use of hospitalization will be for brief treatment (three to 21 days). For a very small subgroup, longer hospitalization may be needed. The hospital will also be used for triage and disposition of persons with a broad range of problems, which will rarely take more than three days. Complementary changes will be required in training and research; a promising training model may be continuous care teams by which trainees can manage chronic, multiproblem patients through different levels of care within and outside the hospital. Research must move to the out-of-hospital settings if the new patterns of care are to be understood and improved.

**Computer simulation in allocation design of a health-care delivery system.**

Bandyopadhyay JK

J Clin Eng ,Jul-Sep 1978, 3 (3) p285-91, ISSN 0363-8855

Journal Code: HOA

Languages: ENGLISH

With the introduction of the concept of progressive patient care in the health-care delivery system, most hospitals now encounter a heterogeneous flow of patients through the various service units. This complicates the problem of allocation of beds and other facilities and equipment. In this paper, a simulation model has been developed by considering the flow of patients in a hospital as a multi-population immigration-birth-death process. Based upon this model, an algorithm has been developed for allocation of beds to various service units using a search process combined with total systems simulation.

**The role of a regional treatment center in a model mental health delivery system.**

Ecklund LA

Hosp Community Psychiatry ,Jun 1978, 29 (6) p379-83,

ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

The author discusses the changes that have occurred at the Mendota Mental Health Institute in Madison, Wisconsin, in response to the growth of the community movement. He traces Mendota's evolution from a traditional state hospital to a regional center that offers specialized treatment services for those who cannot be cared for in community programs, and that places strong emphasis on education and consultation services and on research into treatment methods. He believes a major problem with the community mental health movement has been the expectation that community services should be able to meet all the needs of the people in their areas, an expectation that he considers impossible to fulfill. He proposes a mental health delivery system with primary, secondary, and tertiary levels of care (at the third level would be regional centers similar to Mendota), and a fourth level that would provide protective care.

**Plasma fibronectin and associated variables in surgical intensive care patients.**  
Rubli E; Bussard S; Frel E; Lundsgaard-Hansen P; Pappova E  
Ann Surg ,Mar 1983, 197 (3) p310-7, ISSN 0003-4932  
Journal Code: 67S  
Languages: ENGLISH

An acute depletion of plasma fibronectin or FN has been observed in critically ill, surgical, or trauma patients, but there is little information on the relationships between FN levels and the final outcome in such cases, and on the simultaneous behaviour of other serum proteins. The daily values of FN, antithrombin III, IgG, C3, prealbumin, and transferrin were monitored in 98 intensive care patients after major elective surgery or trauma. According to their clinical course, they were divided retrospectively into three groups. Group A (33 patients) had sepsis. Group B (31 patients) had nonseptic complications, and group C (34 patients) had no complications in the ICU. The individual, nadir levels of FN, AT III, prealbumin, and transferrin were lower ( $p$  less than 0.01) in the septic group A than in B and C. Within the septic group, the nadir levels of AT III, but not those of FN, were lower ( $p$  less than 0.01) in the 14 nonsurvivors than in the 19 survivors. The FN and AT III levels had returned at least temporarily to the normal range in the six ultimate fatalities from sepsis who survived for more than two weeks. In the septic group, transferrin showed the highest percentages of actually subnormal levels and differed from FN in this respect with  $p$  less than 0.05. Furthermore, all six proteins showed a significant overall pattern ( $p$  less than 0.01) of parallel variations. The results confirm other reports on the behavior of fibronectin in septic patients as a group, but it was not informative as to the individual outcome, and its reduction might be viewed as part of a general plasma protein depletion associated with acute septic disease. This pattern is probably attributable to a combination of intravascular consumption and an overall excess of protein catabolism over synthesis.

Desa DJ  
Arch Dis Child ,Jan 1983, 58 (1) p24-8, ISSN 0003-9888  
Journal Code: 6XG  
Languages: ENGLISH

The histological findings in the middle ear cavity of 72 infants of varying gestations, birthweights, and ages are presented. All infants died after receiving ventilatory support and oxygen for longer than 14 days. In 5 infants there was no detectable histological abnormality. In the remainder, a wide range of lesions was seen including glandular metaplasia, retained squamous debris, squamous polyps, otitis media, and destruction of ossicles. None of the cases of otitis media was diagnosed before necropsy; all were associated with pneumonia. No single specific infectious agent predominated. Several factors could contribute to the spectrum of lesions, and these include persistent amniotic squamous debris, infection, and the effects of oxygen and a nasal airway. The possible implications of these findings are discussed, and it is argued that similar changes of lesser severity could be present in survivors in whom otitis media and conduction hearing defects could be expected.

**[Psychological stress factors in intensive care]**  
Psychische Stressfaktoren in der Intensivmedizin.  
Bunzel B; Benzer H; Gollner C; Pauser G  
Anaesthesist ,Dec 1982, 31 (12) p693-8, ISSN 0003-2417  
Journal Code: 4MY  
Languages: GERMAN Summary Languages: ENGLISH  
In three intensive care units we looked into the question whether there are environmental situations somewhat equally stressful for the patients using 52 stress items designed by ourselves for the study. The patients had to place the various items in a sequence of increasing annoyance just one day after discharge from the intensive care unit. The most annoying factor for all patients, almost independent of sex and diagnosis, was the item "lack of information and communication". The item "noise and unrest caused by the daily routine and the nursing staff of the intensive care unit" was put in the first place by patients aged more than 50 years. Helplessness and physical impairment are the most annoying factors reported by the ventilated patients. The item "dependence on technical devices" (e.g. ventilators, dialyzer etc.) was surprisingly quoted low by our patients. We conclude that a human orientated intensive care medicine approach should be developed. Further investigations concerning psychical care and help should be performed.

The treatment of intensive care patients is complex and sometimes unrewarding. The identification of factors that predict the outcome of these patients would make treatment easier to evaluate. Various pulmonary, cardiovascular and metabolic variables have been tested as prognostic measures. They have so far not been found conclusively reliable. It seems as if measurements of factors in the cascade systems, in particular prekallikrein, Hageman factor, and antithrombin III may be the best available indexes to predict a fatal outcome.

Management of the pediatric patient sustaining a traumatic injury is influenced by patient size, surface area to body mass ratio, thermoregulation, and fluid requirements. A predetermined and systematic approach to the injured child guarantees recognition of life-threatening injuries and provides a method for rapid stabilization. The algorithm is divided into two distinct phases: life support and post-stabilization. The unique aspects of care of the injured child are highlighted to emphasize the significant differences in resuscitation and diagnosis from that of the adult patient.

Hemodynamic measurement is now an important and feasible adjunct to clinical practice. Its successful application to alleviate illness in human beings is evident in its contribution to an understanding of the pathophysiology of disease and the efficacy of various interventions to alter the course of a variety of diseases. Its application is widespread in the high risk patient undergoing surgery and the critically ill medically treated patient. Hemodynamic measurement permits accurate determination of the state and, if necessary, of the continuously changing function of the heart as related to disease process and guides treatment and interventions on a rational physiologic basis.

**Pituitary-thyroid dysfunction in severe non-thyroidal disease: "low-T4 syndrome".**  
Bratusch-Marrain P; Vierhapper H; Grubeck-Loebenstien B; Waldhausl W; Kleinberger G  
Endokrinologie ,Oct 1982, 80 (2) p207-12, ISSN 0013-7251 Journal Code: EHJ  
Languages: ENGLISH

Thyroid function tests were obtained from 335 consecutive patients admitted to an intensive care unit. Twenty patients suffering from severe non-endocrine diseases (septicaemia, fulminant hepatic and renal failure, acute pancreatitis, polytrauma, cerebral haemorrhage) were found to have serum thyroxine levels in the hypothyroid range (less than 4 micrograms/dl). Serum concentrations of total thyroxine (2.3 +/- 0.2 micrograms/dl), triiodothyronine (0.23 +/- 0.03 ng/ml), and thyroxine binding globulin (15.1 +/- 1.3 micrograms/ml) were reduced, but were above normal for reverse triiodothyronine (0.43 +/- 0.06 ng/ml). Response of TSH secretion to iv TRH was found to be either normal, lowered or absent. Primary hypothyroidism was excluded, as no enhanced TSH response was observed in any case. Although decreased thyroxine levels may be due to increased thyroid hormone degradation it appears that associated impaired TSH responsiveness to TRH may result from illness-related inhibition of pituitary TSH release. Although the finding of decreased thyroid hormone levels is not rare in care patients, it represents an index of poor prognosis. Differentiation between this "low-T4 syndrome" and true hypothyroidism depends

essentially on clinical symptoms and course of disease.

Status epilepticus is a medical emergency requiring immediate treatment. General treatment is aimed at restoring physiologic homeostasis, and drug therapy is aimed at arresting the convulsive activity and preventing its recurrence. Concurrent administration of diazepam and either phenytoin or phenobarbital will be effective in most cases. After the status epilepticus has been treated the underlying cause should be investigated and, if possible, treated.

Biotelemetry has developed as a reliable alternative to continuous monitoring of physiological variables under realistic circumstances of data assessment. For incorporation in clinical routine the lack of an adequate number of biotelemetry frequencies forms a severe disadvantage. This paper shows a way to circumvent the problem, namely by using infrared light as the carrier for the transmission system. Use of infrared light is limited to indoor applications, and a number of additional restrictions have to be accepted, but on the other hand infrared telemetry opens new possibilities not known to radiotelemetry, especially suited for clinical applications.

**Pulmonary extraction of catecholamines in critically ill patients.**

Russell WJ; Frewin DB; Jonsson JR  
Anaesth Intensive Care ,Nov 1982, 10 (4) p319-23,  
Journal Code: 4M5

Languages: ENGLISH

Plasma catecholamine concentrations in blood obtained simultaneously from the pulmonary and radial arteries of ten critically ill patients have been measured. The mean mixed venous concentrations of noradrenaline, adrenaline and dopamine were extremely high, noradrenaline 11.3 pmol/ml (SD 11.6), adrenaline 2.7 pmol/ml (SD 3.0) and dopamine 7.1 pmol/ml (SD 12.3). An appreciable drop in the concentrations occurred as the blood passed from the pulmonary artery to the radial artery (mean fall 24.1, 29.7 and 45.8% respectively). Four patients receiving a therapeutic dopamine infusion were also studied and demonstrated similar trends in catecholamine concentrations. The results suggest a substantial pulmonary clearance mechanism for all three catecholamines.

**[Specific stress of intensive therapy: its analysis and suggestions for changes]**

Situationsspezifische Belastungen der Intensivbehandlung: ihre Analyse und Änderungsmöglichkeiten.

Hannich HJ; Wendt M; Bertlich P

Anaesthesist ,Nov 1982, 31 (11) p615-20, ISSN 0003-2417  
Journal Code: 4MY

Languages: GERMAN Summary Languages: ENGLISH

Proceeding from studies which make the environment of an intensive care unit responsible for psychopathological disturbances in thoracic patients, we made investigations on an operative intensive care unit concerning its influence on the psychical state of surgical patients. For this purpose photometry and noise measurements were made at the patient's bedside; additionally the environment of a ventilated patient was recorded continuously by means of a cine-camera. The results we obtained from noise measurements showed that all patients were affected with both sensorial monotony and sensorial overstimulation. Overstimulation results from sudden and unexpected noise (for example due to emergency admissions) on an intensive care unit. The analysis of the illumination intensity showed a day and night turn; that means, the patient was able to distinguish between daytime and nighttime but due to missing bearings no further temporal orientation was possible. The filmings demonstrated that there were numerous contacts between the patient and his environment which, however, did not last longer than 105 s on an average. These findings refer to the problem of the patient's social isolation; others show the loss of sleeping and resting stages. So the "resting stages", that means stages without visible contact, last between 1-3 min. In the light of the results, psychopathological disturbances in the patients of this intensive care unit are connected with the situational conditions of the unit. Suggestions concerning the removal of

situational load-factors are deducible from these findings.

**[Effect of arm splinting on the duration and possibility of monitoring invasive long-term pressure determination of the radial artery]**

Einfluss der Armschienung auf Verweildauer und Monitorierbarkeit bei blutiger arterieller Langzeitdruckmessung über die A. radialis.

Mutz N; Koller W; Pauser G; Schedl R

Anasth Intensivther Notfallmed ,Dec 1982, 17 (6) p351-3,  
ISSN 0174-1837 Journal Code: 4CP

Languages: GERMAN Summary Languages: ENGLISH

A special splint technique, which can improve continuous intraarterial blood pressure monitoring via the a. radialis is reported. This method could be applied successfully in 41 patients of the ICU up to 27 days. Cannulating the contralateral side because of catheter's dysfunction was necessary only in 6 patients. These observations could be seen in contrast to our results, using a conventional splint system, applied in 12 patients for comparison (maximal duration of catheter's placement: 9 days). Our experiences, using this special splint method of arm fixation, lead to the recommendation to use our method routinely in long-term monitored patients, with respect to a longer duration of catheter's intravasal placement, the possibility of undisturbed monitoring and a simple clinical handling.

**Evaluation of a new monitoring device for arterial blood pressure and heart rate measurement by automatic sphygmomanometry.**

Chastonay P; Morel D; Forster A; Suter PM

Anasth Intensivther Notfallmed ,Dec 1982, 17 (6) p348-50  
ISSN 0174-1837 Journal Code: 4CP

Languages: ENGLISH

Measurements of arterial blood pressure (BP) and heart rate (HR) using a new non-invasive automatic apparatus were compared with the BP and HR values obtained with an invasive technique, i.e. arterial catheter and pressure transducer. This new device consists of a self-inflating BP cuff and of a microphone which converts Korotkoff sounds into digital values. The comparison was made on 400 measurements in 10 surgical intensive-care patients during 18 hours after open heart surgery. Systolic pressure was underestimated by the new device by  $13 \pm 20$  mm Hg/ $1.7 \pm 2.6$  kPa (means  $\pm$  SD) and the linear correlation coefficient between the non-invasive and the invasive technique was  $r = 0.70$ . Diastolic pressure was overestimated by  $9.4 \pm 12.0$  mmHg ( $1.2 \pm 1.5$  kPa) with an  $r = 0.63$ . HR was also underestimated by  $7 \pm 17$  heart beats per minute ( $r = 0.58$ ). We conclude that this new device is not adequate for monitoring intensive-care patients, not so much because of the differences noted between the invasive and the non-invasive measurements, but in particular because there are no alarms, no mean arterial pressure measurement and also because it gives aberrant results once out of twenty measurements.

**Use of thrombocytopenia for the early identification of sepsis in critically ill newborns.**

Storm W

Acta Paediatr Acad Sci Hung ,1982, 23 (3) p349-55, ISSN 0001-6527 Journal Code: 1JQ

Languages: ENGLISH

The detection of thrombocytopenia seems to have gained widespread use as an early sign of neonatal septicaemia. A prospective study of 78 full term and preterm babies was done to clarify the significance of serial platelet counts for early sepsis identification in critically ill and ventilated newborns. The results show that thrombocytopenia in this special patient group is too unspecific to be associated with septicaemia. Neither sporadic nor serial platelet counts are suitable as a reliable diagnostic test for the early detection of neonatal septicaemia.

**Fluctuation of intracranial pressure associated with the cardiac cycle.**

Daley ML; Gallo AE; Gehling GF; Isom JB; Mauch W; Kingsley PD

Neurosurgery ,Nov 1982, 11 (5) p617-21, ISSN 0148-396X  
Journal Code: NZL

Languages: ENGLISH

Within the intensive care setting, a portable microcomputer system was used to extract three parameters from the intracranial pressure fluctuation associated with the cardiac cycle. One parameter, the mean of sampled intracranial pressure, was defined as the average value of pressure for a 1.08-second interval following the R wave of the electrocardiogram. Another parameter, the amplitude of intracranial pressure, was defined as the difference between the mean and the peak value of the sampled intracranial pressure for the interval considered. The third parameter, a latent interval, was defined as the time period between the occurrence of the R wave and the occurrence of the peak value of the subsequent intracranial pressure fluctuation. Six adults and one pediatric patient were monitored. Both the amplitude and the mean of sampled pressure tended to vary inversely with the latent interval. For the adult patients, the latent interval varied between 503 and 804 ms; the mean pressure ranged between 2.4 and 19.0 mm Hg and the amplitude pressure ranged between 0.6 and 7.2 mm Hg. The latent interval for the child was much shorter (ranging between 269 and 325 ms), and both the mean and the amplitude pressures were much higher (ranging between 38.4 and 57.3 mm Hg and 14.2 and 16.5 mm Hg, respectively). Statistical correlation between hourly pulse rates and the latent interval among the adult cases revealed little association ( $r = -0.20$ ). For all patients considered, the correlation between the amplitude and the mean of sampled intracranial pressure was quite high, with an  $r$  value of  $+0.91$ . These reported observations support a conceptual model in which blood volume changes associated with the cardiac cycle occurring within the semirigid craniospinal sac are assumed to underlie the fluctuation of intracranial pressure.

**The use of computerized learning in intensive care: an evaluation of a new teaching program.**

Skinner JB; Knowles G; Armstrong RF; Ingram D

Med Educ ,Jan 1983, 17 (1) p49-53, ISSN 0308-0110  
Journal Code: MZ3

Languages: ENGLISH

A computer-assisted learning program in respiratory intensive care was introduced into the undergraduate curriculum at University College Hospital. Educational effectiveness was assessed. This method of learning was found to be highly acceptable to students. The improvement in students knowledge of the subject was up to three times greater in those who used the computer program, than a control group of students who received only teaching by conventional

means, ( $P = 0.016$ ). The results of a questionnaire designed to elicit students' attitudes to this learning experience are discussed.

**Decision-making among emergency room residents: preliminary observations and a decision model.**

Quick JD; Moorhead G; Quick JC; Gerloff EA; Mattox KL; Mullins C

J Med Educ ,Feb 1983, 58 (2) p117-25, ISSN 0022-2577  
Journal Code: J13

Languages: ENGLISH

Emergency room residents face a range of clinical decisions and often call on senior residents or faculty members for help. The individual clinical decision process has frequently been analyzed, but little attention has been given to the social process in clinical decision-making. Based on data from interviews and over 100 hours of direct observation at two large urban general hospitals with busy emergency rooms staffed by medical and surgical residents, the authors suggest there are five basic decision situations. In each situation, the residents appeared to follow implicit decision patterns about involving other medical and surgical staff in the final clinical decision. The decision situations are nonacute, routine acute, nonroutine acute, multispecialty acute, and crisis. These situations call for individual, consultive, or consensual patterns in making decisions. The consequences of these patterns are explored. Improving residents' decision-making should contribute to improved understanding of the resident's role, better resident supervision, and better emergency room functioning.

Boles JM; Garre MA; Youinou PY; Mialon P; Menez JF; Jouquan J; Miossec PJ; Pennec Y; Le Menn G  
Crit Care Med ,Feb 1983, 11 (2) p87-90, ISSN 0090-3493  
Journal Code: DTF  
Languages: ENGLISH  
A prospective nutritional evaluation of 84 unselected

patients admitted to a multidisciplinary ICU was performed using anthropometric measurements, creatinine height index (CHI), and serum protein assays. All values tested were significantly lower than those of 40 healthy controls. A matrix of correlation coefficients showed many similarities among the variables studied. Fatal outcome and poor prognosis indices, such as sepsis and renal failure, were analyzed separately. Anthropometric measurements and CHI were not different in the separate groups. Albumin (Alb) and transferrin (Tr) were not different in patients with or without sepsis. Retinol binding prealbumin was significantly higher in patients with renal failure. Thyroxin-binding prealbumin (TBPA) was significantly lower in all the groups. We emphasize the interest of this rapid turnover protein in evaluating nutritional status. We suggest: (1) a systematic nutritional assessment, and (2) an aggressive nutritional support in the ICU patient.

A noninvasive technique for assessing cardiac output (CO) was evaluated by comparing it with thermodilution determinations in patients in the intensive care unit. The new method uses pulsed ultrasound to measure aortic diameter and continuous-wave Doppler ultrasound to obtain aortic blood velocity. An initial study evaluating just the velocity measurement showed that changes of the Doppler index of output (DI) correlated well with those of thermodilution cardiac output (TDCO). Linear regression analysis yielded  $\Delta DI = 0.87 \Delta TDCO + 0.14$  ( $r = 0.83$ ,  $n = 95$ ). Using a university research instrument these measurements were possible in 54 of 60 patients (90%). A second study using a prototype commercial device incorporated the diameter measurement. Ultrasonic cardiac output (UCO), calculated as the time integral of velocity multiplied by the aortic area, was compared to TDCO. The data, obtained from 45 of 53 patients (85%), are described by the linear regression  $UCO = 0.95TDCO + 0.38$  ( $r = 0.94$ ,  $n = 110$ ) over a range of 2-11 l/min. Patients with aortic stenosis, aortic insufficiency or a prosthetic valve have been excluded from the second study due to conditions likely to violate the assumptions upon which the calculation of absolute cardiac output is based. These results indicate that accurate CO can be measured by noninvasive ultrasound in most patients.

The technique may be useful for extended CO monitoring in acute care patients and for CO assessment in many other types of patients undergoing diagnostic studies and therapeutic interventions.

Languages: FRENCH Summary Languages: ENGLISH

Twenty-three cases of disseminated candidiasis (DC) were observed between 1965 and 1981. In 23 cases the DC was a complication of a preexisting disease process (16 abdominal surgery, 18 bacterial septicemia, 16 acute renal failure, 4 carcinoma) requiring polytherapy (23 antibiotherapy, 5 parenteral nutrition, 4 corticotherapy). The most frequent foci were ocular (6), peritoneal (5), renal (4), and pulmonary (3). Diagnosis was confirmed by blood culture (20), urine culture (12), culture of the catheter tip (7), isolation of candida from a localised focus and by anti candida antibodies in some patients. Nine patients were not treated and died; 14 patients were given antifungal agents; 6 died, three despite cure of DC. The recognition of favouring circumstances, early diagnosis and systematic treatment of all foci of candidiasis allow effective prophylaxis against DC; the last case in our series was in 1978.

**[Sodium gamma-hydroxybutyrate. Effects on visual flash-evoked potentials]**

Le gamma hydroxybutyrate de sodium. Action sur les potentiels evoques visuels obtenus par flash.

Desbordes JM; Marillaud A; Roualdes G; Badouraly MJ  
Ann Fr Anesth Reanim ,1982, 1 (2) p147-51, Journal Code: 4ZT

Languages: FRENCH Summary Languages: ENGLISH

Na gamma hydroxybutyrate being recognized as a mean of brain protection, the effect of Na gamma hydroxybutyrate on visual evoked potentials is studied in ten neurosurgical patients. Recordings are made in the same intensive care unit and with the same equipment. Latencies of the three principal peaks (III, IV, V) are analysed. No gamma hydroxybutyrate, given intravenously (60 mg . kg-1), significantly increased latencies ( $p$  less than 0.001). So, it must take into account of this effect when visual evoked potentials are studied in Na gamma hydroxybutyrate treated-patients. However, visual evoked potentials peaks are only delayed by Na gamma hydroxybutyrate and none of the studied peaks is abolished.

Proceeding from studies which make the environment of an intensive care unit responsible for psychopathological disturbances in thoracic patients, we made investigations on an operative intensive care unit concerning its influence on the psychical state of surgical patients. For this purpose photometry and noise measurements were made at the patient's bedside; additionally the environment of a ventilated patient was recorded continuously by means of a cine-camera. The results we obtained from noise measurements showed that all patients were affected with both sensorial monotony and sensorial overstimulation. Overstimulation results from sudden and unexpected noise (for example due to emergency admissions) on an intensive care unit. The analysis of the illumination intensity showed a day and night turn; that means, the patient was able to distinguish between daytime and nighttime but due to missing bearings no further temporal orientation was possible. The filmings demonstrated that there were numerous contacts between the patient and his environment which, however, did not last longer than 105 s on an average. These findings refer to the problem of the patient's social isolation; others show the loss of sleeping and resting stages. So the "resting stages", that means stages without visible contact, last between 1-3 min. In the light of the results, psychopathological disturbances in the patients of this intensive care unit are connected with the situational conditions of the unit. Suggestions concerning the removal of situational load-factors are deducible from these findings.

A computer-assisted learning program in respiratory intensive care was introduced into the undergraduate curriculum at University College Hospital. Educational effectiveness was assessed. This method of learning was found to be highly acceptable to students. The improvement in students knowledge of the subject was up to three times greater in those who used the computer program, than a control group of students who received only teaching by conventional means, (P = 0 X 016). The results of a questionnaire designed to elicit students' attitudes to this learning experience are discussed.

When transfer of a newborn infant by helicopter becomes necessary, electrical and mechanical devices are used to overcome some inconvenient aspects of the aviation environment. The aircraft must have an effective cabin heater, satisfactory interior illumination, a system for noise attenuation and voice communication, an oxygen source, and a supply of usable electric current. Medical equipment should be lightweight, portable, and designed or adapted for out-of-hospital use and have redundant energy sources. The transport incubator is the most important medical item. Electrical monitors for pulse, cardiac rhythm, blood pressure, respiratory rate, and body temperature are essential, and a defibrillator, infusion pump, and several other items are highly desirable.

This exploratory study sought to identify factors that critical care nurses consider relevant in making rapid patient care decisions; to explore the decision making of these nurses in crisis situations; and to identify critical patient care situations where rapid nursing decisions are made. The convenience sample consisted of 50 nurses in critical care settings. A semi-structured interview with a critical care case study was utilized to examine the nurses' decision making. Open ended responses were transformed into fixed categories for tabulation. The findings suggested that: 1 knowledge and experience were the most important factors influencing rapid decision making; 2 although the nurses identified the appropriate decisions in a given crisis situation they had difficulty providing a theoretical rationale for their decisions; 3 the given case study and the 50 crisis situations identified by the subjects indicated that many nursing decisions for critically ill patients were carried out prior to physician assistance. A demographic data questionnaire that examined age, nursing experience, formal education and continuing education of the subjects determined that the majority of the nurses were under 30 years old, had either less than 1 year experience or 7-9 years in critical care, were graduates of a 2-year diploma programme, and took continuing education courses at the community college level.

**Study of diarrhea in critically ill patients.**

Kelly TW; Patrick MR; Hillman KM  
Crit Care Med ,Jan 1983, 11 (1) p7-9, ISSN 0090-3493  
Journal Code: DTF

Languages: ENGLISH

There has been an impression that diarrhea occurs commonly in seriously ill patients treated in ICUs. In view of the sparsity of published work on the problem, we embarked on a prospective study of all patients admitted to the ICU for more than 48 h over a 12-month period. Three factors were examined in detail: nasogastric feeding, cimetidine administration, and antibiotic treatment. Other factors also were considered, notably the nature of the underlying illness and the spread of a possible infective agent by cross-infection. There was a 41% incidence of diarrhea. A significant increase in the incidence of diarrhea occurred in patients on nasogastric feeding (p less than 0.01) and in those receiving cimetidine (p less than 0.05); there was no increased incidence in those receiving antibiotic therapy. The cytotoxin of *Clostridium difficile* was specifically looked for in all patients with diarrhea, but was not detected.

**Comparative studies of IPPV and HFPPV with PEEP in critical care patients. II: Studies on intrapulmonary gas distribution.**

Wattwil LM; Sjostrand UH; Borg UR; Eriksson IA

Crit Care Med ,Jan 1983, 11 (1) p38-43, ISSN 0090-3493

Journal Code: DTF

Languages: ENGLISH

The ventilatory patterns of a conventional ventilator for volume-controlled ventilation (SV-900) and a low-compression ventilator utilizing the pneumatic valve principle for pressure/flow-generated, volume-controlled ventilation (system H) were studied in a lung model and in 10 patients with respiratory failure. System H was used at frequencies of 20 (H-20) and 60 (H-60 = high-frequency positive-pressure ventilation [HFPPV]) breath/min, and SV-900 at a frequency of 20 (SV-20) breath/min. With system H, inspiration constituted 22% (no inspiratory pause) and with SV-900, 25% (with 10% inspiratory pause). System H delivers an instantaneous accelerating flow which rapidly decelerates during the second part of the inspiratory phase. Maximal flow rates studied were 1.3 (H-60), 0.9 (H-20), and 0.7 (SV-20) L/sec. Thus, HFPPV delivers an effective tidal volume with highest linear velocity. This increased velocity increases gas mixing by increasing turbulence in conducting airways. In the 10 patients with respiratory failure, intrapulmonary gas distribution (measured as the nitrogen washout delay) was improved from 106% during SV-20 to 74% with H-60 (p less than 0.05). H-60 also increased carbon dioxide elimination in the 2 patients with the most severe pulmonary dysfunction.

Wattwil LM; Sjostrand UH; Borg UR

Crit Care Med ,Jan 1983, 11 (1) p30-7, ISSN 0090-3493  
Journal Code: DTF

Languages: ENGLISH

The effects of the ventilatory patterns of a conventional ventilator (SV-900) and a low-compression ventilator (system H) were studied in 12 patients with respiratory failure (RF). Volume-controlled ventilation at frequencies (f) of 20 breath/min (SV-20) with SV-900, and 20 (H-20) and 60 (H-60 = high-frequency positive-pressure ventilation, HFPPV) breath/min with system H was given. Inspiration constituted 25% (with an inspiratory pause of 10%) of the ventilatory cycle with SV-900 and 22% with system H. Intratracheal (ITP), intrapleural, systemic and pulmonary arterial (PAP), and central venous (CVP) pressures were measured at normoventilation. During H-60, normoventilation was provided with smaller tidal volumes and lower mean intratracheal pressures than during SV-20 and H-20. Cardiac index and oxygen transport were not affected by changes in ventilatory pattern. The respiration-synchronous variations in CVP, PAP, and pulmonary capillary wedge pressure (WP) during ventilation at 20 breath/min were abolished during HFPPV. In the most severely ill patients, long-term HFPPV was uneventful. Airway

suctioning during ventilation with oxygen was an important feature of the pneumatic valve principle (system H). The results of this study indicate that volume-controlled HFPPV is as efficient and as well accepted by the patient as conventional ventilation (SV-20).

**Selection criteria for pediatric critical care transport teams.**

Smith DF; Hackel A

Crit Care Med ,Jan 1983, 11 (1) p10-2, ISSN 0090-3493  
Journal Code: DTF

Languages: ENGLISH

The primary goal of an interhospital critical care transport program is to provide quality medical care during transit as close as possible to that available in the receiving ICU. Critically ill pediatric patients are transported between hospitals by a variety of transport teams. The skills possessed by physicians, nurses, respiratory therapists, and paramedics overlap. To determine the criteria for selection of the team members for these patients, we reviewed the medical records of 115 pediatric patients transported to this facility in 1978 and 1979. Patients were categorized by diagnosis, severity of illness at the time of transport, and the monitoring and life support required during transport. Our data indicate the medical transport team members should have skills required for pediatric critical care diagnosis and management including endotracheal intubation and assisted ventilation; insertion of peripheral, central venous, and arterial catheters; fluid and electrolyte therapy; antibiotic therapy; cardiovascular monitoring; and pharmacological life support. The team members should be chosen based on the particular skills needed for a transport with a goal of providing the patient care required on a consistent basis.

**Therapeutic Intervention Scoring System: update 1983.**

Keene AR; Cullen DJ

Crit Care Med ,Jan 1983, 11 (1) p1-3, ISSN 0090-3493  
Journal Code: DTF

Languages: ENGLISH

The Therapeutic Intervention Scoring System (TISS) introduced in 1974 has become a widely accepted method of classifying critically ill patients. In response to requests to update the system because of recent innovations in critical care, some items have been deleted, some have been added, and certain point scores have been adjusted. Explanations of items within the system and guidelines for the user are included. A comparison of the new 1983 system to the old 1974 system in 100 consecutive patients reveals no difference in total point scores. We hope this updated explanation will ease the task of assessing use of intensive care services.

**Prognostic signs in abdominal surgery patients treated in the intensive care unit.**

Kaukinen L; Kaukinen S

Ann Chir Gynaecol ,1982, 71 (5) p283-90, ISSN 0355-9521  
Journal Code: 51N

Languages: ENGLISH

To determine which factors had correlation with mortality during intensive care, 300 consecutive admissions to the intensive care unit in 286 critically ill patients requiring abdominal surgery were analyzed. The follow-up was one year. On admission, before any treatment was given, disturbances of vital functions (circulation, respiration, fluid- and acid-base balance, renal function, consciousness and other special disturbances) were classified into three grades according to their severity. The increase in the grade of severity, or especially in the sum of the grades of disturbances in various vital functions, correlated well with the mortality rate. Deviations in several biochemical

parameters (e.g. serum sodium and potassium concentrations and serum osmolality) during intensive care were associated with an increase in mortality rate, even where these parameters were abnormal for only a short time and were later brought within normal range. With stepwise multiple discriminant analysis of model including 13 variables was formed to identify survivors and nonsurvivors. The strongest predictors of fatal outcome in this analysis were cirrhosis, increasing are and the sum of severity grades of disturbances in vital functions on admission.

Intensive care cannot consist only of monitoring and compensatory measures in organ system failure, but likewise must comprise psychological treatment of the patient. In this field psychology and anaesthesiology share a unique opportunity to get insight into neurobiological relations of human behaviour. If psychological investigation of the intensive care patient is understood as a behavioural analysis related to biological function, then anaesthesiology may contribute substantially to this evaluation. Moreover important information on prolonged but subtle influences of anaesthetics on central nervous system function, may be gained and expand our as yet poor knowledge in this field.

**Regional differences in lung function during anaesthesia and intensive care: clinical implications.**

Hedenstierna G; Santesson J; Bindsvlev L; Baehrendtz S; Klingstedt C; Norlander O

Acta Anaesthesiol Scand .Oct 1982. 26 (5) p429-34. ISSN 0001-5172 Journal Code: 080

Languages: ENGLISH

Anaesthesia and most frequently acute respiratory failure are accompanied by a lowered functional residual capacity (FRC). This lowering promotes airway closure in dependent lung units and forces ventilation to non-dependent regions. Perfusion, on the other hand, is forced towards dependent lung units. A ventilation-perfusion mismatch is created and hypoxaemia may develop. General PEEP counters airway closure, but impedes cardiac output and forces perfusion further to dependent regions. In addition, barotrauma may occur. Improved matching of ventilation and perfusion can be achieved by: (1) positioning the subject in the lateral posture; (2) ventilating each lung separately in proportion to its perfusion (differential ventilation); and (3) applying PEEP only to the dependent lung (selective PEEP). Because of less overall intrathoracic pressure and lung expansion, interference with the total lung blood flow and the danger of barotrauma should be less than with general PEEP. Improved gas exchange with a 50-100% increase in PaO<sub>2</sub> has been observed in a limited number of patients with acute bilateral lung disease studied so far during differential ventilation and selective PEEP.

Languages: GERMAN Summary Languages: ENGLISH

Increasing limitations on personnel and material in intensive care render a reevaluation necessary. Follow-up of critically ill patients might be a useful contribution to this. In 330 patients the situation during intensive care and the subsequent stay on the ward, as well as physical and psychological status 3 years later, were analyzed. In 96% the acute event necessitating intensive care corresponded to a preexisting chronic illness. Although the mean stay of 3.6

days in ICU was relatively short, total time of hospitalization exceeded that of patients who did not undergo intensive care. Three quarters of the 330 patients survived ICU and two thirds the subsequent hospitalisation. Half of the patients were still alive three years later, most under medical supervision for the same illness. 89 Patients could be followed up after three years; 84% were physically independent and 53% were at work, but 20% of these had had to change jobs.

The later outcome in patients ventilated during intensive care was inferior in all respects. Comparing the quality of life to 1977, 33% of the patients described their physical capacity and 14% their mental activity as reduced. One third of the patients had specific memories of the stay on the ICU, such as pain, fear of being alone, of the illness or of the technical environment. In conclusion, three years after intensive care half of the patients had survived and in most of the cases a qualitatively satisfactory life style was possible.

**Indwelling chemical sensors based on semiconductor technology.**

Eberhart RC; Thomasson TH; Munro MS; Kumar A; Szabo G  
Crit Care Med ,Dec 1982, 10 (12) p841-7, ISSN 0090-3493  
Journal Code: DTF  
Languages: ENGLISH

Indwelling chemical sensors have been designed and built which operate on similar principles to field effect transistors, the fundamental structural unit of the computer. By appropriate use of ion-filtering membranes with these devices, it is possible to measure, continuously, serum electrolytes, including hydrogen ion, and CO2 tension. Semiconductor processing techniques allow incorporation of multiple ion sensors on a single miniaturized chip. Chip-based signal processing can also allow compensation for temperature effects and other sources of instability. Because these devices can be produced inexpensively, they seem to be promising for patient monitoring in the critical care environment. Problems with stability, blood compatibility, and reference electrode design are addressed and potential solution methods are proposed. The performance of preliminary devices in vitro and in vivo is discussed.

0090-3493 Journal Code: DTF  
Contract/Grant No.: P01 HL25840-02  
Languages: ENGLISH

Computer techniques have been developed to image, noninvasively, anatomical structure, vessel blood flow, and physiological and biochemical functions, utilizing a number of physical principles. These devices, though costly, appear to provide sufficient diagnostic benefits to warrant their use in some critical care units. The emergence of x-ray, digital subtraction angiography, ultrasound, emission and nuclear magnetic resonance imaging techniques and their medical applications are described. It is shown that the physical variables measured by these techniques are sensitive to disease conditions and, thus, their incorporation in critical care procedures are likely in the future.

**Computers in critical care medicine: promises and pitfalls.**

Osborn JU  
Crit Care Med ,Dec 1982, 10 (12) p807-10, ISSN  
0090-3493 Journal Code: DTF  
Languages: ENGLISH

Computer-based patient monitoring is a science in transition. Its purposes are vague, its technology variable, and there is no clear evaluation of its utility. Monitoring originally developed because of an intuitive feeling that if we knew more, we would be able to take better care of patients. Physiologic monitoring, statistical monitoring, and integrative monitoring will eventually combine to make a coherent patient care system. However, the subcomponents must be made to work before we reach this stage. It is still unclear what ICU measurements should be monitored and what to compute from those measurements. Once agreed upon, these measurements must be presented in human terms and, ultimately, used to make computer-based diagnosis. The day will come when the computer will be viewed as a tool to extend our medical power to let us take better care of the patient.

**Rate of elimination of the Intralipid fat emulsion from the circulation in ICU patients.**

Lindholm M; Rossner S

Crit Care Med ,Nov 1982, 10 (11) p740-6. ISSN 0090-3493

Journal Code: DTF

Languages: ENGLISH

The rate of removal of Intralipid was studied in 2 groups of intensive care patients by analysis of the fractional removal rate after a single iv dose and by analysis of the removal rate during a constant infusion of Intralipid which immediately followed. The patients in group 1 were moderately ill after uncomplicated surgery whereas group 2 patients were critically ill and had a mortality of 44%. The fractional removal rate was 2-fold greater in group 1 than group 2 and controls; the 2 latter groups had similar rates of removal. During the constant infusion of Intralipid, 0.42 g/min for 3 h, group 1 patients were found to have a first order removal rate with a constant plasma concentration of Intralipid. The rate constants were not different during the entire infusion from those obtained by the single injection. In all of the group 2 patients, a zero order removal rate was present as the concentration of Intralipid particles increased linearly with time. Group 2 patients had cleared all Intralipid within 6 h after the end of the infusion. Some patients were treated with heparin and/or insulin for clinical reasons. The removal rates were not influenced in either group by these drugs. Thus, moderately traumatized patients were found to clear plasma from Intralipid at recommended infusion rates. However, in critically ill patients, the infusion rate of Intralipid may have to be adjusted below the maximal elimination capacity to avoid Intralipid accumulation in plasma.

**Myxoedema and open heart surgery: anaesthesia and intensive care unit experience.**

Finlayson DC; Kaplan JA

Can Anaesth Soc J ,Nov 1982, 29 (6) p543-9. ISSN

0008-2856 Journal Code: CG7

Languages: ENGLISH

Myxoedema has been considered a major anaesthetic risk which could be increased by concurrent heart disease. Thyroid ablation with the production of myxoedema has, in the past, been used to control intractable angina. Eight ablated patients (Group I) and five patients with heart disease and incidental hypothyroidism (Group II) presented for open heart surgery. Management included diazepam-narcotic anaesthesia in generally reduced doses, careful monitoring and the use of digoxin, steroids and L-thyroxin given during or after operation. All patients survived. A number of the anaesthetic considerations and potential problems with myxoedema are discussed.

**The development of critical care medicine in Singapore.**

Tan SH

Ann Acad Med Singapore ,Jul 1982, 11 (3) p389-91. ISSN

0304-4602 Journal Code: 53F

Languages: ENGLISH

The development of critical care medicine in Singapore is similar to that in other countries. The fact that intensive care work was not centralised meant that anaesthetists had to attend to patients who were to be found all over a large hospital. Moreover, up to 1967, there was only one ventilator in the Singapore General Hospital although this was commonly used. When open-heart surgery was restarted in 1967, the need for intensive care in the post-operative patients became obvious and a post-basic intensive care nursing course was subsequently started. The quest for an area to centralise intensive care also stepped up and as space in certain wards were generously given toward this cause, intensive care further developed. With the opening of the new Singapore General Hospital, critical care medicine is certainly ready to move toward an even more sophisticated standard.

**[Oncometry--measurement results and practical experiences with the Oncometer BMT 921 in the intensive care unit]**

Onkometrie--Messergebnisse und praktische Erfahrungen mit dem Onkometer BMT 921 auf der Intensivstation.

Wendland R; Siepmann HP

Anasth Intensivther Notfallmed ,Aug 1982, 17 (4) p240-2, ISSN 0174-1837 Journal Code: 4CP

Languages: GERMAN Summary Languages: ENGLISH

Measuring the colloid osmotic pressure in the serum of 8 healthy individuals and 28 intensive care patients with the oncometer BMT 921 we obtained reliable results. The mean colloid osmotic pressure in the serum of our intensive care patients was 7 mm Hg less than that of our healthy volunteers.

There was a good correlation between the level of the colloid osmotic pressure and the seriousness of the affection and the clinical trend. In view of the simplified process of measurement the control of colloid osmotic pressure represents an important additive diagnostic dimension in intensive care medicine.

**Measurement of transcutaneous PCO2 in critically ill patients.**

Rithalia SV; Ng YY; Tinker J

Resuscitation ,Mar 1982, 10 (1) p13-8, ISSN 0300-9572  
Journal Code: R8Q

Languages: ENGLISH

Transcutaneous carbon dioxide tensions (tcPCO2) measured with a heated electrode were compared with arterial carbon tensions (PaCO2) in 28 patients. Seventy-eight observations were made. At a skin electrode temperature of 44 degrees C the tcPCO2 was significantly higher than PaCO2 but changes in PCO2 detected by both measurements were closely correlated. The correlation coefficient between tcPCO2 and PaCO2 was 0.92 (P less than 0.001). The 90% response time of the electrode in vitro was less than 1 min, and in vivo stabilization of the recording occurred in less than 15 min. It was found that the transcutaneous PCO2 electrode can be employed usefully in intensive care monitoring of adult patients especially when weaning them from artificial ventilation.

Methode de surveillance continue non sanglante en reanimation respiratoire.

Dautzenberg B; Sors C

Rev Fr Mal Respir ,1982, 10 (4) p269-76, ISSN 0301-0279

Journal Code: RZ8

Languages: FRENCH Summary Languages: ENGLISH

Non-invasive methods of monitoring have two principal objectives: --the detection of vital problems requiring immediate treatment : reflex monitoring or type I; --continuous surveillance, as sophisticated as possible, of a large number of parameters which help to predict the outcome either spontaneously or as a result of treatment. These two objectives are reached in different ways according to whether the patients are or are not artificially ventilated. At present it seems that the best compromise between cost, ease of operation, reproducibility and non-invasiveness are obtained by the following techniques: --type I Monitoring (reflex) in patients artificially ventilated : pressure or spirometric alarm; if spontaneously breathing : electrical impedance or simple E.C.G.; --type II Monitoring (or reflection) in patients on ventilators : study of expired CO<sub>2</sub>, careful analysis of pressure curves, compliance; for those breathing spontaneously : PO<sub>2</sub> and PCO<sub>2</sub> picked up transcutaneously and possibly impedance of the lungs separately.

**Assessing the effectiveness of neonatal intensive care.**

Budetti PP; McManus P

Med Care ,Oct 1982, 20 (10) p1027-39, ISSN 0025-7079

Journal Code: LSM

Contract/Grant No.: HS02975

Languages: ENGLISH

Although neonatal intensive care has been praised widely for

individual successes, its effectiveness has not been established systematically or conclusively. The literature consists principally of reports from individual intensive care units with sample sizes too small for statistical validation or generalization. This study analyzes the results obtained by recalculating and pooling the isolated reports. In addition, the findings of the solitary clinical trial, some scattered epidemiologic data, and several analyses of regional birthweight-specific time series data are reviewed. Taken together, this constitutes a body of evidence that supports the conclusion that intensive neonatal medical care has played a significant role in bringing about the impressive reduction in infant mortality that has taken place in this country since 1965.

**Mental status, the intensive care unit, and cimetidine.**

Cerra FB; Schentag JJ; McMillen M; Karwande SV; Fitzgerald GC; Leising M

Ann Surg ,Nov 1982, 196 (5) p565-70, ISSN 0003-4932

Journal Code: 67S

Contract/Grant No.: 120-1258K

Languages: ENGLISH

A blinded, prospective study of the association between cimetidine treatment and altered mental status (MS) was evaluated in 217 surgical intensive care patients stratified by the degree of renal or hepatic dysfunction or both. The cimetidine and noncimetidine groups did not differ in blood chemistries, physiologic-metabolic data, or concurrent medications. There was a correlation between treatment with cimetidine and changes in MS (p less than 0.0001). The MS changes with cimetidine ranged from 33% for neither hepatic nor renal dysfunction to 80% for both renal and liver impairment. The magnitude of MS change was influenced by disease and serum concentration, with patients with both renal and liver disease having the greatest MS change at the highest serum concentrations. The type of MS change was also disease specific. All MS change cleared within 24 to 36 hours of stopping the drug. It appears that both dosage and underlying disease state are important factors determining the nature and severity of cimetidine-associated mental status changes.

**Computer-based monitoring and data analysis in anaesthesia and intensive care.**

Phillips GD; Gordon PJ; Cousins MJ

Anaesth Intensive Care ,Aug 1982, 10 (3) p223-8,  
Journal Code: 4M5

Languages: ENGLISH

A computer with a software package for physiological monitoring at the bedside has been set up, modified and used in a Department of Anaesthesia and Intensive Care over the last three and a half years. Many difficulties have been experienced in implementing a useful computer-based program for monitoring physiological data. The cost of further development to overcome these difficulties could not be justified, and demands for computer time to allow storage and analysis of other data was increasing. A decision was therefore made to eliminate the monitoring role of the computer, and it is now used for storage and analysis of administrative and clinical data from the Intensive Care Unit, Operating Theatres and Pain Management Unit.

**[The prognostic value of various intensive medicine parameters in long-term intubated neurosurgical patients]**

Zum prognostischen Wert einiger intensivmedizinischer Parameter bei langzeitintubierten neurochirurgischen Patienten.

Hausmann D; Schulte am Esch J

Anasth Intensivther Notfallmed ,Jun 1982, 17 (3) p139-44,  
ISSN 0174-1837 Journal Code: 4CP

Languages: GERMAN Summary Languages: ENGLISH

The prognosis of 1693 patients of the intensive care unit of the Neurochirurgische Universitätsklinik Bonn was investigated. They all required intubation and mechanical ventilation, 912 of them for more than 24 hours (prolonged intubation). The overall mortality rate was 25.3%, while in cases with prolonged intubation it was 41%. No valid conclusion could be drawn from the duration of intubation as to survival. Next to the primary disease which was most important, the patient's age was of great prognostic value. Pneumonia (16% incidence) and prerenal failure (14.9%) seemed to be of minor importance, whereas renal failure (16.6%) worsened prognosis considerably by a mortality of 71-100%. Dexamethasone therapy proved to be of advantage in the management of brain tumors. No influence on the outcome of patients with severe head injury was seen. Patients with cerebrovascular disease were detrimentally affected by corticosteroid administration. Apart from extreme situations there were no satisfying predictors of outcome by means of which one could preselect patients to enter intensive care units. The decision to eventually withdraw life support can only be made on the basis of numerous factors.

**[Tube change in nasotracheally intubated intensive care patients using injector ventilation: a method for the prevention of hypoxic complications]**

Tabuswechsel bei nasotracheal intubierten Intensivpatienten mit Hilfe der Injektorbeatmung: Eine Methode zur Verhütung hypoxischer Komplikationen.

Jungck E; Kloss T

Anasth Intensivther Notfallmed ,Jun 1982, 17 (3) p135-8, ISSN 0174-1837 Journal Code: 4CP

Languages: GERMAN Summary Languages: ENGLISH

Conventional methods for the replacement of nasotracheal tubes are often dangerous. The interruption of respiration while replacing the nasotracheal airway may cause severe hypoxia. We developed a technique which shortens the time of apnoe to a few seconds. A 16F nasogastric tube is connected to a simple jet ventilation device driven by 100% oxygen. The nasotracheal tube is disconnected from the respirator and its cuff deflated. While performing jet ventilation (inspiration time 1.5 sec, frequency 12/min., pressure 1.5-2 bar) the nasogastric tube is threaded into the nasotracheal tube until the tip lies inside its distal end. The old endotracheal tube can now be retracted over the nasogastric tube under continuous jet ventilation. The nasogastric tube need only be disconnected from the jet ventilator for a few seconds while the old endotracheal tube is replaced for a new one. Now the new endotracheal tube is guided into the trachea by the nasogastric tube while jet ventilation is continued. We used this technique 19 times without any complications. We found the method safe and simple, giving sufficient ventilation in all patients, provided that contraindications and precautions are observed.

**The operation of a radiology consultation service in an acute care hospital.**

Baker SR

JAMA ,Nov 5 1982, 248 (17) p2152-4, ISSN 0098-7484

Journal Code: KFR

Languages: ENGLISH

The operation of a radiology consultation service in an acute care teaching hospital is described. The radiologist acts as an active advisor in the structuring of diagnostic evaluations in three disease categories; biliary tract disease, nonemergency gastrointestinal tract bleeding, and abdominal mass. There was a 64% reduction in the time needed to establish a diagnosis and a 32% decrease in the number of studies for each patient on the consultation ward compared with a control group, which consisted of patients with similar clinical presentations. A formal partnership between clinician and radiologist serves two important functions in teaching hospitals. It can simultaneously expedite diagnostic evaluations and teach the best utilization of imaging examinations.

**"The nurse should consider." Critical care ethical issues.**

Lawrence JA; Farr EH

J Adv Nurs ,May 1982, 7 (3) p223-9, ISSN 0309-2402 Journal Code: H3L

Languages: ENGLISH

A hypothetical dilemma on resuscitation of an intensive care patient was presented to nurses at a workshop on ethics of critical care nursing. Nurses responded to separate questionnaires about what a charge nurse should do, and what they themselves would do in relation to ten considerations arising from the dilemma. Nurses were agreed that legal consequences, patient wishes and rights, and physician authority should and would be considered, and that peer influence should not. Nurses were divided in their attitudes to following procedure and personal moral beliefs, and to job risk. The most contentious issues were related to the nurse's role as a decision-making member of the health care team. Implications for regarding nurses as independent decision-makers are discussed.

**Does the pattern of ventilation determine the degree of lung damage following intensive care of the newborn?**

Robinson MJ; Maayan C; Eyal FG; Armon Y; Bar-Yishay E; Godfrey S

Isr J Med Sci ,Aug 1982, 18 (8) p835-9, ISSN 0021-2180

Journal Code: GYO

Languages: ENGLISH

Lung function tests were performed on 14 infants 22 to 67 wk following mechanical ventilation of 6 h to 51 days and on 5 infants of comparable age who had been treated with continuous positive airway pressure (CPAP). Airway resistance increased (P less than 0.01) and specific airway conductance decreased (P less than 0.001) in the ventilated infants compared with the CPAP-treated group who were normal. The airway resistance and specific airway conductance were normal in two ventilated infants and in one CPAP-treated infant who were studied earlier in the neonatal period. There were no significant differences in thoracic gas volume between groups of ventilated and nonventilated babies studied initially or at follow-up. There was no relationship between lung damage and the following: peak inspiratory pressure, the duration of high pressure ventilation, the level of CPAP or its duration, or the duration of greater than 60% oxygen administration. The degree of lung damage was not related to the maximum ventilatory frequency used, but there was a significant correlation with the duration of rapid frequency ventilation. This study supports the view that barotrauma is a major cause of lung disease following neonatal intensive care.

**Results of intensive care in abdominal surgery patients.**

Kaukinen L

Ann Chir Gynaecol ,1982, 71 (3) p168-71, ISSN 0355-9521

Journal Code: 51N

Languages: ENGLISH

A one-year follow-up of 300 consecutive critically ill abdominal surgery patients treated in an intensive care unit is presented. 77 patients (26%) died during intensive care. By the end of the follow-up period altogether 139 patients (47%) had died from the primary disease. Almost all patients who died after intensive care, did so within the first month. The majority of the survivors (124 patients) recovered completely, most of them within six months after intensive care. Only 22 patients remained incapable of their previous work, and five became permanently disabled. Mortality rates were at their lowest in diseases of the pancreas (34%), the stomach and duodenum (43%) and of the liver and gall bladder (44%), if cirrhosis with ruptured oesophageal varices is excluded; here the mortality was highest, 76%.

A new diagnostic key has been established based on the  
reports of 3845 critically ill patients in our medical  
intensive care unit. The clinical diagnoses in these patients  
were classified in 22 different groups according to different  
organs or etiological entities (diseases of the liver,  
infectious diseases, intoxications etc.). 42 different  
laboratory parameters were selected for classification of  
metabolic or organ-related complications. Combining of  
clinical diagnoses with laboratory values characterizes the  
seriously ill patient. Our new system proved to be practicable  
in describing the degree, complications and prognosis of  
disorders in intensive care medicine. The results are  
demonstrated in patients with hepatic coma.

55 intensive care patients with an internal underlying disease were treated with cefotaxime, and 12 patients with bronchopulmonary infections were treated with the combination cefotaxime/ticarcillin. The following aspects were evaluated: clinical success, antimicrobial activity of bacteria in evidence before and after therapy, persistence of pathogens, and resistance. Renal function was monitored continuously in 21 patients over a period of 20 days in order to demonstrate nephrotoxic side-effects of cefotaxime when administered simultaneously with furosemide (in doses of more than 1 g/day). In view of the clinical results and of the fact that the cefotaxime/ticarcillin combination is well tolerated by the kidneys, the possibility of efficient chemotherapy without aminoglycosides is being discussed for treatment of bronchopulmonary infections in patients under intensive care.

A program has been developed for simplification of initial dilution calculations for several rapidly metabolized, vasoactive drugs that must be administered by continuous infusion. Included in the program is the capability for serial recalculation of drug dosage or iv flow rate as well as a checking routine to reduce errors. This program was developed primarily for the pediatric age group, where dilution of drugs into a small volume of diluent, accurate dosage calculations, and low iv flow rates are frequently necessary.

Languages: ENGLISH

The stress imposed on the emotional equilibrium of a team of health-care professionals by the serious illness of a child can disrupt communication among the team, the child, and the parents. Such stresses may be so severe as to interfere with the ability to the adults to meet the child's needs. Although the feelings and attitudes of critically ill children and their parents are well described in the medical literature, very little has been written about the psychosocial interaction among those responsible for the patient's care. Patterns of interaction which would be most beneficial to the child are still in doubt. The purpose of this article is to review available information, as well as experience at St. Jude Children's Research Hospital, on the psychosocial interaction of the health-care team with critically ill children and their parents. An awareness of the difficulties of caring for such patients is essential in overcoming communication barriers, in reducing any interprofessional tensions that might arise during treatment, and in ensuring high-quality medical care.

**Critical care at Tianjin's First Central Hospital and the fourth modernization.**

Fox RC; Swazey JP  
Science ,Aug 20 1982, 217 (4561) p700-5. ISSN 0036-8075  
Journal Code: UJ7  
Languages: ENGLISH

This case study of the Critical Care Unit at Tianjin's First Central Hospital, its physician-director, and one of its patients provides a portrait of how the policy of the four modernizations is being applied to the field of medicine in the People's Republic of China. On this unit of an urban hospital the "fourth modernization," science and technology, is systematically brought to bear on the problems of critically ill patients. The Chinese dualities and dilemmas that this "scaling the heights" policy entails are continually played out on the Critical Care Unit. An intricate balancing is involved between modern Western and traditional Chinese medicine, and between rural public health programs and primary and tertiary care services, within a medical morality framework that combines present-day political ideology with age-old ethical precepts. At this juncture the overall balance seems to be moving in the direction of modern, city-based, curative medicine.

**Assessment of pediatric intensive care--application of the Therapeutic Intervention Scoring System.**

Yeh TS; Pollack MM; Holbrook PR; Fields AI; Ruttiman U  
Crit Care Med ,Aug 1982, 10 (8) p497-500, ISSN  
0090-3493 Journal Code: DTF  
Languages: ENGLISH

There are few reports analyzing the results of intensive care for children. We evaluated quantitatively the amount of care required in our multidisciplinary pediatric ICU using the Therapeutic Intervention Scoring System (TISS) and assessed qualitatively the severity of illness using the Clinical Classification System (CCS). Over a 6-month period, there were 323 patients (99 CCS Class II, 83 Class III, 141 Class IV) whose overall mortality at 1-month follow-up was 10% (Class II, 0%; Class III 2%; Class IV, 23%). A strong association was obtained between CCS and TISS admission scores (Class II-TISS, 11 +/- 0.6; Class III-TISS, 20 +/- 0.8; Class IV-TISS, 38 +/- 1.0). Class IV patients had a highly significant difference between survivors (S) and nonsurvivors (NS) for admission TISS (S = 36, NS = 47, p less than 0.001) and highest TISS (S = 38, NS = 54, p less than 0.001), as well as slopes of the regression of TISS points versus days of care (S = -4.2 vs. NS = +2.3). The mortality of our Class IV patients was lower than a comparable adult population with similar TISS scores; however, the TISS regression slopes for Class IV patients were similar. We conclude that CCS and TISS are both useful for describing the pediatric intensive care patient population. TISS is particularly helpful in assessing the amount of care received as well as providing a means of evaluating severity of illness.

**Evaluating outcome from intensive care: a preliminary multihospital comparison.**

Knaus WA; Draper EA; Wagner DP; Zimmerman JE; Birnbaum ML;  
Cullen DJ; Kohles MK; Shin B; Snyder JV  
Crit Care Med ,Aug 1982, 10 (8) p491-6, ISSN 0090-3493  
Journal Code: DTF  
Contract/Grant No.: HS 04857  
Languages: ENGLISH

To contrast mortality for groups of ICU patients treated in different hospitals, we surveyed 795 consecutive ICU admissions in 5 ICUs using a general severity of illness classification system. After obtaining information from the medical record on age, sex, indication for ICU admission, and severity of illness, we used a logistic multiple regression equation to project death rates for each ICU based on data from a sixth reference hospital. There were substantial differences in severity of acute illness among the hospitals which accounted for most of the variation in death rates. In all ICUs, however, projected death rates were quite similar to observed deaths. These findings suggest that the use of a general severity of illness index and multivariate statistical techniques could, after further refinement and validation, improve interhospital comparisons of the outcome of acutely

ill patients.

**Cricothyrotomy in the emergency department.**

McGill J; Clinton JE; Ruiz E  
Ann Emerg Med ,Jul 1982, 11 (7) p361-4, ISSN 0196-0644  
Journal Code: 4Z7  
Languages: ENGLISH

Thirty-eight emergency cricothyrotomies were performed over a 3-year period. This was the first airway control maneuver attempted in 5 patients, 3 of whom had facial and/or neck injury, one apneic with upper airway hemorrhage, and one with aortobronchial fistula. The remaining 33 procedures were performed only after other airway management failed. Five indications were identified among these cases: 1) excessive emesis or hemorrhage (11), 2) possible cervical spine injury with airway compromise (9), 3) technical failure (7), 4) clenched teeth (5), and 5) masseter spasm following succinylcholine administration (1). Fourteen immediate complications occurred in 12 patients (32%). The most frequent was incorrect site of tracheostomy tube placement (5), with 4 of 5 misplaced through the thyrohyoid membrane. Others included execution time greater than 3 minutes (4), unsuccessful tracheostomy tube placement (3), and significant hemorrhage (2). Twelve of the 38 patients were long-term survivors. There was one long-term complication, a longitudinal fracture of the thyroid cartilage during forceful placement of an oversized tube (8 mm inner diameter) through the cricothyroid membrane. This required operative repair and left the patient with severe dysphonia.

**The anaesthetist and intensive care.**

Loder RE  
Anaesthesia ,Jun 1982, 37 (6) p691-3, ISSN 0003-2409  
Journal Code: 4MC  
Languages: ENGLISH

The author retired from active practice as a consultant anaesthetist in the British National Health Service during 1980 at the age of 60. He kept a detailed diary for the last full year as a consultant. One of the Editors suggested that the diary, augmented by his considered views culled from the experiences of a professional lifetime, could form the basis of a series of essays on various aspects of the life and practice of a consultant anaesthetist during the second half of the twentieth century. This essay considers the present and future role of the anaesthetist in intensive care and the need for proper policies of organisation and training in that discipline.

**Nutritional considerations in the critically ill.**

Barrocas A; Webb GL; Webb WR; St. Romain CM  
South Med J, Jul 1982, 75 (7) p848-51. ISSN 0038-4348  
Journal Code: UVH

Languages: ENGLISH

The total care of the critically ill patient must include attention to his nutritional status from the onset of illness. The essential role of protein in body functions must be stressed; unfortunately, it is this essential compartment that will be called upon for gluconeogenesis in stress or starvation. Simple technics of bedside nutritional assessment have been developed and should be familiar to all those who deal with critically ill patients. The multiple technics of optimal nutritional support should become a standard component of the therapeutic armamentarium of those who provide intensive care. The goal must always be to use the GI tract whenever possible, avoiding the numerous complications associated with intravenous nutrition. Care must be taken to avoid CO<sub>2</sub> overload of an embarrassed respiratory system by the nutritional support. Whether nutritional or pulmonary support should take priority can usually be resolved by a team approach toward the patient. It is hoped that this superficial review of nutritional support will stimulate the desire for further knowledge of this rapidly changing and interesting aspect of critical care.

**[Cell-mediated immunity studied by skin tests in patients receiving intensive care. Prognostic value of repeated tests. Study of some factors predisposing towards anergy (author's transl)]**

Etude de l'immunité cellulaire par la méthode des tests cutanés en réanimation.

Tasseau F; Gaucher L; Nicolas F  
Sem Hop Paris, Apr 1 1982, 58 (13) p781-4. ISSN 0037-1777  
Journal Code: ULD

Languages: FRENCH Summary Languages: ENGLISH

Cell-mediated immunity was assessed by three skin tests (using tuberculin, candidin, and Varidase) in one-hundred patients in a medical intensive care unit. Anergy on admission was most often found after major blood loss and massive transfusion as well as in patients over sixty. For the 49 patients who were anergic on admission the mortality rate was 32%, against 12% for the 51 reactive subjects (p less than 0.01). Repetition of skin tests considerably improved their prognostic value. No deaths occurred among the 21 patients who were reactive on admission and throughout the course of their disease, or among the 16 patients who, after being anergic on admission, became reactive subsequently. Conversely, the survival rate was only 40% for the 22 patients who remained or became anergic. Our results confirm the value of skin tests for assessing cell-mediated immunity in patients receiving intensive care. Repeated tests allow early detection of high risk patients in whom fatal outcome, whether due to infection or not, is more frequent. Two factors which predispose to

anergy are underlined: advanced age and massive transfusion after major blood loss.

**Newborn intensive care and neonatal mortality in low-birth-weight infants: a population study.**

Paneth N; Kiely JL; Wallenstein S; Marcus M; Pakter J; Susser M  
N Engl J Med, Jul 15 1982, 307 (3) p149-55. ISSN 0028-4793  
Journal Code: NOW  
Contract/Grant No.: HD 12626; HD 14807; 5T32-HD 07040; +  
Languages: ENGLISH

We examined the neonatal mortality rates of low-birth-weight infants (501 to 2250 g) born between 1976 and 1978 in three kinds of hospitals in New York City: those with newborn-intensive-care units (Level 3), those with capabilities for the care of most premature infants (Level 2), and those without any special facilities for premature newborns (Level 1). Among 13,560 singleton low-birth-weight infants, the adjusted neonatal mortality rate for Level 3 hospitals was 128.5 per thousand live births - significantly lower (P less than 0.001) than the rates for both level 2 (168.1) and Level 1 units (163.0). The association of level of care with mortality could not be accounted for by differences between groups in social or demographic status, in prenatal care, or in medical complication of pregnancy. We infer that birth at a Level 3 center lowers neonatal mortality in low-birth-weight infants. However, only 34 per cent of the patients in this study were born in such units.

The impact on mortality of stabilization in the field before transport of patients with penetrating heart injuries is unknown. This retrospective study compares patients promptly transported with minimal therapy after penetrating cardiac injuries with such patients who had received prolonged attempts at stabilization in the field. During the period of study from 1979 to 1981 23 patients with penetrating wounds of the heart were seen at our institution. The overall mortality was 78%. Forty-three per cent of patients were not salvageable on the basis of extensive anatomic injury or excessive time delays before ambulance arrival. Fifty-six per cent were alive at the time of ambulance arrival with systolic blood pressures of greater than 90 mm Hg. All patients were injured within 10 minutes' rapid transport time from our institution. Approximately one half the patients were treated with 'scoop and run' technique with minimal in-field treatment. Delay from the arrival of the ambulance until definitive surgical correction was less than 9 minutes. The remaining patients were treated with extensive in-field attempts at stabilization with a delay of 25 minutes or more from ambulance arrival until definitive treatment (mean, 40 minutes). Patients with potentially salvageable injuries had a survival rate of 38%. In this group of patients, a salvage rate of 80% was achieved if transport delays were minimized. In contrast, no patients in whom field resuscitation with concomitant prolonged prehospital delay survived. These data suggest that prompt transport to the hospital without attempts at field resuscitation provides a better chance for survival among patients with penetrating heart wounds.

**A long-term geriatric teaching ward in an acute-care hospital: a three-year experience.**

Clarfield AM

J Am Geriatr Soc ,Jul 1982, 30 (7) p457-65, ISSN 0002-8614  
Journal Code: H6V

Languages: ENGLISH

The development and management of a long-term geriatric ward in an acute-care teaching hospital are described. Structure, function, and costs are discussed, and issues of service and

medical education are emphasized. A full geriatric team (physician, nurse, social worker, physiotherapist, and occupational therapist) assessed 165 long-term patients in the general wards of the hospital and accepted 98 for admission to the new long-term geriatric ward. Of these, 31 were discharged; 29 per cent went to a facility that encouraged more independent living. Eighteen patients died during their stay in the geriatric ward; autopsies were obtained in 33 per cent--a higher autopsy rate than the average for general hospitals. General hospitals may continue to have large populations of chronically ill patients. This model for a geriatric ward may offer a way of dealing with a difficult situation.

**Self-instruction and assessment in techniques of intensive care using a computer model of the respiratory system.**

Hinds CJ; Ingram D; Dickinson CJ

Intensive Care Med ,1982, 8 (3) p115-23, ISSN 0342-4642  
Journal Code: H2J

Languages: ENGLISH

There are considerable logistical difficulties involved in providing an adequate training programme for each new doctor when starting intensive care. One solution is to use an interactive computer terminal and provide programmes for self-instruction and assessment. Using a computer model of the respiratory system linked to a computer-assisted instructional driver we have developed instructional exercises on the management of artificial ventilation and the treatment of respiratory failure. Each teaching session contains explanatory text, multiple choice questions and model simulations. The student can interact with the simulations, appropriate assistance being provided when required, while his answers are marked and assessed with further explanation when necessary. The use of computer models adds a new dimension to computer-assisted learning techniques and is particularly applicable to intensive care medicine.

0378-0791 Journal Code: G01

Languages: GERMAN Summary Languages: ENGLISH

30 intensive care surgical patients were investigated over a period of five days following trauma or major surgery. The patients were randomized into two groups. Both collectives received equal amounts of protein (1.0 g amino acids . kg-1 . d-1) and carbohydrate (6.7 g . kg-1 . d-1). Under this infusion regimen the patients of group I received an amino acid solution containing 45% branched-chain amino acids (BCAA), the patients of group II an amino acid solution with a 10% content of BCAAs. After only 24 hrs of infusion, the total amino acid concentration and branched-chain amino acid concentration in the plasma of patients receiving the solutions containing 45% BCAAs already clearly exceeded reference range, and continued increase during the entire investigation period. In those patients receiving the 10% branched-chain amino acid solution, these parameters rapidly returned to normal and then remained within reference range. Cumulative nitrogen balance and nitrogen balance on each day of investigation were significantly less negative in those patients administered the amino acid solution with small amounts of BCAAs. These results seem to indicate that after severe trauma or major surgery amino acid solutions containing high concentrations of BCAAs may be an unphysiological load on the already stressed metabolism, rather than a benefit

**[Advances in the therapy of myocardial infarct. Prognosis and clinical course of acute myocardial infarct with intensive therapy]**

Fortschritte in der Therapie des Myokardinfarkts. Prognose und klinischer Verlauf des akuten Herzmuskelinfarkts unter intensivtherapie.

Beck DA  
Fortschr Med ,Apr 15 1982, 100 (14) p656-62, ISSN  
0015-8178 Journal Code: F62  
Languages: GERMAN Summary Languages: ENGLISH

In a group of 1319 patients with acute myocardial infarction treated in an intensive care unit from 1969-1977 30% died within the years 1969-1971 during the stay in the clinic. The hospital death-rate decreased significantly to 22% between the years 1975-1977, while the average age of the patients was increasing, inspite of an increase in haemodynamically complicated infarcts. The number of patients in the age group of 50-69 years has decreased from 56% to 41%. The number of patients aged 70 years and older increased, while lethality decreased from 53% to 32%. Lethality in patients with total AV-block decreased, and was unchanged in patients with plurifascicular blocks. The incidence of ventricular fibrillation increased, lethality in these patients decreased. The high lethality of patients with cardiogenic shock remained unchangedly high. In patients with all other forms of severe heart failure lethality decreased, even in patients aged 80 years and more. Deaths occurred later during 1975-1977 compared to former periods. The interval between the beginning of symptoms and admission to the intensive care unit decreased, but has no more any prognostic significance. Improved survival is referred to effective treatment of life threatening disorders of cardiac rhythm and of severe heart failure.

**Telemedicine in critical care: problems in design, implementation, and assessment.**

Grundt BL; Jones PK; Lovitt A  
Crit Care Med .Jul 1982, 10 (7) p471-5, ISSN 0090-3493  
Journal Code: DTF

Languages: ENGLISH

We introduced telemedicine, i.e., telecommunications for delivery of health services, to alleviate scarcity and maldistribution of critical care services. For 18 months, we used interactive television to provide consultation with university-based critical care physicians for patients in the ICU of a 100-bed hospital. Telemedicine "visits" (1548) were made to 395 patients. Television consultation had greater clinical and educational impact than consultation using the telephone. Equipment was expensive but proved to be reliable and easy to use. Interactive television extended the availability of specialist expertise, but full exploitation of this technology for delivery of critical care services was not achieved. Extensive background research, currently underway at the University of Pittsburgh, is necessary before the next telemedicine demonstration.

**Continuous monitoring of mixed venous oxygen saturation in critically ill patients.**

Baele PL; McMichan JC; Marsh HM; Still JC; Southorn PA  
Anesth Analg (Cleve) .Jun 1982, 61 (6) p513-7, ISSN 0003-2999  
Journal Code: 4R8

Languages: ENGLISH

A new pulmonary artery balloon flow-directed catheter combines a fiberoptic photometric system for continuous display of mixed venous blood oxygen saturation (SvO<sub>2</sub>) with the capacity for hemodynamic measurements including thermodilution cardiac output estimation. This oximetry system was studied to determine its accuracy, reliability, and usefulness in the surgical intensive care unit (ICU). Twenty-two catheters were tested, but only 17 were successfully placed in 16 patients. There were technical problems associated with 10 catheters and on six occasions these necessitated the use of another catheter. The catheter values for SvO<sub>2</sub> were closely related ( $r = 0.9516$ ) to those obtained from a laboratory Co-oximeter. Continuous monitoring of SvO<sub>2</sub> is accurate and valuable as a warning system for deterioration in cardiopulmonary function and as an indicator of the effects of various therapeutic maneuvers in critically ill patients.

**Immediate radiologic and surgical management of renal injuries.**

Cass AS  
J Trauma .May 1982, 22 (5) p361-3, ISSN 0022-5282  
Journal Code: KAF

Languages: ENGLISH

Urologic evaluation for renal trauma is usually delayed in the multiple-injured patient, since the management of life-threatening associated injuries takes precedence. A method of immediate radiologic diagnosis and surgical management was carried out in 1,205 patients with 1,222 renal injuries. Blunt external trauma caused 96% of the renal injuries. Immediate IVP resulted in a definitive diagnosis in 91% of the cases. The renal injuries comprised contusions in 87%, lacerations in 8%, rupture in 2%, and pedicle injuries in 3%. Associated injuries were present in 75.5% of patients, including 49% requiring a laparotomy for intra-abdominal injury. The overall nephrectomy rate of 3.7% compares favorably to the nephrectomy rate in studies reporting the conservative management of renal injuries.

Former trainees in Critical Care Medicine (CCM) were polled regarding the reasons which have dissuaded intensivists from continuing practice in the field. Among the reasons cited, the most common were poor reimbursement for services rendered and the constant rivalry among practitioners in various fields for responsibilities in caring for the critically ill. A greater portion of anesthesiologists have discontinued practice in CCM than internists. Among those trained in CCM fellowship programs who are still practicing CCM, internists are most numerous.

Seventeen critically ill patients were studied prospectively to determine the relationship of serum albumin, creatinine-height index (CHI) and weight-height index (WHI) to clinical outcome. Use of the conventional "normal values" as cut-offs failed to discriminate between survivors and nonsurvivors better than chance alone. A serum albumin less than 2.5 g/dl correctly separated 93% of the patients in terms of survival prognosis.

The Shock Research Unit has applied computer technology to the care of the critically ill and injured patient since 1961.

The requirements for patient monitoring were initially explored with a process control computer (IBM 1710). In the current system, a Xerox Sigma-5 computer is utilized for monitoring EKG, hemodynamic, respiratory, and biochemical signals. Electronic preprocessing increases the efficiency and speed of data acquisition and signal analysis. Provisions are made for recording narrative data as part of a commitment to evolve an automated patient record. Bedside displays include both tabular and graphic summaries of patient status and trends. A computer accessible archive of patient files is maintained. Clinical operation of the system has been facilitated by automation of afferent and efferent functions including flushing of catheters, servo-calibration of pressure measuring systems, automated urine collection and disposal, and computer controlled infusion of fluids and medications. We anticipate the continuing development of automated afferent and efferent components for feedback control of ventilators by automated sampling and measurement of arterial blood gases and infusion of fluids and medications in response to changes in monitored hemodynamic variables. Such automation, together with medical intelligence for priority alarms and interpretive displays, hold promise of increasingly potent and cost-effective systems to facilitate and improve care of the critically ill or injured patient.

**Brain-orientated intensive care treatment in severe neonatal asphyxia. Effects of phenobarbitone protection.**

Svenningsen NW; Blennow G; Lindroth M; Gaddlin PO; Ahlstrom H

Arch Dis Child ,Mar 1982, 57 (3) p176-83, ISSN 0003-9888 Journal Code: 6XG

Languages: ENGLISH

The effect of applying brain-orientated neonatal intensive care for term infants with severe neonatal asphyxia was studied. Such treatment included protective phenobarbitone administration together with assisted ventilation and other measures to counteract postasphyxial cerebral oedema and any abrupt changes in blood pressure and oxygenation. The mortality rate and incidence of long-term sequelae were reduced appreciably, resulting in a 0-1 year mortality rate of 14% (previously 50%) and an incidence of neurodevelopmental handicap at 18 months of 17% (previously 50%). It is important in the management of infants with severe asphyxia at birth to avoid blood pressure fluctuations and to control neuronal epileptic activity by the use of barbiturates and early ventilator treatment.

**Survival of patients with cancer in a medical critical care unit.**

Hauser MJ; Tabak J; Baier H  
Arch Intern Med ,Mar 1982, 142 (3) p527-9, ISSN 0003-9926 Journal Code: 7FS

Languages: ENGLISH

The records of 40 patients with cancer and 684 patients without cancer admitted to a medical critical care unit were reviewed for the purpose of comparing survival. Patients with cancer had a higher mortality (55%, 22/40) than the patients without cancer (17%, 118/864). Patients with cancer and respiratory failure had a higher mortality (75%, 18/24) than patients without cancer but with respiratory failure (25%, 66/273) and a higher mortality than patients with cancer but without respiratory failure (25%, 4/16). In patients with cancer, the manifestation of respiratory failure as the adult respiratory distress syndrome (ARDS) was associated with a high mortality (86%, 12/14), which was not statistically higher than in patients with cancer with non-ARDS respiratory failure (60%, 6/10) or in patients without cancer with ARDS (65%, 28/43). Patients with cancer but without respiratory failure had a mortality of 25% (4/16). All eight patients with cancer admitted to the hospital because of life-threatening metabolic disturbances survived. In deciding whether to apply critical care techniques to a patient with cancer, the physician should consider the specific nature of the life-threatening illness.

**Mortality rates and neonatal intensive care for very small**

**babies.**

Walker GJ; Simpson H

Arch Dis Child ,Feb 1982, 57 (2) p112-6, ISSN 0003-9888

Journal Code: 6XG

Languages: ENGLISH

Mortality rates of very small babies (those weighing 1500 g or less) born to mothers normally resident in the 11 health districts of the London portion of the North-east Thames Health Region in 1971-73 and 1975-77 were compared with admission rates to neonatal intensive care units in 1972 and 1976 in the region. There was no significant correlation between mortality and admission rates for babies weighing 1000 g or less during either period. For babies born weighing between 1001 and 1500 g this was also so in 1972. In 1976 however, mortality rates were significantly correlated negatively at 24 hours but not at 28 days with admission rates to neonatal intensive care.

**Severity of illness and the relationship between intensive care and survival.**

Scheffler RM; Knaus WA; Wagner DP; Zimmerman JE

Am J Public Health ,May 1982, 72 (5) p449-54, ISSN 0090-0036 Journal Code: 3XW

Contract/Grant No.: 18-P-97079/3-03

Languages: ENGLISH

Currently about 15 per cent of hospital costs are attributed to intensive care. Research using statistical models has not adequately demonstrated that therapy in intensive care units (ICUs) is associated with reductions in the probability of death. In a study of 613 consecutive admissions to a multidisciplinary ICU, we reevaluate the relationship between ICU care and survival using a new acute physiology scoring system to control for the severity of illness of the patient population. When our severity of illness index was employed, we found a statistically significant and nonlinear relationship between the use of intensive medical care and the probability of survival. This statistical relationship produced a U-shaped curve with three distinct segments. The first segment exhibited an overall decrease in the probability of death with increasing therapy (275 admissions); the second segment, a fairly stable survival rate (281 admissions). Only in the third segment, where there were 57 admissions, did we find an overall increase in the probability of death as utilization of therapy increased. These findings suggest that quantitative measurement of severity of illness, when used in clinical studies, could produce improved insights into the relationship between therapy and health outcomes.

This report is intended to familiarize the reader with the current legislation concerning state definitions of death, the pertinent judicial decisions concerning termination of life support and the current status of medical/ethical committees. However, it is of paramount importance to all health care personnel to become involved in the resolution of these problems. Current information regarding legal clarity to these issues leaves much to be desired. Unless we wish major decisions that will affect us all to be decided by others, it is strongly suggested that we become directly involved in this process and accept the challenge and the opportunity to influence major legal, ethical, and medical decisions.

**Pediatric intensive care: factors that influence outcome.**

Rothstein P; Johnson P

Crit Care Med ,Jan 1982, 10 (1) p34-7, ISSN 0090-3493  
Journal Code: DTF

Languages: ENGLISH

Four hundred sixty-one consecutive admissions to the Pediatric Intensive Care Unit (PICU) were evaluated using the Therapeutic Intervention Scoring System (TISS). Patients requiring an increased level of care, defined as TISS points greater than or equal to 10, accounted for 75% of patient days in the ICU. Within this group, the primary reason for admission to the ICU was congenital heart disease, trauma, malignancy, respiratory failure, and sepsis. Survival was inversely related to TISS points, though TISS itself could not differentiate between survivors and nonsurvivors. The mortality rates for children who had a congenital malformation, a cardiac arrest before admission, or who developed acute failure secondary to other disease processes were significantly increased. Comparison of critically ill children and adults using TISS showed mortality rates that were similar. Assuming that the cost of intensive care is related to both seriousness of illness (assessed by TISS) and length of hospitalization, in this pediatric population the cost of hospitalization was not disproportionately high for nonsurvivors compared to survivors. Reduction in mortality rates in a PICU population will be dependent on factors largely uncontrollable by ICU practitioners. This will come about by reduction in the numbers of congenital malformations and the prevention of childhood trauma.

0200054 82116163

**The value of routine daily chest x-rays in intubated patients in the medical intensive care unit.**

Greenbaum DM; Marschall KE

Crit Care Med ,Jan 1982, 10 (1) p29-30, ISSN 0090-3493  
Journal Code: DTF

Languages: ENGLISH

Two hundred routine chest x-rays were evaluated to determine their value in the management of critically ill patients in a Medical ICU (MICU). Seventy-four x-rays (37%) were of suboptimal value or were delivered to the MICU too late for inclusion on morning rounds. Of the remaining 126 films, 54 (43%) showed worsening of a known, or development of a new, cardiopulmonary abnormality, or an unexpected misplacement of an invasive device. On the basis of these findings, routine daily chest radiographs were judged to be valuable in identifying abnormalities in critically ill patients. However, the system for providing this service was only 63% efficient, and improvement must be sought in this regard.

**Use of balloon-tipped catheters in the critically ill child.**

Weesner KM; Rocchini AP; Rosenthal A

Clin Pediatr (Phila) ,Mar 1982, 21 (3) p146-9, ISSN  
0009-9228 Journal Code: DHE

Languages: ENGLISH

A retrospective study of our experience in the placement of 19 consecutive balloon-tipped catheters in the pulmonary artery of 18 children disclosed that the procedure can be performed with relative ease in the intensive care unit without the aid of fluoroscopy. Insertion of the catheters was not associated with any serious complications. Catheter malfunction, however, occurred in 9 of 18 patients: balloon rupture in 6 and clot formation in 3. Comparison of pulmonary capillary pressure through a balloon-tipped catheter and venous pressure through a central venous line indicates that, in the absence of significant pulmonary disease requiring high positive end expiratory pressure, or significant left heart dysfunction, a central venous pressure line is frequently adequate for monitoring right heart pressures and as a guidance to fluid therapy.

The professional assigned to critical care must be able to respond to a variety of problems--respiratory, heart, renal, neurologic, and others. Advent of critical care medicine will produce much change in personnel functions and will greatly benefit critically ill patients.

Effective peer group relationships are essential in both primary nursing and the peer review process. Yet professional peer behaviors are frequently lacking in primary nursing

groups. These authors believe that if some of the problems in peer relationships are not resolved, primary nursing could be doomed to failure. Here they discuss the concept of "peer contracting" as a potentially useful method for facilitating the development of more professional peer group relationships. From their experience with peer contracting, they present some practical considerations regarding its use and value. Their discussion raises some critical points concerning problems in peer group relationships, and it stimulates further exploration of the nature, use, and implications of peer contracting as a vehicle that can help primary nursing realize its potential.

Just because primary nursing care traditionally has not been offered during the childbearing year does not mean there is no need. Prenatal classes, which were once a rarity, are now well accepted as a necessary and important service to expectant parents. Nurses have a responsibility to document the need for, and illustrate the impact of, nursing interventions. Nursing needs to accept the challenge for the sake of improved patient care. Supporting the expanding family during the crises of the child-bearing year has the potential for improving that family's functioning. The community stands to gain from anything that improves that functioning of the family unit.

Deuber CM

Nurse Pract ,Sep 1982, 7 (8) p26-30, 68, ISSN 0361-1817  
Journal Code: OA1

Languages: ENGLISH

The diagnosis, classification and treatment of depression as a pediatric problem are receiving attention by an increasing number of clinicians and researchers today. Until recently skepticism concerning the emotional ability of a child to experience depressive feelings or illness resulted in a scarcity of research on the topic. A review of literature published in the last two decades reveals that depression can and does exist in children as young as six years. Furthermore, several studies suggest that it is underdiagnosed and underreported in pediatric clinical settings. Current literature provides pediatric practitioners with "at-risk"

factors and symptoms of childhood depression to aid in casefinding, referral and treatment necessary to promote the emotional well-being of a child.

**Primary or team nursing? Two conditions determine the choice.**

Shukla RK

J Nurs Adm ,Nov 1982, 12 (11) p12-5, ISSN 0002-0443  
Journal Code: JEL

Languages: ENGLISH

The cost-benefit analysis of the primary nursing structure is contingent on the factors that affect the proper use of nursing skills. By reducing the problems of coordinating the work, primary nursing has the potential of greater professional nurse involvement with patients. However, in a unit with inefficient support systems, inappropriate use of professional skills in primary nursing render the primary nursing structure less cost-beneficial than the team nursing structure. We may postulate here that primary nursing will be more cost-beneficial than team nursing when the nursing support system requires very little of the RNs' time and the patients require highly skilled care. In a hospital that has inefficient nursing support systems and on nursing units that have mostly self-care to intermediate care patients, primary nursing will only diminish proper use of nursing skills without significant potential to improve the quality of care. On the contrary, with highly efficient nursing support systems and on nursing units that have mostly intermediate use to extensive care patients, primary nursing will have great potential to improve quality and to use nursing skills properly.

The Risser Patient Satisfaction Scale was used to evaluate the effectiveness of implementing the key concepts of primary nursing. An experimental control design was used. Forty-six subjects from two units completed the questionnaire. Estimates

of reliability and homogeneity are reported. There is reason to question the discriminant validity of the subscales. No significant differences were obtained between the units on any of the subscales or total scale score. A number of explanations are offered for interpreting the measuring of the nonsignificance of the differences. Work need to continue on revising existing patient satisfaction measures or developing new ones. Other criteria with theoretical importance should be used in conjunction with satisfaction measures in assessing the effects of primary nursing.

This paper describes the recorded concerns of clients and the management activity of Master's prepared nurse providers in an urban, ambulatory, university affiliated primary care nursing practice during after-hours call. Retrospective record review was used to collect data. Pain was the most common client concern, and the abdomen the most frequently identified pain site. The majority of concerns expressed by clients were minor health problems appropriate for telephone management. The most frequent interventions used were nursing measures such as comfort, supported and reassurance. Finally, the nurse providers in this group practice managed the majority of calls with nursing interventions.

**Primary health care nurse training in Kwazulu. An evaluation of diagnostic flow charts versus a conventional training method.**

Solarsh G; Irwig LM; Reinach SG; Muller EU  
S Afr Med J ,Jul 17 1982, 62 (3) p100-4, ISSN 0038-2469  
Journal Code: U4R  
Languages: ENGLISH

Diagnostic flow charts have been adapted for the training of primary health care (PHC) nurses in a rural area of South Africa. We designed a randomized controlled trial to assess whether nurses' clinical competence differed if they were trained using flow charts or using conventional patient-centered teaching. Although clinical competence improved during the training programme, this improvement did not differ significantly according to which of the two training methods was used. The nurses in this trial had considerable earlier experience and some training in primary care. Before the trial they had a high level of clinical competence and may already have developed their own diagnostic strategies. We therefore cannot make inferences from our study about whether or not flow charts will be a valuable addition in PHC. Flow charts need to be adapted to take into account where, by whom, and for what purpose they will be used. They must then be tested to ensure that they only rarely result in incorrect diagnosis and treatment. A decision on the use of flow charts in the training of PHC nurses should be based on further educational trials and long-term follow-up of trained health workers. Nurses should participate in educational trials at the start of their careers in PHC. The additional value of flow charts in the auditing of competence and assessment of educational needs should also be explored.

**The nursing process--is the title right?**

Henderson V  
J Adv Nurs ,Mar 1982, 7 (2) p103-9, ISSN 0309-2402  
Journal Code: H3L  
Languages: ENGLISH

The use of the term nursing process is traced from the 1950s. The author argues that the nursing process is now used as a substitute for nursing. In this paper questions are raised as to whether problem-solving is all there is to nursing and whether problem solving is peculiar to nursing. It is further argued that whilst the nursing process recognizes the purpose of the problem-solving aspects of the nurse's work, it ignores the subjective or intuitive aspects of

nursing. It also ignores the role of experience, logic and expert opinion as bases for nursing practice, the author contends. She concludes that because the nursing process stresses a dominant and independent function for the nurse this may undermine the value of collaboration of health professionals and the development of the client's self reliance.

**A proposal: primary nursing for the mother-baby dyad.**

Vestal KW

Nurs Clin North Am ,Mar 1982, 17 (1) p3-9, ISSN  
0029-6465 Journal Code: 092

Languages: ENGLISH

Nurses who work in a maternity setting must define their role in terms of the families for whom they care. Care of the childbearing family includes the social, cultural, and economic environment in which the new baby and his family are a part. The postpartum period is an ideal time for the primary nurse to influence the care of the baby and family in a way that supports their unique family system. The nurse who utilizes this opportunity to care for the family can contribute positively to the start of a new member of society.

The interactional system of the infant and family can be viewed as a mutually dependent dyad that is best supported by consistent and knowledgeable nursing care. It is no longer reasonable to deny such care to maternity clients. Family-centered care has been shown to be successful in a variety of hospital maternity settings, improving care for the mother-baby dyad and promoting cost-effective staffing. The process of proposing such a change is challenging. Obstacles to change can be overcome and, although painful, they often lead to clearer definition of the proposal. Nursing must provide the impetus to sound family-centered care. The alternatives are no longer acceptable to consumers, and fragmented nursing care is seldom satisfying to nurses. There is much to be gained by fulfilling the true sense of family-centered postpartum care.

0033-3549 Journal Code: QJA

Contract/Grant No.: O2-H-000-477

Languages: ENGLISH

Since there are data to indicate that the composition of clinic staff is important in attracting and maintaining contact with adolescents seeking contraceptive services, in this paper the importance of age, sex, and ethnicity of counselors and medical providers is examined. Female clients of the Young Adult Clinic at Columbia-Presbyterian Hospital, New York City--most of them low-income blacks or Hispanics--were asked to complete questionnaires. The 150 respondents, aged 16-21 years, used a 4-point rating scale of very important = 4 to not important at all = 1. The findings indicated that the sex of the counselor and examiner was more important to female teenagers than ethnicity or age. Clinic administrators seeking to provide contraceptive services to teenagers should make an effort to include at least one female counselor and medical provider. However none of these characteristics was very important to the majority of patients. These findings are discussed in the context of the literature on the provision of contraceptive services to teenagers and on patient preferences for counselors or therapists in general.

**Home health audit tool--at last!**

Hand JS; Bruno P; Feffer DA; Plath SL  
Home Health Rev ,Dec 1981, 4 (3) p15-21, Journal Code:

GDW

Languages: ENGLISH

Dissatisfied with the use of an audit tool not applicable to home health nursing, administrators of the Missoula Home Health Agency formed a special audit committee to review audits used by agencies around the country. After examining 50 audit tools, the committee agreed that the Phaneuf public health nursing audit did not adequately emphasize nursing care and charting specific to home health agencies but did fit most of their criteria. After redesigning the Phaneuf audit and testing it through two quarterly audits, the new Missoula Home Health Audit tool has been found very satisfactory. The Missoula Audit emphasizes: 1. home health's goal of independent living and/or self-care; 2. service provider-family-patient relationship; 3. nurse-physician relationship; 4. charting and recording; 5. coordination of careproviders. Unlike many existing audit tools, the Missoula Audit is specific to home health nursing, covers the spectrum of home health services, has sensitive scoring which reflects true differences in quality of care, and initially, at least, appears to be consistent from audit to audit.

When used effectively, meetings can provide a mechanism for integrating different viewpoints, improving the decision-making process, generating new ideas, and coordinating the activities of participants. To be effective, meetings need to be conducted in an organized way by using an agenda, starting and ending on time, facilitating productive participation of members, and by summarizing the work which was accomplished. The following list includes several points to make the most of meetings: 1. Explore alternatives to meeting--telephone, conference call, memorandum. 2. Limit attendance to only those people who have to be there. 3. Make sure all participants know the purpose of the meeting in advance. 4. Send a written agenda in advance of the meeting. 5. Make sure there is a leader who will assume responsibility for starting, guiding, and closing the meeting with a summary. 6. Choose an appropriate place, conveniently located. 7. Choose an appropriate time--afternoon is usually the best. 8. Designate a recorder to make note of decisions, actions, and recommendations. 9. Start and end on time. 10. Stick to the agenda--don't get distracted by side issues which eat into time allotted for the meeting. 11. Control interruptions such as telephone calls for members, or people coming in and out. 12. Make sure everyone is clear about what is expected of them after the meeting.

**The school of allied health--a political model of university governance.**

King EC; Dietrich MC

J Allied Health .Nov 1980, 9 (4) p242-52, ISSN 0090-7421 Journal Code: HA8

Languages: ENGLISH

Curtailment of direct federal funding coupled with greater governmental demands for fiscal accountability in the 1970s has led to events such as allied health program moratoria and a closer scrutiny of the fundamental goals of allied health schools. Resulting organizational stress has also stimulated an emergence of interest groups in these schools. This paper attempts to place these events in a historical and sociological context by: (1) summarizing three governance models; (2) relating these models to the organizational maturation of allied health schools in light of predictions from contemporary management theory; (3) discussing the interrelationships between organizational structure, age of allied health schools, and characteristics of allied health administrators; (4) describing variables of organizational transition that affect organizational effectiveness; and (5) making recommendations to assist schools in organizational planning so they can adjust to the potential negative impact of organizational maturation, shrinking resources, and increasing accountability. A series of recommendations from the Baldrige political model of contemporary organizational research is presented. These recommendations may help facilitate conflict resolution in schools of allied health.

**An approach to preventive intervention in child psychiatry.**

Caplan G

Can J Psychiatry .Dec 1980, 25 (8) p671-82, ISSN 0706-7437 Journal Code: CLR

Languages: ENGLISH

A conceptual model for primary prevention is proposed. Its five elements are (1) Risk Factors that increase the likelihood of (2) eventual Mental Disorder contingent upon (3) intervening psychological stresses that promote Crises, which the individual may master more or less effectively dependent on (4) his current psychological Competence and (5) the powerful influence of Social Supports. The paper summarizes recent preventive intervention efforts and evaluative studies that focus on these elements in seeking to reduce psychiatric disorders in child populations: reduction of risk factors through mental health consultation and collaboration by mental health clinicians with child care workers and administrators; improvement of competence in children at risk by special educational programs with children and their parents that seek to enhance their cognitive and emotional programs with children and their parents that seek to enhance their cognitive and emotional problem-solving and coping skills; crisis intervention for children and their families by anticipatory guidance and preventive intervention; and fostering protective social supports by convening supportive

groups for persons in need, and organizing mutual help groups, both of which seek to provide individuals under stress with help with emotional reequilibrium and cognitive guidance to compensate for capacities that are usually temporally eroded by the upheaval of crisis. (38 Refs.)

**Inpatient medical rehabilitation: 1979 survey of hospitals and units.**

Mullner R; Killingsworth C; Matthews D; Byre CS

Arch Phys Med Rehabil .Aug 1980, 61 (8) p341-45, ISSN 0003-9993 Journal Code: 8BK

Languages: ENGLISH

This survey by questionnaire was conducted by the Hospital Data Center of the American Hospital Association. The survey universe consisted of 516 hospitals; of these, 416 (80.6%) completed the questionnaire. The responding hospitals are classified into 4 categories: 1) independent rehabilitation hospitals, 2) self-contained rehabilitation hospitals within larger medical centers, 3) defined rehabilitation units of institutions, and 4) no formalized units. The survey yielded information concerning: 1) utilization, and predicted future trends in utilization; 2) referral sources of admissions; 3) the areas to which patients are discharged (their homes, nursing homes, etc); 4) the classes of fulltime equivalent personnel and their relative proportions, and those types of personnel that hospitals would most like to hire if it were possible to do so; 5) the sources of payment for inpatient claims, and problems with reimbursement; and 6) other findings including the use of beds designated for rehabilitation for other types of patients, and the number of fulltime administrators and of fulltime medical directors.

**The academic in Washington--worthwhile effort or waste of time?**

Petersdorf RG

Pharos Summer 1979, 42 (3) p2-8, ISSN 0031-7179  
Journal Code: P48

Languages: ENGLISH

Petersdorf draws conclusions from his decade of experience with the legislative and administrative process in Washington as a member of the AAMC Executive Council. He points out that the interface between academe and the government is inevitable since the government has some level of interface in all aspects of academic medicine: (1) the number and type of students admitted; (2) quality and quantity of teaching facilities; (3) content of curriculum; (4) the number and type of residents trained; (5) nature of research and training programs; and, most importantly, (6) resources. He identifies and discusses the relative effectiveness of the organizations which are on the Capitol scene: strictly scientific associations; specialty societies; groups oriented to categorical diseases; broad-spectrum organizations such as the AAMC and the Washington offices of the AMA; three associations of presidents of universities; and the Institute of Medicine. Petersdorf notes two essentials for success: a Washington location and an able full-time staff. Three issues recently before Congress--unionization of housestaff, payment of teaching physicians, and health manpower legislation--are discussed. At the conclusion of the article, grades are assigned to each group participating in the deliberations. The author identifies three lessons to be learned: (1) the academic medical establishment should attempt to speak with a single voice; (2) if the diversity among the organizations that speak on health and educational policy makes a uniform position impossible, they should keep each other informed; and (3) perceptions of academic interest groups should be tempered through actions that consider the public interest. He emphasized the need for team rather than individual plan and recommends that deans, faculties, administrators, and students increase their participation in organizations that work to improve education, research, and health care. "We need," he concludes, "to work together to interpret our views to our legislators and the public whom we all serve."

**The decision-making process: implications for the medical school organization.**

Lostetter JO; Chapman JE

Health Policy Educ Mar 1980, 1 (2) p161-76, ISSN 0165-2281  
Journal Code: G2I

Languages: ENGLISH

In this article, the authors make use of some contemporary models of decision-making to show how the process of decision-making can become more self-conscious, and thus both more enlightened and more assured. The approach is an examination of several models examined both from the perspective of the steps in the process itself, as well as

general observations about the decision-making process. The practical focus is on the medical school organization with its unique characteristics. This article also examines the decision-making process through a comparison of two types of organizational structure (pyramidal and matrix) found in most medical schools. Certain constants emerge from this article that positively enhance good decision-making. These elements are: (1) the rapidity of change; (2) the critical need for a wide range of alternatives; (3) an understanding of both the organizational structure and human factors involved; and (4) the necessity of involving others in the decision-making process. By analyzing various modes of decision-making and presenting options, this article should be of real assistance to administrators.

**CHMC directors' preferences for training of bachelor's level psychologists.**

Randolph DL

J Community Psychol Jul 1979, 7 (3) p228-35, ISSN 0090-4392  
Journal Code: HUU

Languages: ENGLISH

A questionnaire devised to measure preferences for training of bachelor's level psychologists was mailed to 302 community mental health center (CHMC) directors in the southeastern United States; 117 or 39% completed and returned questionnaires. Based on the preferences of CHMC directors, bachelor's level candidates for employment in CHMCs should manifest the following: (1) a good foundation in generic "core" psychology theory; (2) training in fundamental intervention skills in the area of group, family, and individual counseling/psychotherapy and consultation; plus crisis intervention and intake interviewing; (3) specialized training/experiences in working with such high priority groups as disadvantaged blacks, the physically disabled, and alcohol/drug abusers; (4) knowledge of community resources and skill in publicizing/public relations; and (5) personal characteristics that include personal warmth, a neat personal appearance, and good oral and written communication skills.

**Rural-urban differences in the structure of services for the elderly in upstate New York counties.**

Taietz P; Milton S

J Gerontol ,May 1979, 34 (3) p429-37, ISSN 0022-1422  
Journal Code: IAV

Languages: ENGLISH

This research examines the impact of federal intervention and local community effort on the development of programs for the elderly. The study was designed, first, to gather longitudinal data on the structure of services for the elderly in 53 upstate New York counties for comparison with a study conducted in 1967 and, second, to measure the effectiveness of 43 counties with a County Office for the Aging (COFA) in mobilizing resources to increase services for the elderly. The findings reveal: (1) federal intervention has had the effect of an overall increase in services while at the same time decreasing rural-urban differences; (2) urban COFAs score consistently higher on the measures of community effectiveness; (3) the educational attainment of COFA directors is not a good predictor of success in mobilizing outside resources in both urban and rural counties; (4) in urban but not in rural counties, directors with administrator/planner experience have greater success in mobilizing outside resources.

**Intensive care--a medical audit.**

Tomlin PJ

Anaesthesia ,Sep 1978, 33 (8) p710-5, ISSN 0003-2409  
Journal Code: 4MC

Languages: ENGLISH

A 4-year audit of one Intensive Care Unit, during which time 1718 patients were admitted, shows that allocating 1% of all acute beds for intensive care purposes is not adequate. This is reflected by the high mortality among the patients discharged from the unit. Sophisticated monitoring equipment led to a marked improvement in mortality rates in each group to which it was applied. Simple to use, automated, biochemical equipment was very cost effective for blood gas measurement but less so for electrolyte determinations. Intensive care is very labour intensive, but the cost benefit in terms of lives saved is large. It is suggested that audits of this type help to identify the consequences, including adverse consequences, of decisions by administrators.

**Comparative costs to the Medicare program of seven prepaid group practices and controls.**

Weil PA

Milbank Mem Fund Q ,Summer 1976, 54 (3) p339-65, ISSN 0026-3745  
Journal Code: NQU

Languages: ENGLISH

This research was conducted in order to compare costs to the

Medicare program for providing health care service to old people enrolled in two forms of health delivery organization: open market and prepaid group practice (pgp). Two data sources were employed: cost data provided by the Social Security Administration for seven prepaid group practices in five SMSAs and northern California and interviews conducted with administrators of the prepaid groups to determine: organizational sponsorship, incentive structure, pattern of selectivity of patients, and resource availability. Major findings are: (1) Enrollees in prepaid groups incur higher physician costs. This includes services provided by practitioners in and outside the plans. (2) Overall, prepaid groups demonstrate savings to the Medicare program in provider-initiated services- in hospital care and extended care facility services, but not in home health care. (3) Reduced spending in the hospital component does not imply reduction in the extended care facility or home service. (4) Outpatient costs in the hospital are generally higher in the open market modes, probably because this mode of care is viewed as an alternative to physician visits. (5) The greatest cost savings to the Medicare program are demonstrated by groups which are relatively small, yet hospital-based.

**Uses of individualized client goals in the evaluation of drug and alcohol programs.**

Peckham RH

Am J Drug Alcohol Abuse, 1977, 4 (4) p555-70, ISSN 0095-2990 Journal Code: 3GW

Languages: ENGLISH

The issue of accountability increasingly places demands on administrators to evaluate program results. This paper attempts to show that individualized goal setting by clients can provide information which can be used (1) to compare stated program goals to actual client goals, and (2) as a realistic, individualized set of outcomes for follow-up evaluation. Evaluation of many drugs and alcohol programs is often based on the premise that abstinence is the goal of all treatment programs for all clients. While this may be a proper ultimate goal, it may not be sufficiently precise for more specific or short-term evaluations. A technique recently developed in the mental health field is Goal Attainment Scaling (GAS). In this approach, individual goals are usually developed through negotiations between client and counselor and provide individualized measurement of client success in treatment. GAS was tested on a sample of clients entering public and private drug and alcohol treatment facilities: (1) nearly all clients in the sample chose to set goals, although they were not required to do so; (2) a content analysis aggregated individual goals into a group profile of percent of clients writing goals in each of 17 goal areas; (3) goal content changed over successive interviews; and (4) there were differences in goal content between age and facility subgroups.

**Implementing family planning in a Ministry of Health: organizational barriers at the state and district levels.**

Simmons RS; Ashraf A

Stud Fam Plann, Feb-Mar 1978, 9 (2-3) p22-34, ISSN 0039-3665 Journal Code: V52

Languages: ENGLISH

1. Family planning occupied a subordinate position in the medical and health bureaucracy almost two decades after its introduction. Senior Ministry officials accorded low priority to formal program objectives, while the State Family Planning Officer, the highest state official concerned solely with the family planning program, suffered from a relatively subordinate position in the Directorate and a lack of authority and support. Within the medical profession, family planning was held in low esteem, and the medical and health bureaucracies did not have a mechanism for selecting personnel on the basis of interest and commitment. 2. Organizational adjustment to family planning in the Ministry of Health was a slow and painful process, absorbing the energy and attention of Ministry officials for almost a decade. The repeated reorganizations of the district setup revolving around the division of labor between medical, health, and family planning

months of almost total inertia and detracted substantially from the supervisory capacity of the officials involved. 3. Decision making and guidance suffered from the quick turnover of the Secretary, the most powerful administrator in the Ministry. In Uttar Pradesh Secretaries stayed barely long enough to begin to understand the complex organizational setup of the program. 4. Multiple and often conflicting lines of authority characterized the relationships between the higher and lower echelons within the Ministry. This was accentuated when the District Family Planning Officer was placed under the administrative control of the District Magistrate. While intended to "energize" family planning through the association of the most prestigious and powerful district official with the program, this organizational arrangement resulted in conflicting instructions to the staffs of the primary health centers. 5. The organizational behavior of the Ministry of Health was shaped by the interplay of the various "professional cultures" of its key actors. The generalist administrators' short time horizon and eagerness to produce quantitative results clashed with the specialists' emphasis upon long-term goals and technical constraints; the politician's defense of the interest of his constituents clashed with the administrator's desire to defend his autonomy. The calculus of political survival made support for family planning goals a costly burden that few politicians have been willing

Factors determining the quality of physician performance in patient care.

Rhee SO

Med Care .Sep 1976. 14 (9) p733-50. ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

The study determined the separate and joint effects of 1) physician specialty, 2) type of medical school attended, 3) time in practice, 4) type of ambulatory care setting, and 5) type of hospital on the quality of physician performance in patient care. The sample consisted of 454 physicians in 18 specialty categories. Multiple Classification Analysis was used to determine the effects of these predictors on the quality of physician performance. The study found that the organization of hospital care had a large independent effect, but that the other four predictors had relatively small effects on the quality of physician performance. The findings imply that the organization of the setting in which care is provided has more influence than the education and training that physicians had attained. All five predictors together explained 20 per cent of the variance. Methodological suggestions were made to improve the explanatory power of the variables, and various pragmatic for medical care administrators were presented.

If a nursing service uses agency nurses to help cope with staff shortages, the nursing administrator must manage the cost and quality of care delivered by these nurses. The authors describe their hospital's system for using agency nurses. The components of their system--an orientation program, contracts with the agencies, and systematic

performance evaluation--can be used or adapted in other institutions.

A meaningful quality assurance program comes only with appropriate knowledge, communication, and accountability for all quality assurance functions among nurses at all levels. Describing the implementation of their quality assurance program, these authors tell of their eventual realization that, in fact, they had merely implemented a quality assurance tool that brought the nursing staff little benefit and a lot of grief. Highlighting the identified problems, the factors contributing to the program's failure, and the actions they took to develop and meet appropriate objectives, they detail their later, successful implementation of the concept and the process of quality assurance. Their experience provides readers with food for thought and stimulus for critical evaluations of their own quality assurance programs.

This article describes a conceptual and methodological framework for evaluating nursing care quality. The conceptual framework is based on Drem's theory of self-care which emphasizes the importance of decisions in the selection of nursing process based on patient status and problems. The primary outcome criteria is self-care. The methodological framework is based on Greenfield's criteria maps methodology for linking patient status (problems or diagnoses) to decisions about nursing interventions and linking these specific nursing intervention criteria to desired outcomes for self-care. The article further describes a multiagency quality assurance programme for nursing. The programme includes: a definition of criteria and standards across agencies; nursing care management protocols that define standards of care; continuing education courses for nursing based on management protocols; the maps method of auditing actual and recorded nursing process and patient outcomes as defined in the management protocol.

A Delphi study was undertaken to identify the changes in library roles and functions that the directors of academic health sciences libraries believe will occur over the next decade. The methodology is described and the results are summarized. Two scenarios resulted: one, highly desirable; the other, highly probable. They overlap by 64%. Library directors expect moderate evolutionary changes in the next ten years. Users are perceived to be the force maintaining the status quo, while technology is the force advancing change. The adoption of technology is seen as desirable and within the libraries' span of control. Education and service roles of librarians will expand. Library and institutional priorities are seen as obstacles to change.

The Association of American Medical Colleges, under National Library of Medicine sponsorship, is conducting a study of the academic health sciences library's roles in education for the health professions as these may be affected by changes in health information handling and management. The study's aims, objectives, and methods are described. The study aims to develop guiding principles for the use of academic health center administrators, library administrators, federal agency personnel, and others involved in planning and policy decision making for health sciences libraries.

**The status of women in the administration of health sciences libraries: a five-year follow-up study, 1972-1977.**  
Goldstein RK; Hill DR  
Bull Med Libr Assoc ,Jan 1980, 68 (1) p6-15, ISSN 0025-7338  
Journal Code: BOW  
Languages: ENGLISH

A follow-up survey was conducted in 1977, five years after a previous survey of head librarians in large biomedical libraries, to assess changes that had occurred in the representation of women in top administrative positions. Results for the 126 libraries that responded are reported in six category groupings, with comparative figures for 1977, 1972, and 1950. Also reported are data on head librarian and associate librarian positions and on the appointment rate of women and men to head librarian posts that became vacant from 1972 to 1977. Despite a large number of vacancies and turnover, which provided an opportunity for change to have occurred, the most striking aspect of the 1977 survey is the similarity of its results to those of the 1972 survey. Women made up over three-fourths of the librarian work force and held considerably less than one-half of the head librarian positions.

The first year of the Health Sciences Library Management Intern Program, funded by the National Library of Medicine and administered by the Council on Library Resources, has recently been completed. This paper discusses the origins of the internship, the selection of the successful applicants, and the motivation of the interns and host directors. The basic components of the intership year are described, and its

effects on the host libraries and interns are considered. The immediate future of the internship is outlined, and other methods for training health sciences library administrators are briefly discussed.

**Cooperation strengthens small hospital libraries in a rural area of New England: a five-year experience.**  
Sekerak RJ  
Bull Med Libr Assoc ,Jul 1979, 67 (3) p322-9, ISSN 0025-7338  
Journal Code: BOW  
Languages: ENGLISH

Before 1970, library facilities and services at the small hospitals in rural Vermont were essentially nonexistent. Similar findings were later encountered along the Connecticut River in New Hampshire and in a small area of upstate New York. The Hospital Library Development Services program was established at the University of Vermont's Dana Medical Library to improve these conditions. Financial assistance was received from the National Library of Medicine, and by the end of 1974, thirty-three hospitals had staffed libraries. Earlier that year it has been decided to begin emphasizing cooperation among the developing libraries, including the production of union lists and regular meetings of staff members from geographically proximate hospital libraries to plan and implement various activities. An additional one-year award from NLM was received in 1975. Results achieved during and after the period of grant support are reported. Cooperation among hospital libraries is seen as a feasible and beneficial undertaking provided that the participating libraries are internally supported and developing.

Lyders R

Bull Med Libr Assoc ,Jul 1979, 67 (3) p287-96, ISSN  
0025-7338 Journal Code: BOW

Languages: ENGLISH

Management by Objectives (MBO) as it has been implemented in the Houston Academy of Medicine--Texas Medical Center Library is described. That MBO must be a total management system and not just another library program is emphasized throughout the discussion and definitions of the MBO system parts: (1) mission statement; (2) role functions; (3) role relationships; (4) effectiveness areas; (5) objective; (6) action plans; and (7) performance review and evaluation. Examples from the library's implementation are given within the discussion of each part to give the reader a clearer picture of the library's actual experiences with the MBO process. Tables are included for further clarification. In conclusion some points are made which the author feels are particularly crucial to any library MBO implementation.

Languages: ENGLISH

A representative committee of Houston Academy of Medicine-Texas Medical Center Library staff and faculty, under the direction of the library administration, successfully redesigned a job classification system for the library's nonprofessional staff. In the new system all nonprofessionals are assigned to one of five grade levels, each with a corresponding salary range. To determine its appropriate grade level each job is analyzed and assigned a numerical value using a point system based on a set of five factors, each of which is assigned a relative number of points. The factors used to measure jobs are: education and experience, complexity of work, administrative accountability, manual skill, and contact with users. Each factor is described according to degrees, so that a job can be given partial credit for a factor. An advisory staff classification committee now participates in the ongoing administration of the classification system.

A demonstration core collection of twenty-four ready-reference sources and five journals was selected cooperatively by a solo practitioner in rural Menifee County, Kentucky, and the University of Kentucky Medical Center Library Field Librarian to fit the ready-reference and current awareness information needs of a primary care solo rural practice in eastern Kentucky. The collection selections were systematically assessed by the physician to determine their utility in filling the practitioner's information needs with regard to his particular situation in terms of medical experience and level of training, available library and educational resources, and the type of health problems seen in his practice. This assessment showed that the Rural Demonstration Library Collection completely filled the information needs of the physician 66% of the time materials were consulted and filled his immediate information needs either completely or partially 82% of the time the collection was searched. This demonstration has shown that, under a specific set of circumstances, a librarian and a solo rural practitioner can effectively work together in identifying health sciences materials which fit the information needs of a solo rural practitioner. It suggests that cooperation between a librarian and a physician is important in meeting information needs.

**Selected list of books and journals for the small medical library.**

Brandon AN; Hill DR

Bull Med Libr Assoc ,Apr 1979, 67 (2) p185-211, ISSN

0025-7338 Journal Code: B0W

Languages: ENGLISH

This revised list of 492 books and 138 journals is intended as a selection guide for small or medium-sized hospital libraries or for the small medical library serving a specified clientele. It can also be used as a core list by small hospital library consortia. Books and journals are categorized by subject, with the books being followed by an author index and the journals by an alphabetical title listing. Items suggested for initial purchase by smaller libraries are indicated by an asterisk. To purchase the entire collection of books and to pay for annual subscriptions to all the journals would require an expenditure of about \$22,500. The cost of only the asterisked items, recommended for first purchase, totals approximately \$6,100.

The MD undergraduate program at McMaster University, based entirely on self-instruction, requires the provision of all kinds of learning resources. How these are assembled and made available is described. Emphasis is placed on the practical library problems of cataloging, shelving, maintenance, and distribution of audiovisual materials including pathology specimens and 'problem boxes' as well as the more usual films, videotapes and slide/tape sets. Evaluation is discussed briefly.

Planning a new library and developing a book and journal collection for the College of Veterinary Medicine at Iowa State University are described. The Veterinary Medical Library is a self-contained unit (6,800 square feet) for print material within the Veterinary Medical Building. Seating for 140 patrons is available. The collection is designed to provide basic materials for teaching and research in veterinary and comparative medicine. Indexing and abstracting tools permit access to local, state, and national resources as well. At present the collection totals over 17,000 volumes and over 500 serial titles. A working collection of 25,000 volumes will be maintained in the Veterinary Medical Library, and the University Library will continue to function as the principal backup source.

**Management of a learning resource center: a seven-year study.**

Hampton CL; Hurwitz GH; Shaffer MC  
J Med Educ ,Feb 1979, 54 (2) p90-5, ISSN 0022-2577  
Journal Code: J13  
Languages: ENGLISH

Data compiled over seven years present evidence that small-group or "cluster" carrels are successfully utilized by medical students in a learning resource center (LRC) and, therefore, should be considered to be an efficient method of managing space, software, and hardware. Three management concepts account for high utilization of an LRC operated as a service in support of a medical school curriculum. Of special importance is the interaction of LRC staff with faculty, which directly accounts for a collection relevant to the curriculum. The other management concepts are responsiveness to students and delivery of services that support production and distribution of print and audiovisual resources for student learning.

This paper was conceived in the context of the "RTSD Guidelines for the Formulation of Collection Development Policies." It describes fundamental qualities of policy applicable to all kinds of libraries and recommends a step-by-step process leading to the successful realization of policy planning. Placing an emphasis on the values of the process itself, the paper also suggests implications for collection development personnel and for the library as an organization, when a working policy is adopted.

**The necessity for a collection development policy statement.**

Feng YT

Libr Resources Tech Serv ,Winter 1979, 23 (1) p39-44,  
ISSN 0024-2527 Journal Code: LAE

Languages: ENGLISH

The heart of the library lies in its collections, and collections have to be built continuously. Budgetary constraints perforce stress the need for better defined collection development policy, although the ultimate goal should be an improvement of library service rather than any reduction of library cost. A written collection development policy facilitates a consistent and balanced growth of library resources, and a dynamic policy is one that evolves as the institution grows. Such a policy is based on the understanding of the needs of the community it serves and seeks to define and delimit the goals and objectives of the institution. A collection development statement is not a substitute for book selection; it charts the forest but does not plant the trees. It should be used as a guidepost, not a crutch. Book selection requires judgment and the courage to choose. A sound collection development policy, on the other hand, provides the necessary rational without which a collection may grow amoebalike, by means of pseudopodia.

The evaluation strategy of a medical library program within an Area Health Education Center is described. One of about thirty programs in the AHEC project, this library program was singled out as the first to be evaluated both because it was considered a key part of the total program and because a fair amount of quantitative data were available for measurement. Eleven hospitals of the thirty-nine in the area were selected for the study. Two specific and measurable objectives, the evaluation method, instruments, and results are presented. Finally, several important issues raised in conjunction with the evaluation are discussed in terms of the implications of evaluation and policy making.

This paper describes the application of zero-base budgeting to libraries and the procedures involved in setting up this type of budget. It describes the "decision packages" necessary when this system is employed, as well as how to rank the packages and the problems which are related to the process. Zero-base budgeting involves the entire staff of a library, and the incentive engendered makes for a better and more realistic budget. The paper concludes with the problems which one might encounter in zero-base budgeting and the major benefits of the system.

**Health information for patients: The hospital library's role.**  
Roth BG  
Bull Med Libr Assoc ,Jan 1978, 66 (1) p14-8. ISSN  
0025-7338 Journal Code: BOW  
Languages: ENGLISH

Libraries today, including most hospital-based patients' libraries, are involved only peripherally in providing patient health science information. Hospital libraries should collaborate with health professionals in getting health information to patients--along with the library's more traditional roles of providing recreational reading for patients and serving the informational needs of the physician and medical staff. The library should act as the center for educational materials and programs within the hospital. Many health agencies, health educators, physicians, and librarians have been discussing the need for patient health education, but there are few effectively organized or established education centers. This paper discusses an overview of patient health education and intellectual freedom, proposes a new role for the existing hospital library in patient health education, and suggests guidelines for establishing a patient education center.

A library's environment as an inviting place to study, read, and relax is an important function often overlooked or avoided. A nursing school library was underutilized and had an unacceptable of lost materials. A study undertaken to determine the setting's impact on all the library's intended functions showed that the physical environment seriously hampered many activities. A change in the library's arrangement offered users a more functional area for all types of library activities. Statistics show that the library is now more fully utilized, with an impressive decline in losses. The majority of students and faculty report more positive feelings toward the library and the librarian.

**Providing library services in a time of fiscal crisis: alternatives.**

Cheshier RG

Bull Med Libr Assoc ,Oct 1977, 65 (4) p419-24. ISSN  
0025-7338 Journal Code: BOW  
Languages: ENGLISH

The nature of the fiscal crisis in health science libraries in the United States is in part due to the style of management in these libraries, in part due to the lack of user identification, in part due to the lack of economically valid fees for service, and in part due to the success of the Biomedical Communications Network. These issues are discussed in terms of how they might be approached. A pragmatic stance is advocated for practitioners, the MLA, the NLM, and library schools to jointly address the questions raised.

A historical account is given of the Houston Academy of Medicine--Texas Medical Center Library within its Texas Medical Center setting in Houston, Texas. Outlined are planning, financing, and construction of the new library, which consists in part of new building and in part of renovated interiors of an old building originally completed in 1954. A concise picture is given of the new library's interiors, showing its functional success for users and employees alike. An architectural summary is appended showing gross and net footages, source of funds, costs and capacities.

In the summer of 1973 one resource library in each of the six states of the Midwest Health Science Library Network received funding from the National Library of Medicine to hire a coordinator for health science libraries. The development of the role of coordinator is examined and evaluated. The coordinators have proved valuable in the areas of consortium formation, basic unit development, communication facilitation, and program initiation. The function of the coordinators in the extensive planning effort now being undertaken by the network and the future need for the coordinator positions are discussed.

**The organization of successful participative management in a health sciences library.**

Wood MB

Bull Med Libr Assoc .Jan 1977. 65 (2) p216-23. ISSN

0025-7338 Journal Code: BOW

Languages: ENGLISH

The University of Washington Health Sciences Library, Seattle, and its participative management process are described in detail. The evolution of the management system is reviewed by interrelating the various phases of the library's growth, its service complexities, and its communication needs.

Staff development results of this participative management mode are discussed. Reference is made to the use of group dynamics concepts. The current organizational design, which integrates the participative subunit with the simple line management structure, is considered effective by both the library staff and its director.

White HS

Bull Med Libr Assoc .Jan 1977. 65 (1) p6-12. ISSN

0025-7338 Journal Code: BOW

Languages: ENGLISH

This paper examines changes in the management of university, special, and medical libraries brought about by the budget curtailments that followed the more affluent funding period of the mid-1960s. Based on a study conducted for the National Science Foundation by the Indiana University Graduate Library School, this paper deals with misconceptions that have arisen in the relationship between publishers and librarians, and differentiates between the priority perceptions of academic and of special librarians in the allocation of progressively scarcer resources. It concludes that libraries must make strong efforts to reduce the growing erosion of materials acquisitions budgets because of growing labor costs as a percentage of all library expenditures; that they must make a working reality of the resource-sharing mechanisms established through consortia and networks; and that they must use advanced evaluative techniques in the determination of which services and programs to implement, expand, and retain, and which to curtail and abandon.

Growing awareness of the transition from an industrial age to a communication- and knowledge-based economy appears reflected in some changing directions in libraries. Major trends include (1) a change in management practices, (2) a realignment of operational goals away from technical processing activities to client-oriented outreach services, and (3) the identification of educational functions as a primary professional role. The twin concepts of knowledge utilization and information brokering are beginning to have an impact on the definition of the librarian's role.

**Primary journal selection using citations from an indexing service journal: a method and example from nursing literature.**

Hafner AW

Bull Med Libr Assoc ,Oct 1976, 64 (4) p392-401, ISSN 0025-7338 Journal Code: BOW

Languages: ENGLISH

Although serial literature is extremely important to a library collection, it is also the source of many problems. Specialty journal selection is difficult, particularly for the librarian of a small or intermediate-size library that is not in a position to develop or maintain an exhaustive or inclusive collection in a particular field or discipline. Steadily increasing journal costs and recent economic trends necessitate establishment or reexamination of a periodical collection policy. In this investigation, the technique used analyzes citations assigned to medical subject headings (MeSH) and subheadings by indexers who prepare the MEDLARS data base.

Citations have been retrieved by exploiting the on-line nature of the MEDLARS data base. A four-year time period is used to identify specialty journals in the area of nursing. Results given include a separate rank-order listing arranged by decreasing frequency of productivity for each MeSH term searched. A composite listing is given for the 16,355 unique citations retrieved. The approach illustrated and data presented may be useful in establishing library policy for questions of periodical subscription and setting of priorities for binding and microform purchases. The purpose of the approach described is to predict collection demand with efficiency and economy.

The Program Planning Model (PPM) is a planning and management tool that facilitates development and acceptance of significant programs. PPM assists program planning by systematically involving consumer or user groups in the development and review of new programs. While user participation is important throughout PPM, this involvement is especially important during the problem exploration phase, when the problems or needs of these users are surveyed. The Nominal Group Technique (NGT), a variation of the "brainstorming" process, is a structured but flexible group process used in the problem exploration phase to generate a high number of useful responses concerning problem areas. NGT ensures maximum contribution of ideas by all participants. NGT and its application in the planning and management efforts of several libraries and library networks are described in detail.

**The status of women in the administration of health science libraries.**

Goldstein RK; Hill DR

Bull Med Libr Assoc ,Oct 1975, 63 (4) p386-95, ISSN 0025-7338 Journal Code: BOW

Languages: ENGLISH

Results of a survey of large health science libraries in the United States demonstrate that the relative position of men and women in administration is comparable to that prevalent in other types of libraries. Medical school and the largest libraries are the most likely to be administered by men. The percentage of women who are directors of large biomedical libraries has declined radically since 1950. The statistics presented here will serve as a base for assessing future change.

**Planning serials cancellations and cooperative collection development in the health sciences: methodology and background information.**

Bourne CP

Bull Med Libr Assoc ,Oct 1975, 63 (4) p366-77, ISSN

0025-7338 Journal Code: BOW

Languages: ENGLISH

In an era of steady-state budgets many research and academic libraries must cancel a significant number of current serials to maintain acquisitions of monographs. Thus paper reviews several techniques that have been used or that are of potential use in a rational selection of titles for cancellation. The context of the proposed methodology involves a network of libraries rather than an individual library. The methodology was tested with specific health sciences serial titles held by University of California libraries and resource libraries in NLM Region XI. As a test for the proposed methodology, background data were collected on 600 current foreign language serial titles included in SERLINE and held by at least one of the libraries in the networks of interest. Price, major secondary service coverage with productivity/impact factors, extent of holdings, and average number of recorded circulations per year in several of the libraries were recorded for each title. With the use of several different rules, estimates were made of the subscription savings that might be realized. It seems feasible to extend the same methodology to other groups of serial titles.

**Cost-performance analysis of cataloging and card production in a medical center library.**

Butkovich M; Braude RM

Bull Med Libr Assoc ,Jan 1975, 63 (1) p29-34, ISSN

0025-7338 Journal Code: BOW

Languages: ENGLISH

The unit cost of cataloging current English language monographs was studied and compared with the cost of purchasing catalog cards from a commercial source. Two hypotheses were proposed: (1) in-library costs for cataloging and card production are higher than those for the purchased-card method; (2) throughput time is faster for the in-library method. In addition, the data can be used to develop an analytical cost-performance model for administrative purposes. The data presented support the hypotheses. The model developed provides a mechanism for arriving at a cost for different levels of service and can be used to measure the performance of other alternative methods of cataloging. Implications for the use of CATLINE are discussed and suggestions for further studies are described.

**Six months of Medicaid data: a summary from the National Medical Care Utilization and Expenditure Survey.**

Dobson A; Scharff J; Corder L  
Health Care Financ Rev ,Mar 1983, 4 (3) p115-21,  
Journal Code: GHX  
Languages: ENGLISH

This is a summary of the first report in a series of three comprehensive Medicaid program reports based on National Medical Care Utilization and Expenditure Survey data. Preliminary analyses are presented based on data from the first half of 1980 which include the personal characteristics and medical care utilization patterns of noninstitutional Medicaid enrollees and the health insurance coverage of the U.S. noninstitutionalized population. More comprehensive analyses employing full calendar year 1980 data will be available in subsequent reports. The information provided in this summary is useful in appraising the impact of eligibility, benefit package, and reimbursement policy on Medicaid enrollee health care utilization at both the Federal and the State Medicaid level.

**National health expenditure growth in the 1980's: an aging population, new technologies, and increasing competition.**

Freeland MS; Schendler CE  
Health Care Financ Rev ,Mar 1983, 4 (3) p1-58, Journal  
Code: GHX

Languages: ENGLISH

Health care spending in the United States more than tripled between 1971 and 1981, increasing from \$83 billion to \$287 billion. This growth in health sector spending substantially outpaced overall growth in the economy, averaging 13.2 percent per year compared to 10.5 percent for the gross national product (GNP). By 1981, one out of every ten dollars of GNP was spent on health care, compared to one out of every thirteen dollars of GNP in 1971. If current trends continue and if present health care financing arrangements remain basically unchanged, national health expenditures are projected to reach approximately \$756 billion in 1990 and consume roughly 12 percent of GNP. The focal issue in health care today is cost and cost increases. The outlook for the 1980's is for continued rapid growth but at a diminished rate.

The primary force behind this moderating growth is projected lower inflation. However, real growth rates are also expected to moderate slightly. The chief factors influencing the growth of health expenditures in the eighties are expected to be

aging of the population, new medical technologies, increasing competition, restrained public funding, growth in real income, increased health manpower, and a deceleration in economy-wide inflation. Managers, policy makers and providers in the health sector, as in all sectors, must include in today's decisions probable future trends. Inflation, economic shocks, and unanticipated outcomes of policies over the last decade have intensified the need for periodic assessments of individual industries and their relationship to the macro economy. This article provides such an assessment for the health care industry. Baseline current-law projections of national health expenditures are made to 1990. (148 Refs.)

Multivariate studies of health services utilization have been particularly disappointing. Some of the difficulties might be within the conceptualization of the utilization concept. The purpose of this paper is to suggest that propensity to utilize should be expressed in time sequences and that an explanation should be sought for such sequences, rather than for the total number of times physicians are consulted. Using data from the universal health insurance scheme in Quebec, the concept of sequence of visits is illustrated, while variations in utilization patterns are better explained by the sequences of utilization than by age and sex.

**Economic evaluation methods and health policy.**

Stoddart GL

Eval Health Prof ,Dec 1982, 5 (4) p393-414, ISSN 0163-2787 Journal Code: ENK

Languages: ENGLISH

Economic evaluation of health services may take many forms, depending on the range of costs and consequences included in the analysis and the methods employed to measure and value them. In order to clarify the sometimes confusing array of economic analyses for users and evaluations, an analytic overview of costs and consequences to be considered for inclusion in such evaluations is presented. This allows the techniques of cost-effectiveness, cost-benefit, and cost utility analysis to be differentiated. Two often neglected methodologic issues are also discussed. First, it is suggested that the significance of the analytic viewpoint for economic evaluations should not be underestimated. Second, it is recognized that economic evaluations that demonstrate cost savings from a program or policy change implicitly assume that resources can be removed from the health sector. In fact, this is seldom true, consequently strategies for incorporating this knowledge into evaluations are discussed.

**Regionalization of surgical services.**

Peterson DL; Bloom BS

Am J Public Health ,Feb 1983, 73 (2) p179-83, ISSN 0090-0036 Journal Code: 3XW

Languages: ENGLISH

Using data from the Studies on Surgical Services for the United States (SOSUS), the extent of existing surgical care regionalization was examined in a defined area. Specialist surgeons comprised 55 per cent of all physicians who did operations, but performed nearly three-fourths of all operative work. About one-third of the most complex operations (CRV greater than or equal to 30), more than one-fifth of medium complexity (CRV = 20-29), and 14 per cent of low complexity (CRV less than 20) were obtained out of county of residence. Nearly one-half of all surgical patients at the university hospital were from other counties; but for those obtaining the most complex operations (CRV greater than or equal to 30), three-fourths of them were from other counties. Thus there was a substantial amount of regionalization of surgical care already existing in this area.

**Health care for rheumatic disorders in a Swedish county.**

Bjelle A; Magi M

Scand J Rheumatol ,1982, 11 (4) p209-16, ISSN 0300-9742 Journal Code: UD1

Languages: ENGLISH

Utilization of rheumatological care by individual patients was studied in a Swedish county at all levels of the health care system. Calculated per population at risk, 0.6--0.8% per year were seen for rheumatoid arthritis. Of these, 35--81% were patients at the rheumatology department, varying according to distance of residence from the university hospital. The number of patients with other inflammatory diseases was, however, larger in primary care than in the specialist department. Only a minor part of the total care for rheumatic disorders (Chapt. XIII of ICD) in the county was provided by the rheumatology department. Back disorders constituted the largest diagnostic group of rheumatic disorders in primary care. During a period of one year a total of 12--14% of the population had contact with primary care, of the district hospital and/or the rheumatology department, because of rheumatic disorders. The results show the value of epidemiological studies to follow the development of and to define the future objectives of rheumatological care.

**Screening of depression in relationship to subsequent patient and physician behavior.**

Linn LS; Yager J  
Med Care ,Dec 1982, 20 (12) p1233-40, ISSN 0025-7079  
Journal Code: LSM  
Contract/Grant No.: 1-D28-19157-01  
Languages: ENGLISH

When internal medicine clinic patients were prescreened for depression and this information was fed back to their physicians, significant effects could be noted on the medical records. On the initial visit, prescreening and previsit feedback about depression increased its notation in the medical record by three times, and among depressed patients, resulted in significantly fewer laboratory tests being ordered ( $X = 2.85$  vs.  $8.12$  for depressed patients with feedback after). During the following year, record notations about depression were more likely to be made for those depressed patients that initially were in the "feedback before" group. These patients also saw twice as many providers, made three times as many visits, had three times as many tests ordered, and twice as many medications prescribed as those depressed patients in the "feedback after" group. These findings demonstrate that simple prescreening and feedback techniques may have significant and persistent influences on several dimensions of patient and physician behavior.

Languages: ENGLISH

This study examines the reduction in medical care utilization after mental health treatment, also known as the offset effect. With data from a computerized ambulatory care information system, an episode-of-care method is used to characterize the mental health care received by patients in a prepaid group practice. The characteristics of the psychiatric episodes, such as duration, type of therapy, and number of visits, are examined in relation to the degree of offset effects among psychiatric patients. The results indicate that offset effects are most pronounced for a variety of characteristics related to the psychiatric episode of care including brief, high-intensity therapy, treatment for

transient rather than chronic mental illness, and individual rather than group therapies. Finally, this study replicates two major findings in the offset literature: the characteristic peaking of medical use before mental health care and the short-term nature of the offset effect.

Medical expenditure within the National Health Service (NHS) is based upon an arrangement whereby doctors share in common resources provided by the Health Authority. This arrangement is unsatisfactory when resources are contracting and leads to social regulation of medical activity. If doctors within the district work-group do not response to the challenge of cost-containment by internal organisation, more and more externally imposed regulations will result to the detriment of patients and doctors. The continual redevelopment of organisation to permit the optimal mix of internal and external regulation should be a subject of long-term enquiry and action for doctors in each district.

**Alteration of emergency room usage in a family practice residency program.**

Benz JR; Shank JC  
J Fam Pract ,Dec 1982, 15 (6) p1135-9, ISSN 0094-3509  
Journal Code: I4L  
Languages: ENGLISH

A patient education program was instituted that emphasized the importance of telephoning the physician prior to making an emergency room visit and defined an inappropriate visit in simple terms. The purpose of the program was to reduce the percentage of nonurgent or inappropriate emergency room visits each month. A total of 3,825 emergency room visits were reviewed. The percentage of inappropriate visits dropped from 29 percent in the control period to 18 percent in the patient education period (P less than or equal to .001). This included significant decreases in the four major reimbursement groups: self-paying (P less than or equal to .005), group insurance (P less than or equal to .001), Medical Assistance (P less than or equal to .01), and Medicare (P less than or equal to .01). Also during the patient education period there was a trend toward increased telephone calls prior to emergency room visits.

**Social networks, beliefs, and the decision to seek medical care: an analysis of congruent and incongruent patterns.**

Berkanovic E; Telesky C  
Med Care ,Oct 1982, 20 (10) p1018-26, ISSN 0025-7079  
Journal Code: LSM  
Contract/Grant No.: 5-R18-CA18451  
Languages: ENGLISH

This article focuses on the impact of congruent and incongruent patterns of symptom specific beliefs and social network advice on the decision to seek medical care for symptoms. Data from 769 individuals who reported symptoms in the Los Angeles Health Survey are used to examine this issue. Further, the role of more general health orientations and social network influences in the decision to seek care is examined under these congruent and incongruent conditions. It is concluded that the more general factors, which have little effect on the aggregate, may play a role in decision making when beliefs and advice are incongruent. Further, it is concluded that reports of beliefs and advice about specific symptoms that have been given after the decision has been made to seek care may be valid and not the result of retrospective reconstruction.

Languages: ENGLISH

To determine the prevalence of asthma and to examine the pattern of health service utilization of asthmatic children in Baltimore, we sent questionnaires randomly to 4096 first and sixth graders attending Baltimore City public schools; 2898

completed the questionnaire. Asthma was defined as "a condition which causes difficulty in breathing, with wheezing noises in the chest." On the basis of this definition, we found that the cumulative prevalence of asthma was 10.5% and the 12 mo period prevalence was 7.2%. The prevalence was significantly higher for boys (male:female = 1.6:1) and for blacks (black:white = 1.5:1). Nearly 50% of the children with active asthma missed 6 days or more out of the school year because of illnesses due to asthma. Almost half the asthmatic children obtained their care of asthma in the emergency room, and twice as many blacks as whites used the emergency room as their primary source of care. Moreover, emergency room users had a higher school absentee rate than non-emergency room users.

Health care in jails: a unique challenge in medical practice.  
Lessenger JE  
Postgrad Med ,Sep 1982, 72 (3) p131-4, 137, 141-4, ISSN  
0032-5481 Journal Code: PFK  
Languages: ENGLISH

Prisoners deserve to be taken seriously and treated with respect by the physician, as does any person seeking medical care. Treatment should include an adequate history and physical examination as well as indicated laboratory tests. Anxiety is a ubiquitous problem in prison life and can adversely affect any medical condition. The diagnosis of malingering is and should be one of exclusion, and the physician should keep in mind that a seemingly healthy prisoner might have several other reasons for seeking medical help. The physician needs to be confident of the diagnosis before returning the person to the cell block, as prisoners do not have freedom of access to medical care. New standards, programs, literature, journals, and conferences have drawn attention to the jail as a place where the physician can intervene in a positive way to decrease the recycling of crime and illness. It is not enough to be able to practice good medicine in a jail. Such practice must recognize the special needs of prisoners and the special problems inherent in the jail environment.

Racial/ethnic differences in access to health care: further comments on the use-disability ratio.  
Marcus AC; Stone JD  
Med Care ,Sep 1982, 20 (9) p892-900, ISSN 0025-7079  
Journal Code: LSM  
Contract/Grant No.: 5-R18-CA-18451  
Languages: ENGLISH

Indicators of access to health care generally fall into one of two broad groups. The first group of indicators focuses on factors responsible for differential rates of use and often are assessed through reports of patient satisfaction. The second group of indicators focuses more specifically on actual rates of use, and therefore represents a more objective measure of access. One of the most widely used objective indicators of access is the use-disability ratio. This article illustrates some problems in using this ratio in health services research and some strategies one might adopt to minimize these problems. The data reported below were obtained

from an analysis of racial/ethnic differences in use of services that was conducted as part of the 1979 Los Angeles Health Survey (N = 1003). Our findings suggest that 1) blacks had greater access to health care than either white/Anglos or Hispanics, particularly for respiratory and musculo-skeletal problems, and 2) the use-disability ratio should be used cautiously, since it is sensitive to subgroup differences in the chronicity and cause of the disability

Barriers to medical care of Mexican-Americans: the role of social class, acculturation, and social isolation.  
Chesney AP; Chavira JA; Hall RP; Gary HE Jr  
Med Care ,Sep 1982, 20 (9) p883-91, ISSN 0025-7079  
Journal Code: LSM  
Contract/Grant No.: 232-78-0010  
Languages: ENGLISH

Literature on medical care utilization by Mexican-Americans suggests that patterns of utilization can be explained, in part, by acculturation, social class and social isolation. The relative importance of these variables is explored in a survey of a rural Mexican-American community in Southern Texas. Data on 152 families are analyzed using a logit analysis, with utilization as the outcome variable. The results suggest that acculturation has a direct effect, while social class and social isolation interact to have a weak effect independent of acculturation. These results confirm the importance of understanding all three variables in planning and implementing medical care programs in Mexican-American communities.

Self-care education: impact on HMO costs.  
Kemper DW  
Med Care ,Jul 1982, 20 (7) p710-8, ISSN 0025-7079  
Journal Code: LSM  
Contract/Grant No.: R18 HS 02109  
Languages: ENGLISH

The ability of a medical self-care program to have an impact on the utilization and cost of in-clinic and referral visits in a prepaid group practice was studied by following the medical encounter records of 900 HMO members in 217 families during a 12-month period. A control group selected by randomization after acceptance of an initial invitation to participate was employed. In spite of the program's impressive effect on both self-care knowledge and per-visit costs, the study could not demonstrate any significant program effect either on the frequency or on the total costs of clinic visits.

**Health status and the development of health services in colonial state: the case of British Malaya.**

Leng CH

Int J Health Serv ,1982, 12 (3) p397-417. ISSN 0020-7314 Journal Code: GRJ

Languages: ENGLISH

The health of a population and the development of health services in a country at a particular time in history are directly linked to the socioeconomic system. This paper discusses health and health services in Malay Peninsula during the time that it was a British colony. Economic production under British colonialism, which is basically a capitalist system, is organized primarily for the purpose of realizing profits. The health of the population is in direct conflict with and generally subordinated to this main objective. The pattern of health that emerges reflects this general framework. Moreover, health services under the colonialist system are developed primarily to serve the economic interests of the colonialists. Hence, the structure of health services is biased toward curative medicine and centered mainly in the urban areas.

The lack of a precise definition as to what unnecessary surgery really means continues to be a significant problem. The most accurate statement of the problem appears to be that unnecessary surgery exists, but its true scope is yet to be determined. Further research on health services must be devised before all of the questions concerning unnecessary surgery can be answered.

**The use of ancillary services: a role for utilization  
review?**

Eisenberg JM

Med Care ,Aug 1982, 20 (8) p849-61, ISSN 0025-7079

Journal Code: LSM

Contract/Grant No.: DHHS grant HS02577

Languages: ENGLISH

Despite both the increasingly high cost of ancillary services such as laboratory tests, x-ray examinations and prescription drugs, and the authority provided to Professional Standards Review Organizations to review their use, ancillary services review remains underdeveloped. Several early programs have used claims review or profile analysis to assess the appropriate use of ancillary services and have claimed effectiveness in reducing medical care costs. Based on this experience, several principles for ancillary services review may be set forth, including problem identification, design of the audit system, determination of requirements for data and development of data sources. Evaluation of model ancillary service review programs is necessary to demonstrate their cost-benefit or cost-effectiveness and their validity.

**Physician bias in cesarean sections.**

Phillips RN; Thornton J; Gleicher N

JAMA ,Sep 3 1982, 248 (9) p1082-4, ISSN 0098-7484

Journal Code: KFR

Languages: ENGLISH

Various aspects of physician bias in the decision to perform a cesarean section were investigated by comparing indications for cesarean sections for 1979 and 1980 and investigating the distribution of indications according to the day of the week. The contention that obstetricians may perform cesarean sections on weekends for secondary gain was refuted by showing no difference in the distribution of nonelective cesarean section indications between weekdays and weekends. Statistically significant changes in cesarean section indications were, however, observed between the two investigated years, which may be attributed to an organizational change within the department toward more sophisticated obstetric care. These changes included a significant increase in cesarean sections for dystocia and breech presentation and a decrease for fetal distress and "other" indications. Because the total cesarean section rate did not change during the study periods, it is suggested that modern obstetric practice per se does not increase cesarean section rates, but may shift the distribution of indications for cesarean section.

Journal Code: UT9  
Contract/Grant No.: No-18-P-97192  
Languages: ENGLISH

This paper discusses the puzzling problem of large differences in per capita use of certain common surgical procedures among neighboring populations, which by all available measures are quite similar in need for and access to services. The evidence reviewed here supports the hypothesis that variations occur to a large extent because of differences among physicians in their evaluation of patients (diagnosis) or in their belief in the value of the procedures for meeting patient needs (therapy). This hypothesis, which we call the professional uncertainty hypothesis, is germane to current controversies concerning the nature and extent of supplier influence on the demand for medical services. It is also important because of its implications for health regulatory policy. Our plan is to (1) review the relevance of the hypotheses for the supplier-induced demand controversy; (2) review the epidemiologic evidence on the nature and causes of variation; (3) examine patterns of use of common surgical procedures to illustrate the importance of supplier influence on utilization; and (4) consider some of the implications of the professional uncertainty hypotheses for public policy.

**The effects of latent social needs on physician utilization by immigrants: a replication study.**

Honig-Parnass T  
Soc Sci Med ,1982, 16 (5) p505-14, ISSN 0277-9536  
Journal Code: UT9  
Languages: ENGLISH

The research reported in the present paper is a replication of Shuval et al.'s study of the effects of latent social needs of new immigrants on their utilization of health care services. By restoring to path analysis, the replication undertook to explore two questions: (1) Is the need for catharsis (i.e. for emotional support) found by Shuval et al. to affect utilization directly (i.e. not via illness) indeed characteristic only for the first years of stay in the host country. (2) Isn't it rather the differential access to social resources, as determined by social class and age, which at present explains the need-utilization relationship? The findings show that even though the need still persists among the one-time immigrants, it is a quite poor predictor of all other attributes found to affect physician utilization: viz. the emotional and physical illness and the tendency to define oneself as ill. With the passage of time the former immigrants seem to have abandoned the previously customary mode of gratifying the need for catharsis by turning to the health services. Hence, even the respondents with a keen experience of that need tended to refrain from turning to physicians in

the absence of 'concrete' symptoms. At the same time, the lower classes and the elderly, without experiencing the need for catharsis, turned to have higher rates of physician visits, simply by virtue of being relatively more ill. In conclusion, a plea is made for the improvement of the design flaws common for the type of causal inquiry into the need-utilization relationship, which this study represents.

**A current reappraisal of Berry's hospital typology.**

Klasterin TD; Watts CA

Med Care ,May 1982, 20 (5) p441-9, ISSN 0025-7079

Journal Code: LSM

Languages: ENGLISH

In an earlier article, Berry published the results of a study that examined possible relationships among hospital facilities and services. In general, Berry found that hospitals behaved in a reasonably consistent fashion; that is, hospitals added facilities and services in a well-defined order, and these facilities and services were added in distinct groups. Berry defined five such groups and hypothesized that each group represents an increasing level of case-mix complexity. Given the current interest in using Berry's results to measure hospital case mix, this study attempted to replicate Berry's results using recent data from the American Hospital Association. Using a number of statistical methodologies (including cluster analysis and Guttman scale analysis), we found that hospitals continue to add facilities and services in a well-defined order (although this order contains some notable differences from the order found by Berry). However, our results indicate that hospitals no longer add facilities and services in well-defined groups but in a more continuous fashion. Thus, it would appear that hospitals have become more differentiated.

**The effectiveness of contraceptive programs for teenagers.**

Namerow PB; Philliber SG

J Adolesc Health Care ,Mar 1982, 2 (3) p189-98, ISSN

0197-0070 Journal Code: HAM

Languages: ENGLISH

This paper critically reviews the effectiveness of adolescent family planning programs in the United States. Various models for evaluating family planning programs and the findings from empirical studies of adolescent programs are

reviewed. During the past decade there have been major increases in the availability and utilization of contraceptive services by adolescents. Most of those who are sexually active are now aware that these services exist. Program continuation rates among adolescents are not high, in part, because of the sporadic nature of adolescent sexual activity. Data on contraceptive continuation and pregnancy rates in these programs are limited, since few studies follow up clinic noncontinuers. Among clinic continuers pregnancy rates are relatively low, suggesting that at least some programs are effective in reducing pregnancy and/or fertility rates (number of children born) in their target populations. Ecological analyses seem to indicate that programs have had an impact on adolescent marital fertility. (54 Refs.)

**Diagnostic utility of carboxyl-terminal and intact parathyroid hormone immunoassays in hospitalized patients.**

Juan D; Wehrmeister J  
Am J Clin Pathol ,Jun 1982, 77 (6) p720-5, ISSN  
0002-9173 Journal Code: 3FK  
Languages: ENGLISH

In a university-affiliated community hospital, medical records of 58 patients on whom the intact parathyroid hormone immunoassay (I-PTH) and 29 patients on whom both the carboxyl terminal PTH(C-PTH) and I-PTH ordered by physicians were reviewed to determine the reasons for requesting these tests. Reasons for ordering the PTH tests include (1) the evaluation of hypercalcemic patients (25/58 I-PTH); (2) the evaluation of hypocalcemic patients (2/58 I-PTH); (3) to rule out primary hyperparathyroidism in normocalcemic stone formers (4/58 I-PTH, 4/29 C-PTH) and in those with abnormal skeletal x-ray (3/48 I-PTH 1/29 C-PTH); (4) to follow patients with chronic renal failure on dialysis (11/58 I-PTH, 9/29 C-PTH); (5) to rule out ectopic hyperparathyroidism in patients with cancer (2/58 I-PTH, 3/29 C-PTH); (6) to satisfy physicians' intellectual curiosity of patients with diabetes mellitus (3/58 I-PTH, 3/29 C-PTH) and obesity (5/58 I-PTH; 6/29 C-PTH); (7) to evaluate acute renal failure (1/29 C-PTH). In 3/58 patients on whom I-PTH tests were ordered, reason(s) could not be determined. The C-PTH was elevated in 9/9 patients with chronic renal failure, 4/6 obese patients, 2/3 patients with cancer, 1/3 diabetic patients, 1/4 stone formers, 2/2 patients with primary hyperparathyroidism. Patients with chronic renal failure had the highest C-PTH. Based on well established indications for ordering the PTH immunoassays, 25 out of 58 (43%) of I-PTH and 9 out of 29 (31%) of C-PTH ordered are inappropriate.

**Assessing access constraints on system equity: source of care differences in the distribution of medical services.**

Sawyer DO

Health Serv Res ,Spring 1982, 17 (1) p27-44, ISSN

0017-9124 Journal Code: G2L

Languages: ENGLISH

This article shows how differences in source of care can affect the likelihood that a person will obtain the medical services that he or she requires. Previous work has shown that the setting where care is received can have important effects on the quality of the services that are provided. The present study extends this line of research to questions of system equity. Unlike prior work in the area, the present approach emphasizes systemic relations among different types of delivery sites as a means of formulating and testing alternative models of service delivery. Preliminary findings indicate significant differences in utilization patterns depending on whether one establishes contact in a physician's private office. The results of the study suggest the need for continued concern over the role of access constraints in determining service opportunities.

**Socioeconomic evaluation of a state-funded comprehensive hemophilia-care program.**

Smith PS; Keyes NC; Forman EN  
 N Engl J Med ,Mar 11 1982, 306 (10) p575-9, ISSN  
 0028-4793 Journal Code: NOW  
 Languages: ENGLISH

To assess the effectiveness, cost, and socioeconomic gains associated with a comprehensive state-funded hemophilia program, we compared data from a three-year experience with such a program in Rhode Island with those from the preceding year. Self-treatment, integration of children into school, and achieving satisfying employment of adults are the main goals of the program. During the most recent year, 77 per cent of the patients with severe hemophilia in the state received total care through the Hemophilia Center. Twenty-eight of the 43 patients now treat themselves, the annual number of hospital days per patient has decreased from 12.6 to 3.5, and the number of visits to hospital facilities has fallen from 34 to 2.4, while the yearly cost of clotting factor per patient has remained about \$7,000. Altogether, this has saved more than \$10,000 each year for treatment, despite the cost of rehabilitative surgery. Numbers of days lost from school and work have decreased twofold and threefold, respectively. Best of all, comprehensive care has vastly improved the quality of life for patients with hemophilia in Rhode Island.

**Prevalence and characteristics of frequent attenders in a prepaid Canadian family practice.**

Browne GB; Humphrey B; Pallister R; Browne JA; Shetzer L  
J Fam Pract ,Jan 1982, 14 (1) p63-71, ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

Frequent attenders in family practice represent a small proportion of the total population, yet they consume a large amount of services. A description of their characteristics and problems is needed in order to design a therapeutic intervention tailored to meet these needs. A comparative analytic survey of 9,313 patients was done in order to isolate three cohorts: 200 zero users in the previous year, 200 modal (one to two times per year) users, and 200 frequent users (nine or more times per year). It was found that frequent attenders (who represented 4.5 percent of the practice, yet generated 21 percent of the annual visits) differ from infrequent attenders in that they have twice the probability of being single; are more physically, socially, emotionally distressed; suffer from problems of self-esteem; show a slightly greater degree of family dysfunction; tend to be unemployed, retired, or mothers of infants; are externally controlled or tend to rely on others for help; receive low incomes, retirement pensions, or family benefits; tend to be high users of other physician, social work, nursing, and laboratory services; consume a significantly greater number of pills than their infrequent user counterparts; and tend to present more emotional and gastrointestinal complaints than their modal user counterparts.

**The relative impact of status and health variables upon sick-role expectations.**

Honig-Parnass T  
Med Care ,Feb 1983, 21 (2) p208-24, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

This study deals with the relative impact of socioeconomic status and the level of physical and emotional health upon the sick-role concepts of the laymen in a comprehensive health care system. The selection of variables was guided by our recognition that Parsons' "deviation" model of the sick-role ignores the importance of environmental resources, in particular those that are required for coping with chronic illness and permanent handicaps. No significant differences were found across social classes with regard to serious acute illnesses. By contrast, significant differences between occupational groups were found for chronic illnesses, in which recovery and resumption of independent functioning depend more on the patient's own resources than on professional medical care. The lower the occupational status, the more dependency the patient was allowed. These differences are largely attributable to socioeconomic rather than to cultural resources and to the state of health.

**Comprehensive health care for the elderly.**

Fisk AA  
JAMA ,Jan 14 1983, 249 (2) p230-6, ISSN 0098-7484  
Journal Code: KFR  
Languages: ENGLISH

Health care for the elderly in the United States remains fragmentary and noncomprehensive despite concern for the needs of an expanding elderly population and a new emphasis on geriatrics. Model health care programs for the elderly have been few and not generally applicable to central city populations. A model health care program has been designed to offer a continuum of comprehensive, multidisciplinary health care to Milwaukee elderly. An acute care unit for the elderly, rehabilitation-oriented nursing home, outpatient clinic, home care service, outreach clinics, rehabilitation day hospital, Alzheimer's Disease Day Care program, and acute geriatric psychiatric unit have been developed and integrated into one continuum of care. The program serves chiefly the frail elderly, who are demonstrated to be markedly impaired physically, mentally, and socially, requiring the services of multiple professionals to enable the patients to achieve maximum independence. Alternatives to institutionalization are emphasized, and geriatric education and research programs are part of the model program.

**Health care for handicapped adolescents: international legislative and policy trends.**

Paxman JM

J Adolesc Health Care ,Sep 1982, 3 (2) p103-9, ISSN 0197-0070 Journal Code: HAM

Languages: ENGLISH

Between 1970-1976, 45 countries enacted or made adjustments to laws on health care for the handicapped. This article explores some of the legal arrangements made to address the issue of health care for the handicapped adolescent. It reviews the legal definition of "handicapped" and analyzes the legislative support created for health care programs. Most programs are comprehensive. They focus on prevention, detection and reporting, as well as treatment and rehabilitation. Better care for disabled adolescents is one of the more important intended results of recent legislation directed to the handicapped. Rehabilitation has been increasingly recognized as a right. Prevention is an increasing focus. Legislation, however important, is only a beginning; it expresses the political will to create programs to address the issue. The challenge is to implement the law.

**Developing a system of comprehensive care for the spinal cord injured patient in Houston, Texas, U.S.A.**

Donovan WH; Clifton G; Carter RE

Paraplegia ,Jun 1982, 20 (3) p174-9, ISSN 0031-1758

Journal Code: QQT

Languages: ENGLISH

The authors agree with the principle, widely accepted, that spinal cord injured (SCI) individuals should receive all their acute, rehabilitative and follow-up care in a spinal cord injury centre. The evolution of rehabilitation medicine and services in the United States, however, has favoured the separation of acute and rehabilitation care for spinal cord injured patients, as well as other disabilities. This has resulted partly from specialisation of medical and allied health personnel, physical separation of acute and rehabilitation facilities, and reluctance of some funders of health care to see rehabilitation as a natural extension of medical care in these patients. In Houston the proximity of a rehabilitation facility to three acute care university hospitals, representing three medical schools, provided an opportunity to improve communication among the medical personnel. These individuals have recognised the value of early rehabilitation even while the patient is acutely ill; they agreed to institute a system of care wherein the rehabilitation physician partakes in the early management in a designated area of the acute hospitals for spinal cord injured patients and works toward early transfer to the rehabilitation hospital in as ideal a condition as possible. Surgeons, who have initial primary responsibility, also visit the rehabilitation hospital, following their patient's progress at selected conferences and at the bedside. This paper describes how a spinal cord injury service was established, how the major barriers to early transfer were confronted, and the results of the first 6 months of operation.

**Cost measurement and cost data in mental health settings.**

Rubin J

Hosp Community Psychiatry ,Sep 1982, 33 (9) p750-4,

ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Costs play a major role in determining the types of mental health services that are delivered and thus are a key factor in any discussion of the future of mental health services. The author presents some of the available cost data for care provided in three kinds of settings: hospitals; nonhospital settings such as halfway houses, health maintenance organizations, and community mental health centers; and comprehensive community programs. He discussed the methodological and measurement problems in the estimation of costs and the difficulties in comparing costs across settings.

He emphasizes the need for cost data that permit accurate and comparable predictions of costs that will assist policymakers in making intelligent choices between types of services.

0002-9378 Journal Code: 3NI

Contract/Grant No.: 231-75-0616; 231-77-01156; FPR-23-01; +

Languages: ENGLISH

This final report from the cooperative manpower study of the University of Southern California and The American College of Obstetricians and Gynecologists describes the development of a female data file that outlines the care of women patients by all specialties. Obstetrician-gynecologists are compared to other specialists; they see 300,000 women per day in the United States and provide a wide range of care. Preventive care plays a larger role than in other major specialties, patient counseling and education are emphasized, and obstetric care is a major commitment. Nonetheless, acute and serious surgical and medical diagnoses are an important component of the practices of obstetrician-gynecologists.

Bergman R; Golander H

J Adv Nurs ,May 1982, 7 (3) p203-10, ISSN 0309-2402

Journal Code: H3L

Languages: ENGLISH

There is a growing recognition of the need to evaluate quality of care. As the aged are a particularly vulnerable group, often dependent on care-givers for their remaining years, it is important to control related services. An interdisciplinary workgroup prepared a tool which lists cues to be considered in determining the quality of care for the aged in ambulatory services, home care programmes, short- and long-term institutions. The cues fall into six domains: physical environment, psychosocial environment, basic personal care, health care, family involvement and manpower. The tool can be used by clients and families for selecting placement for care; by caregivers in choosing or remaining in a place of work; by those administratively responsible for care, such as supervisors, or licensing bodies for controlling performance and policy; and by other involved persons, such as educators, researchers, volunteers or funding agencies for their specific purposes.

Journal Code: GFP

Contract/Grant No.: HURA 06-D-00495-02

Languages: ENGLISH

A comprehensive health center is defined as the synergistic coupling of a medical and administrative structure designed to provide inpatient, outpatient, and public health services. While health centers have been widely established in other countries, only limited implementation has occurred in rural areas of the United States. The successful implementation of the health center concept in a sparsely populated area of northwestern New Mexico, which is predominately inhabited by Navajo Indians and Spanish Americans, is descriptively analyzed. The physical environment and the socioeconomic characteristics of the catchment area residents are related to dominant conditions in underdeveloped countries. The evolution of the delivery system with its network of satellite clinics staffed by mid-level primary care providers is documented. The funding and provision of a wide range of preventive and curative health services supported by communication, transportation, outreach, education, public health, and administration components are described. Several problems thought to impede the application of the health center concept to other regions in the United States are identified and discussed relative to this New Mexican experience. Innovative and persevering systems designers who are strongly committed to delivering a balance between preventive and curative services are considered to be absolutely necessary for successful implementation of the health center concept in the United States.

Ross M; Willer B

Med Care ,Feb 1982, 20 (2) p235-41, ISSN 0025-7079

Journal Code: LSM

Languages: ENGLISH

There is considerable argument for the value of educating medical students in the basics of primary care, comprehensive care and concern for psychological needs of patients. However, medical schools do not place much emphasis on primary care. Most clinical experiences take place in tertiary care centers, and most teaching is provided by specialists. Relatively little attention is paid to psychological issues of care and development of interpersonal skills among would-be physicians.

The impact of the tertiary care orientation is widespread. Medical students are expected to adopt the role of the physician-specialist or technologist. Those who want to be primary care physicians have to face value conflicts with the establishment, and some develop emotional problems. The effects carry over into practice. Physicians who do not develop adequate personal skills are less likely to be viewed as competent by their patients. They are also more likely to develop mental health problems themselves. This article argues for a modification of the medical school curriculum to reflect the orientation of the primary care model.

**High-risk infants: the need for nursing follow-up.**

Noga KM

JGON Nurs ,Mar-Apr 1982, 11 (2) p112-5, ISSN 0090-0311

Journal Code: KS2

Languages: ENGLISH

The goal of perinatal care can no longer focus only on the medical management of mother and infant, but instead must take a more global approach and focus on the entire family. One aspect of family care is to provide comprehensive nursing follow-up to the high-risk family at the time of the mother's and infant's discharge. To meet this need, a program was developed to educate all interested community nurses to the specific needs of the high-risk family. Evaluation indicates that the program helped nurses to provide consistent comprehensive care to these families, who were very grateful for home visits by a community nurse.

**Integrating health and mental health services: historical obstacles and opportunities.**

Goldman HH

Am J Psychiatry ,May 1982, 139 (5) p616-20, ISSN 0002-953X Journal Code: 3VG

Languages: ENGLISH

Historically, health and mental health services have been separated by a variety of forces, including specialization; ideological, attitudinal, and financial barriers; the professionalization of psychiatry; and functional and organizational differentiation. Recently, several models of integration and coordination have been proposed. If they are to succeed, health planners will have to be aware of the essential ingredients of interorganizational cooperation and work to eliminate the obstacles to integration of health and mental health services.

**Use of general medical care services by persons with mental disorders.**

Hankin JR; Steinwachs DM; Regier DA; Burns BJ; Goldberg ID; Hooper EW

Arch Gen Psychiatry ,Feb 1982, 39 (2) p225-31, ISSN 0003-990X Journal Code: 72C

Contract/Grant No.: 278-76-0027; 278-76-0028; 278-76-0058

Languages: ENGLISH

Data are presented on the medical diagnoses and the type of general medical services used by persons with mental disorder diagnoses. This study is based on the 1975 experience of registrants in four medical programs contained in three organizational settings. The data on services were retrieved from each program's automated data system. The percent of patients seen in general medical departments receiving a mental disorder diagnosis ranged from 4.8% to 13.6% among the four programs. Patients with mental disorder diagnoses visit general medical departments from 1 1/2 to two times as frequently as patients without such diagnoses. Persons with a diagnosed mental disorder are likely to receive care for conditions in more International Classification of Diseases categories than other patients, and are more likely to receive a diagnosis for ill-defined conditions, signs, and symptoms.

Contract/Grant No.: 278-76-0027; 278-76-0028; 278-76-0058

Languages: ENGLISH

The division of responsibility between general medical staff and mental specialists for care of persons with medical record

diagnoses of mental disorders is documented in four organized health care settings. Rates of mental disorders identified in all departments ranged from 35.6 to 122.8 per 1,000 population. Specialty mental health departments treated most severe psychotic and personality disorders, plus transient situational disturbances, whereas neurotic, childhood behavior, and psychophysiological disorders received as much or greater attention in general medical departments. Mental disorder diagnoses were associated with greater patient use of general medical departments. However, joint specialty mental health/general medical treatment of these patients was associated with lower general medical department visit rates in all settings. Such joint care was facilitated by the low average visit frequency use of mental health departments. (2.2 to 8.9 visits per patient per year).

**Nurse practitioner and physician adherence to standing orders criteria for consultation or referral.**

Watkins LO; Wagner EH

Am J Public Health ,Jan 1982. 72 (1) p22-9. ISSN 0090-0036 Journal Code: 3XW

Languages: ENGLISH

The degree to which nurse-practitioners (NPs) and physicians (MDs) follow the mutually agreed-upon rules for their practice and the effects of any deviations are unknown. This study assessed whether NPs adhered to consultation/referral (C/R) criteria in NP standing orders for hypertension, whether MDs adhered to the task-delegation intent expressed in standing orders, and the relationship between adherence and blood-pressure (BP) control. A sample of 161 patients from a practice of five MDs and four NPs in a rural primary care clinic was studied over 16 months. Patient characteristics associated with provider non-adherence were identified by discriminant analysis. NPs failed to obtain consultation or referral for 22 of 66 patients (33 per cent) with conditions requiring C/R. MDs retained 17 of the 43 patients (40 per cent) without C/R conditions. NP non-adherence was associated with care by a single NP, presence of few non-hypertension problems, and need for dietary alteration (p less than .05). MD non-adherence was associated with males and presence of severe non-hypertensive disease (p less than .005). Diastolic BP control (less than or equal to 90 mm Hg) was similar in NP patient groups without C/R conditions, retained by NPs despite C/R conditions and shared with MDs by C/R. Control in the shared group was better than in the MD-treated group with C/R conditions (p less than .025). Although in this setting NPs frequently did not adhere to C/R criteria for hypertension, this did not affect acceptable BP control.

**A project in physical education for handicapped and health-risk groups.**

Jaaskelainen M

Patient Couns Health Educ ,1983, 4 (3) p146-51, ISSN 0190-2040 Journal Code: PAL

Languages: ENGLISH

An interdisciplinary project concerning the physical education and culture of handicapped and health-risk groups, conducted during the years 1976 to 1980 under the auspices of the Finnish Society for Research in Sports and Physical Education, is reported in this paper. The concept of special group used in connection with the project is relative and describes the groups of people who do not receive the normal services in the field of physical activities. The goals of the project were not only to provide these services but also to study the problems connected with the use and supply of these services for these groups. The project approached its goals from the point of view not only of the individuals concerned but also of the organizations involved. The project was conducted in two towns and one rural community in Finland. Twenty-eight groups were formed in these communities, comprising about 500 participants. Of these, 350 regularly took part in the exercises. About 250 participants and 28 group leaders were studied in more detail. The decision-making and administrative processes at both local and national levels were analyzed. The project resulted in considerable increased activity of the persons taking part in the exercises, most of whom reported favorable results. Most group leaders also gave positive responses when asked about the results of the project. The project also effected a change in the decision-making processes at local and national levels, as more resources were allocated for these purposes than before the project. In this sense, the project fulfilled its original mission as a change agent.

**An evaluation of subsidized rural primary care programs: II. The environmental contexts.**

Ricketts TC; Konrad TR; Wagner EH

Am J Public Health ,Apr 1983, 73 (4) p406-13, ISSN 0090-0036 Journal Code: 3XW

Languages: ENGLISH

The placement of subsidized primary care programs in rural communities has been an important aspect of national health policy over the last decade. Using survey and secondary data from programs in over 700 counties in the United States, it was found that while about one-fourth of all counties with some rural populations have been affected by these programs, certain environmental factors are associated with more or less likelihood of placement. High levels of need and low levels of health care resources are positively associated with the presence of a program. States with health policy climates supportive of reimbursement and broader staffing of primary care programs also contained programs in a higher proportion of their rural counties. The effects of decreased federal funding, increased state responsibility, and the precarious market conditions for primary care programs are discussed with emphasis on the mechanisms for developing favorable climates for these programs.

[The economic and social effects of rheumatoid  
pelvis-spondylitis]

Les conséquences économiques et sociales de la  
pelvispondylite rhumatismale.

Sailly JC; Lebrun T

Rev Epidemiol Sante Publique ,1982, 30 (3) p305-24,  
ISSN 0398-7620 Journal Code: RST

Languages: FRENCH Summary Languages: ENGLISH

The purpose of the research reported in this article was to reconstruct a typology of the various courses taken by rheumatoid pelvis-spondylitis based on medical evidence and then to assess the economic and social consequences of the illness generally and for each of the groups brought out by our research. The investigation dealt with 172 patients who had either been hospitalized or had consulted outside physicians or community clinics in the Nord-Pas-de-Calais Region or Paris. Between January 1978 and May 1979, these patients were asked to report to the places where they had had their consultations. Using the information in their medical records, the patients' statements and additional examinations, the case histories were pieced together, the patients' current condition was described and the typology of the disease was constructed. Then we collected the economic data and the disease's costs were reconstructed (medical costs, cost of losses in output, costs under the heading of either the individual or the community). Finally, data of a psychosocial nature made it possible to clarify the patients' understanding of the disease according to various criteria (particularly the different forms taken by the disease). The analysis of clinical, radiological, biological investigations makes it possible to bring out three trajectories of the disease. We have brought to light medical and economic costs of the disease clearly differentiated according to the trajectories of the illness. We have also underlined the role played by social factors in determining how the disease is perceived. Finally, the analysis of the effectiveness of known therapies shows that these therapies aim above all at easing the pain and limiting the stiffness and that a delay in applying these therapies does not seem decisive for the seriousness and the progression of the illness.

Integrating primary health care and mental health  
services--a successful rural linkage.

Prindaville GM; Sidwell LH; Milner DE

Public Health Rep ,Jan-Feb 1983, 98 (1) p67-72. ISSN  
0033-3549 Journal Code: QJA

Languages: ENGLISH

The local delivery of human services is currently receiving national emphasis. The expectation is that community-based services shall be provided with a minimum of duplication and with maximum efficiency, achieved partly by interdisciplinary and interorganizational cooperation. This emphasis was appropriately facilitated in the mid-1970s through the availability of the Mental Health Initiative grants. The

grants, initiated by the Bureau of Community Health Services in conjunction with the National Institute of Mental Health, Public Health Service, promoted the increased availability of mental health services through formal linkages between community mental health centers and primary health care programs. One such successful linkage was between a small primary health care center and a nonfederally funded, multicounty, mental health center in northwest Illinois. Initiated in September 1980, the services of the linkage project included direct clinical mental health services delivered at the primary health care center site, consultation and education activities, and the coordination of interagency services. The project patients differed from the general clients of the mental health center in demographic characteristics, source of referral, and diagnoses. The key elements in successful linkages and the achievement of goals are analyzed. The experience of the linkage project is relevant to the 1980s. The project was prematurely ended after 14 months. Reduction in Federal funds severely cut support for the primary health care center, and the depressed local economy could not match the withdrawn Federal funds.

The Good Neighbor Rescue Program utilizes volunteers who pay for their basic life support training. Acting as first responders during cardiac emergencies, they become involved in

the emergency care of seriously ill patients. In the program described, they participated in saving two lives during the first two years of the program. They reduced the time for trained help to arrive at the scene in 90 percent of the emergencies. The program requires coordination of existing resources within the rural community, is inexpensive, and is heavily dependent on volunteerism. The program complements the goals of providing basic life support to cardiac victims before the arrival of an ambulance and of providing advanced life support at the scene.

Primary health care in Cameroon meets with serious  
obstacles. The state gives it a low priority in its budget and  
over-all policy. The health institutions are rarely active in  
this field. Institutions which do practice some primary health  
care are usually foreign. The villagers, finally, are little  
interested. They insist only on improvement of curative  
services and material life conditions. The conclusion is that  
primary health care is regarded as something of secondary  
importance. First comes a better life. The research for this  
paper was conducted in 1980 in the South of Cameroon.

Social contradictions, including uneven economic development and the private-public duality, make community-based provision of health care difficult. The unrestricted expansion of private medical centers has been criticized from several perspectives including inadequate coordination of services, high costs, and negative effects on urban housing and living conditions. Corporate and professional control over health policy, monopolization, and public subsidization foster expansion of private institutions. While private facilities enlarge, public health-care institutions deteriorate, close, or shift to private management. Many clients eligible for care at public hospitals do not receive adequate attention in the private sector. Despite their achievements, community clinics have problems that threaten their survival. The financial insecurity of community clinics is an inherent feature of the private-public duality that affects the entire health-care system. Community clinics and public hospitals offer a potential for broader organizing and empowerment.

**Effect of timing of measles vaccination on compliance with immunizations during the second year of life.**

Sherrrod JL; Kane R; Cherry JD; Fricker J; Maples K  
J Pediatr ,Feb 1983, 102 (2) p186-90, ISSN 0022-3476  
Journal Code: JLZ

Languages: ENGLISH

In 1976 the recommended time for routine measles immunization was changed from 12 to greater than or equal to 15 months of age. Because of the known decrease in compliance with immunizations given during the second year of life and the scheduling of an additional visit close to the time of the diphtheria-tetanus-pertussis (DTP) booster immunization, the potential benefit from this change might be offset by a decrease in compliance in securing both measles vaccination and DTP booster immunization. A study of the change in immunization compliance was carried out in a county health facility and in a prepaid medical group practice. Charts of 795 infants (395 born before and 400 born after the change) were reviewed to assess the rates of compliance with measles and with DTP immunizations. Administration of measles vaccine at a scheduled time decreased by 10% (0.05 less than P less than 0.06) at the public health facility after the change in 1976 and by 13% at the prepaid group practice (P less than 0.01). This difference evened out in the public health facility patients by age 2 years, but a 9% decrease was still apparent at the prepaid medical group. A similar pattern was seen in compliance with the DTP booster immunization at each site. Any benefit derived by an increased measles seroconversion rate apparently was offset by an overall decrease in compliance for both measles and DTP booster immunizations.

**Population study of blood pressure and associated factors in St Lucia, West Indies.**

Khaw KT; Rose G  
Int J Epidemiol ,Dec 1982, 11 (4) p372-7, ISSN  
0300-5771 Journal Code: GR6

Languages: ENGLISH

A population survey of blood pressure in St Lucia, West Indies has confirmed that high blood pressure constitutes an important public health problem. In common with other studies blood pressure was found to be significantly correlated with body weight, possibly by a primary effect on diastolic pressure. Blood pressure was also significantly correlated with casual urinary sodium/potassium and potassium/creatinine

ratios in those under 45 years of age. This unexpected finding suggests that casual urinary electrolyte estimations may in some circumstances be a useful guide to intake, perhaps especially in populations with more stable intakes. An independent role of potassium in the aetiology of high blood pressure would have important public health implications.

**Assessment of immunoglobulin use for hepatitis A control in New Mexico.**

Mann JM; Francis DP; Hoffman RE; Montes J  
 Public Health Rep ,Nov-Dec 1982, 97 (6) p516-20, ISSN  
 0033-3549 Journal Code: QJA  
 Languages: ENGLISH

Community control of hepatitis A (HA) requires improvement of sanitation and timely use of immune globulin (IG) for selected contacts of ill persons. A marked increase in reported HA cases in New Mexico in late 1978 and early 1979 prompted aggressive evaluation of morbidity trends and of control efforts. This evaluation provided an opportunity to study the practices in disease reporting and IG administration in the State. In the 6-months study period January-June 1979, 596 cases of HA were reported in New Mexico (an annualized incidence rate of 95.9 cases per 100,000 population). Nearly three-fourths of the cases were reported within 14 days of onset of illness. IG was administered to the household contacts of 89 percent of the index patients; it was not indicated for the household contacts of 9 percent. Reasons for the failure to administer IG to the household contact of the other 2 percent of the index patients were not ascertained. Overall, 93 percent of the eligible household contacts received IG, and 80 percent of these contacts received it within 14 days of the onset of illness in the index patient. Differences in the relationship of physicians and health offices in the only metropolitan area in the State and in the rest of the State in respect to case reporting and IG administration were observed. The benefits from health department surveillance and control exceeded the costs by approximately fivefold. The reporting practices and the IG use of the physicians who reported HA cases were good; to improve further HA surveillance and control in the State, the focus needs to be on physicians who fail to report HA cases.

**The problems and benefits of associating academic medical centers with health-maintenance organizations.**

Hoft RH; Glaser RJ  
 N Engl J Med ,Dec 30 1982, 307 (27) p1681-9, ISSN  
 0028-4793 Journal Code: NOW  
 Languages: ENGLISH

The growth of prepaid medical-care programs has caused the leaders of a number of academic medical centers to begin to have an increased interest in affiliating with or sponsoring centers in prepaid programs -- otherwise known as health-maintenance organizations (HMOs)--is motivated by a number of potential benefits. An HMO may provide an academic medical center with an additional source of patients for teaching and research; generate additional revenue; increase resources for education in primary care; increase the exposure of students, residents, and faculty to the characteristics of prepaid medical practice; and improve the delivery of health services locally. Issues of importance to the academic medical center include the pros and cons of sponsorship of, as opposed to affiliation with, an HMO and the additional costs attributable to medical education in the HMO setting. Problems may arise between HMOs and medical centers as a result of disparate styles of practice, the high cost of clinical services at the medical center, and the differing perspectives of HMO and medical-center policy makers.

**Prevention of mental retardation in offspring of hyperphenylalaninemic mothers.**  
Cartier L; Clow CL; Lippman-Hand A; Morissette J; Sriver CR  
Am J Public Health ,Dec 1982, 72 (12) p1386-90, ISSN  
0090-0036 Journal Code: 3XW  
Languages: ENGLISH

Maternal hyperphenylalaninemia constitutes a potential hazard to the fetus for whom the risks of postnatal mental retardation, microcephaly, and congenital malformations are elevated. Preconception and intragestational dietary treatment can apparently improve the outcome of such pregnancies. In the absence of predictive mechanisms for pregnancies at risk and preventive measures involving reproductive counseling and treatment, there could be a rebound in the population frequency of mental retardation related to disorders of phenylalanine metabolism in subsequent generations. We describe a program serving a population of six million that includes screening, diagnosis, treatment, and counseling of the hyperphenylalaninemias. The program has recently added a simple dedicated register for males and females with

hyperphenylalaninemia to supplement traditional methods for continuous surveillance of probands. We registered 153 patients: 43 females and 56 males with phenylketonuria, 23 females and 31 males with benign hyperphenylalaninemia, of which 22, 7, 27 and 5, respectively, had reached their 12th birthday in an 1981. Regional centers in the program provided counseling about the consequences of maternal hyperphenylalaninemia and the options to prevent them. No family has rejected the principle or fact of the Register and its goals.

Contract/Grant No.: AM 21881; 5 F32 AMO6136  
Languages: ENGLISH

A prospective 29-year population study of diabetes in Oxford, MA, is the basis for a case-control analysis of diabetes mortality rates and their validity. Two case groups were considered, one consisting of previously known diabetics at the study's inception in 1946 and the other defined by hyperglycemia above 140 mg/dl. Mortality rates were significantly higher for diabetics than for age- and sex-matched controls, and disproportionately higher for women largely due to the advantageous mortality experience of nondiabetic women compared to nondiabetic men. Estimated survival experience showed longevity to be shorter by some 10 to 15 years for the female and six to nine years for the male diabetic. Mortality rates were also significantly higher for the hyperglycemic group than for matched controls. Although deaths from cardiovascular causes were predominant, they proved significantly higher for women with known diabetes only. Substantial underreporting of diabetes on the death certificates persisted in every decade of the study. The proportion of prevalent and incident cases of diabetes during the 19-year period of the study, whose diagnosis failed to appear anywhere on the death certificate, was found to be at or above 50%. Among subjects with death certificates that did not list diabetes, 4.4 to 14.1% were known to have diabetes, based on the underlying composition of the sample. Prevalent cases of diabetes had a higher reporting rate than incident cases, suggesting that duration of diabetes may also be a factor in such rates.

**A study of deafness in West Africa.**

Holborow C; Martinson F; Anger N  
Int J Pediatr Otorhinolaryngol ,Jun 1982, 4 (2) p107-32,  
ISSN 0165-5876 Journal Code: GS2  
Languages: ENGLISH  
Some 800 profoundly deaf children from 4 Yoruba states in  
Nigeria were assessed and examined in an attempt to identify

the causes of deafness in this part of West Africa. It was found that measles, meningitis and rubella were the three major preventible diseases causing deafness. Genetic abnormalities, in contradistinction to other tropical countries, do not seem to be very important and chronic ear infections show different manifestations in this area to the situation reported in East Africa. The overwhelming problems that face the deaf and any possible extension of services for the deaf are detailed. In view of these it seems that the most cost-effective way of helping the deaf in Nigeria is by immunizing the population against those infectious diseases that cause the disability. This policy would accord with the recent initiatives by the United Nations: the International Year of the Child (I.Y.C.) and the International Year of the Disabled Person (I.Y.D.P.) as well as The Expanded Programme of Immunization (E.P.I.) of the World Health Organization.

**Teaching effectiveness in coordinated undergraduate program in dietetics. Assessments of students, graduates, and program directors.**

Spence H; Spears MC; Vaden AG; Hoyt DP  
J Am Diet Assoc ,Aug 1982, 81 (2) p151-8, ISSN  
0002-8223 Journal Code: H6F  
Languages: ENGLISH

The effect of practitioner experience on teaching effectiveness of faculty in coordinated undergraduate programs in dietetics (CUPS) was studied on the basis of ratings from program directors, students, and program graduates. Instruments to measure teaching effectiveness were developed that contained 36 items common to all teaching situations and 6 each related to teaching in clinical/community dietetics and to food service management. Four dimensions of effective teaching were identified using factor analysis: interpersonal skill, dietetic expertise, organizational focus, and clinical or practical orientation. Extensive practitioner experience did not contribute to teaching effectiveness.

**Development of a model practice for pediatric residents. Economic and administrative considerations.**

Mankad VN; Shell RT  
Clin Pediatr (Phila) ,Sep 1982, 21 (9) p519-24, ISSN  
0009-9228 Journal Code: DHE

Contract/Grant No.: 5528 PE 14236-04

Languages: ENGLISH

A model pediatric residents' group practice which functions independently of the hospital administration and, to a large extent, of the university administration was developed for the specific purpose of training pediatric residents. During the second year of operation (1981), the residents' group practice met 91 per cent of all expenses, including faculty and resident salaries. The residents' group practice shares many characteristics of private practice (e.g., continuity of physician-patient relationship, appointment keeping, efficient patient flow, and physician participation in practice management). Through their involvement in the management of the practice, residents learn about socioeconomic aspects of pediatric practice and learn how to provide affordable primary care of high quality. Suggestions for developing similar models elsewhere are described.

Languages: ENGLISH

This exploratory study examines the persistence of depressive symptomatology as measured by the Center for Epidemiological Studies Depressive Scale (CES-D). Over a 12-month period, half of the group of 309 prepaid group practice enrollees reporting depressive symptoms at the beginning of the interval also had high scores on the CES-D at the end of the interval. Sociodemographic characteristics did not predict persistence of depression. Persistence of depression was positively associated with initially reporting cognitive and affective types of depressive symptoms, the presence of physical illness, the seeking of psychiatric treatment, and the receipt of psychotropic drug prescriptions.

**Incentives, reproductive behavior, and integrated community development in Asia.**

David HP

Stud Fam Plann ,May 1982, 13 (5) p159-73, ISSN

0039-3665 Journal Code: V52

Languages: ENGLISH

Surveying experience with incentives, disincentives, and integrated community development approaches in selected Asian countries, this overview defines concepts, notes policy trends, and discusses ethical and legal constraints, psychosocial and socioeconomic aspects, and cultural-environmental influences on reproductive behavior. Major emphasis is on experience reported from China, India, Indonesia, Korea, Philippines, Singapore, and Thailand. Findings to date suggest that, to be successful, programs using incentives, disincentives, and integrated community development approaches will have to be formulated as consistent, clearly defined, and well-communicated policies, responsive to development needs and sensitive to local autonomy and values, with dynamic leadership to obtain and nurture continued policy backing.

**The role and goals of academic optometry. Some unfulfilled missions.**

Abplanalp P; Baldwin WR  
J Am Optom Assoc ,Apr 1982, 53 (4) p277-83, ISSN  
0003-0244 Journal Code: H82  
Languages: ENGLISH

The authors express the opinion that optometry schools have obligations to the profession and the public which involve missions beyond their primary function of educating and training students. They identify those missions which they believe are highly important but only partially addressed. They are: clinical research; expansion of optometry's scientific base; specialized patient care; and education of practitioners. They offer explanations for lack of progress, but insist it is vital that these obligations be met by our schools, and offer suggestions toward this end.

**Rehabilitation of hearing-handicapped elderly adults.**

Garstecki DC  
Ear Hear ,May-Jun 1982, 3 (3) p167-72, ISSN 0196-0202  
Journal Code: E9G  
Languages: ENGLISH

This paper describes procedures used in the development and implementation of an aural rehabilitation program for hearing-impaired elderly adults. Program emphasis is directed toward meeting the self-perceived needs of this population.

Suggestions for ways to enhance the elderly adult's interest in self-management of hearing problems are gleaned from consumer workshop reports as well as clinical observations. Suggestions for identification of program candidates were offered with emphasis on dissemination of informational literature. Intake procedures were described with mention of the client's possible expectations from the program, as well as the program's expectations from the participants. Finally, program goals and procedures were described. Emphasis was directed toward three interrelated goal areas: amplification, communication remediation, and counseling-education. The role of the hearing aid as a critical tool in the rehabilitation process was highlighted. A controlled approach toward communication assessment was described, along with a scheme for determining remediation goals. Topics for personal and family counseling or education were listed along with suggestions for facilitating individual and group discussion.

**A community hearing conservation program for senior citizens.**

Dodds E; Harford ER  
Ear Hear ,May-Jun 1982, 3 (3) p160-6, ISSN 0196-0202  
Journal Code: E9G  
Languages: ENGLISH

A community hearing conservation program for more than 1000 senior citizens is described. Seminars about hearing loss, hearing aids were conducted. Results of hearing tests under various conditions are drawn from a population of more than 500 senior adults. Information about hearing aid use and self-awareness regarding hearing impairment was also collected. It is concluded that senior citizens are very interested in learning more about hearing loss and treatment, but as a group they are reluctant to seek out remediation voluntarily. Thus, it appears that outreach programs are important considerations for serving the ambulatory senior population. It is concluded that it is highly feasible to obtain dependable pure-tone audiometric data in field locations with some minor precautions. In our opinion, audiological services should be taken to populations of senior citizens, provided they can be cost effective. Some suggestions are offered for improving the type of program described in this paper.

**Community health planning from an interorganizational perspective.**

Cohen PD  
Am J Public Health ,Jul 1982, 72 (7) p717-21, ISSN  
0090-0036 Journal Code: 3XW  
Languages: ENGLISH  
Planning agencies do not have control over health care resources in the community. Resources are concentrated in a number of provider organizations, associations, and government agencies, which have common goals as well as a diversity of individual objectives, and therefore enter into networks of relationships to accomplish their overlapping service missions. Interorganizational research shows that it is important to enhance the interdependence and benefits of cooperation between organizations and at the same time maintain the identity and distinctive qualities of each organization. Thus, in addition to the important role to provide information for decisions, planners have a role to

manage the interdependencies and identities among organizations in the health system. Research shows that in situations where only methods, data, and analysis were emphasized by health planners, they had less impact on community decisions than in situations where planners also emphasized the development of the interorganizational system of decision-making. In a neutral position with respect to competing forces, planners can more effectively use their leverage from their information processing role and from their regulatory powers to facilitate the balancing of interorganizational interests and to enhance cooperative benefits to the community.

Int J Health Educ ,1982, 24 (3) p156-63, ISSN 0020-7306  
Journal Code: YEE  
Languages: ENGLISH

In 1975, the African Regional Health Education Centre (ARHEC) inaugurated two training programmes in health programmes in health education: a two-year postgraduate course leading to a master's degree, and a one-year course preparing for a non-graduate diploma. The purpose of the latter was to give advanced training and updating to experienced health personnel who had either received a diploma in health education some years before or had been functioning as health educators. This was intended to be a temporary course, to phase out in three years. However, due to its popularity, it was extended in spite of certain negative aspects, mainly the fact that new graduates often return to their former positions with little opportunity to utilize fully their new skills. Those who succeeded best tried to merge health education with their basic professional practice (for example, nursing with patient education). ARHEC decided therefore to modify the programme of its advanced diploma course, which now provides for the teaching of a basic core of health education subjects to all students, and includes three modules to which students are assigned according to their previous training and their future professional activities: community health education and primary health care; hospital-based patient and family health education; and school health education. The practical field work, which is an essential aspect of the course, is tailored to the interests of students in each module. Preliminary evaluation indicates that this programme provides a better response to the needs of students and their employers and eliminates the problem of two categories of health educators (diploma and masters level). It is intended to create other modules dealing with the media, occupational health, and so on.

The psychiatric morbidity associated with mastectomy and breast cancer was substantially reduced by a specialist nurse who counselled women before and after surgery and monitored their progress. A controlled study was, therefore, carried out to determine what this cost. National Health Service costs were almost wholly covered by savings made because counselled subjects who developed psychiatric problems were recognised and treated much earlier than control patients. Counselled and control subjects suffered considerable financial losses, but these were offset in the counselled group by their relatives' earlier return to work. Such counselling schemes are necessary and effective and may be implemented at little extra cost.

Control of cancer through risk reduction and early detection has great potential. Roswell Park Memorial Institute's Prevention-Detection Center addresses a community need for health promotion, disease prevention, and cancer detection as well as providing opportunity for research on the efficacy of such a program. The Prevention-Detection Center offers a range of services including education, genetic counseling, risk assessment, counseling in smoking cessation and other means of risk reduction, and screening for cancer. It is also involved in evaluation of new technologies of cancer detection such as the ultrasonic examination of the breast. A community outreach program is aimed at attracting high-risk populations. In its first eighteen months of operation, the Prevention-Detection Center detected 24 confirmed cancers. The Center is used by approximately 60 persons each week. Interviews with persons using the clinic over a two-week period indicate that most are motivated to attend because a relative has had cancer or because of a belief in the importance of regular checkups. Client satisfaction with the clinic is high. Although many of the activities of the prevention-Detection Center have a research dimension, many of its activities and services are suited to the community ambulatory health care setting.

General agreement exists on the utility of and need for more widespread applications of health system performance indicators measured on a per capita basis. This article contains a discussion of certain methodological issues in per capita measurement and provides recommendations to facilitate applications and future advances. The two basic approaches to per capita measurement are summarized and the need for methodological research is emphasized. Illustrative per capita measures that would be of assistance in applied settings are presented in the context of a tabular display of health and demographic data for a hypothetical state.

Languages: ENGLISH  
Data are presented on the medical diagnoses and the type of general medical services used by persons with mental disorder diagnoses. This study is based on the 1975 experience of

registrants in four medical programs contained in three organizational settings. The data on services were retrieved from each program's automated data system. The percent of patients seen in general medical departments receiving a mental disorder diagnosis ranged from 4.8% to 13.6% among the four programs. Patients with mental disorder diagnoses visit general medical departments from 1 1/2 to two times as frequently as patients without such diagnoses. Persons with a diagnosed mental disorder are likely to receive care for conditions in more International Classification of Diseases categories than other patients, and are more likely to receive a diagnosis for ill-defined conditions, signs, and symptoms.

Languages: ENGLISH  
A study of the cost-effectiveness of community-based, long-term care was conducted with voluntary enrollees eligible for Medicaid reimbursed nursing home care. One year after enrollment, average longevity was greater for the 575 clients in the experiment group, but average Medicaid plus Medicare costs for this group were higher than for the 172 clients in the control group. Among those more at risk of entering a nursing home, costs for persons in the experimental group were somewhat lower than for those in the control group. The results suggest that community-based services targeted to those most at risk of institutionalization may be cost-effective.

Although it is generally assumed that there has been a narrowing of the gap in health care between poor and nonpoor families, the relative contributions of improved fiscal and geographic access are not well documented. Almost 2,000 elderly poor persons were studied to examine factors affecting their use of health services. A number of personal and structural problems are identified when cultural and ethnic backgrounds are considered.

**Community care compared with hospital outpatient care for hypertensive patients.**  
Bulpitt CJ; Daymond MJ; Dollery CT  
Br Med J [Clin Res] ,Feb 20 1982, 284 (6315) p554-6, Journal Code: B4X  
Languages: ENGLISH

Three hundred and seventy-six patients with treated diastolic blood pressures of less than 105 mm Hg and no history of accelerated hypertension or renal failure were selected from among those attending the Hammersmith Hospital hypertension clinic. Their average lying treated blood pressure was 146 mm Hg systolic and 90 mm Hg diastolic and

average age 56 years; 18% were black, 6% Asian, and 76% white. The patients were mostly having multiple treatment, 90% receiving a diuretic, 35% methyldopa, 33% propranolol, 18% atenolol, 9% hydralazine, and 7% bethanidine. They were randomly allocated to either two years of further hospital outpatient care or referred back to their general practitioners. During the two years 19 (10%) of the 187 patients followed up in hospital defaulted and three had their treatment discontinued. Twelve (6%) of the 189 followed up by their general practitioners defaulted from follow-up and nine had their treatment discontinued. At the end of the trial the average lying blood pressure was 148 mm Hg systolic and 88 mm Hg diastolic in the hospital group and 149 mm Hg systolic and 90 mm Hg diastolic in the general practice group. The change in blood pressure was calculated for each individual and showed an average fall of 1.6 mm Hg in standing diastolic pressure in the hospital group and a rise of 1.4 mm Hg in the general practice group (p less than 0.05). The 90% confidence limits for a difference in standing diastolic pressure between the groups were 1 and 5 mm Hg with the pressure lower in the hospital group. General practice care was not quite as effective in controlling blood pressure as continued specialist supervision over two years in this selected group of treated outpatients with mild or moderate hypertension, but these results show that the discharge back to general practitioners of patients who are well controlled after hospital treatment is a sensible policy.

Five-year findings of the hypertension detection and follow-up program. III. Reduction in stroke incidence among persons with high blood pressure. Hypertension Detection and Follow-up Program Cooperative Group.

JAMA, Feb 5 1982, 247 (5) p633-8, ISSN 0098-7484  
Journal Code: KFR

Contract/Grant No.: N01-HV-124; N01-HV-229; N01-HV-32933; +  
Languages: ENGLISH

The Hypertension Detection and Follow-up Program (HDFP) previously reported a 16.9% reduction in all-cause mortality among its Stepped Care (SC) group, relative to the community-treated Referred Care (RC) group. The current report compares cerebrovascular disease (CV) morbidity and mortality in the SC and RC populations. The SC five-year stroke incidence (1.9 per 100 persons) is significantly lower than that found among the RC (2.9 per 100 persons). Reductions in stroke rates among SC were experienced for all race-sex groups, all diastolic blood pressure strata, all ages, and among those with or without evidence of long-standing hypertension. Comparisons of the CV death rates for SC (1.06 per 1,000 persons) and RC (1.91 per 1,000 persons) with those obtained for the general US population (0.83 per 1,000 persons) indicate that the CV death rate decreased in the SC hypertensive population to a level approaching that of the general US population.

**Child mortality and fertility in Colombia: individual and community effects.**

Rosenzweig MR; Schultz TP  
Health Policy Educ ,Mar 1982, 2 (3-4) p305-48, ISSN  
0165-2281 Journal Code: G2I  
Languages: ENGLISH

The education of a mother is strongly and positively correlated with the survival rate of her children. This paper combines household data from the Colombian Census of 1973 and characteristics of the 900 residential areas in Colombia, to test various hypotheses concerning the mechanism by which mother's education and public policies affect child survival and the distribution of health benefits resulting from policy interventions. The hypothesis is advanced that education provides people with skills in acquiring and decoding new information and thus effectively lowers the costs of using more beneficial child health and contraceptive technologies. Since a primary function of health and family planning programs is to disseminate information on these same technologies, the hypothesis is tested that mother's education and these program interventions may substitute for each other in improving child health and reducing family size. The empirical analysis confirms that in urban areas the availability of medical services, family planning activities, transportation infrastructure and climate, in addition to mother's education, are associated with child mortality ratios and fertility within a birth cohort of mothers. The least educated mothers are the most strongly affected, in terms of their reduced fertility and increased child survival rates, by the local urban health programs. The evidence is, thus, consistent with the substitution hypothesis. No effects of program interventions and medical facilities are found on rural populations, though both child mortality ratios and fertility are lower for more educated rural women.

**An analysis of hospital costs by cost center, 1971 through**

1978.

Ashby JL Jr  
Health Care Financ Rev ,Sep 1982, 4 (1) p37-53,  
Journal Code: GHX  
Languages: ENGLISH

Hospital cost analyses generally have not used costs broken down by hospital department or function due to the unavailability of appropriate data. The Medicare Cost Reports display direct cost by cost center, and the Health Care Financing Administration (HCFA) funded a project to abstract, edit, and categorize these data from a sample of 457 hospitals into meaningful groups. The author used the resulting data base to analyze trends in hospital costs, with cross tabulations by a hospital's teaching status, type of control, and bed size class, from 1971 through 1978. The author also used this data base to preliminarily assess whether introduction of the Medicare Section 223 reimbursement limits altered cost center growth trends. The study found that the largest cost increases occurred among Ancillary Services. It also found slightly higher than average increases in Inpatient Services (concentrated in Special Care Units), and General Services increased at a below average rate. Outpatient Service costs escalated rapidly in absolute terms but rose much more slowly in per unit terms. The fastest growing cost quantity in the study was Other Ancillary Services, a miscellaneous group encompassing many of the new advanced technology services, which increased at a rate of 24 percent per year between 1973 and 1978. The study found costs per unit of output to be positively associated and bed size across all cost center categories, including General Services, where some evidence of economics of scale might have been expected. The study found no evidence that the Section 223 limits affected cost growth longitudinally, but an understanding of the impact of these limits will require considerably more study.

When asked how he has been able to effectively stay in one job for so long, the man who has been at the head of one of the nation's largest banking organizations for 16 years, Richard Cooley, chairman, Wells-Fargo Bank, said that he "learned very early that board relations was the most important key to his continuity." Cooley said his strategy over the years has been to meet for dinner about once a year with each member of this board to allow the board member to get to know him, to personally hear the issues that the board member considers most important, and to solicit input on proposed management plans.

Languages: ENGLISH

The erosion of the capital position in the hospital industry--one of the most complex and overregulated industries in the United States--is a major challenge to trustees. Hospital trustees have often neglected to examine their hospitals' capital needs on more than a project-by-project basis. In dealing with their hospitals' capital needs, trustees, most of whom are successful business people, too often take off their "business" hats and put on their "social worker" hats. In doing so they not only neglect to subject their hospitals' capital and operating programs to searching cost-benefit review, but they also overlook much useful knowledge about how to use corporate organization to shelter new ventures and strengthen their hospitals' market position and solvency. In this article, the authors discuss how hospitals can adopt successful corporate restructurings and strategies to respond to the adverse financial developments they will have to face in the coming years.

Given the changing industrial realities we now face, more and more employers and their employees are becoming involved in cooperative work ventures such as work teams, quality circles, and joint employer-employee committees. Successful ventures of this sort minimize the adversary nature of the relationship between management and labor and enhance employees' sense of responsibility and authority. The result is better working relationships and increased productivity. In both union and nonunion settings, however, employers face legal obstacles to work-force redesign. In the following article, the author discusses these obstacles and offers some suggestions on how they may be avoided.

Unprecedented advances in medical technology can save lives, but they also produce complex ethical questions for providers, patients, and government alike. What is the value of human life? When, if ever, is a life not worth saving? In which expensive technologies should limited resources be invested? These questions are reaching into the boardroom as trustees seek to shape institutional policy and help practitioners with the life and death decisions they face.

Institutional mergers are not a panacea for hospitals with financial or operating problems, and the apparent advantage of multihospital systems does not lie in their access to capital and human resources. The critical disadvantage of independent hospitals may be the result of attitudes held by governing boards. This article suggests that boards adopt new business tenets, especially regarding accountability, risk, pricing, competition, regulation, innovation, resource management, and purpose.

Languages: ENGLISH

The goal of having local health planning agencies represent their communities is considered. A basic premise is that the legal structure of an agency is related to how well a community is represented. This premise is tested, and two strategies are presented for building HSAs which will include strong representation of traditionally under-represented or under-served groups: (1) increasing competition for governing-body membership by requiring all planning agency governing bodies to be small (30 members or less); and (2) increasing the organizational simplicity of the HSA.

A previous article in this journal analyzed the efforts of health care consumers to organize around the Health Systems Agency in east central Illinois. This article continues the account by describing how local providers organized in response to these initiatives, elected their own slate to the local HSA board, and caused consumers to reconsider their participation in health planning. Among the conclusions drawn is that health planning operates in an imbalanced political arena in which providers can mobilize powerful resources to defeat consumer action.

Rapid change demands that the traditionally passive duties of the board of directors of non-profit organizations be replaced by a more assertive role, the author says. Facing new political and economic realities, volunteer organizations will have to adjust to increasing demands for services, and reductions in government funds in which the board of directors can be a strong, guiding force.

Most often, a county decides to sell its hospital without considering all of the alternatives for revitalizing the hospital or the ultimate consequences of the sale. Issues and recommendations regarding sale to investor-owned chains and not-for-profit systems as well as other arrangements are examined in this article.

The board's role in energy management consists primarily in enunciating the hospital's commitment to energy management, asking leadership questions, and keeping energy on the board's agenda. Key energy-saving actions include capital-intensive energy conservation measures, such as the installation of computer-based controls, and improvements in operations and maintenance, such as modification of heating, ventilating, and air conditioning systems.

A decentralized nursing structure allows the head nurse to become actively involved in the planning and budgeting process. In Nursing Decentralization: The El Camino Experience (published in November 1981 by Nursing Resources) the authors describe the development of a budgeting system that supports autonomy, accountability, and authority at the practitioner level. For JONA readers, we present, in two parts, an abridged version of the chapter "Budgeting: Holding the Purse Strings." Part 1, which follows, outlines important steps for the development of a successful and efficient budgeting program that can be adapted to meet the needs of other decentralized organizations. Part 2, which details a typical budget session, will appear in the next issue of JONA.

Declining budget conditions in many social service settings suggest that education must provide future graduates with very different managerial skills. When human service organizations are perceived as evolving political structures, populated with a variety of individuals who represent diverse values and claims, resource scarcity often results in growing conflict and a preoccupation with individual and subunit survival. This changing organizational context will require increasing political skill on the part of managers as well as an ability to harmonize new approaches with prior service values in achieving consensus around solutions to service delivery problems.

This article is concerned with establishing a revenue and expense budget for a diagnostic radiology department. It deals with setting up a breakout of examinations into specific categories and projecting the volume in each category. The volume should be expressed in RVUs rather than examinations. The volume predictions for the upcoming year would then be decided by factoring in such things as new procedures, new technology, patient day projections, ER projections, and any known outside influences. Once the volume is projected, expenses should be matched to these increases or decreases. These expenses would be prior to adding inflationary impacts. Finally, a follow-up should be performed on a monthly basis to ensure that the percentage change in volume is being matched by the same percentage change in expenses.

Capital budgeting technics provide for financial evaluation of planned purchases of equipment or other major investments. In capital budgeting, the laboratorian often is faced with a complex set of alternatives, including leasing, installment purchasing, contracting work to another laboratory, and outright purchasing. This paper presents a mathematical model useful for simultaneously evaluating the financial worth of all such alternatives under the same set of assumptions. Armed with the results of financial evaluation and evaluations of quality, turnaround time, and other patient-care factors, the laboratorian can make better decisions regarding the choice of method which, in turn, will affect the productivity of the laboratory. The model is tended for application to mutually

exclusive alternatives and includes three useful capital budgeting technics: (1) payback period, (2) net present value, and (3) profitability index. The technics are demonstrated as well as a method of programming the model in financial planning software for solution by microcomputer.

**Geographical variation in mortality from conditions amenable to medical intervention in England and Wales.**

Charlton JR; Hartley RM; Silver R; Holland WW  
Department of Community Medicine, St Thomas' Hospital  
Medical School, London.

Lancet (ENGLAND) ,Mar 26 1983, 1 (8326 Pt 1) p691-6,  
ISSN 0023-7507 Journal Code: LOS

Languages: ENGLISH

There is a need for indicators of the outcome of health-care services against which the use of resources can be evaluated. From a previously published series of outcome indicators, which included diseases for which mortality is largely avoidable given appropriate medical intervention, causes were selected which were regarded as most amenable to medical intervention (excluding conditions whose control depends mainly on prevention) and for which there were sufficient numbers of deaths to allow an analysis of the variation in mortality rates among the 98 area health authorities of England and Wales. Considerable variation between AHAs was found in mortality from most of these diseases, and this variation remained even after adjustment for social factors. This substantial variation should be examined further in relation to health-service inputs and other factors. A finding of large variations in the quality of health-care delivery in different parts of the country would have important implications for resource allocation.

**The psychiatric nurse specialist: a valuable asset in the general hospital.**

Fife B; Lemler S

Research and Staff Development, James Whitcomb Riley  
Hospital for Children, Indianapolis, Indiana.

J Nurs Adm (UNITED STATES) ,Apr 1983, 13 (4) p14-7,  
ISSN 0002-0443 Journal Code: JEL

Languages: ENGLISH

In summary, what are the ways in which the psychiatric/mental clinical specialist contributes to cost-effectiveness, the professional growth of nursing staff, and quality patient care in the general hospital setting? All services of the psychiatric/mental health clinical specialist are ultimately directed toward increasing the effectiveness with which staff can deliver care. This goal is accomplished by helping staff nurses maximize their knowledge, by providing needed educational opportunities, by promoting the use of a holistic model of care, and by helping staff cope with their own stress. In our experience, high quality care that meets the physiological, psychological, and sociological needs of patients decreases the length of the hospital stay, prevents repeated hospitalizations, and minimizes the development of psychosocial problems secondary to the illness. With the necessary support and cooperation from administration, this clinical specialist role reduces health care costs, promotes a higher level of functioning in patients and their families, and increases the level of job satisfaction for the staff who provide direct bedside care.

J Fam Pract (UNITED STATES) ,Apr 1983, 16 (4) p785-8,  
ISSN 0094-3509 Journal Code: I4L

Languages: ENGLISH

A sigmoidoscopy skills preceptorship was developed for physicians to increase the rate of sigmoidoscopy by physicians in a health maintenance organization. The preceptorship was designed as a randomized, controlled study of continuing medical education. Baseline sigmoidoscopy rates of participating physicians were similar to those of nonparticipants, as were selected demographic and professional characteristics. Physicians randomized to receive sigmoidoscopy training significantly increased their rate of sigmoidoscopy when compared with controls. The proportion of barium enemas accompanied by sigmoidoscopy likewise increased.

All physicians who participated improved when compared with nonparticipants. The sigmoidoscopy skills preceptorship appears to be a worthwhile endeavor in continuing medical education.

**Patient response to participation in a quality review program conducted in private dental offices.**

Strauss RP; Lindahl RL; Barksdale MB

Dental Research Center, University of North Carolina, Chapel Hill.

J Am Dent Assoc (UNITED STATES) ,Feb 1983, 106 (2)  
p185-8, ISSN 0002-8177 Journal Code: H5J

Languages: ENGLISH

A sample of largely well-educated affluent, and youthful dental patients drawn from 11 private dental offices participated in a quality assurance project that included clinical review examinations conducted at a special appointment. More than 90% of patients were willing to participate at no cost to them, and examinations were conducted on 225 patients. Attitudinal measurements were taken on all the patients both before and after their involvement. Patients responded well to this mechanism. Patients responded well to this mechanism of quality assurance and expressed increased trust and confidence in their dentists' care after experiencing reviews. Issues concerning the confidentiality of dental records were addressed. Of the participants,

approximately 75% believed clinical examinations by visiting dentist/examiners would increase the quality of American dentistry. Generally, patients were willing to have the examinations repeated periodically, although few were willing to pay for this review. The potential for quality assurance to increase patient confidence in dental care was verified.

Center for Population and Family Health, Columbia University, New York.

Demography (UNITED STATES) ,Feb 1983, 20 (1) p27-43,  
ISSN 0070-3370 Journal Code: EOH

Languages: ENGLISH

We examine mortality at ages 50 and above in female populations of 38 countries and control for variation in quality of the mortality data. We find that economic development, economic distributional inequality, and basic primary health care have independent cross-national effects on cause of death structures and that these effects are not uniform across the age intervals of interest. As improvements occur in level of living and health care, age-specific death rates decline except at the oldest ages, at which point they may increase. Our results are interpreted in terms of their relevance for mortality research, theory, and policy.

**The implications of managing confused and disabled people in non-specialist residential homes for the elderly.**  
Wilkin D; Evans G; Hughes B; Jolley D  
Health Trends ,Nov 1982, 14 (4) p98-100, ISSN 0017-9132  
Journal Code: EJM  
Languages: ENGLISH

Local Authority residential homes for the elderly are caring for substantial proportions of physically disabled and mentally confused residents in non-specialist settings. The results of an intensive study of six homes caring for varying proportions of disabled and confused residents are summarized. The homes are compared in terms of staff training and attitudes, physical care of residents, social environment, and attitudes of residents. The authors suggest that a "mix" of residents can have advantages over segregation and that most homes can manage around 30% confused residents. If this is to be successful, attention should be given to staffing levels, staff training and the role of health service staff in residential homes.

**A conceptual model for outcome assessment.**

Parker SO  
Nurse Pract ,Jan 1983, 8 (1) p41, 44-5, ISSN 0361-1817  
Journal Code: OA1  
Languages: ENGLISH

Nurse practitioners are concerned with demonstrating quality of care. Of the three variables which compose quality assessment, the third variable, outcome, provides the most direct and appropriate way to judge the nurse practitioner's special health orientation. Most studies have judged nurse practitioners' care based on medical standards and criteria. Starfield's conceptual model of outcome measures is health oriented. This model is a multi-dimensional health profile with categories that incorporate a longitudinal approach to outcome assessment. It allows for identification and evaluation of nursing effectiveness in primary care.

**The effect of algorithms on the cost and quality of patient care.**

Orient JM; Kettel LJ; Sox HC Jr; Sox CH; Berggren HJ; Woods AH; Brown BW; Lebowitz M  
Med Care ,Feb 1983, 21 (2) p157-67, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

In a Veterans Administration ambulatory care facility staffed by experienced nurse practitioners, we observed the length of visits, time utilization for various activities, and the use of diagnostic tests before and after introducing algorithms for 12 common chief complaints. Charges for diagnostic tests decreased as much as 40 per cent, primarily because of reduced utilization of radiographs such as spine films. Nurse practitioner productivity was unaffected once the nurse practitioners became familiar with the algorithms. Outcome of illness did not change measurably, but the process of care improved as reflected by more complete data collection

documented in the medical record.

**Care of cancer patients in thirty-one Italian general hospitals. Methodological aspects and general findings.**

Liberati A; Andreani A; Colombo F; Confalonieri C; Tognoni G  
Eur J Cancer Clin Oncol ,Feb 1983, 19 (2) p179-85,  
Journal Code: ENW  
Languages: ENGLISH

A large sample of cancer patients was reviewed over a two-year period (1978-1979) in 31 general and community hospitals representing five Italian regions, differing in terms of health care organization. Two thousand four hundred and six patients had breast cancer, 1692 lung cancer, 303 non-Hodgkin's lymphomas, 277 ovarian cancer and 235 Hodgkin's lymphoma. Relevant information was collected from medical records through specific pre-standardized and tested forms. The paper discusses the results obtained with respect to (a) general descriptive data of the population; (b) completeness and reliability of recorded data (e.g. staging, histological classification, therapy); and (c) accuracy and completeness of the follow-up. Consistency of the information obtained on selected items with published series of patients suggests that this methodology is worth a wider testing as a simple, inexpensive tool for routinely monitoring the care of cancer patients and the impact on it of organizational and educational interventions.

**quality of restorative dental care.**

Milgrom P; Ratener P; Weinstein P  
Community Dent Oral Epidemiol ,Feb 1983, 11 (1) p33-9,  
ISSN 0301-5661 Journal Code: DNF  
Languages: ENGLISH

A model describing the relationship between self-reported quality of restorative dentistry and dentist characteristics for 119 Montana general dentists is presented. The best predictors formed a significant model explaining 22% of the variance of the quality measure. Results are contrasted with a previous estimation of the model for 102 Washington general practitioners. Evidence for the external validity of the model is presented.

**Peer appraisal in Leicestershire Community Dental Service.**

Baxter JA  
Community Dent Oral Epidemiol ,Feb 1983, 11 (1) p12-7,  
ISSN 0301-5661 Journal Code: DNF  
Languages: ENGLISH

During the period 1976 to 1980 inclusively a form of staff appraisal amongst dental officers was introduced into the Community Dental Service in Leicestershire. The aim was to observe and review the output performance and potential of individual dental officers. In practical terms it was noticed that during this period there was a distinct change in work output and treatment patterns. Routine fillings and extractions showed a marked downward trend; the number of crowns per operator, the number of orthodontic appliances fitted, the number of root treatments performed, the patients radiographed and, above all, the total visits per full time equivalent dental officer all showed a noticeable and at times a highly pronounced increase. Although the downward trend in fillings and extractions reflects what now appears to be the overall tendency in developed countries, it is felt that the increase in other items was, to a large extent, due to peer appraisal.

**Ward meetings: a forum for patients' concerns.**

Graffy J  
Br Med J [Clin Res] ,Jan 29 1983, 286 (6362) p371-2,  
Journal Code: B4X  
Languages: ENGLISH

A series of meetings between patients and staff were held on two general medical wards to discuss the concerns of patients. Issues ranged from the quality of hospital food, ward facilities, and visiting arrangements to the medical and nursing care provided and patients' views on medical students. Most issues were raised by the patients themselves and the outcome was either acceptance or rejection of a suggestion, an explanation by the staff, or a general discussion if a specific decision was inappropriate. Most staff and patients considered the meetings to be valuable. Ward meetings thus seem to provide a way of making hospitals more responsive to patients' concerns.

**Aid posts in Enga Province.**

Parsons L  
Papua New Guinea Med J ,Sep 1982, 25 (3) p173-5, ISSN  
0031-1480 Journal Code: YEU  
Languages: ENGLISH

In Papua New Guinea (PNG) primary health care in rural areas is principally provided by aid post orderlies (APO's). During 1979-80, all 110 aid posts in Enga Province were visited; 20% were found to be unstaffed. All APO's were from the province and about 50% were providing satisfactory service. Aid posts were judged on standard of cleanliness, daily patient attendance, number of inpatients, number of family planning consultations provided weekly and on the attendance record of TB and leprosy patients. Aid posts usually had sufficient supplies of basic drugs. Despite the presence of a good APO training school in Enga, the standard of graduates was very variable and some of the best APO's in the province had minimal training over 30 years previously. Tribal warfare in Enga continues to be a threat to the delivery of primary health care.

**Antenatal education: does it improve the quality of labour and delivery?**

Gunn TR; Fisher A; Lloyd P; O'Donnell S  
NZ Med J ,Jan 26 1983, 96 (724) p51-3, ISSN 0028-8446  
Journal Code: 08Q  
Languages: ENGLISH

Of 196 nulliparous women who delivered in a two month period, 78 percent had attended antenatal education classes. The mothers who did not attend antenatal classes consisted of significantly more Maori and Pacific Island mothers, they were younger, smoked more, had a lower socioeconomic status and fewer were married. The group who went to antenatal education classes had a significantly longer second stage in labour and required more forceps assistance during delivery compared to non-attenders. These results remained for the polynesian mothers, when they were analysed separately and the

differences in age and socioeconomic status were no longer present. There was no difference in the type of pain relief required during childbirth by the attenders or non-attenders. We found no evidence that attending antenatal education classes will ensure an easy and less complicated childbirth.

Traditional continuing medical education (CME) keeps physicians aware of the state of the art. It has limitations, however, as a quality-assurance tool: it is memory based, involves a group endeavor with diffuse goals, often unrelated to practice, is an inappropriate remedy for many problems in patient care, is hampered by poor-quality evaluation, and is governed more by market factors than educational outcomes. The self-study of practice and practice-linked CME offer rich potential for development. The physician's monitoring of his work, with appropriate improvements in performance, is valuable CME. Computers provide facts and guidance at the time and place the physician is developing diagnostic plans, diminishing reliance on memory. The next step in CME is for hospitals, societies, and medical schools to perfect methods of self-study of practice and practice-linked CME.

**Good health care for the aged.**

Kennie DC

JAMA ,Feb 11 1983, 249 (6) p770-3, ISSN 0098-7484

Journal Code: KFR

Languages: ENGLISH

Despite the recent upsurge of interest in geriatrics, relatively little guidance has been given on what constitutes good health care for the aged. Ten basic principles for good health care are outlined. They include emphasis on the restoration of functional ability; the building and maintenance of a support system; a broadened approach to health assessment; the application of specific medical knowledge and skills; cautious medical intervention; true advocacy for the patient; the acceptance of the legitimacy of death; increased community orientation; the allowance of sufficient time for recovery; and continuity of care. These principles should serve as the basis for educational, research, and service programs for the aged.

Languages: ENGLISH

In this research, we examine the relative importance of different structural units in a professional organization, the hospital, as they affect organizational effectiveness. The difficulties of measuring effectiveness in a complex professional organization are discussed, and an adjusted measure of surgical outcome is developed. Data are drawn from a prospective study of over 8,000 surgical patients treated by more than 500 surgeons in 15 hospitals throughout the nation. Two different types of analyses are presented, both indicating that hospital features have more impact on surgical outcomes than do surgeon characteristics. The second analysis assesses the relative importance of specific attributes of the hospital, surgical staff organization, and surgeon characteristics on surgical outcomes.

Lebow J  
Hosp Community Psychiatry ,Dec 1982, 33 (12) p1010-4,  
ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Models for evaluating mental health treatment include the organizational model, the care-process model, the consumer-evaluation model, the efficacy model, and the community-impact model. Although organizational data (such as type of programs, number of personnel, amount of available funds, and quality of practitioners' training) are most frequently used to assess mental health centers, the author discusses the data generated by each of the other models. He also examines the advantages and disadvantages of applying such data to the evaluation of mental health services.

0002-953X Journal Code: 3VG  
Contract/Grant No.: MH-30906  
Languages: ENGLISH

The authors conducted quality review of outpatient psychopharmacological practice in 180 cases with the screening criteria of the APA Task Force on Psychopharmacological Criteria Development and a subset of 12 criteria involving higher-risk practices. Excessive duration of drug treatment was the most common questionable practice, and no relationship was found between frequency of questionable practices and patients' sex, age, social class, or Global Assessment Scale score. An educational exercise based on the audit resulted in a nonsignificant decrease in the higher-risk practices.

**Impact of inter-physician communication on the effectiveness of medical consultations.**

Lee T; Pappius EM; Goldman L  
Am J Med ,Jan 1983. 74 (1) p106-12, ISSN 0002-9343  
Journal Code: 3JU

Languages: ENGLISH

To evaluate the impact of the inter-physician communication on the effectiveness of consultations, consultations performed by general and subspecialty medical consultation services for one week both early and late in the academic year were prospectively evaluated. Physicians commonly requested consultations to get advice on diagnosis (56 percent), advice on management (37 percent), or assistance in arranging or performing a procedure or test (20 percent). Despite our very liberal definitions, the requesting physician and the consultant completely disagreed on both the reason for the consultation and the principal clinical issue in 22 (14 percent) of 156 consultations. Consultants were twice as likely as the requesting physicians to rate consultations as crucial for management (35 percent versus 18 percent,  $p = 0.001$ ) because they gave significantly higher ratings when they and the requesting physicians did not agree on the reasons for consultation. Consultations ordered for very specific purposes, such as assistance in arranging or performing a test, were rated significantly higher by the requesting physicians. It was found that breakdowns in communication are not uncommon in the consultation process and may adversely affect patient care, cost effectiveness, and education.

**Improving the quality of community care for the chronically mentally disabled: the role of case management.**

Intagliata J  
Schizophr Bull ,1982. 8 (4) p655-74, ISSN 0586-7614  
Journal Code: UDH

Languages: ENGLISH

This article draws upon an extensive case management literature in order to integrate a number of key concepts and findings that must be considered by those responsible for the planning, administration, and provision of effective community care to the chronically mentally disabled. A discussion of the reasons for the current popularity of the case management concept within human services is followed by a detailed presentation of the objectives, ideology, functions, and structural elements that characterize case management systems.

A series of practical problems and issues that must be addressed to effectively implement a case management system are then identified and analyzed. Finally, a set of recommendations for those developing case management systems is offered, and a number of important unanswered research questions about the delivery and impact of case management services are identified.

Languages: ENGLISH

The purpose of this study was to determine whether regional poison centers handle a particular poisoning situation better than nonregional centers do. Informed consent was obtained from 15 regional and 15 nonregional poison centers. A case involving salicylate ingestion by a three-year-old child was presented twice (one day call and one night call) to each center. Those answering the phone at the regional centers asked more information-gathering questions than did those at the nonregional centers (P less than 0.01) and were more proficient in their history taking (P less than 0.01). Nonregional centers did not consider the potentially toxic ingestion (220 mg per kilogram of body weight) important enough to treat or were not willing to handle the poisoning in one third of the calls. The nonregional centers recommended manual stimulation to induce emesis in 30 per cent of the calls, whereas none of the regional centers recommended this treatment. Four calls to the nonregional centers resulted in recommendations of inappropriate emetics--e.g., saltwater, raw eggs, or mustard water. The chance of obtaining incorrect recommendations for poisoning treatment from the nonregional centers was determined to be nine times greater than that from the regional centers. Indications of intention to follow up were twice as frequent among regional as among nonregional centers. These data strongly suggest that regional poison centers provide better and more consistent poison information than do nonregional centers.

**Effects of health insurance on physicians' fees.**

Sloan FA

J Hum Resour ,Fall 1982, 17 (4) p533-57, ISSN 0022-166X

Journal Code: IE9

Languages: ENGLISH

According to conventional wisdom, the growth of health insurance is partly responsible for the rise in physicians' fees; however, to date, convincing empirical evidence is lacking. A standard model of physician fee determination yields unambiguous predictions about insurance effects on fees. Empirical evidence, based on national interview surveys of physicians, shows insurance does affect fees in the predicted direction. Insurance parameter estimates imply that a \$1.00 increase in an insurer's fee schedule raises physicians' fees somewhere between \$0.13 and \$0.35 on average. The higher fees could be associated with higher quality, an issue discussed in the last section.

Breitenbacher RB; Schultz AL  
Ann Intern Med ,Jan 1983, 98 (1) p96-100, ISSN 0003-4819  
Journal Code: 5A6  
Languages: ENGLISH  
A continuity care program for patients in nursing homes using internal medicine residents in training has been developed in a county teaching hospital. Resident physicians on a paid basis assume primary care responsibility for 1000 patients in 29 private community nursing homes. A faculty internist coordinates the activities of the residents and monitors patient care through an extended care office in the county hospital. The program has produced a significant upgrading of the continuity and quality of care of patients in these nursing homes as well as providing medical residents with geriatric and nursing home experience. The increased sensitivity and concern for the needs of nursing home patients developed by the medical residents seems to continue after they complete their training.

**Analyzing inpatient hospital duration and intensity: a methodology.**

Studnicki J; Honemann D

QRB ,Sep 1982, 8 (9) p15-26, ISSN 0097-5990 Journal Code: OKP

Languages: ENGLISH

As a complement to a number of existing cost-containment programs, Blue Cross of Maryland developed a length of stay (LOS) review process for its members. The method is based on the premise that the utilization of hospital inpatient services varies along two major dimensions--service duration (expressed in days of hospital stay) and service intensity (expressed as the proportion of ancillary service charges to total charges). Composed of seven steps, the method statistically analyzes the relationship between LOS and ancillary service charges as a proportion of total charges for selected diagnoses. The attempt to monitor two dimensions of inpatient care simultaneously is a departure from existing utilization review methods. Besides a detailed description of each step in this methodology, this article presents preliminary findings from a pilot study conducted in eight Baltimore hospitals.

Languages: ENGLISH

The growth of prepaid medical-care programs has caused the leaders of a number of academic medical centers to begin to have an increased interest in affiliating with or sponsoring centers in prepaid programs -- otherwise known as health-maintenance organizations (HMOs)--is motivated by a number of potential benefits. An HMO may provide an academic medical center with an additional source of patients for teaching and research; generate additional revenue; increase resources for education in primary care; increase the exposure of students, residents, and faculty to the characteristics of prepaid medical practice; and improve the delivery of health services locally. Issues of importance to the academic medical center include the pros and cons of sponsorship of, as opposed to affiliation with, an HMO and the additional costs attributable to medical education in the HMO setting. Problems may arise between HMOs and medical centers as a result of disparate styles of practice, the high cost of clinical services at the medical center, and the differing perspectives of HMO and medical-center policy makers.

**Assessment of hospital performance by use of death rates. A recent case history.**

Hebel JR; Kessler II; Mabuchi K; McCarter RJ  
JAMA ,Dec 17 1982, 248 (23) p3131-5, ISSN 0098-7484  
Journal Code: KFR

Languages: ENGLISH

This article discusses an analytical approach for integrating hospital death rates. A study of patient mortality in four hospitals in a large metropolitan areas demonstrates the principles underlying this approach. One hospital, which experienced an annual crude death rate almost twice that of the other three, was suspected of providing an inferior quality of care. Case-mix differences among the hospitals introduced a serious bias, however, and were later taken into account. The patients' primary diagnosis was found to be the most important case-mix variable, with a potential for biasing death rate comparisons. After readjustment for case mix, the maximum difference in death rates among the four hospitals was reduced from 19 to four deaths per 1,000 patients. Further analysis of diagnosis-specific mortality supported the thesis that the observed mortality excess was largely attributable to patient referral patterns in the community.

Rising costs, concern over quality of care, and low worker productivity are some of the factors suggesting a need for revision in the organization of the health care delivery system. Reorganization of the nurse-physician working relationship through the establishment of collaborative practice can serve as the mechanism for improving cost, quality, and productivity outcomes. This analysis evaluates collaborative practice within the disciplines of obstetrics and gynecology.

This article presents an integrative model of the relations among health status, quality of care, and resource expenditure. It defines medical care quality in terms of outcomes, measured as the expected improvements in health status attributable to care. The consideration of how quality so defined is affected by the unconstrained, efficient use of resources for care leads to the specification of the absolutist definition of quality. Consideration of the incidence of individual and external costs and benefits of care provides the basis for distinguishing further between the individualized definition of quality, which depends upon

individual preferences and ability to pay, and the social definition of quality, which includes consideration of external benefits, full social definition of quality, which includes consideration of external benefits, full social costs, and preferences for the distribution of welfare. An additional distinction is made between clinical efficiency and production efficiency. This article examines in detail the implications, for the selection of optimal strategies of care, of the three definitions of quality (absolutist, individualized, and social) and the two types of efficiency (clinical and production).

Journal Code: LSM  
Languages: ENGLISH

We describe a nurse practitioner program that has improved ambulatory care in a large municipal teaching hospital. The significant feature of this program is an expanded role for nurse practitioners in the follow-up of patients with complicated illnesses. Benefits of this program include improved continuity of care and an easing of the house staff's service burden. Similar use of nurse practitioners at other municipal teaching hospitals would be a useful approach to problems in quality of care and continuity of care.

J Fam Pract ,Nov 1982, 15 (5) p929-37, ISSN 0094-3509  
Journal Code: I4L  
Languages: ENGLISH

Continuity of care with a personal health care provider is both an honored and controversial concept. This paper reviews the literature regarding the effect of a continuous relationship with a personal health care provider (longitudinal care) on quality of care using specific selection criteria and methodological standards. Sixteen studies were found of which four provided most of the valid information. Among the studies reviewed, the most common serious methodological problem was inconsistent definitions of continuity. Longitudinal care from a provider has been shown in certain settings to improve patient and staff satisfaction, compliance with medication and with appointments, and patient disclosure of behavioral problems. No ill effects have yet been demonstrated. There is some evidence that having an ongoing provider could reduce the costs of care. From available information, any evolution of the medical care delivery system away from reliance on an ongoing relationship between provider and patient may sacrifice important benefits.

The flexible sigmoidoscope may represent a partial solution to the longstanding problem of physician and patient noncompliance with sigmoidoscopy for the detection of colorectal cancer. A three-year longitudinal audit of medical records revealed at least a sevenfold increase in the number of sigmoidoscopies performed after the introduction of flexible sigmoidoscopy to a salaried medical group. This procedure has made a significant contribution to patient care and resident education in the UCLA family practice residency program.

**Monitoring perinatal mortality by birth weight specific mortality rates.**

Erkkola R; Kero P; Seppala A; Gronroos M; Rauramo L  
Int J Gynaecol Obstet ,Jun 1982, 20 (3) p231-5, ISSN  
0020-7292 Journal Code: E4T  
Languages: ENGLISH

The perinatal mortality at University Central Hospital of Turku, Finland decreased significantly from 15.7/1000 in years 1970-75 to 8.9/1000 in years 1976-78. The main decrease has occurred in weight groups of 1000 g and more. In years 1976-78 the perinatal mortality of non-malformed babies in the weight group 1500-1999 g was 93/1000, in the group 2000-2499 g 21/1000 and in the group of 2500 g and over 1.7/1000. The early neonatal mortality of non-malformed infants has decreased significantly only in the weight group of 1500-1999 g. The 1-week survival rate has been 48% in the weight group 500-999 g, but 77% in the weight group 1000-1499 g. The birth weight specific mortality rates are greatly required when the quality of obstetrical care is assessed. Birth weight specific neonatal mortality rates are essential when guidelines for elective termination of third trimester pregnancy are designed.

To assess the relative competence of pediatricians and general practitioners in managing febrile illnesses in childhood, a prospective study was undertaken of 259 children less than 10 years of age seen consecutively at the emergency room of a children's hospital and a general hospital. Both groups of patients were similar in demographic characteristics, age, sex, presenting complaints, and height and duration of fever. Of the 148 patients entered in the study at children's hospital and the 111 at general hospital, 90% and 94%, respectively, were interviewed by telephone within two weeks of their emergency room visit to determine outcomes based on duration of the acute illness episode and further physician contacts or admissions to hospital. Although no significant differences in the measured outcomes of febrile illnesses seen by pediatricians or general practitioners were found, a trend in favor of those cared for by pediatricians was discernible with respect to two key measures: unresolved symptoms at one week (8.3% vs 12.5%) and subsequent hospitalization (0.8% vs 3.0%). The overall frequency of laboratory use and antibiotic prescriptions was the same in both groups; however, significant differences were noted in the type of laboratory test used: general practitioners ordered three times more roentgenograms than pediatricians and one fifth the number of microbiologic tests. Larger prospective studies are needed to test how these findings may be generalized in view of their importance for quality assurance in the primary care of children.

**Effectiveness of an ambulatory care telephone service in reducing drop-in visits and improving satisfaction with care.**

Stirewalt CF; Linn MW; Godoy G; Knopka F; Linn BS  
Med Care ,Jul 1982, 20 (7) p739-48, ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

The purpose of this research was to determine whether a specialized telephone service could cut down on unscheduled visits to ambulatory care and improve satisfaction with care. Patients who were to receive care (N = 561) were assigned randomly to a specialized telephone service or a control group. They were measured with regard to satisfaction with care before being assigned and 6 months later. The number of scheduled and unscheduled visits also were monitored for a 1-year follow-up period. The telephone service, which provided a triage system for referrals as well as a source of central contact for scheduling or for complaints, helped to improve satisfaction and reduce the number of unscheduled visits within 6 months. Such a service also may have application in other problem areas in the delivery of quality ambulatory care.

**Relationship of size and payment mechanism to system performance in 11 medical care systems.**

Nutting PA; Burkhalter BR; Dietrick DL; Helmick EF  
Med Care ,Jul 1982, 20 (7) p676-90, ISSN 0025-7079  
Journal Code: LSM

Languages: ENGLISH

The performance of 11 medical care systems of varying size and payment mechanisms (consisting of six government owned and operated Indian Health Service units, three fee-for-service private practices and two HMOs) was studied. Performance was defined as the percentage of consumers in need of care who received adequate care according to predetermined standards for the process of care for various functions (i.e., prevention, screening, treatment, follow-up) and various health conditions (i.e., prenatal and infant care, hypertension, anemia, UTI). Size was found to have a strong negative relationship to the quality of treatment and follow-up care, but payment mechanism did not show such a relationship. Neither size nor payment mechanism was significantly related to prevention performance. In screening, the results depended on the health condition: size was inversely related to performance of screening for hypertension; HMOs performed significantly better in screening for prenatal anemia; and neither size nor payment mechanism was related to performance of screening for infant anemia.

**Health care in Poland: from crisis to crisis.**

Millard LF

Int J Health Serv ,1982, 12 (3) p497-515, ISSN  
0020-7314 Journal Code: GRU  
Languages: ENGLISH

During its first twenty years the Polish health service represented a neglected sector of government activity, as the development of heavy industry remained the predominant economic goal, with social policy regarded as a "nonproductive" sphere. When Edward Gierek came to power in 1970, the promise of reform extended throughout society to include health. However, despite a fundamental organizational reform, the health service has remained in a state of crisis, currently worsening as a result of mounting economic dislocation and political tension. Inadequate access to treatment, lack of continuity of care, poor quality of care, profound shortages of drugs and supplies, and the absence of preventive medicine are some of the manifestations of this crisis. Its main causes lie in the political weakness of the Ministry of Health, with consequent underfunding and the nonfulfillment of its plans. This situation is exacerbated by continuing organizational fragmentation, the neglect of primary care, the existence of conflicting aims in health policy, and the dominance of an ideology of clinical specialism.

**Gastrointestinal endoscopy: some perspectives.**

Grant AK; Harley HA  
Br Med J [Clin Res] .Sep 25 1982, 285 (6345) p868-70,  
Journal Code: B4X  
Languages: ENGLISH

Remarkable technological advances of fiberoptic endoscopy in the past two decades have produced important improvements in diagnosis and treatment of gastrointestinal and hepatobiliary disorders. These advances must be kept in perspective; continuing, critical assessment of their contribution to the management of patients is desirable. Endoscopy can have adverse effects on the total performance of departments of gastroenterology, on gastroenterology as a discipline, and even on the status of the medical profession in the community. Gastroenterologists need to show proficiency of performance and integrity of practice. Control may be achieved by certification delineation of privileges, peer review, public accountability, and realistic financial returns for procedures. Records of a department of gastroenterology indicate that some control may be achieved by insistence on a consultation before decision on endoscopy. This may be a desirable alternative to endoscopy on demand. Undue emphasis on technology runs some risk of destroying the proper practice of consultant medicine.

In this study of the delivery of outpatient psychiatric care to Medicaid patients at all 29 free-standing psychiatric clinics and at six hospital clinics in New York City, the authors found that nonphysician mental health workers provided much direct patient care: diagnosis and identifying data, necessary for reimbursement, were always included in records whereas mental status and medical history were poorly documented; and nonphysicians in hospitals generally surpassed physicians in the latter two areas. An additional observation was that attitudes of mental health workers toward certain diagnostic and ethnic groups may be inferred from the selective completeness of their psychiatric record keeping.

**Variations in physician utilization patterns in a capitation payment IPA-HMO.**  
Burkett GL  
Med Care ,Nov 1982, 20 (11) p1128-39, ISSN 0025-7079  
Journal Code: LSM  
Contract/Grant No.: 1 R03 HS 03485-01  
Languages: ENGLISH

Health care utilization data, using measures such as rates of hospitalization, physician visits, and specialty referrals, were collected for individual provider offices in an Individual Practice Association-Health Maintenance Organization (IPA-HMO) that used a capitation payment system to reimburse its primary physicians. Variations in health care utilization patterns between IPA offices were identified and examined for possible associations with other characteristics of these medical practices. As an indirect test of the effectiveness of the HMO's incentive system, it was hypothesized that IPA offices with a larger number of HMO subscriber-patients and those with a longer duration of membership in the IPA would exhibit practice patterns that would conform most with the HMO's cost control objectives. Associations were found between health care utilization measures and characteristics such as the specialty of physicians, but size of HMO patient load and length of IPA membership did not have the predicted effect. The findings of this study serve to identify several questions that need to be addressed in further assessments of the performance of IPAs that follow this general model.

**A study of HMO physicians' receptivity to special programs for sociomedical and behavioral problems.**  
Nash DB; Freeborn DK; Barker WH  
J Community Health ,Summer 1982, 7 (4) p239-49, ISSN  
0094-5145 Journal Code: HUT  
Languages: ENGLISH

The purpose of this study was to determine HMO physicians' receptivity to special organized programs dealing with sociomedical and behavioral problems. The study population consisted of full-time physicians in a large prepaid group practice HMO, and the data were obtained in 1977 by means of a self-administered structured questionnaire. Most physicians favored special organized services for alcoholism, drug abuse, obesity, disturbances in sexual relations, and the like. Except for alcohol and drug abuse, favoring organized services for one problem did not correlate highly across problem areas. Specialty, AMA membership, and political orientation were the main characteristics that differentiated physicians on their receptivity to organized programs for sociomedical problems. Social background and professional training and experience may be more important than the practice setting in influencing physicians' receptivity to these types of services.

It is estimated that 200 million people worldwide, including 0.1 percent of the U.S. populations, are carriers of hepatitis B virus. The carrier state is defined as positivity for hepatitis B surface antigen for six or more months without additional features of acute or chronic infection. The risk of spreading hepatitis B virus depends on the infectivity of the carrier, the nature of exposure to the carrier and the susceptibility of the contact. At present, some types of exposure merit prophylaxis with immune globulin. A safe and effective vaccine is currently available and should markedly reduce the incidence of hepatitis B and its chronic sequelae.

**Criticisms of exercise after heart attack--variations on an old theme?**

Noakes TD  
S Afr Med J ,Aug 14 1982, 62 (8) p238-40, ISSN  
0038-2469 Journal Code: U4R  
Languages: ENGLISH

In many countries it is accepted medical practice for selected patients to undertake carefully prescribed programmes of physical exercise after acute myocardial infarction or coronary bypass surgery. This situation has evolved despite considerable initial and ongoing medical resistance, some of which is now surfacing in this country. The most popular criticisms of exercise programmes for cardiac patients are that such programmes are unsafe, do not provide any medical benefit and are too costly, and that there are insufficient facilities and trained personnel to develop a realistic nationwide rehabilitation service. It is of interest that these criticisms are the same as those which were initially used to counter the proponents of coronary bypass surgery. It can be shown that these arguments are not scientifically valid. The risks of exercise for cardiac patients are minimal and considerably less than those posed by cardiac surgery. There is encouraging evidence that exercise training may reduce morbidity and mortality, but even if such hopes are not fulfilled the improved quality of life enjoyed by cardiac patients who take part in an exercise programme is sufficient to justify this therapy. The additional costs imposed by these programmes are minimal, as are the staffing requirements. It

seems likely that just as coronary bypass surgery has overcome widespread medical opposition in this and other countries, so too will the concept of formal exercise training programmes for selected patients after heart attack or coronary bypass surgery.

Prepaid medical practice, bolstered in its growth over the past eight years by government legislative and financial support, is currently at a unique crossroad. Confronted with a reduction in federal support as a result of the 1981 amendments to the HMO Act, and faced with an undefined investment commitment from the private sector, HMO expansion and future growth rates are subject to some uncertainty. An assessment of the future of HMOs must take into account not only the immediate past, but also how present, evolving marketplace factors will shape trends in the years ahead.

J Fam Pract ,Mar 1982, 14 (3) p527-32, ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

The majority of patients care calls referred to practitioners at each of two family practice office study sites were related to medications. However, there were significant differences in the proportion of patient care calls managed by staff physicians, family practice residents, and clinical pharmacists which involved discussion of medication. There were also significant differences in the callers and types of medication related calls managed by each practitioner group. Calls initiated by patients and those classified as refill requests accounted for the largest proportion of calls managed by staff physicians, residents, and clinical pharmacists. The majority of calls received by each practitioner group were managed without consultation. A follow-up office visit was recommended in approximately one half of all medication related calls. The findings of this study may be useful in determining the personnel required to manage medication related telephone calls and in identifying potential areas for education and training of personnel in family practice.

Cost-benefit analysis is fast becoming--if it is not already--an essential tool in decision making. It is, however, a complex subject, and one in which few doctors have been trained. This paper offers practical thoughts on the art of cost-benefit analysis, and is written for clinicians and other medical specialists who, though inexperienced in the techniques of accountancy, nevertheless wish to carry out their own simple analyses in a manner that will enable them, and others, to take effective decisions.

Languages: ENGLISH  
During an 18-week period in 1978-1979, a weekly bulletin  
containing information about patients' stay in hospital and

prescribing patterns in each unit was distributed to all  
doctors and senior nurses of six general medical and six  
general surgical units in the Royal Adelaide Hospital. For the  
first nine weeks, the bulletins contained information from  
half of the units, then crossed over in the second nine-week  
period. The mean stay in all units of 2251 persons discharged  
from hospital during the first nine weeks was 9.5 days,  
compared with 8.7 days for the 2234 patients in the second  
nine weeks (a reduction of more than 2000 bed-days (P less  
than 0.002)). The percentage of outpatients and discharged  
inpatients who were given prescriptions for more than two  
drugs fell from 15.3% to 13% (P less than 0.001). It is likely  
that publication of the bulletins influenced discharge and  
prescribing decisions by increasing general awareness that  
these matters were under review.

**Benefit-cost analysis of antimicrobial prophylaxis in abdominal and vaginal hysterectomy.**

Shapiro M; Schoenbaum SC; Tager IB; Munoz A; Polk BF  
JAMA ,Mar 11 1983, 249 (10) p1290-4, ISSN 0098-7484  
Journal Code: KFR

Languages: ENGLISH

We performed a benefit-cost analysis of antimicrobial prophylaxis for hysterectomy using data from a randomized, placebo-controlled clinical trial of the efficacy of three doses of cefazolin sodium. The excess cost per patient with either operative site or urinary tract infection, or febrile morbidity diagnosed during hospitalization, was +1,777 for vaginal and +716 for abdominal hysterectomy. In patients undergoing vaginal hysterectomy, prophylactic cefazolin reduced in-hospital infectious morbidity from 52% to 23% (preventive fraction, 56%), resulting in an average net benefit of +492 per patient. In abdominal hysterectomy, cefazolin decreased in-hospital morbidity from 43% to 25% (preventive fraction, 42%), resulting in an average net savings of +102 per patient. These benefits would be eroded by use of newer, more expensive cephalosporins unless they were considerably more effective than cefazolin. The benefits also would be diminished by inappropriate prolongation of the duration of prophylaxis.

**[Analysis of the criteria of choice of hospital materials and technologies]**

Analyse des criteres de choix des materiels et technologies a l'hopital.

Morizet-Mahoudeaux P; Dubuisson B  
Int J Biomed Comput ,Jan 1983, 14 (1) p53-63, ISSN 0020-7101  
Journal Code: GQQ

Languages: FRENCH Summary Languages: ENGLISH

Decision-making in hospital, when a biomedical instrumentation investment has to be decided, is not simple because of the large amount of criteria which should be considered. To show the most important criteria in decision-making, their respective weight and their interdependencies, we used multi-dimensional analysis methods.

A quasi-exhaustive list of criteria has been constructed and sent to all the heads of medical departments, the directors and the clinical engineers of the French university hospitals, in order to obtain their appreciation of the influence of these criteria in their own decision-making experience. The application of factorial analysis methods to the answers gives two main results. There is no characteristic behaviour of professional groups, such as engineers, directors, surgeons, radiologist, etc.... A list of 21 criteria, which are the most influential in decision-making, can be identified. This result will be emphasized in order to develop a tool which allows one to measure the adequacy of a biomedical instrument that shows a clinical need.

Social workers play a vital role in the screening and admission of applicants to skilled nursing facilities because they provide unique attention to patients' psychosocial as well as medical needs. This article reports on a study that investigates social workers' employment in nursing homes and their actual involvement in the admission process. It also details the practices and procedures used to screen, select, and admit applicants to the facilities.

Current advances in discharge planning have focused on comprehensive assessment, levels of care, and reducing the length of hospital stays. However, evidence also indicates the importance of involving patients and their families in making decisions about long-term care. This article identifies nine factors related to the patients' involvement in decision making.

**The ethically trained physician: myth or reality?**

Balkos GK

Can Med Assoc J ,Mar 15 1983, 128 (6) p682-4, ISSN

0008-4409 Journal Code: CKW

Languages: ENGLISH

Through a questionnaire distributed to 300 physicians in the Toronto area, three aspects of their ethical awareness were examined: the formal codes, the need for consultation in making decisions and the need for training in medical ethics. Most of the physicians (81%) felt that they were facing ethical problems in their daily practice. A majority of these would try to solve the problems either themselves (30%) or through discussion with a colleague (43%). When they turned outside the profession it was sometimes to a lawyer (12%), which suggests concern with the legalities of some situations.

Only a small proportion of the respondents were found to be familiar with two of the established codes of ethics, yet 13% would still turn to the code of the Canadian Medical Association for guidance. Finally, there was widespread recognition of the need for proper training in medical ethics and for the establishment of a specialty in this field.

**A method to determine a non-economic personal value of life.**

Zalkind DL; Shachtman RH

J Oper Res Soc ,Feb 1983, 34 (2) p145-53, ISSN

0160-5682 Journal Code: JHN

Languages: ENGLISH

This paper presents a method for estimating a non-monetary personal value for death in the context of a decision problem.

The method evolved from a case study of a personal decision strategy for choosing whether to receive the swine influenza vaccine, based on the predicted epidemic in the United States in the fall of 1976. Rather than dealing with the decision-maker's assessments of utilities associated with extreme outcomes such as one's own death, the basic approach considers probabilities representing marginal reductions in the probability of death. An application to the swine influenza decision is included.

**Errors of intuitive logic among physicians.**

Borak J; Veilleux S  
Soc Sci Med ,1982, 16 (22) p1939-47, ISSN 0277-9536  
Journal Code: UT9  
Languages: ENGLISH

The effectiveness of specific training in statistics and decision-making principles upon physicians' judgmental skills was assessed by means of problems of intuitive logical reasoning. The responses of 43 statistically sophisticated physicians (SP) were compared to those of 42 practicing physicians (PP), 43 clinical nurses (CN) and 41 hospital laborers (HL). On problems evaluating use of faulty heuristics in judgments of conditional probabilities, the SP group's responses were the most biased. The proportion of subjects displaying consistent use of a particular heuristic in solving the three problems were 0.36 (SP), 0.45 (PP), 0.35 (CN) and 0.41 (HL). On problems assessing use of prevalence rate data in estimating probabilities, SP performed substantially better than the other three groups: 34% of their responses were accurate. However, 37% of their responses reflected ignorance of prevalence information concepts. We conclude that intensive statistical and decision-making training of physicians is likely to be of only limited value for improving clinicians' judgmental skills.

Languages: ENGLISH

This study explored the decision making process of physicians and parents in choosing between hospital and home care for children in the terminal phase of cancer. Data were gathered from hospital records of the children and from interviews with their parents. Discriminant function analysis of hospital record data suggested that the physician's influence over care and treatment choices remained the dominant influence into the terminal phase. Yet parents reported that they were most influenced by their child's and their own desires and beliefs about their ability to provide care. The possibility of a two-stage decision process is offered to explain this discrepancy.

**Women's perceptions of vaginal and cesarean deliveries.**

Cranley MS; Hedahl KJ; Pegg SH  
Nurs Res ,Jan-Feb 1983, 32 (1) p10-5, ISSN 0029-6562  
Journal Code: D9K  
Contract/Grant No.: 5R02 NU00 531-3  
Languages: ENGLISH

Three groups of women were compared to determine their perceptions of giving birth and the relationships between those perceptions and their degree of participation in decision making, the type of anesthesia for delivery, and the presence of their husbands at the births. Forty women had vaginal deliveries; 39 had emergency cesareans, and 43 had planned cesareans. All the women were interviewed and completed self-administered questionnaires two to four days after delivery. The three groups had significantly different perceptions of the birth experience with the emergency cesarean birth group having the most negative perception. Among women having cesareans, more positive perceptions were associated with regional anesthesia, presence of their husbands at delivery, and greater participation in decision making. Women in the cesarean groups were less likely to breast feed, and those having planned cesareans were least likely to attend childbirth classes. Many of the women were unaware of the options available to them that could influence the birth experiences.

**Predictors of employment status after cardiac surgery.**

Stanton BA; Jenkins CD; Denlinger P; Savageau JA; Weintraub RM; Goldstein RL

JAMA ,Feb 18 1983, 249 (7) p907-11, ISSN 0098-7484  
Journal Code: KFR

Contract/Grant No.: HL 20637

Languages: ENGLISH

Preoperative predictors of postoperative employment status were studied in 228 patients (aged 25 to 64 years) who underwent cardiac surgery. Of the 150 patients working in the year before surgery, 73% returned within six months. Of those not so employed, 18% started working. Patients who expected preoperatively to return to work did so at an 82% rate compared with 39% of the others. This was a strong predictor in the multiple regression analysis. Educational level and family income were stronger predictors than occupation or level of physical exertion required. Rates of return were higher in patients with less severe angina and less fatigue preoperatively, but did not differ significantly by sex, surgical procedure, or duration of illness. Seven variables predicted work status correctly for 86% of persons. These results suggest that determinants of return to work are largely present before surgery and that patients' attitudes and expectations play an important role.

**Decision-making among emergency room residents: preliminary observations and a decision model.**

Quick JD; Moorhead G; Quick JC; Gerloff EA; Mattox KL; Mullins C

J Med Educ ,Feb 1983, 58 (2) p117-25, ISSN 0022-2577  
Journal Code: J13

Languages: ENGLISH

Emergency room residents face a range of clinical decisions and often call on senior residents or faculty members for help. The individual clinical decision process has frequently been analyzed, but little attention has been given to the social process in clinical decision-making. Based on data from interviews and over 100 hours of direct observation at two large urban general hospitals with busy emergency rooms staffed by medical and surgical residents, the authors suggest there are five basic decision situations. In each situation, the residents appeared to follow implicit decision patterns about involving other medical and surgical staff in the final clinical decision. The decision situations are nonacute, routine acute, nonroutine acute, multispecialty acute, and crisis. These situations call for individual, consultative, or consensual patterns in making decisions. The consequences of these patterns are explored. Improving residents' decision-making should contribute to improved understanding of the resident's role, better resident supervision, and better emergency room functioning.

How can a nursing service convincingly argue for autonomy and accountability without an understanding of the precise meanings of these terms? In this second of two articles exploring the meanings and implications of autonomy and accountability in nursing service, Lewis and Batey arrive at this and other provocative questions. They analyze the concept of accountability and provide selected definitions of the concept by directors of nursing. Their discussion provides insights into the presence or absence of true accountability in nursing organizations and presents issues for further study.

**A model for teaching ethics in a family practice residency.**

Self DJ; Lyon-Loftus GT

J Fam Pract ,Feb 1983, 16 (2) p355-9, ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

The model used for teaching ethics at the Ghent Family Medicine Residency at Eastern Virginia Medical School consists of a monthly one-hour noon conference integrating ethical principles and clinical decision making. The underlying objective is to help produce effective physicians by developing their knowledge, skills, and attitudes. The model combines didactic material and clarification of personal values in a case study format. The most important kind of learning to be derived is the self-awareness of one's own value structure and its contribution to the clinical decision-making process. Such a conference will succeed in capturing resident participation in direct proportion to faculty support. Medical ethics teaching in family medicine is appropriate, important, and consistent with the principles of a good family practice residency. An illustration of a typical ethics noon conference on confidentiality is given.

**Creativity in management in family medicine.**

Stephenson MJ; Bass MJ

J Fam Pract ,Feb 1983, 16 (2) p347-50, ISSN 0094-3509

Journal Code: I4L

Languages: ENGLISH

Family practice presents some complex patient management problems with organic, social, and psychological components. There is a great potential for creative problem solving in such patient management problems, in that many alternative solutions are possible. A cross-sectional study was carried out to test the hypothesis that "more creative people as defined by a standard creativity test would have a better quality of management." Sixteen volunteers from the University of Western Ontario Family Practice Residency Program completed a written management problem and the Barron Welsh Art Scale, which is a measure of a person's preference for complexity. The number of options given in each answer was calculated, and the results showed that more creative residents had a higher quality of management score, a higher number of high-quality options, more options of an interpersonal nature, and a higher proportion of original options. The results suggest that creative people are more able to generate the number and types of options that are needed for quality management. The higher proportion of original options may represent a more comprehensive approach to management, and the creative groups' preference for complexity may enable them to deal more effectively with the problem. These results are not generalizable but indicate a need for further investigation into this area.

**Work environments of different types of nursing subunits.**

Leatt P; Schneck R

J Adv Nurs ,Nov 1982, 7 (6) p581-94, ISSN 0309-2402

Journal Code: H3L

Languages: ENGLISH

Based upon organizational theory, the purpose of this research was to identify and describe similarities and differences in the work environments of nine different types of nursing subunits (intensive care, medical, surgical, psychiatric, auxiliary, rehabilitation, rural, paediatric and obstetrical) in hospitals. Six measures of nursing subunit environment were developed; these included measures of nursing subunit autonomy, and the complexity and pervasiveness of other medical and hospital groups interacting with the nursing subunit. Data were collected by questionnaire from headnurses in 157 nursing subunits located in 24 hospitals in Alberta, Canada. The results indicated that the types of nursing subunits were similar in their degree of autonomy from both physicians and administration in the larger context in which they were located but were significantly different in terms of number and heterogeneity of groups outside nurses with which they interacted and the extent to which such groups pervaded the subunits. For example, intensive care units appeared as the type of nursing subunit with the greatest need for

interaction with physicians, paramedics, hotel services and so on, whereas, psychiatric subunits appeared to be the least dependent on groups outside nursing in the hospital. These findings have implications for the management practices and educational programme for nursing.

**Changes in patterns of care of the mentally handicapped: implications for nurses' perceptions of their roles and hospital decision making processes.**

Shaw M; Heyman B

J Adv Nurs ,Nov 1982, 7 (6) p555-63, ISSN 0309-2402

Journal Code: H3L

Languages: ENGLISH

This paper reports on the findings of a longitudinal study of a mental subnormality hospital in the North of England. The focus is upon how nurses have experienced a major change in care and treatment of residents from 1978 to 1980. We explore, through the eyes of nurses, the change in their role from a predominantly nurturing/custodial one to a mainly educational/community orientated role. The research findings demonstrate that this change has increased nurses' self-esteem and their satisfaction with important areas of their work. There is some evidence also that nurses/resident relationships have improved in spite of reservations felt about new forms of treatment and community care. We suggest that such reservations may be linked to critical views expressed by nurses, particularly sisters and charge nurses, that decisions were taken about residents by other more senior personnel who had little contact with residents. One important conclusion of this study is that the traditional processes of decision making in the hospital appears to impede the full implementation of a major change which requires nurses to be involved in a potentially threatening process of altering their perceptions of themselves and residents.

Franklin C; Jackson D  
Crit Care Med ,Feb 1983, 11 (2) p61-6, ISSN 0090-3493  
Journal Code: DTF  
Languages: ENGLISH

To identify those patients most likely to be readmitted to a Medical ICU (MICU), we studied 512 MICU admissions during a 1-yr period. There were 36 readmissions within the same hospitalization in that interval. When ICU deaths and short-term drug overdoses were excluded, these 36 readmissions comprised 12% of all patients discharged from MICU. The mortality rate of this group was 58%, greater than twice the overall mortality rate for the year. Fifty-three % of the patients were readmitted because of recurrence of their initial disease on admission, with septicemia being the most common disease. Another 30% were readmitted because of a new complication, one-half of which were medication toxicities. We have attempted to delineate diseases, medications, and complications which may predict the high-risk discharge from MICU. Further studies to identify high-risk and low-risk admissions and discharges will effect better use of intensive care.

Economic evaluation of health services may take many forms, depending on the range of costs and consequences included in the analysis and the methods employed to measure and value them. In order to clarify the sometimes confusing array of economic analyses for users and evaluations, an analytic overview of costs and consequences to be considered for inclusion in such evaluations is presented. This allows the techniques of cost-effectiveness, cost-benefit, and cost utility analysis to be differentiated. Two often neglected methodologic issues are also discussed. First, it is suggested that the significance of the analytic viewpoint for economic evaluations should not be underestimated. Second, it is recognized that economic evaluations that demonstrate cost savings from a program or policy change implicitly assume that resources can be removed from the health sector. In fact, this is seldom true, consequently strategies for incorporating this knowledge into evaluations are discussed.

**A comparison of definable traits in women requesting reversal of sterilization and women satisfied with sterilization.**

Leader A; Galan N; George R; Taylor PJ  
Am J Obstet Gynecol ,Jan 15 1983, 145 (2) p198-202,  
ISSN 0002-9378 Journal Code: 3NI  
Languages: ENGLISH

More women of reproductive age are being sterilized. Some of these women regret the decision and subsequently request a reversal of sterilization, whereas others do not. This study was undertaken to develop a profile of easily definable traits of 159 women who requested a reversal of sterilization and compare it with that of 160 women who apparently were satisfied with sterilization. Statistically significant differences were found. Remarriage was the most common cause for regret among women in the group which requested reversal of sterilization. Women in this group married younger, completed their family earlier, and were sterilized at a

younger age. These women had significantly fewer live children and had undergone more therapeutic abortions (p less than 0.005).

**Uses of clinical algorithms.**

Margolis CZ  
JAMA ,Feb 4 1983, 249 (5) p627-32, ISSN 0098-7484  
Journal Code: KFR  
Languages: ENGLISH

The clinical algorithm (flow chart) is a text format that is specially suited for representing a sequence of clinical decisions, for teaching clinical decision making, and for guiding patient care. A representative clinical algorithm is described in detail; five steps for writing an algorithm and seven steps for writing a set of algorithms are outlined. Five clinical education and patient care uses of algorithms are then discussed, including a map for teaching clinical decision making and protocol charts for guiding step-by-step care of specific problems. Clinical algorithms are compared as to their clinical usefulness with decision analysis. Three objections to clinical algorithms are answered, including the one that they restrict thinking. It is concluded that methods should be sought for writing clinical algorithms that represent expert consensus. A clinical algorithm could then be written for any area of medical decision making that can be standardized. Medical practice could then be taught more effectively, monitored accurately, and understood better.

**Demand v need v physician prerogatives in the use of the WBC differential.**

Rock WA Jr; Grogan JE  
JAMA ,Feb 4 1983, 249 (5) p613-6, ISSN 0098-7484  
Journal Code: KFR  
Languages: ENGLISH

The clinical use of the WBC differential was investigated before and after it was made available on demand. The results indicate that no consistent policy existed in our hospital for the ordering of a differential. When differentials were made available on demand, the number of differentials did not increase compared with earlier periods. The demand for differentials may have been caused more by the denial of a physician's prerogative to order a differential rather than by its requirement for patient care.

**Nursing decision making in critical care areas.**

Baumann A; Bourbonnais F  
J Adv Nurs ,Sep 1982, 7 (5) p435-46, ISSN 0309-2402  
Journal Code: H3L  
Languages: ENGLISH

This exploratory study sought to identify factors that critical care nurses consider relevant in making rapid patient care decisions; to explore the decision making of these nurses in crisis situations; and to identify critical patient care situations where rapid nursing decisions are made. The convenience sample consisted of 50 nurses in critical care settings. A semi-structured interview with a critical care case study was utilized to examine the nurses' decision making. Open ended responses were transformed into fixed categories for tabulation. The findings suggested that: 1 knowledge and experience were the most important factors influencing rapid decision making; 2 although the nurses identified the appropriate decisions in a given crisis situation they had difficulty providing a theoretical rationale for their decisions; 3 the given case study and the 50 crisis situations identified by the subjects indicated that many nursing decisions for critically ill patients were carried out prior to physician assistance. A demographic data questionnaire that examined age, nursing experience, formal education and continuing education of the subjects determined that the majority of the nurses were under 30 years old, had either less than 1 year experience or 7-9 years in critical care, were graduates of a 2-year diploma programme, and took continuing education courses at the community college level.

**The competency of children and adolescents to make informed treatment decisions.**

Weithorn LA; Campbell SB  
Child Dev ,Dec 1982, 53 (6) p1589-98, ISSN 0009-3920  
Journal Code: D28  
Languages: ENGLISH

This study was a test for developmental differences in competency to make informed treatment decisions. 96 subjects, 24 (12 males and 12 females) at each of 4 age levels (9, 14, 18, and 21), were administered a measure developed to assess competency according to 4 legal standards. The measure included 4 hypothetical treatment dilemmas and a structured interview protocol. Overall, 14-year-olds did not differ from adults. 9-year-olds appeared less competent than adults with respect to their ability to reason about and understand the treatment information provided in the dilemmas. However, they did not differ from older subjects in their expression of reasonable preferences regarding treatment. It is concluded that the findings do not support the denial of the right of self-determination to adolescents in health-care situations on the basis of a presumption of incapacity. Further, children as young as 9 appear able to participate meaningfully in personal health-care decision making.

Ten years ago, decision analysis was still an experimental management technique. But even then supporters claimed that eventually it would become for the manager what calculus is to the engineer. According to the authors of this article, decision analysis that incorporates personal judgment has not yet become what some expected, but it has, nonetheless, gained acceptance in many large corporations and government departments. One of the reasons for this acceptance is the greater flexibility and sensitivity of decision analysis to managers' needs than earlier forms had. In other words, today's decision analysis techniques can better take into account the people, the politics, the time pressures, and all the messy but critical factors that managers have to contend with. In this article, the authors describe three major forms of decision analysis and show how real managers have used decision tree analysis, probabilistic forecasting, and multiattribute analysis to solve real business problems.

**A study of decision-making behavior of aircraft pilots deviating from a planned flight.**

Flathers GW 2d; Giffin WC; Rockwell TH  
Aviat Space Environ Med ,Oct 1982, 53 (10) p958-63,  
ISSN 0095-6562 Journal Code: 9JA  
Languages: ENGLISH

This paper outlines an investigation into the worth structures of pilots facing a deviation from a planned flight.

A "paper and pencil" simulation was used to frame the situation into which pilots interjected their own decision-making skills in a simple ranking of candidate diversion airports with varying locational, navigational aid, radar, and weather attributes. Using the conjoint measurement technique, attribute worth functions of 30 pilots were constructed. Systematic differences in the worth functions of the pilots were not found as a result of dividing the pilot sample according to any measure of flight hours' experience. However, differences were found when the pilot sample was grouped according to grade of pilot certificate, type of pilot training, and type of flying most commonly done.

**Women's experiences with second trimester prenatal diagnosis.**

Verjaal M; Leschot NJ; Treffers PE  
Prenatal Diagn ,Jul 1982, 2 (3) p195-209, ISSN  
0197-3851 Journal Code: PJ7  
Languages: ENGLISH

By means of questionnaires, 100 women were asked for their experiences concerning prenatal diagnosis. At four standardized stages of the pregnancy a questionnaire was filled in asking for: expectation, knowledge, attitude towards termination of the pregnancy in case of abnormal findings, reactions to the counselling and the obstetric treatment, interpretation of own risk, experiences since the normal test results were known and ideas to improve the treatment. With regard to the effect of pre-amniocentesis counseling it is concluded that the counselling had little impact on decision making; the counselling caused an increase of factual knowledge: somewhat more than half of the women who did not give a correct answer before counselling, indicated the right answer some time afterwards. Presumed differences in reaction patterns for a number of characteristics were not affirmed by the study; the reactions during the procedure of prenatal diagnosis seem to be highly individual and difficult to predict. In addition to the reaction of the 100 women described in this study, the responses to the first questionnaire of another 16 patients, declining amniocentesis after counselling, are presented.

**Interdisciplinary consultation on the care of the critically ill and dying: the role of one hospital ethics committee.**

Cohen CB

Crit Care Med ,Nov 1982, 10 (11) p776-84, ISSN 0090-3493 Journal Code: DTF

Languages: ENGLISH

Little is known about the structure and objectives of various hospital ethics committees due to their need to preserve confidentiality, their reluctance to reveal internal hospital problems, and their concern about becoming involved in the developing debate about the appropriate role and value of such committees. The evolution, functions, and goals of one distinctive hospital committee concerned with the care of the critically ill and dying are explained. Its membership and proceedings are described, and the medico-moral issues with which it has grappled are presented and discussed. An assessment is provided of the positive and negative impact of this committee within the Medical Center with which it is affiliated. The experience of this particular group illustrates that hospital ethics committees can play advisory and educational roles within a large medical center. They can provide support for patients, medical professionals, and families who face difficult dilemmas about terminal illness. They can function as forces to sensitize medical personnel to the challenges presented by medicine's growing power over death. They can serve as catalysts for interdisciplinary communication. Finally, they can promote the development of new programs for informed and humane care of the terminally ill.

**O.R. workers, information systems analysts and the challenge of the micro.**

Stevens GC

J Oper Res Soc ,Oct 1982, 33 (10) p921-9, ISSN 0160-5682 Journal Code: JHN

Languages: ENGLISH

An assessment of the effects of microcomputing on O.R. should take account of the impact of micros on other professional groups involved in the provision of information and analysis to managers. The paper examines the likely changes in the role of information systems analysts associated with present trends in computer-based information systems and, by concentrating on the decision support systems area, argues that O.R. workers and systems analysts may find themselves competing for new roles in ways which make it difficult to set out the contribution of each in terms of what they do at present. A modest proposal is made for a new form of team for the development of decision support systems. This incorporates a division of skills which cuts across existing lines of differentiation and foresees an increased contribution on the part of user-managers.

**Improving the selection of family medicine residents through development of multi-dimensional policy models.**

Parker BR; Skinner BD

Health Policy Educ ,Oct 1982, 3 (3) p229-47. ISSN

0165-2281 Journal Code: G2I

Languages: ENGLISH

The annual cost of training a single family medicine resident may now exceed \$50,000. This, together with the fact that normally only a small fraction of those applying for family medicine residency is selected for admission, creates a decision problem of enormous import to affected institutions. Despite these considerations, the applicant evaluation and selection process remains relatively subjective, with results often disappointing. In the current paper, a preference-based approach is proposed that first models the evaluation/selection process on the basis of well-defined cognitive and noncognitive criteria. It is suggested that validation of this model be based on future performance levels of both the accepted and rejected cohorts during and following their residencies. Discrepancies between future success levels and predicted outcomes may then be translated into appropriate control actions designed: (1) improve the definition/measurement of selection criteria; (2) enhance the evaluation/selection policies and decisions of the admissions committee; and (3) better inform potential applicants of the department's program and selection philosophies. The approach is applied to two recent, accepted cohorts of the University of North Carolina Department of Family Medicine. Preliminary results indicate that the procedure is capable of improving the in-residency success levels of selected applicants, and that these levels can be better predicted than when no formal, i.e., analytic, process is followed.

**Administrative decision making: staff-patient ratios (a patient classification system for a psychiatric setting).**

Schroder PJ; Washington WP  
Perspect Psychiatr Care ,Jul-Sep 1982, 20 (3) p111-23,  
ISSN 0031-5990 Journal Code: OZT  
Languages: ENGLISH

In this article, we have described a patient classification system in use at the C.F. Menninger Memorial Hospital. It is a type of factor evaluation, in which we use critical indicators or descriptors of care as units of measurement. Each critical indicator represents a grouping of nursing activities rather than concrete time measurement of each activity. The ten critical indicators of patient care needs and nursing activities which were identified were divided into two major categories: routine and extra. Each category was then subdivided to reflect a range or variation of care levels. This type of patient classification appears to have an advantage over other classification systems when applied to psychiatric nursing. The factor evaluations are broad enough in scope to allow inclusion of patient assessment, documentation, and use of the nursing process, while providing a measurement of psychological and psychosocial needs of the patient which are frequently absent in other classification systems that rely on task measurements or acuity levels alone. Because of its practicality it has been readily accepted by nurses working on psychiatric units, and the nurse administrator's effort to put a classification system in place has been made easier.

0300-5771 Journal Code: GR6  
Languages: ENGLISH

An exercise in clinical epidemiology was developed for medical students to demonstrate the process and limitations of scientific measurement using models that simulate common clinical experiences. All scales of measurement (nominal, ordinal and interval) were used to illustrate concepts of intra- and interobserver variation, systematic error, recording error, and procedural error. In a laboratory, students a) determined blood pressures on six videotaped subjects, b) graded sugar content of unknown solutions from 0 to 4+ using Clinitest tablets, c) measured papules that simulated PPD reactions, d) measured heart and kidney size on X-rays and, e) described a model skin lesion (melanoma). Traditionally, measurement variation is taught in biostatistics or epidemiology courses using previously collected data. Use of these models enables students to produce their own data using measurements commonly employed by the clinician. The exercise provided material for a meaningful discussion of the implications of measurement error in clinical decision-making.

Bobrt KF; Purohit AA  
Contemp Pharm Pract ,Spring 1982, 5 (2) p80-4, ISSN  
0162-3761 Journal Code: DQ9  
Languages: ENGLISH

Much has been written regarding physicians' prescribing behavior. However, a literature search revealed a dearth of information regarding physicians' refilling behavior. The purpose of this study was to explore how authorization is given to community pharmacists for refilling a prescription by telephone. A total of 30 physicians (general practitioners and internists) was systematically selected with a random start from the telephone directory of a large metropolitan city. A surveyor acting as a registered pharmacist from a fictitious pharmacy called and requested refill authorization from a prescriber using a simulated patient's name and prescription. Half of the 30 phone calls utilized a controlled substance as the drug in question, and the remaining half utilized a noncontrolled legend drug. All of the phone calls were made either during late afternoon or evening. The results of this study show that 48.3 percent of the physicians authorized refills. Positive refill authorization was given in 29 percent of the instances with the controlled drug and 66 percent of the instances with the noncontrolled legend drug. Only 27.6 percent of the physicians checked their records.

To determine the extent to which different sources of information are perceived to influence common medical decisions, 10 interns, 22 senior residents and 9 faculty general internists rated the degree of influence of house staff, general internists, subspecialists, conferences, journal reading and past experience on their decisions concerning primary prevention (vaccination), secondary prevention (screening) and drug therapy. Analysis of variance of their questionnaire data supports the following conclusions: physicians at different stages of training rely on different sources of information; as physicians advance in training the influence of generalists wanes while that of subspecialists increases; subspecialists and past experience are perceived as primarily affecting therapeutic decisions; primary prevention appears least subject to influence by prevailing information sources; and the preference for reading begins early and increases as physicians advance in training. These data suggest that designing effective medical education requires considering the level of the physician's training and the nature of the medical decision.

**Factors affecting the choice of a psychiatric career: an experimental study.**

Gerber LA  
Psychiatr Q ,Spring 1982, 54 (1) p26-32, ISSN 0033-2720  
Journal Code: QBP

Languages: ENGLISH

Some factors affecting the choice of a psychiatric career are explored using experimental data from all medical students in two classes who started their clinical clerkships with a strong interest in psychiatry. Information was obtained via regularly scheduled observations and discussions over 13-month clerkship periods. A number of themes were expressed by the clerks and explored in this paper. The significant impact of role models was especially noted. Experimental research can be most helpful in deepening one's understanding of the day-to-day forces that impinge upon the clinical clerk and the career decision process.

**The operation of a radiology consultation service in an acute care hospital.**

Baker SR  
JAMA ,Nov 5 1982, 248 (17) p2152-4, ISSN 0098-7484  
Journal Code: KFR

Languages: ENGLISH

The operation of a radiology consultation service in an acute care teaching hospital is described. The radiologist acts as an active advisor in the structuring of diagnostic evaluations in three disease categories: biliary tract disease, nonemergency gastrointestinal tract bleeding, and abdominal mass. There was a 64% reduction in the time needed to establish a diagnosis and a 32% decrease in the number of studies for each patient on the consultation ward compared with a control group, which consisted of patients with similar clinical presentations. A formal partnership between clinician and radiologist serves two important functions in teaching hospitals. It can simultaneously expedite diagnostic evaluations and teach the best utilization of imaging examinations.

**Modification of decision-making behavior of third-year medical students.**

Spiegel CT; Kemp BA; Newman MA; Birnbaum PS; Alter CL  
 J Med Educ ,Oct 1982, 57 (10 Pt 1) p769-77, ISSN  
 0022-2577 Journal Code: J13

Languages: ENGLISH

Modification of physician behavior has been suggested as one approach to controlling health care expenditures. Third-year students participated in an experimental program which attempted both to construct an educational approach that included aspects of such expenditures and to measure the effectiveness of the approach. Students were divided between experimental and control groups, with the former receiving information relative to the appropriate use and costs of diagnostic procedures. Both groups were presented with case studies dealing with specific disease processes discussed in the program. Members of the experimental group scored significantly better in their ability to determine diagnoses, make patient-management decisions, and choose essential diagnostic procedures. Average charges generated by the experimental student group were half the amount generated by the control group. Future studies will be required to determine whether the behavior modification carries forward in practice and to provide a standardized methodology for use by members of the faculty and house staff in educating future medical students.

**'The nurse should consider.' Critical care ethical issues.**

Lawrence JA; Farr EH  
 J Adv Nurs ,May 1982, 7 (3) p223-9, ISSN 0309-2402  
 Journal Code: H3L  
 Languages: ENGLISH

A hypothetical dilemma on resuscitation of an intensive care patient was presented to nurses at a workshop on ethics of critical care nursing. Nurses responded to separate questionnaires about what a charge nurse should do, and what they themselves would do in relation to ten considerations arising from the dilemma. Nurses were agreed that legal consequences, patient wishes and rights, and physician authority should and would be considered, and that peer influence should not. Nurses were divided in their attitudes to following procedure and personal moral beliefs, and to job risk. The most contentious issues were related to the nurse's role as a decision-making member of the health care team. Implications for regarding nurses as independent decision-makers are discussed.

**Career development of McMaster University medical graduates and its implications for Canadian medical manpower.**

Woodward CA; Ferrier BM  
 Can Med Assoc J ,Sep 15 1982, 127 (6) p477-80, ISSN  
 0008-4409 Journal Code: CKW  
 Languages: ENGLISH

A study was undertaken of the career paths and decisions, and the factors influencing the decisions, of the first six graduating classes of McMaster University's medical school. Climate and geography, preference for urban or rural living and influence of spouse were the factors that most influenced the location of practice, although the graduates who moved to the United States considered economic factors important too. Nearly one third of the specialists were practising in the United States. Personal challenge and positive clinical experience in the field were the major influences on choice of medical field. Graduates entering a specialty were more likely than those entering primary care to consider encouragement of others, a positive example set by medical school faculty members, working hours and research experience in the field as important influences on their choice of medical field. Data are needed on the career decisions, and the factors affecting them, of the graduates of all Canadian medical schools if Canadian medical manpower planning is to be realistic.

Blau JR; Alba RD  
 Adm Sci Q ,Sep 1982, 27 (3) p363-79, ISSN 0001-8392  
 Journal Code: ZH6  
 Languages: ENGLISH

To test the implications of field work in a psychiatric hospital for children, this study focuses on the effects of network properties of organizational units, personal network position, and other individual attributes, on individual power. The contextual analysis is carried out by two linked regression equations, one at the individual and one at the contextual level, a procedure that has methodological advantages over a single regression model. The results suggest that sheer complexity can undermine inequalities among bureaucratic units and occupational groups, and that organizational democracy is fostered when complex role relations promote extensive interunit communication. Specifically, we find that a main mechanism that endows individuals with power is found in the local domains of

participation, i.e., the organizational units of which they are members, and that the capacity of such a unit to empower its members depends on its integration in organization-wide communication networks. The basis of this integration is conceived as overlapping circles of weak ties that inhibit segmentation along occupational or organizational lines and sustain wide participation by rewarding those who participate.

**Dilemmas of managing participation.**

Kanter RM  
 Organ Dyn ,Summer 1982, 11 (1) p5-27, ISSN 0090-2616  
 Journal Code: NQ2  
 Languages: ENGLISH

There are two reasons that current corporate efforts to achieve employee "participation" often seem fragile and temporary: unrealistic expectations about the appropriate use of participation and a failure to manage participation efforts for maximum success. Participation is most appropriate when, for example, expertise is diffused, issues are controversial, problems cut across existing roles, or the development of people is desired; autonomy and individual responsibility may be more appropriate under the opposite conditions. Kanter discusses six sets of dilemmas that must be resolved to ensure that participating teams work effectively for the organization: dilemmas around initiation, structure, issue choice, teamwork, links between teams and their environment, and evaluation/continuation. Kanter concludes that participation works best when it is well managed. Participation is best viewed not as a permanent "program" or a "formula" but as temporary episodes of high involvement alternating with a more routine everyday structure.

Supreme Court decisions have liberalized a woman's right to decide whether to obtain an abortion. Some state and local governments have tried to circumvent these decisions by enacting requirements designed to discourage abortions by, among other things, dictating to physicians an elaborate litany of specific information that must be communicated to a patient as a necessary precondition of her informed consent for an abortion. This article discusses the legal status of such requirements, their implications for the professional autonomy of physicians, and the role of the medical profession in challenging these restrictions, on its own behalf and in concert with its patients.

We believe that the outline of a promising approach to the study of expert clinical problem-solving is emerging. This process involves collecting as verbal transcripts the thoughts of experienced clinicians engaged in simulated clinical tasks and analyzing these transcripts to formulate theories of problem-solving tactics and strategies. In turn, these theories are embodied in a computer program that simulates the problem-solving process. The computer program's response to fresh clinical problems can be compared with physician behavior in order to revise, refute, or confirm the problem-solving theories. A scientific understanding of the expert clinician's reasoning strategies could prove exceptionally useful in improving the way we teach and practice medicine and in developing practical computer aids for medical decision-making.

**Juvenile offenders' diversion potential as a function of police perceptions.**

Kraus J; Hasleton SL  
Am J Community Psychol ,Apr 1982, 10 (2) p171-82, ISSN 0091-0562 Journal Code: 3FV  
Languages: ENGLISH

The study concerns the relationship of police perception of arrested male juveniles to potential police diversion (operationally defined by perception of juveniles as deserving lenient treatment). Arresting officers (n = 102) from 20 police stations provided structured reports on 174 juveniles, covering 27 questions that police considered important in encounters with juvenile offenders. Of 16 independent variables suitable for analysis, only 4 were significantly related to diversion potential when other variables were held constant (multiple regression analysis). Only 26% of the potential's variance was accounted for by the 16 variables jointly. Factor analysis yielded six latent dimensions (orthogonal factors) of police perception of juvenile offenders: offensive behavior, conformity of appearance, delinquent background, nonserious offense, favorable impression, single offender. All dimensions except "delinquent background" were significantly related to diversion potential, and an empirical rationale could be found for three of these relationships. The findings are discussed critically. It is concluded that the importance of interpersonal variables in police encounters with juveniles might be less than has been suggested in the literature.

Cost-benefit analysis and cost-effective analysis are formal analytical methods to provide a rational, objective means of comparing total costs with total benefits or of comparing effects in the selection of competing programs for financial support. The use of these techniques in the medical field is a relatively recent development and can aid in future cost containment.

Over a four-year period, 18 children with biliary atresia have required portoenterostomy. Either because of failure of initial biliary output or failure to resume output after an episode of ascending cholangitis, reoperation on the portoenterostomy was performed in ten patients. Each of the patients had essentially no output before curettage. Seven of them are now long-term jaundice-free survivors; two did not respond to curettage and died, and one responded initially but subsequently ceased output and also died.

Contract/Grant No.: CA 26666  
Languages: ENGLISH

To determine whether data available to physicians in the emergency room can accurately identify which patients with acute chest pain are having myocardial infarctions, we analyzed 482 patients at one hospital. Using recursive partitioning analysis, we constructed a decision protocol in the format of a simple flow chart to identify infarction on the basis of nine clinical factors. In prospective testing on 468 other patients at a second hospital, the protocol performed as well as the physicians. Moreover, an integration of the protocol with the physicians' judgments resulted in a classification system that preserved sensitivity for detecting infarctions, significantly improved the specificity (from 67 per cent to 77 per cent,  $P$  less than 0.01) and positive predictive value (from 34 per cent to 42 per cent,  $P = 0.016$ ) of admission to an intensive-care area. The protocol identified a subgroup of 107 patients among whom only 5 per cent had infarctions and for whom admission to non-intensive-care areas might be appropriate. This decision protocol warrants further wide-scale prospective testing but is not ready for routine clinical use.

Languages: ENGLISH

The results of a study to identify the factors that two types of referring physicians, general/family practitioners and general surgeons, consider when deciding whether or not to refer the patient, and where to refer the patient are presented and discussed. The factors for each type of decision were identified initially through interviews with physicians in active practice in Wisconsin and rank ordered according to their relative importance in making the referral decisions. These factors were then used in two alternative normative decision-making models to predict physician referral behavior.

Factors related to the kind and quality of medical care the patient would receive appear to be most important in the decisions, with a high level of agreement between and among general/family practitioners and general surgeons as to the relative importance of the factors. Although the normative decision-making models correctly predicted a relatively high percentage of the referral decisions, not all of the factors were found to be important in explaining the behavior of physicians, and were not always consistent with the factors that were reported to be important.

Adolescent alcohol abuse is an individual and social problem of epidemic proportions. Investigation of the many correlates of this behavior indicates that three are primary: peer pressure, attempts at reaching adult status, and sexuality socialization. The societal support for alcohol use and tolerance of alcohol abuse combine with these three factors to exacerbate the problem. Analyzing each correlate leads to a proposed solution to the problem. It is suggested that the optimal approach is a group-process method that involves adolescents and adults and enables participants to analyze motivation and develop skills necessary for either abstinence or responsible drinking. **Seeking care for cancer relevant symptoms.**

Berkanovic E  
J Chronic Dis , 1982, 35 (9) p727-34, ISSN 0021-9681  
Journal Code: HQV  
Contract/Grant No.: 5-R18-CA-18451  
Languages: ENGLISH

Although it has been estimated that a fourth of the individuals who die of cancer each year might have survived if their cancer had been detected earlier, little is known about the characteristics of individuals who seek care for cancer relevant symptoms. This study reports data from a 1 yr panel study of 1210 individuals in metropolitan Los Angeles who were asked to report any symptoms they had experienced during each six week interval between interviews. These symptoms were classified according to the National Ambulatory Symptom Classification and then rated for their cancer relevance by

three university-based oncologists working independently. There were 35 symptoms rated as cancer relevant. Inter-rated reliability was 0.73. Analysis is directed towards the distribution of these symptoms in the population, the distribution of physician visits for these symptoms and the structural and social psychological factors that predict the decision to seek medical care for these symptoms. The implications of the results for health education are twofold. First, because these symptoms occur homogeneously across subgroups, education programs targeted to specific subpopulations are likely to be inefficient. Second, even if successful education campaigns could be undertaken, it is unlikely that all physicians would agree that all of the increased demand for services would be appropriate.

Languages: ENGLISH

Studies of event-related brain potentials (ERPs) have shown that attributes of the ERP can be used as dependent variables in the study of human information processing. These variables can complement the information gained from the study of overt, skeletal responses. The manner in which the P300 component of the ERP can be used to study human information processing is illustrated in this report. Specifically, we show that through an analysis of the covariation of the latency of P300 component and reaction time, it is possible to examine the relation between the probability of a stimulus and the speed of response to that stimulus. Our data indicate that increased in the probability of a stimulus reduce reaction time by

decreasing both stimulus-evaluation and response-production times. We also examine changes in reaction time and P300 latency induced by the match or mismatch between two stimuli presented consecutively, again as a function of probability. Models of the effects of stimulus matching on reaction time are evaluated.

Languages: ENGLISH

The requirement that a subject be competent as a condition of valid consent to participate in research has been accepted by most students of legal and ethical problems of human experimentation. "Competency," however, has lacked a clear and generally agreed on standard. There are four commonly used standards for competency: evidencing a choice in regard to research participation, factual understanding of the issues, rational manipulation of information, and appreciation of the nature of the situation. These standards can be arranged hierarchically such that each represents a stricter test of competency. The decision as to how rigorous a standard for competency is desirable cannot be made on psychiatric grounds. It requires consideration of the policy goals one hopes to attain. Empirical research helps demonstrate the consequences of choosing a particular standard but cannot replace the need for achieving consensus on policy goals.

Languages: ENGLISH  
How can physicians consider patient preferences in reaching medical decisions? Physicians may intuitively agree about the importance of considering all significant aspects of alternative therapies, including patient preferences. However, it may be difficult to resolve or quantitate critical trade-offs between benefit and risk, and quality and quantity of life. One way to do this is decision analysis, a systematic approach to decision making under conditions of uncertainty. Behavioral research involving the assessment of values and probabilities may bear on the adequacy of decision analysis and help us to better understand patient preferences in clinical decisions.

This article explores who, in the first instance, should decide whether to withhold or withdraw treatment from a defective newborn. The Article begins by defining the term "severely defective newborn" and discussing potential sources of liability for persons who decide to withhold or withdraw treatment. It next analyzes the ability of parents, physicians, and courts to make these treatment decisions. The Article concludes that, although parents and physicians may eventually make the specific determination, the legislature should at least set guidelines so that the decisions will be, in some measure, consistent, predictable, adequately informed, and in accord with community values.

The crossmatching laboratory is regarded as a stressful work environment where many nontechnical issues may influence the interpretation of test results, particularly if the results are unclear. An attempt has been made to identify major areas of conflict and stress and to demonstrate their relationship to the quality of crossmatching. The Janis and Mann model for decision making in conflict situations is presented and related to interpretation of crossmatches.

Languages: ENGLISH

This paper discusses the puzzling problem of large differences in per capita use of certain common surgical procedures among neighboring populations, which by all available measures are quite similar in need for and access to services. The evidence reviewed here supports the hypothesis that variations occur to a large extent because of differences among physicians in their evaluation of patients (diagnosis) or in their belief in the value of the procedures for meeting patient needs (therapy). This hypothesis, which we call the professional uncertainty hypothesis, is germane to current controversies concerning the nature and extent of supplier influence on the demand for medical services. It is also important because of its implications for health regulatory policy. Our plan is to (1) review the relevance of the hypotheses for the supplier-induced demand controversy; (2) review the epidemiologic evidence on the nature and causes of variation; (3) examine patterns of use of common surgical procedures to illustrate the importance of supplier influence on utilization; and (4) consider some of the implications of the professional uncertainty hypotheses for public policy.

A newly designed operator chair is suspended by a floor stand and a horizontal arm that rotates and is adjustable for length. The suspension system is equipped with magnetic locks that enable the surgeon instantaneously to take desired positions in a horizontal plane. The height of the chair is

controlled electrically. The foot plate, which is in one piece with the chair, has 18 switches for the microscope, chair, bipolar coagulator, camera, and so on. This comfortable and multifunctional chair is an important microneurosurgical tool not only for minimizing the physical fatigue of the surgeon but also for performing refined techniques.

**Guidelines for the purchase, placement, and use of electrosurgical equipment.**

Poster A  
Dent Clin North Am ,Oct 1982, 26 (4) p699-710, ISSN  
0011-8532 Journal Code: E10  
Languages: ENGLISH

Many excellent clinicians present a myriad of electrosurgical techniques in this tissue. If you select techniques that are applicable to your type of practice, you will be a better, happier, and more productive dentist. The type of unit you select must also fit into your approach to patient treatment. As can be deduced from the equipment guide, there is no uniformity in the manufacture of electrosurgical equipment. There is no standardized color coding system, no uniform labeling of controls and outlets, and no uniformity in the types of current offered. Each manufacturer can produce evidence for the superiority of its unit; the scope of this article is not to evaluate units. The American Academy of Dental Electrosurgery has been active in promoting the use of uniform nomenclature by manufacturers. For more detailed information, the reader can contact the secretary and founder of this organization, Dr. Maurice Dringer, at American Academy of Dental Electrosurgery, 57 West 57th Street, New York, New York 10019. It is crucial for the dentist to know the uses and the refined methods of electrosurgery that he intends to incorporate into his practice. Only with such knowledge can he make the intelligent choice of unit and placement. There are at least 10 models currently available. It is hoped that the dentist will choose and effective unit to be used in the appropriate manner for the selected procedure. Electrosurgery will then be a splendid addition to the armamentarium of each dentist.

Neill SR  
J Child Psychol Psychiatry ,Jul 1982, 23 (3) p309-18,  
ISSN 0021-9630 Journal Code: HP3  
Languages: ENGLISH

Twenty established children were observed in each of three nursery schools and two day nurseries. Two pairs of nursery schools and day nurseries were matched for building design. Twenty newly arrived children were also observed in each nursery school. Child behaviour was analysed in relation to building design; playroom openness appeared the most important building factor. Children in the more open units spent less time on school-oriented activities and received fewer staff contacts, but more time moving around, doing nothing, and in aggression and active play. Social interaction was little related to building design, but was affected by amount of nursery experience. The findings are discussed in relation to staff aims.

Int J Epidemiol ,Sep 1981, 10 (3) p253-61, ISSN  
0300-5771 Journal Code: GR6  
Languages: ENGLISH

A follow-up study of 5371 men who had worked in 1 or more of 9 furniture factories in Buckinghamshire for an average of 19 years up to 1968 is reported. The incidence of nasal adenocarcinoma in furniture workers taken as a whole was found to be about one hundred times that expected in the local population, and a significant relationship was found between increasing incidence of the tumour and increasing dustiness of work within the cohort. Similar comparisons with the local population produced no evidence for an increased risk of cancer of any other site in the furniture workers including bronchial cancer and malignant disease of the reticulo endothelial system. However, when comparisons were made between men exposed to different amounts of dust within the industry the incidence and mortality of bronchial cancer increased with increasing dustiness of work the latter trend but not the former being statistically significant. This trend is not due to differences in smoking habits among the groups of men. No trends of increasing incidence or mortality of other sites of cancer with increasing dustiness of work were found.

**An investigation into the problems of easy chairs used by the arthritic and the elderly.**  
Munton JS; Ellis MI; Chamberlain MA; Wright V  
Rheumatol Rehabil ,Aug 1981, 20 (3) p164-73, ISSN  
0300-3396 Journal Code: TD9  
Languages: ENGLISH

Groups such as the arthritic and the elderly are particularly susceptible to seating problems. An extensive questionnaire to determine the nature and extent seating difficulties was given to patients at rheumatology clinics and members of day centres for the elderly in Leeds. Forty-two per cent of subjects had some degree of difficulty in rising from their easy chair at home and of these 18% either experienced great difficulty or could not rise unaided. Only 13% had chairs designed to aid rising (e.g. high chair) and 40% of subjects thought their chair could be improved. Thirty-four per cent said that their easy chair caused them pain or discomfort. Information about subjects' body dimensions and their easy chair dimensions was also collected. Further research based on the survey results is planned in order to develop criteria for the design of easy chairs for the arthritic and the elderly.

**Castor bean allergy in the upholstery department of a furniture factory.**

Topping MD; Tyrer FH; Lowing RK

Br J Ind Med ,Aug 1981, 38 (3) p293-6, ISSN 0007-1072

Journal Code: AXS

Languages: ENGLISH

In this study, undertaken to identify the cause of allergy in several upholstery workers in a furniture factory, the workers were handling several different materials, including glue, silicone spray, upholstery fabrics, and felt. Radio-allergo-sorbent test (RAST) assays showed that sera from sensitised workers contained specific IgE towards the felt; however, further investigations using RAST showed that the allergen was not the felt itself but a contaminant of the felt. The felt was manufactured from sacks, some of which had been used to store castor beans. The sera with raised IgE to the felt also had raised IgE to the castor bean extract. By means of RAST inhibition we confirmed that castor bean allergens in the felt were solely responsible for the raised IgE in the sera. The in-vitro RAST results were found to correlate well with the in-vivo pick tests and clinical symptoms.

**A survey of hearing test rooms.**

Siegenthaler BM

Ear Hear ,May-Jun 1981, 2 (3) p122-6, ISSN 0196-0202

Journal Code: E9G

Languages: ENGLISH

Octave-band and broad-band sound level measurements were made on 46 hearing test rooms in physicians' and audiologists' offices, hospitals, and audiology clinics. The data were evaluated against the ANSI 1977 ears open and ears covered standards for hearing test rooms. Five of the rooms met the ANSI 1977 ears open standard, and 18 met the ANSI 1977 ears covered standard. Neither dBA or dBC measurements nor difference between dBA and dBC values is a satisfactory way of specifying a room that meets a given standard. A double-wall hearing test room does not assure a test area that meets ANSI 1977 standard. Sound room ventilating fans seem to be a significant source of noise in many rooms.

Standard Industrial Classification (SIC) 25 -- furniture and fixtures manufacturing -- covers a variety of furniture products. These include household furniture, office furniture, and institutional furniture as well as partitions and fixtures. Statistically, household furniture accounts for two-thirds of the establishments, sales, and employment in this SIC category and will be emphasized in this presentation.

A profile of the household furniture industry (Table 1) indicates that it is very appropriate to discuss this industry in the context of small plants. With 320,000 employees in 5400 plants, the average plant has less than 60 employees. The largest companies in this industry have fewer than 7500 employees and account for less than three percent of the total sales each. Except where furniture manufacturing is a subsidiary or division of a larger company, full-time industrial physicians and hygienists are not employed in this industry. A few of the larger companies have full-time safety managers, and nurses are found in some of the larger plants.

**A case-reference study of neuropsychiatric disorders among workers exposed to solvents in the Danish wood and furniture industry.**

Olsen J; Sabroe S  
Scand J Soc Med [Suppl] .1980. 16 p44-9. ISSN 0301-7254  
Journal Code: UDT  
Languages: ENGLISH

A case-reference study was conducted to estimate the association between neuropsychiatric diseases leading to early retirement pensioning and exposure to organic solvents in the Danish wood industry. Cases were defined as all members of the Carpenter/Cabinet Makers' Trade Union who were diagnosed with a neuropsychiatric disease and received disability or early old-age pensions during the period January 1, 1971 to December 31, 1975. The case group comprised 171 disability pensioners and 35 early old-age pensioners. A reference group of equal size was selected among union members with other diseases who were pensioned over the same time-period. Controls were matched to cases according to age and type of pension. Among a total of 412 eligible study subjects, 342 (i.e., 287 disability pensioners and 55 early old-age pensioners) could be located in 1978. Of these, 9.8% of the disability pensioners and 12.7% of the early old-age pensioners did not respond to the questionnaire. Information regarding occupational exposure and vocational training was obtained both directly from study subjects and from the files of the trade union. Medical diagnoses were obtained through registry linkage and by manual search of hospital records. Former employees with high levels of exposure to organic solvents were more likely to receive disability pensions for neuropsychiatric reasons compared to more modestly-exposed individuals. Cabinet-makers and especially cabinet-makers with high exposure to lacquers and glues had a higher risk of receiving a disability pension for a neuropsychiatric disease than carpenters. Possible sources of bias are discussed in the article.

**The effects of rearranging ward routines on communication and eating behaviors of psychogeriatric patients.**

Melin L; Gotestam KG  
J Appl Behav Anal .Spring 1981. 14 (1) p47-51. ISSN  
0021-8855 Journal Code: HDR  
Languages: ENGLISH

Several aspects of ward routine were changed to study the effects of environmental manipulation on the behavior of 21 psychogeriatric patients. Furniture was rearranged to be more conducive to conversation (i.e., grouped around tables instead of along corridor walls), and mealtime routines were changed to allow patients more time to eat, more freedom in choosing the composition of the meal, and more pleasant surroundings. Patients were divided into experimental and control groups, and data were collected on the frequency of verbal and tactile communication and degree of skill in eating behavior. Following baseline, environmental changes were

introduced across behaviors. Results show that the frequency of communication increased for the experimental group, as compared to both baseline and the control group. Eating behavior also improved significantly for the experimental group. The study shows that minor changes in the physical environment can promote therapeutic change in the behavior of patients diagnosed as senile dementia.

**[Industrial-anthropological basis for development of lounge-chair, for the aged (author's transl)]**

Industrieanthropologische Grundlagen zur Gestaltung eines Ruhestuhles für Bürger.

Flügel B

ZFA (Dresden) ,1980. 34 (6) p527-36. Journal Code: XSR

Languages: GERMAN Summary Languages: ENGLISH

Proceeding on the party and government decisions "On the development of old people's and nursing homes" and on the tasks of the "Working group for appropriate furniture for old people" with the Ministry of Health. 19 measurements and criteria for the design of a lounge-chair for elderly people are demonstrated on the basis of industrial-anthropologically relevant measurements and functions of the body. These data are the scientific foundation for the work of designers and constructors of furniture. By three pictures, the development of the lounge-chair from the industrial-anthropological foundations to the production sample is illustrated.

The staff were sure the chairs in the boardroom were Chippendale. And they took it for granted that they were surrounded by antiques and fine paintings. When a team from Bonhams visited St Luke's-Woodside Hospital in north London there was some good news and some bad news. Brian Watkin tells the story of an enjoyable morning, when he learned from the experts.

**[Magnetic shielded room to measure very low magnetic and electric fields]**  
Magnetisch abgeschirmte Kabine zur Aufnahme kleinster magnetischer und elektrischer Biosignale.  
Mager A  
Naturwissenschaften ,Aug 1982, 69 (8) p383-8, ISSN  
0028-1042 Journal Code: NSW  
Languages: GERMAN Summary Languages: ENGLISH

An extraordinary magnetically shielded room was designed and constructed for the Physikalisch-Technische Bundesanstalt Institut Berlin to measure extremely weak magnetic fields of the human body with SQUID-magnetometers. The inner and the outer dimensions of the cube-shaped room are 2.25 m and about 5 m. The shield has 6 magnetic shells of a high-permeability alloy and an inner shell welded of massive copper plates. The total weight of the magnetic alloy is about 10 t and about 5 t for the inner copper shell. The required shielding factor of 1000 for the very low frequencies was greatly surpassed by the real measured value of 10000 (measured without any compensating or idealizing method). With rising frequencies the shielding factor reaches higher values, at 50 Hz more than

10000 and a million for 1000 Hz. First measurements in the shielded room with high-resolution magnetocardiograms (HR MCG) and high-resolution electrocardiograms (HR ECG) showed new methods for non-invasive electrophysiological investigations in man.

Twenty established children were observed in each of three nursery schools and two day nurseries. Two pairs of nursery schools and day nurseries were matched for building design. Twenty newly arrived children were also observed in each nursery school. Child behaviour was analysed in relation to building design; playroom openness appeared the most important building factor. Children in the more open units spent less time on school-oriented activities and received fewer staff contacts, but more time moving around, doing nothing, and in aggression and active play. Social interaction was little related to building design, but was affected by amount of nursery experience. The findings are discussed in relation to staff aims.

**Carpeting in hospitals: an epidemiological evaluation.**

Anderson RL; Mackel DC; Stoler BS; Mallison GF  
J Clin Microbiol ,Mar 1982, 15 (3) p408-15, ISSN  
0095-1137 Journal Code: HSH  
Languages: ENGLISH

Epidemiological and microbiological studies were conducted in a hospital room with carpet (CR) and in one with carpet (NCR). Microbiological profiles were determined with specimens obtained from patients admitted to these rooms. Patient

records were reviewed to note infection status and other case identities. Eleven-millimeter cylindrical core samples of carpet were obtained, and swab template techniques were used on the bare floor for subsequent enumeration and identification of contaminating microorganisms. In each sampling period, higher microbial counts per square inch (1 in(2) = ca 6.452 cm(2)) were measured for the carpet than for the bare floor. Recovery rates of Enterobacter spp., Klebsiella pneumoniae, and Escherichia coli were higher from carpet samples than from bare floor samples. Typable organisms (such as E. coli, Pseudomonas aeruginosa, K. pneumoniae, and Staphylococcus aureus) obtained from patients were also more frequently recovered from the carpet than from the bare flooring. Patients who stayed in the CR were shown to be colonized with the same types of organisms as those initially recovered from the carpet. However, no statistically significant differences were found in patients in the CR versus NCR in colonization with all typable and nontypable organisms first found on the floor. Disease in patients was found not to be associated with organisms found as contaminants of the carpet or the bare floor. Air above carpeting contained more consistent concentrations of organisms than air above the bare flooring.

Chapman KR; Carmichael FJ; Goode JE  
Can Med Assoc J ,Apr 15 1982, 126 (8) p935-8, ISSN  
0008-4409 Journal Code: CKW  
Languages: ENGLISH

This paper describes the medical services provided at an outdoor rock music festival near Toronto and reviews similar services at other outdoor concerts as reported in the literature. Between 0.5% and 1.5% of concertgoers were reported to have used medical services, proportions that may be useful in planning for future festivals. Most of the medical problems encountered were minor, although life-threatening problems occasionally occurred. Alcohol and drug abuse were common but led to major medical problems in only small proportions of patients. Guidelines for planning are suggested that include recommendations about facilities, supplies and equipment, transportation and communications, staffing and procedures. The need for liaison with the concert promoters, the police, ambulance officials and local hospital personnel is noted, and the use of the nonmedical ancillary staff is encouraged.

 A new library building at the University of California  
 Medical Center, San Diego provides 7,100 net square feet,  
 seating for 100 readers, and a stack capacity of 23,000  
 volumes. The building contains three split-level floors with  
 conventional reference and circulation services, a combination  
 of group and single seating, rapid copying machines,  
 audiovisual facilities, a public elevator, and an electronic  
 security system for the protection of library materials. The  
 library, intended primarily for the use of health care  
 professionals and students in their third and fourth years of  
 medical school, serves a teaching hospital and its associated
- research facilities.

**Review of nuclear pharmacy practice in hospitals.**

Kawada TK; Tubis M; Ebenkamp T; Wolf W

Am J Hosp Pharm ,Feb 1982, 39 (2) p266-74, ISSN  
0002-9289 Journal Code: 310

Languages: ENGLISH

An operational profile for nuclear pharmacy practice is presented, and the technical and professional role of nuclear pharmacists is reviewed. Key aspects of nuclear pharmacy practice in hospitals discussed are the basic facilities and equipment for the preparation, quality control, and distribution of radioactive drug products. Standards for receiving, storing, and processing radioactive material are described. The elements of a radiopharmaceutical quality assurance program, including the working procedures, documentation systems, data analysis, and specific control tests, are presented. Details of dose preparation and administration and systems of inventory control for radioactive products are outlined.

**The family physician's office: proposed design criteria for family centered medical care.**

Coble RJ; Sinnott SK; Walz TH  
J Fam Pract ,Jan 1982, 14 (1) p77-81, ISSN 0094-3509  
Journal Code: I4L  
Languages: ENGLISH

Four design criteria, home extension, personal extension, family centered environment, and patient education, are explored as guidelines for creating a therapeutic atmosphere in the family physician's office. They can be applied to the entryway, waiting and reception areas, hallways, examination rooms, nurses' station, laboratories, and the physician's private office. They are intended not to replace the traditional design criteria of efficiency, economy, safety, and convention, but to enhance their effectiveness. This occurs when the total environment, physical, administrative, and social, is consciously managed for the purpose of patient therapy and staff well-being. Attention to family centered design criteria facilitates this management and helps to ensure that many components of the health-care system benefit the patient.

Roos LL Jr  
Am J Public Health ,Apr 1983, 73 (4) p414-21, ISSN  
0090-0036 Journal Code: 3XW  
Languages: ENGLISH

This paper explores the relationships among physician supply, workload (output per physician), and utilization (physician services per capita) in rural Manitoba. Surgery taking place within a patient's home area and that taking place outside this area are discussed. Longitudinal and cross-sectional analyses are compared. Although the average surgeon does more surgical procedures than does the average general practitioner, the number of procedures performed varies greatly within each specialty. Individual physician workloads remained fairly stable over time when a surgically active physician moved into an area, while population utilization increased 17 per cent. When such physicians left an area, the surgical workloads of the physicians increased significantly (18.7 per cent) while population utilization stayed essentially the same. Both physician workload and surgical utilization in control areas increased gradually (between 6 and 7 per cent) over the period studied. Several models of physician behavior were investigated using data on individual procedures as well as overall figures. A model emphasizing the importance of physician discretion appeared to provide the best fit with the data.

According to conventional wisdom, the growth of health insurance is partly responsible for the rise in physicians' fees; however, to date, convincing empirical evidence is lacking. A standard model of physician fee determination yields unambiguous predictions about insurance effects on fees. Empirical evidence, based on national interview surveys of physicians, shows insurance does affect fees in the predicted direction. Insurance parameter estimates imply that a \$1.00 increase in an insurer's fee schedule raises physicians' fees somewhere between \$0.13 and \$0.35 on average. The higher fees could be associated with higher quality, an issue discussed in the last section.

Within the physicians' services industry, doctors of osteopathy are the only "full line" competitors of medical doctors. Given the current interest in merger of the two schools of practice, this Article examines the benefits of having an independent osteopathic school. These benefits include: (1) reduction of the monopoly power of medical doctors in malpractice litigation, fee negotiations with third party payors and the formulation of health policy; (2) greater satisfaction of consumer desires; and (3) diversity and innovation in physicians' training and methods of practice. The Article concludes that society has an interest in discouraging merger of the two groups; osteopathy should be maintained as an independent school of practice. To this end, society should carefully consider the impact of legislation and regulatory policies that may have the unintended effect of eliminating osteopathy as an independent competitor.

**Rural health care delivery amidst federal retrenchment: lessons from the Robert Wood Johnson Foundation's Rural Practice Project.**

Moscovice IS; Rosenblatt RA  
Am J Public Health ,Dec 1982, 72 (12) p1380-5, ISSN  
0090-0036 Journal Code: 3XW  
Languages: ENGLISH

This paper examines the experience of the Robert Wood Johnson Foundation's Rural Practice Project (RPP), a major non-governmental effort in the last decade concentrating on the direct delivery of rural health services. The nine RPP sites started prior to 1977 showed a slow but steady increase in their utilization levels and improvement in their financial status during their initial operational years. The tempo of their development was remarkably similar to that of federally sponsored practices in underserved rural areas. After four years of operation, all of the practices had completed their period of grant support; the practices survived in all cases, with almost all of the practices still retaining community sponsorship, salaried physicians, and a commitment to comprehensive care. Practices in sparsely populated rural areas and in areas with fewer hospital beds grew more slowly than those set in rural areas with higher population density and more ancillary resources. We conclude that the use of time-limited initial subsidies is an effective strategy in starting new rural practices in underserved areas and that those practices have a good chance of surviving their start-up phase.

Ideally this article should begin with a mathematical model--an equation. On the left we should put together contributions and expenditures in terms of hours, money and effort. On the right we should enter the profits in terms of years of life, money and quality of life. Unfortunately it is not that easy. The literature is comprehensive but also not complete. At the request of the British Department of Social Welfare, Fentem & Bassey went through the literature on exercise and health--1 334 references (4), and were unable to draw up any conclusion in the form of a mathematical equation.

They could only make a declaration which they called "The case for exercise" (10). Lack of scientific proof should not stop us from drawing probable conclusions. In the article below we set out our reasons for the conclusions we have arrived at. In brief, the conclusion should be: "exercise is healthy and health is profitable".

**Where you stand depends on where you sit: musings on the regulation/competition dialogue.**

Cohodes DR

J Health Polit Policy Law ,Spring 1982, 7 (1) p54-79, ISSN 0361-6878 Journal Code: IBC

Languages: ENGLISH

In the past two years, the regulation/competition dialogue has polarized into an "either or" debate. The problems facing our health care system are too complex to allow the acceptance of this paradigm. Reasonable people will differ on what they believe are the key factors which contribute to the inflation of health care costs. Four separate scenarios for diagnosing and solving the health care inflation problem are presented. Alternative intervention strategies are discussed and the potential of current competition proposals is examined.

J Am Optom Assoc ,May 1982, 53 (5) p397-402, ISSN  
0003-0244 Journal Code: H82  
Languages: ENGLISH

The original intent of this study was designed to determine the feasibility of adding an optometric service to an established hospital environment. As the study progressed, it took on a broader perspective. It no longer appeared relevant whether or not one singled-out suburban hospital was ready and willing to add a necessary and beneficial service. It seemed more appropriate to look more closely at the changing national scene with the health care delivery system in a state of flux. The state of transition, in turn, would affect all institutions including the state of the profession, the hospital setting, the shift in population and even the definition of health care. This paper is limited to a background study of health and hospital care.

The National Institutes of Health continue to provide support for a major portion of biomedical research in this country. Research serves as the keystone to the continued health of Otolaryngology, but there are clear indications that otolaryngologists' direct involvement in research is diminishing at a dangerous pace. Some of the causes of this problem are identified. Solutions include, first and foremost, more general recognition of the importance to the speciality of biomedical research; currently available mechanisms offered by the National Institute of Neurological and Communicative Disorders and Stroke for the support of investigator training might be utilized more extensively and collaborative research between clinician and basic science investigators should be encouraged.

Women comprised only 8.8 percent of active physicians in the United States in 1977. However, recent trends in the sex composition of medical school classes indicate that women will make up at least one-fourth of total physician supply in the future. Consequently, the effect of sex-composition changes on the supply of physicians' services is of importance, especially since much current federal policy is based upon assumptions about physician behavior drawn from observation of the current stock of physicians. This article explores the issue of differences by sex in lifetime earnings associated with alternative specialty choices. Economic incentives to specialize rather than enter general/family practice are examined initially. Then the incentives influencing the decision to specialize in either primary care or non-primary

care fields are considered. Findings are reviewed and implications for future trends in specialty distribution of physicians, as well as implications for current and future federal policy affecting physicians' specialty decisions, are discussed.

**Patient education: a component of health education.**

De Haes WF

Patient Couns Health Educ ,1982, 4 (2) p95-102, ISSN  
0190-2040 Journal Code: PAL

Languages: ENGLISH

Because health education is aimed at influencing behavior capable of affecting health and disease, patient education is a important constituent of health education. Patient education should demonstrably lead to increased self-assurance, reduced anxiety, better insight into one's ailments, more knowledge about the effects of medicines administered, greater self-acceptance after surgery, and improved social contacts among the chronically ill. It well deserves a place in primary health care. Patient education is not widely practiced in the Netherlands. Small-scale experiments are needed to establish effective modes of intervention.

Engstrom-Poulin C

Can Ment Health ,Sep 1982, 30 (3) p28-9, ISSN 0008-2791  
Journal Code: C8R

Languages: ENGLISH

This paper describes the community rehabilitation team's role in providing services which enable the elderly to remain in their familiar surroundings. The occupational therapist's contributions as a member of this team are outlined, including environmental modifications and adaptations, activities of daily living training, and use of activities to meet specific aims. Finally, the importance of the team members' attitude is discussed. A positive and understanding attitude is a determining factor in the success of intervention programs for the elderly.

**Changes in the U.S. Army aviator selection and training program.**

Brown WR; Dohme JA; Sanders MG

Aviat Space Environ Med ,Dec 1982, 53 (12) p1173-6,  
ISSN 0095-6562 Journal Code: 9JA

Languages: ENGLISH

The Army's aviator selection program began in the mid 1950's. The first Flight Aptitude Selection Test (FAST) was implemented in 1966 and remained in use until 1980 when changes in personnel, aircraft, and tactics necessitated an improved or revised FAST (RFAST). This paper presents an overview of 1) the composition of the FAST and RFAST; 2) the advantages of the RFAST; and 3) the predictive validity estimates for the FAST and RFAST. Also presented are examples of current research projects which show promise for increasing effectiveness and for broadening the scope of the Army aviator selection program.

**Sex as a moderator variable in the selection and training of persons for a skilled task.**

McCloy TM; Koonce JM

Aviat Space Environ Med ,Dec 1982, 53 (12) p1170-2,  
ISSN 0095-6562 Journal Code: 9JA

Languages: ENGLISH

We gave 51 male and 52 female Air Force Academy Cadets a battery of five cognitive and three perceptual motor tests before they were taught four basic flight maneuvers followed by a complex chandelle maneuver. The results showed that the males were much faster in attaining the criterion level of performance on the flight tasks, and that some of the sex differences in the acquisition of task skills can be reduced by means of pretraining on specific cognitive and motor skills. In the prediction of trials to criterion (acquisition rate) of both the basic and the complex flight maneuvers, individually tailoring the regression equations by sex--as opposed to utilizing general overall regression equations--greatly enhanced the predictive capability.

The use of an Aircrew Psychomotor Test Device and the Air Force Officer Qualifying Test have been proposed for the selection of U.S. Air Force pilot training candidates. Random samples of the U.S. Air Force Academy's class of 1978 and the class of 1979 were given the proposed tests and followed through undergraduate pilot training. The results cast serious doubt as to the utility of these tests in selecting U.S. Air Force Academy cadets for pilot training.

**Rural ophthalmology in West Africa.**

Down B

Aust J Ophthalmol ,Nov 1982, 10 (4) p271-5, ISSN  
0310-1177 Journal Code: 9G5

Languages: ENGLISH

Eye disease is common in Africa where it causes much suffering and loss of valuable man-power. Simple measures can provide immense relief at little cost. The majority of the population is not wealthy and lives in rural areas. The Royal Commonwealth Society for the Blind (RCSB) has established mobile eye units as a cost-effective means of treatment and prevention of blindness, and for training national personnel to continue the good work. Ophthalmologists prepared to give a period of service are urgently needed.

**Screening of hearing disorders in schoolchildren.**

Savary P; Ferron P

Am J Otolaryngol ,Nov-Dec 1982, 3 (6) p388-91, ISSN  
0196-0709 Journal Code: 32W

Languages: ENGLISH

A program of screening hearing in schoolchildren based in part on the teacher's observations of behavioral, language, and learning problems has been initiated. Every child identified as suffering from "school pathology" is referred to the school nurse, who arranges for otolaryngologic evaluation, including a complete otologic examination and audiologic assessment with determination of pure-tone air and bone conduction thresholds. Of the 265 children identified as having "school pathology," 93, or 35 per cent, had audiographic abnormalities, and 120, or 45 per cent, had disease processes requiring otolaryngologic management.

**Aid posts in Enga Province.**

Parsons L

Papua New Guinea Med J ,Sep 1982, 25 (3) p173-5, ISSN  
0031-1480 Journal Code: YEU

Languages: ENGLISH

In Papua New Guinea (PNG) primary health care in rural areas is principally provided by aid post orderlies (APO's). During 1979-80, all 110 aid posts in Enga Province were visited; 20% were found to be unstaffed. All APO's were from the province and about 50% were providing satisfactory service. Aid posts were judged on standard of cleanliness, daily patient attendance, number of inpatients, number of family planning consultations provided weekly and on the attendance record of TB and leprosy patients. Aid posts usually had sufficient supplies of basic drugs. Despite the presence of a good APO training school in Enga, the standard of graduates was very variable and some of the best APO's in the province had minimal training over 30 years previously. Tribal warfare in Enga continues to be a threat to the delivery of primary health care.

Languages: FRENCH Summary Languages: ENGLISH

The staff of the department of psychotherapy at the Salpetriere Hospital (Department of Prof. Duche) includes five psychoanalysts who are in charge of the consultations and treatment of hospitalized children, out-patients and parents. Individual psychoanalytical psychotherapy and psychodrama are the methods used. For adolescents and psychotic children, psychotherapy is carried out in a more flexible way. Special attention is given to the outset of therapy and to the support provided to parents. Two groups for the training of child therapists are ongoing.

Monatsschr Kinderheilkd ,Dec 1982, 130 (12) p872-5, ISSN 0026-9298 Journal Code: NHZ  
Languages: GERMAN Summary Languages: ENGLISH  
With a cure rate of over 50% pediatric oncology contrasts with the adult oncology. The success is the result of a multimodal approach with surgery, radiotherapy and chemotherapy to almost all forms of childhood cancer as outlined in various national and international protocols. These are evaluated permanently concerning efficacy and toxicity at one organisation (in Switzerland: the pediatric section of the "Schweizerische Arbeitsgruppe für klinische Krebsforschung"). For the care of the children with malignancy however a specialist physician team at a tumor center is not

enough. Without the cooperation of the family doctors of the area proper referral of the patients and long term treatment can not be realized. Good information and adequate teaching appears to be necessary to give these patients optimal care.

The School Nurse Achievement Program is a national continuing education course for school nurses to increase and improve their services for disabled children. It is currently being developed under the auspices of the Department of Education, Office of Special Education in conjunction with the University of Colorado Health Sciences Center, School of Nursing. A description of a national needs survey of school nurses and resulting program goals, curriculum development, and course administration in twelve states appeared in last month's Journal. Formative and summative evaluation studies to aid in curriculum development and to examine changes in the school nurses' activities are described in Part II of this article.

**Teen advocate program.**

Miller LM

J Sch Health ,1982, 52 (10) p605-7, ISSN 0022-4391

Journal Code: K13

Languages: ENGLISH

The South Bay Free Clinic's Teen Advocate Program is comprised of three basic components: Clinic duties, outreach and CARE-line. The ten Teen Advocates (TA's) spend a total of ten hours per week divided among these activities. In the Clinic, they perform such duties as intake, blood pressure and hematocrit measurement, exam room assistance, birth control raps and answering the phones. Outreach consists mainly of speaking informally with their peers at school, home, parties or wherever young people congregate. Occasionally, TAs speak formally in high school classrooms or at youth-serving agency meetings (e.g. YWCA). They also distribute evaluation forms for each group presentation given. The CARE-line, a health information and referral helpline for teenagers, is staffed by Teen Advocates Monday-Thursday, 4-8 p.m. Adult volunteer supervisors provide necessary support and guidance for the teen listeners.

**Rapid and slow release phenytoin in epileptic patients at steady state: comparative plasma levels and toxicity.**

Sawchuk RJ; Pepin SM; Leppik IE; Gummit RJ

J Pharmacokinet Biopharm ,Aug 1982, 10 (4) p365-82,

ISSN 0090-466X Journal Code: JOV

Languages: ENGLISH

Phenytoin plasma level and toxicity data were compared in a three-way crossover study performed in 18 patients at steady state. Formulations compared were a rapid and a slow release capsule and an oral solution. Plasma concentration-time integrals and maximum plasma phenytoin levels were significantly greater for the rapid release capsule and solution than for the slow release capsule. The incidence of nystagmus and toxicity did not differ for the three treatments, but the occurrence of mental symptoms was more frequent for the oral solution, possibly because of the solvent used in this formulation.

**Academic espionage: dysfunctional aspects of the publish or perish ethic.**

Mensah LL

J Adv Nurs ,Nov 1982, 7 (6) p577-80, ISSN 0309-2402

Journal Code: H3L

Languages: ENGLISH

There are many dysfunctional manifestations relative to the tenure and promotion process. These are disruptive to academic life. Much of this is encouraged by the university because of their publish or perish ethic. Excellence in classroom teaching and success in the field of clinical and human endeavours are not highly valued in deliberations to grant tenure and advancement in academic rank. Research and publications are the major yardsticks upon which a faculty member is judged. This prevailing perspective poses a dilemma for many nursing faculty who have high clinical workloads and have not been socialized for academic survival. The pressures to publish and research can be achieved in a realistic and non-stressful way. Three aspects seem to be particularly relevant to facilitate this achievement; these are: anticipatory planning, balancing the workload, and understanding the interpersonal dimensions of collegiality.

**Changes in patterns of care of the mentally handicapped: implications for nurses' perceptions of their roles and hospital decision making processes.**

Shaw M; Heyman B

J Adv Nurs ,Nov 1982, 7 (6) p555-63, ISSN 0309-2402

Journal Code: H3L

Languages: ENGLISH

This paper reports on the findings of a longitudinal study of a mental subnormality hospital in the North of England. The focus is upon how nurses have experienced a major change in care and treatment of residents from 1978 to 1980. We explore, through the eyes of nurses, the change in their role from a predominantly nurturing/custodial one to a mainly educational/community orientated role. The research findings demonstrate that this change has increased nurses' self-esteem and their satisfaction with important areas of their work. There is some evidence also that nurses/resident relationships have improved in spite of reservations felt about new forms of treatment and community care. We suggest that such reservations may be linked to critical views expressed by nurses, particularly sisters and charge nurses, that decisions were taken about residents by other more senior personnel who had little contact with residents. One important conclusion of this study is that the traditional processes of decision making in the hospital appears to impede the full implementation of a major change which requires nurses to be involved in a potentially threatening process of altering their perceptions of themselves and residents.

**Radiation control through licensing and intensive training.**

Cheng CH; Yang YC; Wu TY; Weng PS

Health Phys ,Dec 1982, 43 (6) p803-11, ISSN 0017-9078 Journal Code: G2H

Languages: ENGLISH

Various types of intensive training courses to suit radiation workers in different fields were sponsored by both the Atomic Energy Council of Executive Yuan and the National Health Administration of Executive Yuan, Republic of China during the past seven years. During the years 1974-79, the number of radiation workers attending each training course, their age, sex and educational background are presented in detail. The typical course contents for both medical and non-medical radiation workers are given. A summary of the percentage of passes and failures of the final examination given at the end of each training course is also given. The present status of licensing for radiation facilities and workers is described, and its results are indicated. The successful control of ionizing radiation through this kind of intensive training and licensing is evidenced in the film badge records given by a centralized service laboratory located at the National Tsing Hua University.

**Models for evaluating services at community mental health centers.**

Lebow J

Hosp Community Psychiatry ,Dec 1982, 33 (12) p1010-4, ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Models for evaluating mental health treatment include the organizational model, the care-process model, the consumer-evaluation model, the efficacy model, and the community-impact model. Although organizational data (such as type of programs, number of personnel, amount of available funds, and quality of practitioners' training) are most frequently used to assess mental health centers, the author discusses the data generated by each of the other models. He also examines the advantages and disadvantages of applying such data to the evaluation of mental health services.

**An education program that improves the psychomotor skills needed for metaproterenol inhaler use.**

O'Bey KA; Jim LK; Gee JP; Cowen ME; Quigley AF

Drug Intell Clin Pharm ,Dec 1982, 16 (12) p945-8, ISSN 0012-6578 Journal Code: EBU

Languages: ENGLISH

This is the first report assessing an education program's impact on teaching patients the psychomotor skills needed for proper use of the metaproterenol inhaler. Most patients do not use pressurized inhalers correctly. This inability could lead to suboptimal or ineffective therapy. Pharmacists provided a standardized education program to asthma patients and to those with chronic obstructive pulmonary disease for three clinic visits. Proper use of the inhaler was assessed by evaluating the patient's psychomotor performance for each visit before and after instruction. Of 19 patients, 18 demonstrated a mean improvement of 33.5 percent from preinstruction to postinstruction evaluation at the first visit (Student's t-test, p less than 0.0005). Both preinstruction and postinstruction scores demonstrated an upward trend for all three visits, the postinstruction scores always being higher than the preinstruction scores. These results indicate that our standardized education program helped improve psychomotor performance. Certain instructional aspects that need emphasis in future education programs have been identified.

Declining budget conditions in many social service settings suggest that education must provide future graduates with very different managerial skills. When human service organizations are perceived as evolving political structures, populated with a variety of individuals who represent diverse values and claims, resource scarcity often results in growing conflict and a preoccupation with individual and subunit survival. This changing organizational context will require increasing political skill on the part of managers as well as an ability to harmonize new approaches with prior service values in achieving consensus around solutions to service delivery problems.

**Doctors' roles in primary health care.**

Piyaratn P

Trop Doct ,Oct 1982, 12 (4 Pt 2) p196-202, ISSN

0049-4755 Journal Code: WGC

Languages: ENGLISH

Doctors in developing countries where the majority of the population live in rural areas are facing difficult adjustments of their roles to attain health for all of the rural population. In Thailand, doctors directing remote district hospitals act as the focal points of other health care facilities serving the entire population of the districts. To supplement the existing governmental health service network and in accordance with principles of primary health care, community primary health care volunteers are being developed to expand service coverage to rural communities. These lead to changes in doctors' roles. Doctors are required to be not only competent clinicians but also good managers of health promotive and preventive programmes, effective hospital administrators, competent trainers and qualified researchers. They must not only work within the hospital but also support the health personnel and activities of the entire district, and in particular the community primary health care workers. However, as it is now, they are graduates of traditional medical schools, whose educational programmes do not equip them adequately for their emerging new roles in rural hospitals. Reorientation of the existing health system, including its health personnel, is needed. The critical factor in such a process is the development of appropriate attitudes at all levels of health services. This is a difficult but challenging task, as it involves long established medical institutions which hold firmly to old traditions and values.

**Factors related to the prescribing of selected psychotropic drugs by primary care physicians.**

Hadsall RS; Freeman RA; Norwood GJ

Soc Sci Med ,1982, 16 (20) p1747-56, ISSN 0277-9536

Journal Code: UT9

Languages: ENGLISH

The objective of this study were to investigate the influences of differing physician characteristics and attitudes on the diagnosis of emotional problems, and the prescribing of selected psychotropic and non-psychotropic drugs. The 32 physicians who completed the study recorded 10,585 patient visits, which accounted for 7934 prescribed drugs. Overall, 549 (6.9%) of the drugs prescribed were classified as psychotropic drugs. After controlling for patient characteristics, there was not a statistically significant relationship between board certification, practice size, or physician age and the rate at which study physicians diagnose emotional problems. Board certification, physician age, physician propensity to prescribe drug therapy, and the feeling that patients expect drug therapy were significantly related to the prescribing of non-psychotropic drugs, the prescribing of psychotropic drugs was not predictable. Only the propensity to prescribe drug therapy was significantly related to the rate at which physicians prescribed drugs for their patients.

The founding of the National Schizophrenia Fellowship (NSF) is described as a response to the failure of the professional mental health community to meet the needs of schizophrenic individuals and their families. Since its inception, the NSF has engaged in four types of activities: education, political lobbying, policy formulation, and research support. Examples of each type of activity are given, illustrating the efficacy of such consumer-oriented organizations in coping with serious mental disorders such as schizophrenia.

Walter J  
Nurs Clin North Am ,Dec 1982, 17 (4) p607-29, ISSN 0029-6465  
Journal Code: 092

Languages: ENGLISH

Caring for patients who receive chemotherapeutic agents is among the most challenging and potentially rewarding dimensions of oncologic nursing practice. The nurse must possess sound knowledge of not only the biologic and behavioral sciences, but also of current oncologic nursing practices, pathology, and the pharmaceuticals of antineoplastic drugs. However, comprehensive nursing care must counterbalance clinical expertise with sensitivity to the unique problems patients with cancer and their families experience. Because the nurse is often the only health care professional with whom the patient and family have consistent contact, clinical expertise and sensitivity are of critical importance to the well-being of patients and their families during therapy. Through accurate, ongoing assessment and identification of problems, prompt recognition of learning needs, and intelligent, supportive, and creative interventions, nurses can do much to assure that patients and families receive the comprehensive care to which they are entitled. It is the purpose of this paper to discuss essential aspects of antineoplastic drug therapy and the important role of the nurse in caring for patients receiving this type of treatment.

Vojtecky MA  
Med Care ,Dec 1982, 20 (12) p1168-77, ISSN 0025-7079  
Journal Code: LSM  
Languages: ENGLISH

A field study was conducted to examine the relative control of provider and consumer members of HSA Project Review Committee. Three project review committees chosen at random during a single HSA review cycle were observed throughout the decision-making process using Interaction Process Analysis. Results indicated that there were no significant differences in control between the provider and consumer members when considered as subgroups of the review committees. Findings also confirm the critical role of the chairperson in the organization and function of the group. It can be concluded that the occupational prestige of provider or consumer members is not imported into the planning situation to a sufficient degree to allow either the provider or consumer subgroup to dominate the planning process. Innovations in health care planning such as long-term education in health planning, group processes, and related issues should be attempted to enhance the effectiveness of these groups.

**Nursing decision making in critical care areas.**

Baumann A; Bourbonnais F  
J Adv Nurs ,Sep 1982, 7 (5) p435-46, ISSN 0309-2402  
Journal Code: H3L  
Languages: ENGLISH

This exploratory study sought to identify factors that critical care nurses consider relevant in making rapid patient care decisions; to explore the decision making of these nurses in crisis situations; and to identify critical patient care situations where rapid nursing decisions are made. The convenience sample consisted of 50 nurses in critical care settings. A semi-structured interview with a critical care

case study was utilized to examine the nurses' decision making. Open ended responses were transformed into fixed categories for tabulation. The findings suggested that: 1 knowledge and experience were the most important factors influencing rapid decision making; 2 although the nurses identified the appropriate decisions in a given crisis situation they had difficulty providing a theoretical rationale for their decisions; 3 the given case study and the 50 crisis situations identified by the subjects indicated that many nursing decisions for critically ill patients were carried out prior to physician assistance. A demographic data questionnaire that examined age, nursing experience, formal education and continuing education of the subjects determined that the majority of the nurses were under 30 years old, had either less than 1 year experience or 7-9 years in critical care, were graduates of a 2-year diploma programme, and took continuing education courses at the community college level.

**Increased peripheral insulin sensitivity and muscle mitochondrial enzymes but unchanged blood glucose control in type I diabetics after physical training.**

Wallberg-Henriksson H; Gunnarsson R; Henriksson J; DeFronzo  
 R; Felig P; Ostman J; Wahren J  
 Diabetes ,Dec 1982, 31 (12) p1044-50, ISSN 0012-1797  
 Journal Code: EBX  
 Languages: ENGLISH

Nine male, insulin-dependent diabetic patients participated in a 16-wk training program consisting of 1 h of jogging, running, ball games, and gymnastics, performed 2-3 times/wk. The training resulted in an 8% increase of maximal oxygen uptake (P less than 0.01). Insulin sensitivity as determined by the insulin clamp technique increased 20% (P less than 0.05). Glycosylated hemoglobin showed no change (10.4 +/- 0.7% versus 11.3 +/- 0.5%), 24-h urinary glucose excretion was not reduced, and home-monitored urine tests were unchanged. The frequency of hypoglycemic attacks did not change during the training period and body weight remained constant. There was a 14% fall in plasma cholesterol (P less than 0.01) and a rise in the proportion of HDL-cholesterol from 24 +/- 2% to 30 +/- 3% (P less than 0.01). Thigh muscle oxidative capacity increased, as indicated by a 24% increase in succinate dehydrogenase activity (P less than 0.05). The number of capillaries/muscle fiber increased 15% (P less than 0.01). However, as the mean muscle fiber cross-sectional area increased to a similar extent (11%, P less than 0.05), capillary density (cap x mm<sup>2</sup>) was unchanged. In conclusion, this study demonstrates that physical training in insulin-dependent diabetics results in increased peripheral insulin sensitivity, a rise in muscle mitochondrial enzyme activities, decreased total plasma cholesterol levels, and unchanged blood glucose control. The findings suggest that in the absence of efforts to alter dietary regulation and insulin administration, physical training consisting of 2-3 weekly bouts of moderate exercise may not of itself improve blood glucose control in type I diabetes.

**The hospital capital crisis: issues for trustees.**

Bradford C; Caldwell G; Goldsmith J

Harv Bus Rev ,Sep-Oct 1982, 60 (5) p56-68, ISSN

0017-8012 Journal Code: GBE

Languages: ENGLISH

The erosion of the capital position in the hospital industry--one of the most complex and overregulated industries in the United States--is a major challenge to trustees. Hospital trustees have often neglected to examine their hospitals' capital needs on more than a project-by-project basis. In dealing with their hospitals' capital needs, trustees, most of whom are successful business people, too often take off their "business" hats and put on their "social worker" hats. In doing so they not only neglect to subject their hospitals' capital and operating programs to searching cost-benefit review, but they also overlook much useful knowledge about how to use corporate organization to shelter new ventures and strengthen their hospitals' market position and solvency. In this article, the authors discuss how hospitals can adopt successful corporate restructurings and strategies to respond to the adverse financial developments they will have to face in the coming years.

**Development of a national system of physical training to**

**decrease risk factors of diseases in GDR.**

Kabisch D

Ann Clin Res ,1982, 34 p42-7, ISSN 0003-4762 Journal Code: 53A

Languages: ENGLISH

The prevention and control of diseases with priority character for people's health is only possible through concerted measures in the medical, social and political fields. In GDR there is in principle concurrence between the purposes in sports and health policies, which becomes evident in administration and management of public health and sports. Physical culture and sports have gained a new position and function through a conscious integration into protection of health of citizens. Simultaneously there has been a shift in emphasis of all medical and social measures from mainly curative to prophylactic measures. The development of sports medicine and its activities in that field have--directly and indirectly--considerably influenced medical and social measures conducive to health. In addition to the registration of adaptational processes in the organism the organization of health training and the training of functional capacities for all citizens is gaining in importance in sports medical care. This comprises the theoretical justification of the possibility of health training as well as the creation of instructions for training, advice in establishing standards of health and their translation into popular forms of physical culture and sports in institutions of education, in enterprises and communities.

**Home care of the pediatric patient with a tracheotomy.**

Ruben RJ; Newton L; Jornsay D; Stein R; Chambers H; Liquori J; Lawrence C

Ann Dtol Rhinol Laryngol ,Nov-Dec 1982, 91 (6 Pt 1) p633-40, ISSN 0003-4898 Journal Code: 502

Languages: ENGLISH

Forty-seven infants and children with tracheotomies were cared for at home for a follow-up period of 1,581 months. There were two relevant fatalities which gave a death rate of 0.13 deaths per 100 months. The average age at the time of tracheotomy was 13 months and the tracheotomy was in place for an average of 33 months per patient. The ability to care for these children was provided through coordinated, intensive training and a home-care program in which the inpatient nurse, nurse practitioner, social worker, pediatrician, and otorhinolaryngologist worked as a team.

**Parietal cell vagotomy in a surgical training program.**

Weger RV; Meier DE; Richardson CT; Feldman M; McClelland RN  
Am J Surg ,Dec 1982, 144 (6) p689-93, ISSN 0002-9610  
Journal Code: 3Z4

Languages: ENGLISH

Parietal cell vagotomy was performed in 48 patients at the Parkland Memorial Hospital and the Dallas Veterans Administration Hospital between April 1977 and January 1981. The maximum follow-up time was 50 months and the average was 28 months. Seventy-five percent of the patients were followed for more than 1 year. There were no operative deaths. Four patients (8.3 percent) had persistent postoperative side effects including two documented ulcer recurrences (4.2 percent). Acid secretion studies were reviewed to characterize the longterm effect of parietal cell vagotomy. These studies demonstrated marked postoperative reductions in gastric acid secretion. The results of this study suggest that with the simplified technique described in this paper, parietal cell vagotomy can be performed with minimal mortality and morbidity by surgical residents under direct staff supervision.

**The psychiatric chief resident: does gender make a difference?**

Kessler MD; Hellekson-Emery C; Wilder JF  
Am J Psychiatry ,Dec 1982, 139 (12) p1610-3, ISSN  
0002-953X Journal Code: 3VG

Languages: ENGLISH

The authors surveyed women and men psychiatric chief residents who were near the end of their residency training. The findings documented the active participation of women in leadership roles as psychiatric residents in education, administration, and clinical care. Men and women reported remarkably similar job descriptions, opportunities, and difficulties. Women were less likely than men to participate in research activities during the chief residency or to accept full-time faculty positions after training.

**Difficulties in the integration of psychological and medical practices.**

Brown HN; Zinberg NE  
Am J Psychiatry ,Dec 1982, 139 (12) p1576-80, ISSN  
0002-953X Journal Code: 3VG

Contract/Grant No.: MH-14910

Languages: ENGLISH

The authors, who support in principle the important goal of integrated psychological and physical care, discuss five sources of difficulty in the practical application of such integration: 1) differences in values and, consequently, in systems of practice, 2) training influences, 3) differences in dealing with emotions, 4) conflicting patient expectations, and 5) limitations on the degree of intimacy tolerable in

professional relationships. They suggest that practitioners and educators take these difficulties into account without abandoning a holistic perspective.

**Effectiveness of employee training and motivation programs in reducing exposure to inorganic lead and lead alkyls.**

Maples TW; Jacoby JA; Johnson DE; Ter Haar GL; Buckingham FM  
Am Ind Hyg Assoc J ,Sep 1982, 43 (9) p692-4, ISSN  
0002-8894 Journal Code: 3CI

Languages: ENGLISH

The Occupational Safety and Health Administration has advanced engineering controls over administrative controls and protective equipment to reduce exposures to chemicals in the workplace. The application of employee training and motivation programs (such as job safety analysis) to reduce exposures to chemicals has not been emphasized. To determine the effectiveness of such programs, a pilot project in an alkyl lead production facility was conducted with 35 employees in an effort to reduce exposures to organic and inorganic lead. Results after 12 months show a 40% reduction in lead-in-urine and a 24% reduction in lead-in-blood, both indicators of total exposure to organic inorganic lead.

Bruce J

Stud Fam Plann ,Oct 1981, 12 (10) p353-63, ISSN

0039-3665 Journal Code: V52

Languages: ENGLISH

There are today some 200 women's health centers in the United States providing information and, in many cases, direct health and family planning services to women in a manner responsive to their needs and preferences, and that involves them in the design and provision of services. This approach to delivering services was specifically recommended by the International Conference of Family Planning in the 1980's held in Indonesia in April 1981. In addressing the challenges facing family planning programs in the decade ahead, the conference noted that in many parts of the world, women often have little control over decisions related to their own fertility. Furthermore, low levels of acceptance and use of family planning, which are characteristic of many programs, often reflect a failure to design and provide services in a manner that is responsive to the needs and perceptions of the users. The conference called for measures to improve the status of women, and recommended that women be involved in all aspects of program design, management, policymaking, and provision of services. In this special report, Judith Bruce describes how women-oriented services are designed and provided at one of the women's health centers, The New Hampshire Feminist Health Center.

**[Comparative study of a new package insert for benzodiazepines adapted for patients]**

Etude comparative d'une nouvelle notice d'emballage pour benzodiazepines adaptee aux malades.

Desponds G; van Melle G; Schelling JL

Schweiz Med Wochenschr ,Oct 1982, 112 (40) p1376-82,

ISSN 0036-7672 Journal Code: UEI

Languages: FRENCH Summary Languages: ENGLISH

A standardized, patient-oriented package insert for benzodiazepines has been compared with four package inserts printed by manufacturers for these drugs. The leaflets were submitted to 222 hospitalized patients randomly allocated to two groups; 108 received a manufacturer's notice and 114 the standardized notice. The patients were interviewed two or three days later and found the standardized notice more comprehensible than those of the manufacturers. Two independent experts assessed the adequacy of the notices and also found the standardized notice more appropriate for patients. The patients answered a questionnaire about the effects of the drugs and the precautions while using them. Those who had read the standardized notice were significantly better informed than those who had read manufacturers' notices. However, the level of understanding varied largely from one item to another, and depended on the level of education and age.

**Therapeutic drug monitoring: a survey of sub- and supra-therapeutic serum drug levels in a large teaching hospital.**

Frewin DB; Shaw DR; Bochner F  
NZ Med J ,Nov 10 1982, 95 (719) p774-6, ISSN 0028-8446  
Journal Code: DBQ  
Languages: ENGLISH

One thousand five hundred serum drug levels lying outside the defined therapeutic range have been followed up by the clinical pharmacology service at the Royal Adelaide Hospital over a thirteen month period. It was found that digoxin, phenytoin and theophylline were the most frequently monitored drugs. Blood levels outside the therapeutic range tended to be on the high side with digoxin, but were usually sub-therapeutic for the other two. Drug related toxicity was observed in 11.2 percent of those with a high serum level. Several potential drug interacting situations were also noted during the study. The value of therapeutic drug monitoring, to maximise efficacy of therapy and minimise side effects, is stressed. However, correct blood sampling, based on a knowledge of the clinical pharmacology and pharmacokinetics of the drug, must be performed in order to obtain optimal benefit from this exercise.

Languages: ENGLISH

The study reported here documents a variety of psychiatric educational needs of residents in internal medicine. By studying 150 medical outpatients, the authors found that 59 percent of the patients had probable emotional disorders, 48 percent suffered from significant symptoms of depression, negative life events and low social support were significantly associated with both probable emotional disorder and depressive symptoms, only 20 percent of the patient charts contained psychiatric diagnoses, 78 percent of the charts contained no mental status data, patients on the average could report only 56 percent of their diagnoses and 60 percent of their management plans, and 70 percent of the patients reported that they were not asked about personal problems. These results have formed the basis for a psychiatric educational program in internal medicine at the University of Alabama in Birmingham and will serve as pretraining comparison data for the evaluation of outcome.

**Management of minor medical problems and trauma: general practice or hospital?**

Myers P

J R Soc Med ,Nov 1982, 75 (11) p879-83, Journal Code: JX1

Languages: ENGLISH

An assessment of the problems for which 1000 consecutive patients attended an accident and emergency department of a district general hospital showed that 54.2% could have been treated by general practitioner. Amongst 150 patients attending hospital for minor problems between the hours of 09:00 and 19:00 on weekdays, the main reason given for not going to a GP was their impression that only in hospital could the required treatment be provided. A postal survey of 50 GPs found that they tended to avoid regularly handling certain specified minor problems which often present to hospital. The current trend away from the community management of such problems is discussed. It is suggested that improving patient education and GPs' incentives, while decreasing list sizes and expanding the primary care team, may encourage the management by GPs of trivial trauma and minor medical problems.

**Geriatric medicine: a multidisciplinary training and education model in an acute care medical center.**

Crooks V; Lee P; Yoshikawa TT

J Am Geriatr Soc ,Dec 1982, 30 (12) p774-80, ISSN 0002-8614  
Journal Code: H6V

Languages: ENGLISH

A description of a comprehensive multidisciplinary education and training program in geriatrics in an acute care hospital is presented. A brief review of the history of medical education in geriatrics is examined, and the need for and potential of a hospital-based training program is discussed. The methods used in implementing an education program that attracts house staff physicians and other health professionals are described. The program incorporates the application of a multidisciplinary team model of patient assessment and treatment, which is augmented by clinical bedside teaching and a broad-based educational program. Using hospital-wide faculty, the program includes a geriatrics/gerontology lecture series incorporating presentations on the biopsychosocial aspects of aging and a diversity of subjects relevant to aging. Other programs such as weekly house staff topic sessions on aging, interdisciplinary research seminars,

orientations, and special symposia are all part of the education program.

**How to avoid malnutrition during hospitalization?**

Isaksson B

Hum Nutr Appl Nutr ,Oct 1982, 36 (5) p367-73, Journal Code: G9G

Languages: ENGLISH

Doctors often consider malnutrition as a set of symptoms rather than being a state of nourishment. Consequently, the nutrition of patients without obvious signs of malnutrition is often neglected. Among all categories of patients, unrecognized malnutrition at admission or under-feeding during hospitalization are everyday occurrences. Dietary records of hospitalized patients often show energy intakes well below their calculated BMR and their need for an increased supply of essential nutrients, such as protein, is seldom met. The significance of food preparation, food distribution and ward staff attitudes for proper feeding of the patients is discussed and the responsibility of the doctors for the nutritional care of every patient is stressed.

0222992 83055861

**Oral hygiene for children: a look at what we must have and what we should do.**

Leatherman GH

Int Dent J ,Sep 1982, 32 (3) p252-8, ISSN 0020-6539  
Journal Code: GPT

Languages: ENGLISH

Numerous reports show the state of oral health in children from many parts of the world. They indicate that dental caries and periodontal disease in children are common and not under proper control and that there is a high prevalence of dentofacial anomalies requiring early treatment. What we must have in relation to oral hygiene for children are manpower, materials and health education. These needs are analysed in detail. What we do is described for three groups of children: preschool, school and adolescent and young adult. Six common factors for all children carrying out oral hygiene are outlined under the following headings: (a) increasing the resistance of the tooth by the use of fluorides, (b) the control of plaque, (c) correct nutrition, (d) dental health education, (e) early recognition of major disorders of the orofacial complex and (f) regular visits to the dentist and his auxiliary help. What we should be doing for each group is discussed. Finally, some thought about the future way to dental health are presented in which it is suggested that the computer revolution "will have an overwhelming and comprehensive impact on every human being on earth in every aspect of his or her life" (Evans, 1979). The question is asked and discussed whether the dental profession is preparing for this revolution and the great changes that will come in our methods of education, clinical practice, research and education. The paper ends with the proposal that now is the time for organized dentistry to examine its policies in relation to education, clinical practice, research and administration so as to produce a primary dental health service available to total populations in the countries of the

world.

**The demand for human resources by the community: the implications of a community participation approach.**

Whyte AV  
Educ Med Salud ,1982, 16 (3) p287-300, ISSN 0013-1091  
Journal Code: EDR  
Languages: ENGLISH

The author states that community participation needs to be designed at the national level and executed at the local level, which therefore places greater demands on the organizational efficiency and communication skills of national agencies. The ramifications of a community participation approach reach all aspects of national planning, including budget procedures and allocations of responsibility. Above all, the approach requires that authority, responsibility, and procedures be clearly spelled out and understood by all involved. Only when national strategies have been set for numbers of communities to be served, level of service, and degree of community involvement, can the specific implications for manpower needs, training, and national support services be discussed, evaluated, and quantified. Given a clear indication of national policy directions for community participation, sector planners can begin discussions with their regional offices, other agencies, and community leaders on how to implement it. This article reviews some of the major issues about human resources that need to be addressed in the planning process.

ISSN 0301-5661 Journal Code: DNF  
Contract/Grant No.: NIH-NIDR-72-2410  
Languages: ENGLISH  
The objectives were to demonstrate that a combination of

preventive regimens could significantly reduce dental disease in a school population, to demonstrate the feasibility of a school-based program in relation to sustained benefits. There were 1286 students in 1st and 6th grades enrolled in the study. Subjects were stratified by grade, sex, and race and randomly placed in a treatment or education group. Procedures included ingestion of fluoridated water, oral hygiene education program, dental examinations, prophylaxis, acidulated phosphate fluoride gel (1.23%) applied in trays, pit and fissure sealants (bis-GMA) on occlusal surfaces of all eligible posterior teeth, and provision of all restorative care. Fluoride and sealant procedures were repeated at 6-month intervals. After 3 years the treatment group was randomly divided to provide a group that would not continue with treatment and serve as a comparison. The study population was enrolled in 18 schools and clinical procedures were provided on-site, using mobile dental vans. Five-year results indicate high degree of success with fall-off of benefits to those for whom treatment was terminated. This pilot program gives strong evidence for the possibility of implementing school-based dental programs. The study also indicates that prevention programs must be comprehensive and continuous for maximum benefit to occur.

Languages: ENGLISH

The internal medicine unit of the Royal Victoria Hospital in Montreal was created in 1979 to improve the training of residents and the care of patients. The practices of four internists were brought together in one part of the institution, and within 2 years there were 10 attending staff and 6 residents. The unit now provides continuing care for 2500 patients, many of whom have multisystem or potentially lethal problems. Residents and attending staff share the responsibility of providing 24-hour coverage. The group handles 5000 outpatient visits per year (20% of them being consultations) and provides a general medical consulting service for other hospital departments, with about 300 consultations per year. The creation of the unit, with highly visible role models, appears to have given new prestige to general internists in the hospital. The unit has served as a model for the reorganization of the other medical clinics and provides a base for research in health care delivery.

The drug abuse control programme in Baluchistan is inter-disciplinary and progressive. Its main thrust consists of constant vigilance on border check-points by law enforcement agencies, developing in-patient and out-patient facilities for treatment and rehabilitation of addicted persons, and a preventive education programme using the mass media and students from higher educational institutions.

**A comprehensive program to increase job satisfaction among pharmacy technicians.**

Mahoney CD; Gallina JN; Jeffrey LP  
Hosp Pharm , Oct 1982. 17 (10) p547-50. ISSN 0018-5787  
Journal Code: G98  
Languages: ENGLISH

A multifaceted personnel management and continuing education program specifically designed to provide job satisfaction for the pharmacy technician is described. Turnover among technicians is often higher than for other personnel categories. One interpretation of a high turnover rate is that it is a direct indication of job dissatisfaction and disillusionment on the part of technicians towards their career potential. Several approaches were initiated at the Rhode Island Hospital to increase job satisfaction among pharmacy technicians and to assist the pharmacy department in stabilizing this category to reflect a more satisfactory turnover rate. These were: (1) initiating a comprehensive continuing education program; (2) establishing a "career ladder" by developing an advanced level of pharmacy technicians; (3) incorporating technicians in a concept of participative management within the department; (4) increasing job responsibilities as new programs are developed; (5) rotating assignments and responsibilities to foster flexibility and interest. The programs enumerated have made a significant contribution toward increasing the stability and job satisfaction of the technician category. The success of the measures described is reflected in the average tenure of an individual in the technician category, which is 41.9 months.

Contract/Grant No.: HS 02577  
Languages: ENGLISH

We studied the use of stat (ie, statim--as soon as possible) laboratory tests at a university teaching hospital. For the 20 most frequently performed tests, 35.7% of the determinations were performed on a stat basis. The frequency with which a test was ordered on a stat basis ranged from 6.0% (for ESR) to 61.5% (amylase level). The proportion of laboratory test requests from a hospital service that were ordered stat ranged from 3.8% (orthopedic surgery) to 100% (emergency services). The daily number of regular laboratory test requests decreased significantly over the weekend, but the daily number of stat requests fell less sharply. The number of requests for routine tests decreased after 6 pm, but the number of requests for stat tests remained relatively constant until about midnight.

The 1977 field test and first administration of the American Board of Emergency Medicine certification examination produced data which support the assumption upon which it was originally developed. A total of 22 fourth-year medical students, 36 emergency medicine residents, and 36 emergency physicians participated in the field test held in Lansing, Michigan. The examination was found to be highly reliable, to distribute scores among groups according to presumed competence, and to support the concept of treating the examination as a total instrument rather than one subdivided by content areas. Patient management problems were found to be inefficient as a test format. The first administration of the examination, which tested 616 candidates, confirmed the original field test findings.

**A conjoint psychiatry-internal medicine program: development of a teaching and clinical model.**

Shemo JP; Ballenger JC; Yazel JJ; Spradlin WW  
Am J Psychiatry ,Nov 1982, 139 (11) p1437-42. ISSN  
0002-953X Journal Code: 3VG  
Languages: ENGLISH

At a time when psychiatry's repertoire of successful treatment strategies is burgeoning and the public is seeking primary medical care with greater emphasis on humanistic issues, psychiatry has been paradoxically losing status and trainees, partly because it has failed to make its expertise integratable by nonpsychiatric physicians. In response to the educational and patient care deficiencies that result, two universities developed a teaching and clinical program that leads to partial integration of their departments of psychiatry and internal medicine. This collaborative approach includes a conjoint internal medicine-behavioral medicine inpatient unit and a residency program leading to Board eligibility in both specialties.

A new type of occupational medicine clinic has recently emerged in the United States. These clinics are multispecialty in staffing, are located in hospital outpatient departments, and are affiliated with academic medical centers. Their primary goal is to provide personal health and medical services including diagnosis, treatment, and follow-through of occupationally related diseases. Approximately 15 such clinics have been established in the last several years. A review of the medical, economic, and social forces that have historically shaped the content and scope of occupational medical and health services for workers explains in large part the reasons why many of these clinics have now come into being. Characteristics of eight of these clinics are reviewed in detail. These clinics provide a setting for interdisciplinary and interspecialty education of personnel and offer the medical community a demonstration of a means for better recognition and treatment of occupationally related illnesses.

Studies were conducted in 1977 and again in 1980 comparing the knowledge and information escorts of paediatric outpatients had about the child's illness and treatment after completing primary care consultations of various kinds. Primary health care nurses achieved the best communication as

judged by answers to a questionnaire administered to the escorts by a social worker. Understanding was greater when patients were seen initially by doctors in the Department of Paediatrics outpatient clinic rather than by doctors in the Soweto polyclinics. Some of the associated factors are discussed.

Die Zukunft des psychiatrischen Krankenhauses--Auflosung oder Wandlung?

Boker W  
Schweiz Arch Neurol Neurochir Psychiatr ,1982, 130 (2) p203-13. ISSN 0036-7273  
Journal Code: UDS  
Languages: GERMAN Summary Languages: ENGLISH

A great variety of therapeutic models and alternative ways of taking care of the mentally disturbed have lately made the future of the independent psychiatric hospital rather uncertain. Out-patient and partially in-patient facilities, psychiatric wards within the frame of general hospitals, the transfer of chronic cases to non-psychiatric nursing homes, and redress in cases of misplaced persons, constitute steps and measures entailing a considerable shrinkage in the size and extent of the psychiatric hospital of today, although the alternatives mentioned cannot, of course, entirely replace it.

There is in the population an estimated need for 1.1 to 1.6 psychiatric hospital beds for every 1000 of persons. The psychiatric hospital of the future should aim at attending to and satisfy the various needs of the following three categories, i.e. 1. crisis intervention in cases of gravely upset, psychotically agitated or suicidal patients, 2. programs of intensive therapy by specialized nursing teams for average and long-term mentally disturbed patients, and finally, 3. a certain supply of asylums for the comparatively small number of most severely handicapped persons. The experiences drawn from these combined operations will be of great value to the research field, as well as in the basic and continued training of personnel.

Broda M; Bengel J

Rehabilitation (Stuttg) ,Aug 1982, 21 (3) p111-5, ISSN

0034-3536 Journal Code: R3P

Languages: GERMAN Summary Languages: ENGLISH

Rehabilitation facilities (N=110) in the Federal Republic of Germany had been surveyed in order primarily to take stock of the psychological/psychotherapeutic services available for treatment in various disorders. The numbers of psychologists employed are shown to vary with the diagnostic groups served by the respective institutions. Facilities in the field of child and adolescent psychiatry, for the care of disabled person, and of persons with dependence problems are much better provided with psychologists than are facilities in the fields of psychiatry, neurology, and internal medicine. The same picture is found as regards the patients/psychologist ratios applicable in the different facilities. Preference of certain psychotherapeutic models (behavioural therapy, client-centered psychotherapy, psychoanalysis) varies with facility type. Especially noteworthy is an apparent predominance of inpatient services as opposed to outpatients models of service delivery. This fact is an indication of insufficient availability of follow-up care. Finally, various curricular aspects of the professional training of psychologists are outlined in relation to the recently established specialty of rehabilitation psychology.

Successful settlement of disabled persons in gainful employment is closely contingent on both their training and the working environment present. For those disabled persons who cannot find jobs in the open market, it is possible to work in sheltered workshops. Founded on the initiative of parents of spastic children, the Saarbrücken Reha GmbH, a limited liability company for the sheltered employment of disabled persons, has for several years been employing disabled people in the field of text and data processing. This paper not only outlines some practical examples to illustrate suitable systems but also describes the types of tasks where good results can be achieved by the disabled employees.

Smith-Brady R

Nurs Clin North Am ,Sep 1982, 17 (3) p499-512, ISSN  
0029-6465 Journal Code: 092

Languages: ENGLISH

A stroke rehabilitation unit or designated hospital beds for the purpose of implementing a stroke rehabilitation program is an effective way to achieve patient compliance. The program should be structured to support the fact that most patients recover most of their spontaneous improvement of brain and motor function by the time they are discharged from the hospital. The overall goal of the program is to provide a consistent rehabilitative approach to improve and maintain patient compliance with a prescribed regimen. Patient compliance is directly related to the patient's perception and knowledge of the disease, his physical condition, and the prescribed therapy. It is important that the program address itself to these three areas. Key activities that enhance the stroke patient's compliance include education of the patient and patient contracting. The stroke rehabilitation program is also evaluated in terms of satisfaction of the patient and the staff. The preservation, promotion, and restoration of health are the rights of every stroke patient. The scope of rehabilitation will continue to reflect the need for developing alternative methods of assisting patients in restructuring their patterns of living. The development of a stroke rehabilitation unit is a step in that direction.

Journal Code: LSM

Contract/Grant No.: HL-17016, MH-14567; 1-32(HL)-07180  
Languages: ENGLISH

Triage method based upon individual patient characteristics is developed to determine the most effective health education interventions for hypertensive patients. The sample included 402 patients randomly assigned to experimental and control groups. The efficacy of a triage process, whereby patients are subdivided into groups that are more predisposed to benefit from a given health education approach, is discussed. From a limited cost-benefit evaluation, it appears that the benefits of the triage method for achieving medication compliance clearly outweigh its costs only in the case of the highly depressed patients (24 per cent of the sample). Different levels of depression were found to be differentially responsive to different health education treatments for achieving adherence to medication. The most depressed patients were more responsive to family member reinforcement, a 156 per cent increase in the number of high compliers as compared to no intervention.

**In-class evaluation of behavior modification knowledge: parallel tests for use in applied settings.**

Furtkamp E; Giffort D; Schiers W  
J Behav Ther Exp Psychiatry ,Jun 1982, 13 (2) p131-4, ISSN 0005-7916  
Journal Code: HTN  
Languages: ENGLISH

A revision of the Knowledge of Behavioral Principles as Applied to Children test (O'Dell, Tarler-Benlolo and Flynn, 1979) is described. The revision includes reduction of the original 50 item test to two 10 item tests through administration of the test to a sample of 164 direct care staff after training in an applied human service setting. Psychometric assessment of the two short forms was done using a second sample of 111 trainees. Reducing the test had little impact on the internal consistency of the tests (from 0.862 to 0.735 and 0.765). The two short forms exhibited some of the characteristics of parallel forms (equal means and variances) and their intercorrelation ( $r = 0.87$ , corrected for attenuation) was sufficient for further use in research or evaluation settings. Suggestions for further development and use of the two forms were made.

**Motivational management: coping with burnout.**

Richardson M; West P

Hosp Community Psychiatry ,Oct 1982, 33 (10) p837-40,  
ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

Burnout, the emotional state that accompanies an overload of stress, generally has been ascribed to organizational or personal causes. Motivational management is an approach to identifying the causes of burnout among workers and determining ways to effectively intercede. The authors conducted workshops to help staff combat burnout at a public health agency, a small community hospital, and a preschool for handicapped children. During the first phase of the workshop participants generated a list of problems that contributed to their sense of burnout. They then assigned each problem a personal, organizational, or environmental cause. During the second phase participants decided who should accept responsibility for developing and executing strategies for change. The authors believe motivational management techniques can also be used to explore burnout in other roles such as those of parent, child, friend, or community member.

New Priorities in mental health service delivery call for the exploration of previously overlooked sources of mental health personnel whose preparation for practice is adapted to historically underserved populations and service delivery approaches geared to their special needs. One such source are baccalaureate level social workers. This exploratory study of 29 purposively selected baccalaureate social work education programs observes and describes their extensive mental health field instruction, in which the predominant student assignments include case management and related functions stressed in current mental health policy. Implications are drawn regarding the allocation of federal training funds and labor force issues.

Languages: ENGLISH

Clinical cancer research is at a crossroads. The major progress which has been achieved will continue, provided that factors which threaten the clinical cancer researcher are identified and corrected. These problems (with proposed solutions) include: the increasing number of clinical oncologists, particularly medical oncologists; the relationship of the practicing clinical oncologist to cancer centers; the relative attractions of clinical practice, on the one side, and basic science on the other, as compared to clinical cancer research; the lack of recognition that clinical cancer research provides an opportunity for high achievement and challenge, and originality; the threat of curtailment of research funding; jurisdictional and other conflicts between scientific and clinical disciplines; the emerging "establishment generation" of clinical oncology; and the bureaucratic and regulatory ambience that has increasingly enveloped the clinical cancer researcher. That opportunities for originality continue was illustrated by a new therapeutic surgery known as neoadjuvant or anterior chemotherapy. In this strategy, systemic treatment is employed prior to surgery and/or radiotherapy for patients with head and neck cancer has increased operability ("upstaged" the patient) and on preliminary analysis would appear to be increasing disease-free survival. A clinical trial in osteogenic sarcoma involving initial chemotherapy has indicated that such treatment not only provides substantial regression of the primary in the majority of patients but also results in a substantially improved disease-free and overall survival, particularly in patients with locally responsive disease.

**Intensive attention improves glycaemic control in insulin-dependent diabetes without further advantage from home blood glucose monitoring: results of a controlled trial.**

Worth R; Home PD; Johnston DG; Anderson J; Ashworth L;

Burrin JM; Appleton D; Binder C; Alberti KG

Br Med J [Clin Res] ,Oct 30 1982, 285 (6350) p1233-40,

Journal Code: B4X

Languages: ENGLISH

Forty-six diabetics treated with twice-daily insulin were seen every two weeks for six months in an intensive education programme aided by regular home urine glucose testing. Control was improved with a decrease in 24-hour urinary glucose excretion (median 138 mmol/24 h (24.8 g/24 h) falling to 70 mmol/24 h (12.6 g/24 h); p less than 0.002), glycosylated haemoglobin concentration (mean 11.4 +/- SD 2.3% falling to 10.4 +/- 1.5%; p less than 0.001), and Diastix score (median 3.0 falling to 1.3; p less than 0.001). There was no reported increase in hypoglycaemia. Thirty-eight of the diabetics

proceeded to a nine-month randomised cross-over study of the effect on blood glucose control of monitoring urinary glucose or blood glucose measured visually or by a reflectance meter using appropriate reagent strips. No further improvement in control was observed after home blood glucose monitoring. Nevertheless, 29 out of 37 patients preferred blood to urine glucose monitoring. During both the education and cross-over studies there was evidence of an initial improvement in control followed by deterioration. This was independent of the monitoring method used in the cross-over period and may have been due to waning enthusiasm. Despite patient enthusiasm and other reports to the contrary, home blood glucose monitoring offered no improvement in control over intensive attention and conventional urine glucose monitoring.

**The clinical pharmacist as a member of the burn team.**

Anderson PD; Wachtef TL; Frank HA; Trubo BG

Contemp Pharm Pract ,Spring 1982, 5 (2) p120-3, ISSN 0162-3761 Journal Code: DQ9

Languages: ENGLISH

Pharmacists are becoming involved increasingly in a patient care. At the University of California, San Diego Medical Center, a pharmacist has become a member of the multidisciplinary burn team. Through participation in work rounds and team conferences, the pharmacist has had a considerable beneficial impact on drug therapy, drug dosing, monitoring adverse drug reactions, and total parenteral nutrition. Specific benefits to patient care that the pharmacist provides are discussed and also the benefits derived in using a burn unit as a clinical teaching rotation for pharmacy students. The pharmacist has found his association with the burn unit to be professionally rewarding and the attending surgeons and surgical house staff have found his input to be valuable. The authors encourage other burn units to enlist a pharmacist as part of their burn team.

**Training supervision as a separate faculty role.**

Borus JF; Groves JE

Am J Psychiatry ,Oct 1982, 139 (10) p1339-42, ISSN

0002-953X Journal Code: 3VG

Languages: ENGLISH

Training supervision is a longitudinal, nonclinically focused personal relationship between a faculty member and a resident for exploring the latter's professional development. In the authors' program the training supervisor meets with the supervisee monthly over the 3-year residency. The training supervisor's role is that of a nonevaluative senior colleague who orients and advises the resident and systematically reviews training progress and problems. The authors discuss the evolution of the training supervision concept, explore potential role conflicts for the training supervisor, who may serve other functions in the residency of the supervisee, and present positive and negative resident and faculty evaluations of their program.

**A walk-in and telephone inquiry service: a function of a hospital social work department.**

Horn B; Manuele GM; Olvany BF

Soc Work Health Care ,Spring 1982, 7 (3) p47-56, ISSN

0098-1389 Journal Code: U95

Languages: ENGLISH

This article describes a study undertaken to evaluate the Walk-In and Telephone Inquiry Service provided by a social work department in a general hospital division of a large, voluntary, metropolitan teaching hospital. The major social work function provided in such a service is information and referral; to provide this service, a psychosocial evaluation and counseling are essential. This service is valuable to and utilized by many individuals, professionals and community agencies. It can become the point where individuals enter the health care system. Issues related to policy making, institutional costs and cost benefits are discussed.

South Med J .Oct 1982, 75 (10) p1251-5, ISSN 0038-4348  
Journal Code: UVH

Languages: ENGLISH

The cost of medical care in the United States is a matter of great concern to many health policy makers and physicians as well as to the seekers of care. At the University of New Mexico, a comprehensive cost-containment education program was devised and put into effect with residents from three primary care disciplines. In addition to documenting the effectiveness of the educational package in reducing patients charges, we asked house staff to state which parts of the package were of most use. Wall posters displaying charges for commonly ordered tests, procedures, and prescription items and the distribution of sample bills for patients seen by the individual resident were rated most highly. A test of knowledge of charges to patients did not show resident improvement after education. Cost-containment education can be effective in reducing patient charges, even if physicians do not internalize the actual charge data. We recommend the inclusion of cost-containment education in all primary care training programs, as these physicians play such an important role in the generation of patient charges.

**Selective primary health care: strategies for control of disease in the developing world. I. Schistosomiasis.**

Warren KS  
Rev Infect Dis .May-Jun 1982, 4 (3) p715-26, ISSN 0162-0886 Journal Code: SXN  
Languages: ENGLISH

The control of schistosomiasis should be related to its unique biology and ecology. Whereas schistosomes multiply within the snail intermediate host, they do not replicate within the mammalian definitive host. As a consequence, a large proportion of infected humans have low or moderate worm burdens, the disease tending to occur in the small proportion of individuals harboring large numbers of worms. This situation suggests an unusual strategy: the control of schistosomal disease rather than the usual approach of control of infection and its almost invariable end point of

eradication. Control of infection (transmission) requires use of mollusciciding, provision of water supplies and sanitation, health education, and chemotherapy and is still highly unlikely to result in eradication. Control of disease can be achieved at far lower cost by chemotherapy alone using the newer single-dose, oral, nontoxic chemotherapeutic agents.

**Hospice--compassionate, comprehensive approach to terminal care.**

Dupee RM  
Postgrad Med .Sep 1982, 72 (3) p239-41, 244-6, ISSN 0032-5481 Journal Code: PFK  
Languages: ENGLISH

The hospice is a physician-directed, multidisciplinary program of care for terminally ill patients designed to meet their emotional and spiritual as well as their physical needs. Services are provided in the patient's home for as long as possible and then at the hospital, if necessary. Consistent with the hospice's goal of enabling the patient to maintain the highest quality of life possible for as long as possible, every effort is made to relieve enervating symptoms, particularly by administration of analgesics in dosage adequate to control pain. The patient's family and friends are encouraged to participate in care and are given whatever help necessary in coping with their own reactions to the terminal illness. Recent enthusiasm for the hospice concept in this country reflects deficiencies in the care of terminally ill patients that can be attributed in large part to inadequacies in the training physicians receive. By including instruction on the enormous psychologic consequences of illness and impending death, medical schools would better equip future physicians to serve their patients.

**Gold for rheumatoid arthritis: current perspectives.**

Mullin GT Jr

Postgrad Med ,Sep 1982, 72 (3) p205-7, 210-3, 216-7,  
ISSN 0032-5481 Journal Code: PFK

Languages: ENGLISH

Gold therapy induces remission in many patients with rheumatoid arthritis (RA). This fact, coupled with improved understanding of gold's mechanism of action and better ability to monitor its side effects, has led to a resurgence of popularity of this drug in the treatment of RA. Gold should be used as an adjunct when basic therapy, ie, aspirin or nonsteroidal antiinflammatory drugs, rest, and physical therapy, fails. Careful patient selection and education; early attention to side effects, especially mouth and skin reactions; and willingness to increase the dosage if the usual regimen does not bring about a satisfactory response, all contribute to successful use of gold. Although only injectable forms of gold are now available in the United States, an oral form that seems to be less toxic is being tested.

**New baccalaureate graduates' perceptions of organizational conflict.**

Snyder DJ

Nurs Res ,Sep-Oct 1982, 31 (5) p300-5, ISSN 0029-6562  
Journal Code: O9K

Languages: ENGLISH

This study explores the process of professional socialization in a sample of newly graduated baccalaureate nurses whose first experience as practicing professionals was in a hospital organizational system. Professional socialization was defined in terms of concept of identity reassessment as proposed by Strauss and in terms of the new graduates' descriptions of their own behavior during

conflictual situations in the work setting. These descriptions were identified as conflict-reporting behavior and analyzed from two aspects: the source of the conflict and the level reached by the behavior of the respondent, as defined by a model for organizational conflict proposed by Pondy. Although changes in conflict-reporting behavior with increasing experience in the hospital bureaucracy were noted, the study findings showed no significant relationships between this behavior and ideas about the nursing role and the value of organizational inducements. Some trends in conflict-reporting behavior were noted in relation to three other variables: the size of the unit on which the new graduate was working, the identity of the other persons in the conflict, and the new graduates' work experience in a hospital system while in school.

**Medical students' attitudes toward basic sciences: influence of a primary care curriculum.**

West M; Mennin SP; Kaufman A; Galey W

Med Educ, Jul 1982, 16 (4) p188-91, ISSN 0308-0110  
Journal Code: MZ3

Languages: ENGLISH

The emerging popularity of family medicine and primary care among medical students with an attendant pressure for clinical relevance in pre-clinical coursework and early clinical exposure has raised questions in the minds of many academicians about the students' perceived value of basic sciences in such an educational environment. A comparison was made of attitudes toward the basic sciences between students in two, concurrent, pre-clinical medical school curricula at the University of New Mexico School of Medicine. The conventional curriculum offers a teacher-centered, 2-year curriculum of basic sciences taught predominantly by basic scientists in a lecture format. The experimental curriculum entitled the Primary Care Curriculum (PCC), offers a student-centered, 2-year curriculum in which pertinent basic and clinical science learning is derived primarily from common, primary care, patient problems, discussed in small group tutorials. There are no formal lectures. Half the tutors are primary care clinicians, half basic scientists. Attitude scales were administered in two successive classes of students in both curricula at the beginning of the first and second terms of the first year. Increased cynicism toward the curriculum and its relevance to future practice was observed among conventional, but not among PCC students. This finding lends supports to the hypothesis that modification in

educational methods in general and relevant, primary care experience in particular can favourably influence students' attitudes toward basic sciences.

**Postpartum home visits by maternity nursing students.**

Barrett JE

JOGN Nurs, Jul-Aug 1982, 11 (4) p238-40, ISSN 0090-0311  
Journal Code: KS2

Languages: ENGLISH

Fewer babies are being born; hospital postpartum days are being shortened; and many families are choosing home births. These facts have prompted nursing educators to seek maternity experiences for students outside the hospital setting. At the university where the student-visit program was implemented, faculty appreciated the need for follow-up home care and focused on more than the experiences in prenatal clinics and the acute-care setting. Rather than turning the family over to another community service or colleague when indicated, second and third home visits are being considered. These additional visits would assure a greater opportunity for primary prevention in the care of the total family. Hospital management and home-care maternity nurses have found that postpartum visits have decreased the need for parents to return to the emergency room or the hospital. Problems have been anticipated or assessed and nursing intervention provided on the home visit. This service gradually is becoming available to more families, with both physical and psychosocial needs being considered. It is hoped that it soon will be provided to all families. Postpartum families, nurses, and nursing students benefit from follow-up postpartum visits in the home. The families are assisted in their parenting roles and nurses gain satisfaction in providing continuity of care.

The operation of a radiology consultation service in an acute care hospital.

Baker SR  
JAMA ,Nov 5 1982, 248 (17) p2152-4, ISSN 0098-7484  
Journal Code: KFR  
Languages: ENGLISH

The operation of a radiology consultation service in an acute care teaching hospital is described. The radiologist acts as an active advisor in the structuring of diagnostic evaluations in three disease categories: biliary tract disease, nonemergency gastrointestinal tract bleeding, and abdominal mass. There was a 64% reduction in the time needed to establish a diagnosis and a 32% decrease in the number of studies for each patient on the consultation ward compared with a control group, which consisted of patients with similar clinical presentations. A formal partnership between clinician and radiologist serves two important functions in teaching hospitals. It can simultaneously expedite diagnostic evaluations and teach the best utilization of imaging examinations.

Treatment received by depressed patients.

Keller MB; Klerman GL; Lavori PW; Fawcett JA; Coryell W; Endicott J  
JAMA ,Oct 15 1982, 248 (15) p1848-55, ISSN 0098-7484  
Journal Code: KFR  
Languages: ENGLISH

We report on the treatment received by 217 patients in the community with a diagnosis of major depressive disorder of at least one month's duration. Only a low proportion of subjects received intensive treatment with antidepressant medication or electroconvulsive therapy, as judged by research standards and current clinical teaching. Specific associations emerge between treatment and several clinical, sociodemographic, and diagnostic variables; however, taken together these variables account for only a small fraction of the variance in treatment received. Even among patient subgroups based on severity and long duration of illness, high proportions did not receive adequate therapeutic trials. Substantial differences are found in treatment across community centers that are not attributable to variation in the clinical characteristics of patients. We conclude that more research is needed to determine how patients and practitioners contribute to this phenomenon of low intensity of somatic treatment.

Iron intakes and serum ferritin levels in developmentally delayed children. An assessment of maternal knowledge and attitudes.

Caliendo MA; Booth G; Moser P  
J Am Diet Assoc ,Oct 1982, 81 (4) p401-6, ISSN 0002-8223  
Journal Code: H6F  
Languages: ENGLISH

A survey conducted on a quota sample of 42 developmentally delayed children included assessment of maternal nutrition knowledge and attitudes. A 24-hour recall was combined with a two-day food record for calculation of dietary iron intakes of the children. Serum ferritin levels were used to assess subjects' iron stores. Maternal education was positively correlated with maternal nutrition knowledge, attitude toward meal planning, and stricter attitudes toward feeding children. Maternal nutrition knowledge and strictness attitudes significantly correlated with dietary iron intake. Relative feeding skills and age correlated with serum ferritin levels.

**Workshops in personal relationships.**

Strehlow MS

J Adv Nurs ,May 1982, 7 (3) p261-7, ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH

This paper describes the planning, implementation and evaluation of a series of workshops for practising health visitors, as one aspect of continuing professional education. The history demonstrates response to stated need. Planning was intensive and extensive, resulting in one broad educational objective and a flexible approach to teaching/learning. Contributions of expertise from several disciplines proved valuable. Prior to full implementation, experimental workshops were organized and evaluated both objectively and subjectively. The variety of methods of evaluation permitted isolation of some factors which mitigate against success and their avoidance when possible. The objective evaluations used three criteria which appeared to demonstrate positive outcomes to a great extent. Evaluations of 17 workshops demonstrate the continuing value of this form of education, and the summarized response shows, inter alia, that impetus does not necessarily reduce with time. Of significance is the evidence that the results include improved professional practice and that there were increases in depth and breadth of knowledge. Additionally, there were developments of self-help and professional interest groups. Finally, the sequel should lead towards a model of training resource personnel within the NHS, the trial of the model being early in 1982.

**Screening for specific learning disabilities among dental students.**

Parks AW; Antonoff SJ; Drake C; Olivier C; Sedita J; Weiss I ; Daddi B

J Dent Educ ,Oct 1982, 46 (10) p586-91, ISSN 0022-0337  
Journal Code: HY7

Languages: ENGLISH

At a time when recognition of the needs of handicapped students is of great concern, many handicapped persons have not yet been identified. Even with the advent of legislation mandating educational equity for all handicapped students, those with specific learning disabilities (SLD) still remain unidentified or unserved by institutions of higher education. In 1979, New York University College of Dentistry instituted a classwide screening and testing program for SLD students. The

program sought to identify accepted students "at risk" for SLD through the administration of a two-hour battery of tests designed by learning disabilities specialists. Follow-up in-depth evaluations yielded a 90 percent accuracy rate on correct identification of SLD students based on the screening results. This article presents specific test results, analyses of data, and comparison of self-report measures and suggests educational implications, including suggestions for program accommodations.

**Mutual-help groups: members' views of their benefits and of roles for professionals.**

Gottlieb BH

Prev Hum Serv , Spring 1982, 1 (3) p55-67, ISSN 0270-3114 Journal Code: PA8

Languages: ENGLISH

Members of 18 self-help groups in Canada were surveyed as to the benefits of participation in mutual help groups and the roles for professionals in such groups. Three distinctions are made among mutual help groups: (1) those dealing with loss-transition (L-T), (2) those with members one step removed (OSR) from the problem, and (3) groups for stress, coping and support (SC&S). Members in OSR groups feel they benefit significantly more from participation than SC&S group members, while many L-T members feel they could get along well without the group if they had to. Members of SC&S groups tend to favor indirect involvement of professionals and see professional help and mutual help as complementary, more than do members of L-T and OSR groups. The traditional health care system is found to ignore the needs of L-T and OSR group members; mutual help thus provides a critical source of support and education for these people.

**Examining your black box.**

Crisafulli C

Med Group Manage , Jul-Aug 1982, 29 (4) p16-8, ISSN 0025-7257 Journal Code: MA7

Languages: ENGLISH

Effective management employs the skills of eliciting appropriate behavior and performance from people and successfully interacting with the environment. Formal management training is one tool that can help a medical group manager accomplish this objective. Another tool is a set of personal values which are consistent with the manager's

actions. These values are neatly packaged in what the author calls a "black box." It makes for not only a healthy management style, but also a healthy person if the cognitions contained in one's black box are continually examined and weeded. To assist managers in identifying and examining the elements contained in their personal value sets, the author presents a few elements of his own black box.

As part of a study to evaluate health education about breast cancer, a campaign to encourage the early reporting of breast symptoms was organised jointly by Community Medicine, University of Southampton and Southampton Health Education Service. A thorough account of all aspects of the preparation and implementation of the campaign is presented. It is hoped that other organisations, considering a similar campaign, could utilise the materials specially produced to convey our message and benefit from our experiences.

Languages: ENGLISH

There is a shortage of child psychiatrists; at the same time, efforts to establish comprehensive care health resources for families and children are increasing. To ensure that child psychiatry keeps pace with broader changes in medical care, the author recommends that the distribution and practices of child psychiatrists be examined and that the therapies used be evaluated. The structural relationships of child psychiatry remaining programs to medical school departments of psychiatry and pediatrics and to the specialty examining boards also need reappraisal. Discussion of these issues within and outside child psychiatry should be stimulating and useful to the field's future.

Practices by agencies in assigning Level II fieldwork experiences to occupational therapy students were examined. Time-specific logs were collected from students and from agency personnel during a 3-month period. The data generated were used to answer questions about how effectively student time was used in meeting the stated purposes of the assignment. The focus was on "average" student fieldwork activities. The study suggests that more careful and systematic development and design of Level II fieldwork programs are needed to meet the established educational goals and to maximize educational opportunities during the allotted time.

**Outpatient breast biopsies on a gynecologic service.**

Mitchell GW Jr; Homer MJ  
Am J Obstet Gynecol ,Sep 15 1982, 144 (2) p127-30, ISSN  
0002-9378 Journal Code: 3NI  
Languages: ENGLISH

One hundred forty-six breast biopsies in 143 patients were done on outpatient basis, without general anesthesia, on a gynecologic service between 1975 and 1980. This procedure has advantages over in-hospital biopsy in terms of cost, time, reduced immediate risk, and patient acceptance. Greater long-term risk, if carcinoma is found, has not been substantiated. Gynecologists need this procedure as an adjunct to the management of benign breast conditions and should be trained to do it.

**Utilization of analgesics from 1970 to 1978. Prescription patterns in the county of Jamtland and in Sweden as a whole.**

Gustafsson LL; Boethius G

Acta Med Scand ,1982, 211 (6) p419-25. ISSN 0001-6101  
Journal Code: 14G

Languages: ENGLISH

A comparative analysis of the usage of analgesics in the county of Jamtland and in Sweden 1970-78 has been carried out.

An attempt was also made to map out the indications for prescribing such drugs. Both in Jamtland and in Sweden as a whole, analgesics sold over the counter accounted for more than half of the total usage. The same was true for fixed drug combinations. Analgesics were prescribed each year to 17% of the population of Jamtland. Fixed drug combinations containing sedatives maintained a large fraction of the amount of analgesics prescribed--31% of defined daily doses (DDDs) in 1978. Arylalkanoic acids (ibuprofen and naproxen), introduced in 1975, soon took a substantial part of the market--13% of DDDs in 1978. Though arylalkanoic acids were registered for treatment of degenerative joint diseases, four of five patients in Jamtland received them only once or twice during a two-year period. In the national study, every third prescription of these drugs was for degenerative joint diseases. The pattern of usage revealed in this study calls for improved pharmacotherapeutic training of physicians to make drug treatment more rational.

Although it is important to note the cardiovascular effects of the various anesthetic agents, the anesthetist should use the anesthetic agent with which he or she is most familiar and with which it is felt that the best control of cardiovascular parameters can be maintained. It should be remembered that the effects of all drugs are dependent upon the milieu into which the drug is given. Expected effects may be altered because of the patient's cardiac and/or related pathophysiology. It is important that the anesthetist give attention to all parameters so that oxygen supply is always equal to or greater

than cardiac oxygen demand. In this manner, anesthesia may most safely be conducted for patients with compromised coronary circulation.

The public efforts in noise abatement are shared among federal, cantonal, and local authorities. Since the acceptance of a new article in the Federal Constitution concerning the protection of the environment, the federal authorities have primarily the task to prepare and issue regulations, whilst the cantonal and local authorities have to enforce them. The Federal Office for Environmental Protection has to coordinate the activities at the federal level. The main present tasks are the preparation of new regulations, to act as an advisory board for other authorities, to analyse and evaluate the noise impact of installations and facilities, to inform the public, and to prepare the future education and training of the executive officials.

**The INSURE project on lifecycle preventive health services.**

Logsdon DN; Rosen MA; Demak MM

Public Health Rep ,Jul-Aug 1982, 97 (4) p308-17, ISSN

0033-3549 Journal Code: QJA

Languages: ENGLISH

The INSURE Project on Lifecycle Preventive Health Services is a 3-year study to determine the feasibility of implementing preventive services in primary medical care as a health insurance benefit and to assess the short-term impact of this implementation on providers and consumers. Initiated by the life and health insurance companies, the project has received additional support from private philanthropic foundations. Preventive services, which will be provided under a lifecycle approach according to the age and sex of the patient and include education of patients on health-related behavior, will range from prenatal care through geriatrics. A quasi-experimental design will be used in which three study (experimental) group practice sites are matched with three

control group practice sites. At the study sites, the primary care physicians will participate in orientation sessions on recommended preventive services and patient education procedure; they will also examine and counsel the study patients. The study and control physicians and patients will be surveyed before and after the program of intervention is conducted at the study sites to assess their knowledge, attitudes, and behavior toward health behavior practices.

**The role of the Emergency Medical Services in organ donation.**

Whittier FC; Boyd DR; Warren J

Proc Clin Dial Transplant Forum ,1980, 10 p155-9, ISSN

0094-6044 Journal Code: PSZ

Languages: ENGLISH

A potential need for more organ donors has been identified because of the improved survival rates of patients receiving kidney transplants and the reports of improving graft success rates. Because of the development of the EMS trauma program, an awareness of the potential benefit for increased organ donation could be realized by improved working relationship of the EMS trauma unit and the organ recovery agency. In the final analysis, careful planning of a regionwide program for organ recovery by the organ retrieval groups to include the EMS trauma unit should result in an increased number of cadaveric kidneys for transplantation.

Physicians in the United States migrate across county lines more often than nonphysicians, but their migration parallels that of the population at large: from the northern "Frost Belt" to the southern "Sun Belt." The data presented herein show that mobile physicians ("movers") are more often younger and female than nonmobile physicians ("stayers"). Stayers are more likely to be primary care of self-employed physicians, and movers more often are in nonprimary care or in medical administration, research, teaching, or other medical employment modalities. County-level characteristics such as population income and size also help determine whether a physician will be a mover or stayer.

**Increasing the educational value of medical care evaluation: a model program.**

Bashook PG; Maxwell JA; Sandlow LJ  
 J Med Educ ,Sep 1982, 57 (9) p701-7, ISSN 0022-2577  
 Journal Code: J13  
 Languages: ENGLISH

A model medical care evaluation (MCE) program, designed to increase the educational value of MCE activities, was implemented in three clinical departments at the Michael Reese Hospital and Medical Center. The program was evaluated by means of quantitative and qualitative observational techniques, questionnaires, and interviews and by comparing committees for which the implementation was highly successful with those for which it was less successful. The results confirmed the educational value of the following features of the model program: (a) a focus on the process of care rather than standards of care, (b) prior review of records and their presentation as case problems, (c) educational emphasis by the committee chairperson, and (d) attendance by at least four physicians. Implications for other types of hospital quality assurance or educational activities are discussed.

In an interview study of 545 patients recently discharged from The Johns Hopkins Hospital, data were collected on the patients' knowledge of their diseases, knowledge of drug purpose, and compliance with the prescribed drug regimen. The interrelationships of these variables were compared in patients under age 65 and patients aged 65 or older. Age-related factors and trends were sufficiently important to warrant further investigation. Knowledge of and compliance with drug regimens may reflect doctor-patient relationships. Understanding the patterns of drug use offers a potential for appropriate strategies in clinical practice.

A model used to identify patients requiring increased nutritional support and to determine priorities and delineate the degree of care required and role responsibilities is described. The model includes three levels of care: Level I is the most basic care and Level III the most intense. Assignment to a level of care is based on the presence, absence, or anticipated development of nutritional problems and/or the degree of dietary teaching required. Within each level of care, practitioner responsibilities have been defined by frequency and by position.

**Faculty retention in dental hygiene programs.**

Ley ES

J Dent Educ .Sep 1982, 46 (9) p533-6. ISSN 0022-0337  
Journal Code: HY7

Languages: ENGLISH

This study assesses the extent to which faculty turnover in dental hygiene programs is related to the type of educational institution. A questionnaire was mailed to 201 dental hygiene program directors; 175 responded (87 percent). Nearly 47 percent of the directors associated with programs in state colleges and universities indicated they had experienced some degree of difficulty retaining faculty in the past five years; less than 18 percent of those in community colleges and technical schools experienced similar problems. Faculty attrition due to personal reasons and job and salary dissatisfaction occurred to a slightly greater extent in state educational institutions than in community colleges and technical schools. Achieving tenure was perceived as a problem primarily by directors of programs in state colleges and universities. Although inadequate salary was a direct cause of attrition in some cases, the degree to which it influenced personal reasons for leaving was not determined.

**RDA and related tracking systems concerned with sodium.**

Forbes AL

Hypertension ,Sep-Oct 1982, 4 (5 Pt 2) pIII170-5.

Journal Code: GK7

Languages: ENGLISH

The U.S. Food and Drug Administration (FDA) and the Department of Health and Human Services have developed a five-point set of sodium initiatives aimed at moderation of sodium consumption, improved sodium-related information for consumers and health professionals, and improved consumer choice in the marketplace. Implementation is fundamentally based on a voluntary premise, and indications to date are that the program is working. FDA has established a series of tracking systems to measure change over time, particularly relative to changes in the sodium content of the food supply, in the sodium content of American diets, in sodium labeling -- both quantitative and qualitative, in consumer understanding of the sodium-and-hypertension problem, and in consumer food purchasing practices. Some of these efforts are conducted in cooperation with other Federal agencies such as the National Heart, Lung, and Blood Institute and the Department of Agriculture. The epidemiological approach to measurement of the prevalence of hypertensive disease as provided by the periodic National Health and Nutrition Examination Surveys is at the center of all other tracking systems to measure effectiveness of the national effort to reduce sodium intakes and thereby hopefully moderate the magnitude and severity of hypertensive disease as a major public health problem in the United States.

Langford HG

Hypertension ,Sep-Oct 1982, 4 (5 Pt 2) pIII166-9.

Journal Code: GK7

Contract/Grant No.: 5R01 HL24369

Languages: ENGLISH

Antihypertensive drug treatment has been shown to be efficacious in reducing mortality, morbidity, and end-organ damage from hypertension. However, the health care consequences of providing continued antihypertensive therapy for approximately one-fourth of the adult population has led to inquiry into the potential of nutritional change as an alternative therapy. The relapse rate for the return of hypertension after withdrawal of antihypertensive drugs is greater in the obese than in the nonobese patient. The relapse rate is also much greater if the hypertension was severe before antihypertensive drugs were started. A programmed course of dietary instruction enabled participants to drop sodium excretion by 50%, and to lose approximately 5% of body weight in 32 weeks. Adequate large-scale trials to determine the therapeutic success rate of dietary modification in mild hypertension have yet to be done. Studies have been initiated in the United States and Finland to determine the feasibility of dietary modifications as a means of preventing the

occurrence of hypertension. This endeavor deserves the highest priority, for the magnitude of the problem threatens to overwhelm conventional means of provision of medical care.

**Food choices for lowering sodium intake.**

Altschul AM; Grommet JK

Hypertension ,Sep-Oct 1982, 4 (5 Pt 2) pIII116-20.

Journal Code: GK7

Languages: ENGLISH

Excessive intake of dietary sodium is one form of affluent or industrial society malnutrition. When combined with a genetic-based sodium sensitivity, this high sodium intake becomes a factor in the etiology of hypertension. Most dietary sodium comes from food, natural or processed. Indirect measures of discretionary sodium intake, that from the salt shaker in the kitchen or at the table, put it at a level of 25% to 50% in the United States. Direct measures on a small sample of subjects indicate that less than 10% of sodium intake is discretionary. Anyone who needs to reduce sodium intake must, therefore, make major changes in diet. This requires information on the sodium content of common foods, the availability of low sodium analogs of popular foods, and a variety of low sodium condiments to provide more choice for the individual.

Respondents to a mass media cardiopulmonary resuscitation (CPR) recruitment campaign in Harris County, Texas were more likely than non-respondents to be White, female, and under 45 years of age, to have had previous CPR training, experienced an incident in which knowledge of CPR might have been useful, or to have a friend or relative with a relevant medical history. The majority of the respondents were housewives, and professionals or technical workers, particularly in the health field. Findings can be used to identify audiences for future mass media CPR campaigns.

Languages: ENGLISH  
A study conducted by the Asociacion ProBionestar de la

Familia (APROFAM) of Guatemala among 177 urban and 233 rural distributors in its CBD programs indicates a number of characteristics related to distributor success (measured by volume of contraceptives sold). Among urban distributors the most important factors were number of months the distributor had worked in the program, location of the CBD post, and the fact of promoting the service by displaying a poster and organizing community meetings about family planning. Among rural distributors, performance was highest among those who received assistance from their spouse, had local competition in the sale of contraceptives, promoted family planning by visiting their neighbors and organizing group meetings, had a higher level of education, and received frequent supervision. In general, factors involving program design and task performance were better predictors of distributor performance than the sociodemographic characteristics of the distributor.

**A feasibility study of organizing occupational health services for farmers.**

Vohlonen IJ; Husman K; Kalimo E; Nuutinen J; Raitasalo R; Tupi K; Virolainen R

Scand J Work Environ Health ,1982, 8 Suppl 1 p26-9.  
Journal Code: UEB

Languages: ENGLISH

In Finland the Occupational Health Care Act of 1979 provides farmers the possibility of purchasing occupational health services. The main objective of the present study is to develop national model for the organization of occupational health services for farmers. The problems of providing and specifying occupational health services for farmers can be described by two parameters. The first is the type of farm production. The occupational health services to be provided are though to depend on the occupational health risks. The risks vary with the type of farm production, which in turn depends on the geographic location of the farm. The second parameter represents the supply of occupational services to be provided by the municipal health center. The supply has been characterized as occupational health inspections of farms, health examinations, and health education. For the optimization of the supply and the demand, the experiment consists of three models to be tested in respect to two matrices of risk. The feasibility of the models in the 2-a experiment will be evaluated by pre- and postexperimental surveys.

**A new approach for providing occupational health services in developing countries.**

Khogali M

Scand J Work Environ Health ,1982, 8 Suppl 1 p152-6.  
Journal Code: UEB

Languages: ENGLISH

A comprehensive approach to the health problems of workers and the gainfully employed should be adopted when occupational health services are planned in developing countries. The system developed in industrialized countries cannot be applied to new industrializing countries. The definition of what constitutes a developing country is not yet agreed upon. They share many of the criteria which create a vicious cycle of poverty and disease. This cycle can only be broken by industrialization and economic progress. The maintenance of health in industrial communities in the developing countries entails the treatment and prevention of epidemic and endemic communicable diseases, the prevention of occupational injuries and diseases, the planning and organization of medical care, training, the introduction and enforcement of standards of health, and safety and medical care in industry. To achieve this a new approach is advocated. The total health services are visualized as a spectrum, while occupational health services are used as a springboard and a point of entry. The health personnel who provide services to workers in factories, agricultural projects, and mines can carry out a comprehensive

preventive program for the workers and their families.

**[Study of the functioning of Departmental Commissions on Special Education]**

Etude du fonctionnement des Commissions Departementales d'Education Speciale.

Zucman E; Magnier J; Oudard L; Spinga J

Int J Rehabil Res ,1982, 5 (1) p27-34. ISSN 0342-5282

Journal Code: GRL

Languages: FRENCH Summary Languages: ENGLISH

The study of the functioning of the Regional Commissions for Special Education (C.D.E.S.), which were established by the Loi d'Orientation (orientation law) of 1975, was carried through within a three years' period by a team of researchers from the areas of Public Health and Education. The following main results were found: (1) A statistical analysis of 800 dossiers from the Commissions resulted in findings which are in accordance with corresponding epidemiological data from France: in the population aged 0-20 the frequency of handicap is 11.5%. (2) Three quarters of the children had additional social-familial conditions caused by severe behavior disturbances and light or moderate intellectual limitations 8.7% were found to be excluded from school. The hypothesis elaborated by the researchers was that the Loi d'Orientation of 1975 has caused a unifying change in the practice of social action. This assumption was confirmed by the observations and evaluations: the Commissions for Special Education are aware of 90% of the needs of the corresponding population, without creating inadequate needs. They are a place of concertation, bringing together all partners: representatives of parents, representatives of institutions, from the areas of Public Health and Education, and Administration. The integration of the handicapped in regular schools makes progress, not so much in a quantitative but in a qualitative way. At the same time the study points at a number of unsolved problems: the contact with parents is not always well established; the work rhythm of the Commissions and working groups is too quick, the availability of their members is insufficient; finally, the reticence of maintaining accurate dossiers and of keeping to the rules of professional secrecy impede concerted action and coherence of decisions, as much in respect to educational orientation as to the allotment of means. In conclusion, the engaged unifying change should be favored by new means of personnel and by establishing new methodological and deontological tools which are well adapted to a concerted medico-social action.

**The optometrist's role in public health.**

Marshall EC

J Am Optom Assoc ,May 1982, 53 (5) p371-8. ISSN 0003-0244 Journal Code: H82

Languages: ENGLISH

The scope of the optometric profession, and its relationship to the total health care system, is in a state of constant change; many of the changes are influenced by or impact upon that area of health care that is referred to as public health. Very basically, public health is "people's health" -- a concern for the health and well-being of groups of people. It emphasizes the role of health care practitioners in the delivery of health care to the aggregate, as opposed to the individualized or private system of health care delivery. Fundamental to the overall philosophy of public health is the necessity to make comprehensive health care readily available and accessible to all segments of the population. Optometry must expand its efforts to recognize, evaluate and assume its role in the maintenance of the health and well-being of the

**A comparative trial of home and hospital psychiatric treatment: financial costs.**

Fenton FR; Tessier L; Contandriopoulos AP; Nguyen H;

Struening EL

Can J Psychiatry ,Apr 1982, 27 (3) p177-87, ISSN

0706-7437 Journal Code: CLR

Languages: ENGLISH

The financial costs of community-based treatment, stressing home treatment, were compared with the cost of hospital-based treatment during one year. Of 155 patients destined to receive inpatient treatment, 76 were randomly assigned to home treatment, 79 to hospital treatment; the two groups were similar as to important social, demographic, and clinical characteristics. The principal differences between the two treatments concerned the focus of treatment, the locale of treatment, the degree to which continuity of treatment was maintained, and the roles of the respective treatment staffs.

Manpower and operating costs, measured in dollars, were estimated in two ways. Either way, hospital-based treatment was more expensive during the year: 64.1% more expensive (+2,250 vs. 11,980 per patient) in the first instance, 108.9% more expensive (+6,750 vs. +3,230 per patient) in the second. With two exceptions during the first month of treatment, the proportions of patients and families receiving either treatment who incurred other costs of treatment were low, and the differences between groups were not significantly different. A higher proportion of patients and families receiving home based treatment defrayed the cost of the patient's psychotropic drugs; second, a higher proportion of families of patients receiving hospital-based treatment defrayed transportation costs. The proportions of patients and families incurring costs of the consequences of illness were low, and the differences between treatment groups were not significant. We compared this study with similar studies, discussed the generalizability of the results of this study and similar studies, and identified issues for future research.

**Glaucoma patients not compliant with their drug therapy: clinical and behavioural aspects.**

Granstrom PA

Br J Ophthalmol ,Jul 1982, 66 (7) p464-70, ISSN

0007-1161 Journal Code: AZK

Languages: ENGLISH

The pattern of drug self-administration among 15 patients not compliant with their pilocarpine therapy was studied with an electronic medication monitor. Recording the date and the hour every time the medication bottle was opened, the monitor gives detailed information on the medication behaviour. The results indicate different types of medication errors: inadequate spacing of doses during the day with long intervals during the night, frequently missed doses at noon, and long interruptions in the medication, sometimes lasting for several days. Improvement in their compliance was seen in patients who were given instruction and taught to relate their medication to specified events in the day.

**The effect of managerial interventions on high personnel turnover in nursing homes.**

Stryker R

J Long Term Care Adm , Summer 1982, 10 (2) p21-33, ISSN 0093-4445 Journal Code: IWZ

Languages: ENGLISH

This study indicates that administrator attention and intervention can reduce high turnover in nursing homes. It also indicates a need to investigate the contributing factors in a specific organization, to select interventions based on this knowledge and for multiple but related actions that will support one another. Increased supervision of new employees, increased recruitment efforts, supervisory training, revised personnel policies, and avoidance of personnel pools seem to have particularly high impact on the reduction of turnover in nursing homes and are recommended as a place to begin. **Relaxation training. Blood pressure lowering during the working day.**

Southam MA; Agras WS; Taylor CB; Khaemer HC

Arch Gen Psychiatry , Jun 1982, 39 (6) p715-7, ISSN 0003-990X Journal Code: 72C

Contract/Grant No.: 1 R01 HL23667

Languages: ENGLISH

Controlled studies have demonstrated that relaxation training can lead to significant in-clinic blood pressure (BP) reductions in patients with essential hypertension. We examined the BP-lowering effect of relaxation training during the working day. Forty-two patients being treated for essential hypertension with diastolic BPs greater than 90 mm Hg were randomized into either a relaxation training program or no treatment. Multiple BP measurements were made during the working hours, using an ambulatory monitoring device, before and after training. Significant work-site differences between groups were evident after treatment both for systolic and diastolic pressures. These results suggest that relaxation therapy leads to a reduction in BP that is evident in the natural environment, providing new evidence that the procedure is a useful adjunct to the treatment of hypertensive patients.

**Poison center operations: the necessity of follow-up.**

Litovitz TL; Elshami JE

Ann Emerg Med , Jul 1982, 11 (7) p348-52, ISSN 0196-0644 Journal Code: 4Z7

Languages: ENGLISH

A retrospective study of 2,526 calls made to a regional poison center demonstrated the value of telephone follow-up of poison exposures. Further treatment recommendations were required in 21.2% of follow-up calls, more than 25% of which were made to physicians. Poison prevention education and data collection were accomplished in more than 95% of cases. Twenty-four telephone follow-up calls corrected major treatment errors, corresponding to a dramatic change in patient management more than twice each week. This study delineates the functions and value of the follow-up call in the treatment and prevention of poisonings and in toxicologic research. Because the effective use of this procedure is limited to comprehensive poison centers with vast resources and full-time staff, this study further supports regionalization to promote maximal utilization of this and other elements of poison control.

**The anaesthetist and intensive care.**

Loder RE

Anaesthesia, Jun 1982, 37 (6) p691-3, ISSN 0003-2409  
Journal Code: 4MC

Languages: ENGLISH

The author retired from active practice as a consultant anaesthetist in the British National Health Service during 1980 at the age of 60. He kept a detailed diary for the last full year as a consultant. One of the Editors suggested that the diary, augmented by his considered views culled from the experiences of a professional lifetime, could form the basis of a series of essays on various aspects of the life and practice of a consultant anaesthetist during the second half of the twentieth century. This essay considers the present and future role of the anaesthetist in intensive care and the need for proper policies of organisation and training in that discipline.

**Cancer control in India: a multinational approach involving the USA and the USSR.**

Sutnick AI; Saunders JF; Puchkov YI

Am J Public Health, Jul 1982, 72 (7) p714-7, ISSN 0090-0036  
Journal Code: 3XW

Languages: ENGLISH

Based on a long-standing cooperation in medicine and public health between the United States and the Soviet Union, and on the potential contributions to be made by scientists from both of these countries, the World Health Organization invited an American-Soviet collaborative team to recommend a cancer control program for the Government of India. The consultants defined the importance of cancer of the cervix uteri and of the oral cavity, which comprise one-half of India's cancer cases, as the basis for a cancer control program. They recommended incorporation of cancer control functions into the organizational structure of the Ministry of Health as well as specific recommendations in education, prevention, and early detection, diagnosis, treatment, and epidemiologic studies. The mission underscores the value of multinational cooperation on health care problems that are faced in common by the United States, the Soviet Union, and other countries of the world. In addition it serves as a basis for international friendship and understanding in the context of mutually productive activities which may provide a benefit for all nations.

**Organizational change in an adolescent inpatient unit.**

Hargrave MC

Adolescence, Spring 1982, 17 (65) p65-72, ISSN 0001-8449  
Journal Code: 2HB

Languages: ENGLISH

This paper describes a two-year process of evolution toward a more open, yet more structured therapeutic orientation in a

large adolescent inpatient psychiatric unit. The rationale for alterations in structural organization, therapeutic modalities, and staff development are discussed. Issues of treatment team leadership, physical organization of the treatment center, integration of family, group and individual therapy, continuity of care and staff training are examined. Assessment of the impact of the changes were accomplished by administration of the Moos Ward Atmosphere Scale to clients and staff prior to and two years following the implementation of the changes. Adolescents perceived the ward environments as engendering more involvement, being more oriented toward personal problems, and encouraging less anger and aggressiveness. In addition, they saw the program as increasing in clarity, and the staff as being in greater control. Staff's perceptions, shifted in a more positive direction on nine of ten WAS subscales. Implications for the direction of change and its relationship to the organizational changes is discussed.

**Rhinitis medicamentosa: the forgotten factor in nasal obstruction.**

Mabry RL

South Med J, Jul 1982, 75 (7) p817-9, ISSN 0038-4348  
Journal Code: UVH

Languages: ENGLISH

Rebound nasal mucosal edema may follow the use of topical nasal vasoconstrictors for even a short time. The physician seeing a patient with nasal stuffiness should always ask about the usage of these substances. Management of patients with rhinitis medicamentosa includes making the diagnosis, reversing the mucosal changes, patient education, and appropriate follow-up. Systemic medications such as antihypertensives, beta-blockers, and antidepressants may also cause nasal stuffiness, which should resolve upon withdrawal of the offending substance.

**Innovation, ideology and innocence.**

Maddison D

Soc Sci Med ,1982, 16 (6) p623-8, ISSN 0277-9536  
Journal Code: UT9

Languages: ENGLISH

Innovative solutions are required to deal with the inadequacies of existing medical education programmes, in both the developed and developing countries, if we are to promote the evolution of more acceptable, more efficient and more effective health care. The newly formed Network of Community-oriented Educational Institutions for Health Sciences is attempting to promote a series of educational and organisational innovations, aimed at the preparation of health professionals who will be better equipped and better motivated to meet the real health needs of the populations they are to serve. Such innovations encounter many obstacles, of which ideologically-based inflexibility of thought is the most important. Ideologies are here defined, in Barnett's words, as "patterns of belief ... quasi-conceptual, quasi-affective sets assumed to be true", having the power to prohibit "rigorous or experimental examination of novel experience." Such systems of thought have 'negative, restrictive and pathological effects' on the development of innovative solutions to complex problems. A particularly destructive and inhibiting stereotype has flowed from an ideological commitment to the achievement of 'international excellence'. A state of what in this paper is called 'innocence' is regarded as mandatory for the implementation of studies based on a commitment to the empirical approach, to the null hypothesis and above all to the evaluation of the process and outcome of educational and other interventions in the health care system.

**Maternal-infant attachment in a traditional hospital setting.**

Paukert S

JOGN Nurs ,Jan-Feb 1982, 11 (1) p23-6, ISSN 0090-0311  
Journal Code: KS2

Languages: ENGLISH

All changes were implemented by nurse-midwives and staff nurses. Some of the changes required administrative or medical concurrence, but all were initiated by nurses. Nursing administration was supportive and encouraged the staff nurse. It took courage and determination to implement changes described. The biggest hurdle was to overcome the attitude that nothing at the hospital could ever change. Once that attitude was overcome, the actual changes in routine and policy were made with a minimum of difficulty. It is inexcusable not to encourage maternal-infant attachment because the setting is less than ideal. Women, infants, and families benefit too much from this initial contact for nurses to sit back and wait for hospital policy to change, the ABC to open, or the new wing to be built. In addition, there is so much joy and satisfaction in assisting in the development of a positive relationship between a mother and her newborn that the nurse should avail herself of the opportunity to do so.

**Maternity-patient teaching--a nursing priority.**

Brown B

JOGN Nurs ,Jan-Feb 1982, 11 (1) p11-4, ISSN 0090-0311

Journal Code: KS2

Languages: ENGLISH

The overall positive response of the parent participants has validated the utility of the program. Future program expansion and revision will be based on social and technological change.

Participant responses to the program will be monitored continually to determine whether their needs are being met. The program clarified the role nursing personnel have in teaching maternity patients. It serves to increase the new parents' self-confidence in being able to adjust to their new roles. One possible future expansion of the program might be post-discharge group discussion sessions, supervised by nursing personnel. During those sessions, mothers could discuss feelings that they are experiencing, any difficulties they may have adapting to their new roles, and other topics they feel are relevant. Nurses would attend these sessions to serve as resource persons and group facilitators. The need for patient teaching in obstetrics is being recognized increasingly as a priority by health professionals in the field of maternal-child health. A concise and accurate means of documentation is necessary to ensure that consistent, comprehensive instructions are given to all new parents.

**Informed consent to biomedical research in Veterans Administration Hospitals.**

Riecken HW; Ravich R

JAMA ,Jul 16 1982, 248 (3) p344-8, ISSN 0098-7484

Journal Code: KFR

Languages: ENGLISH

To illuminate the process of obtaining informed consent to research in a medically dependent population, we interviewed 156 patients and 37 physicians involved in research projects at four Veterans Administration hospitals. Most patients knew they were research subjects, had voluntarily consented, and knew the details of their medical treatment, but few understood the research well. Readability analysis indicated that consent forms required college-level education. Twenty-eight percent of patients were not aware of their participation in research although they had signed consent forms. No single act, omission, or personal attribute completely explains this unawareness, but it is associated with incomplete consent forms, the identity of the person explaining the research, the manner of the explanation, and, in some cases, grave illness.

**Intravenous antibiotic therapy in an outpatient setting.**

Poretz DM; Eron LJ; Goldenberg RI; Gilbert AF; Rising J; Sparks S; Horn CE

JAMA ,Jul 16 1982, 248 (3) p336-9, ISSN 0098-7484

Journal Code: KFR

Languages: ENGLISH

A program has been developed for the outpatient administration of parenteral antibiotics. To date, more than 150 patients with osteomyelitis, septic arthritis, pyelonephritis, endocarditis, and other infections have been treated. Antibiotic solutions were prepared in the hospital pharmacy and given to the patient to be kept refrigerated at home until used. Patients administered their own antibiotics by means of a heparin lock, which was replaced every four days or when necessary. Complications were infrequent. Many patients were able to return to work while receiving therapy; others enjoyed the comfort of being at home. Cost reductions were substantial, calculated to be at least \$142 a day, or the charge for a semiprivate room in 1981. In addition to the cost savings, critically needed hospital beds were freed for more acutely ill patients.

**Diagnosis of diabetic eye disease.**

Sussman EJ; Tsianos WG; Soper KA

JAMA ,Jun 18 1982, 247 (23) p3231-4, ISSN 0098-7484

Journal Code: KFR

Languages: ENGLISH

The correct diagnosis of proliferative diabetic retinopathy is essential, because it is a treatable disease and missing the diagnosis can lead to the patient becoming blind. We examined the ability of internists and ophthalmologists to diagnose proliferative retinopathy under optimal conditions. Twenty-three physicians performed retinal examinations on ten diabetic patients and one normal patient with dilated pupils. Physician examiners were members of a university medical center and included 10 internists, 2 diabetologists, 4 senior medical residents, 4 general ophthalmologists, and 3 ophthalmologists who were subspecialists in retinal disease. Correct diagnosis was determined separately by the consensus of three ophthalmologists specializing in retinal disease, who reviewed seven-view stereo fundus photographs and medical charts. Of a possible 483 individual eye examinations, 438 were completed. The overall error rate was 61%. The error rate for missing the diagnosis of proliferative retinopathy varied from 0% for retinal specialists to 49% for internists, diabetologists, and medical residents. We conclude that potentially serious mistakes in diagnosis are currently made by the physicians who care for most diabetic patients. Experience and specialized knowledge lessen that the error rate. Further education or greater use of referrals may be necessary to provide optimal patient care.

Mastal MF; Hammond H; Roberts MP

J Nurs Adm ,Jun 1982, 12 (6) p9-15, ISSN 0002-0443

Journal Code: JEL

Languages: ENGLISH

Implementing the Adaptation Model required that the model's concepts be explicitly identified, defined, and understood. Guidelines, standards and tools had to be revised or developed. Effective nursing administration leadership and the personal and professional commitment of administrators, educators, and staff nurses to the goal were necessary ingredients. The abstract nature of theory often requires sheer determination and hard thinking if it is to be effectively applied to practice. A formal education process must also be dynamic and ongoing. Project members continue to gain greater insight into the model's structure, identify problems in its application, and seek ways to solve them. Their combined, concentrated efforts have proved a cost-effective way to close gap between education and practice. The project's initial outcomes, increased patient satisfaction and expanded professional nursing, support the application of the Adaptation Model in our hospital. Further validation of its structure and the value of its outcomes, however, needs additional study, and extended application in multiple practice settings. Validation of the Roy Adaptation Model or any of the evolving conceptual frameworks for nursing practice requires use, input, and evaluation by nurses in all settings. Opening the theoretical domain to hospital nurses needs the support and leadership of nursing and hospital administrators.

**A long-term geriatric teaching ward in an acute-care hospital: a three-year experience.**

Clarfield AM

J Am Geriatr Soc ,Jul 1982, 30 (7) p457-65, ISSN

0002-8614 Journal Code: H6V

Languages: ENGLISH

The development and management of a long-term geriatric ward in an acute-care teaching hospital are described. Structure, function, and costs are discussed, and issues of service and medical education are emphasized. A full geriatric team (physician, nurse, social worker, physiotherapist, and occupational therapist) assessed 165 long-term patients in the general wards of the hospital and accepted 98 for admission to the new long-term geriatric ward. Of these, 31 were discharged; 29 per cent went to a facility that encouraged more independent living. Eighteen patients died during their stay in the geriatric ward; autopsies were obtained in 33 per cent--a higher autopsy rate than the average for general hospitals. General hospitals may continue to have large populations of chronically ill patients. This model for a geriatric ward may offer a way of dealing with a difficult situation.

**Self-instruction and assessment in techniques of intensive care using a computer model of the respiratory system.**

Hinds CJ; Ingram D; Dickinson CJ

Intensive Care Med ,1982, 8 (3) p115-23, ISSN 0342-4642

Journal Code: H2J

Languages: ENGLISH

There are considerable logistical difficulties involved in providing an adequate training programme for each new doctor when starting intensive care. One solution is to use an interactive computer terminal and provide programmes for self-instruction and assessment. Using a computer model of the respiratory system linked to a computer-assisted instructional driver we have developed instructional exercises on the management of artificial ventilation and the treatment of respiratory failure. Each teaching session contains explanatory text, multiple choice questions and model simulations. The student can interact with the simulations, appropriate assistance being provided when required, while his answers are marked and assessed with further explanation when necessary. The use of computer models adds a new dimension to computer-assisted learning techniques and is particularly applicable to intensive care medicine.

J Dent Educ ,Jun 1982, 46 (6) p314-22, ISSN 0022-0337

Journal Code: HY7

Languages: ENGLISH

This article presents a critical analysis of the ten-year experience of the Department of Oral Biology of the University of Kentucky College of Dentistry with a nontraditional basic science curriculum. The factors that led to the adoption of this curriculum are outlined, and its effects on students, faculty, and the college's administration are described. The pitfalls inherent in this approach and in the individualized self-instructional format for teaching the basic sciences to dental students are discussed. This critical evaluation is aimed at providing information for those contemplating similar sweeping curricular changes in the future to enable them to make rational decisions and to help them predict the effects of such changes on the educational program.

**Health visitor support for families with Down's syndrome infants.**

Cunningham CC; Aumonier ME; Sloper P  
Child Care Health Dev ,Jan-Feb 1982, 8 (1) p1-19. ISSN  
0305-1862 Journal Code: C9X  
Languages: ENGLISH

A health visitor was seconded to a university based research team studying intervention with families who have an infant with Down's syndrome. She was given a 3-week practical training and then provided a home-based service for 61 families, visiting every 6 weeks until 2 years of age. Infant development and parental satisfaction with the service were compared to previous findings of the research group. Parental satisfaction was found to be very high and the progress of the infants compared favourably to previous studies. Following this, two field health visitors were given the training and then provided a service in their local areas. The progress of the infants was monitored at 6-month intervals until 2 years of age, and parents were interviewed. Again no differences were found in the developmental progress of the infants and previous groups and parental satisfaction was high. The limitations of the training and some implications for practice were discussed.

**Evaluation of a self-teaching program.**

Roberts CR; Hosokawa MC; Walts B; Mueller R  
Patient Couns Health Educ ,4th Quarter 1982, 3 (4)  
p16f-5, ISSN 0190-2040 Journal Code: PAL  
Languages: ENGLISH

A self-teaching booklet on hypertension was evaluated in two populations: clients attending public health screening clinics and inpatients at a Veterans Administration hospital. Participants were randomized into an education or a control group. Evaluation consisted of measuring knowledge gained from the booklet immediately after reading it and retention of key concepts two weeks later. Men did better than women, and VA education participants did better than VA controls. No differences were detected between the public health education and control groups or the combined VA and public health education and control groups. The self-teaching booklet alone did not appear to yield a measurable amount of new knowledge. Health professionals, when educating patients and evaluating programs, should consider combinations of educational methods when using self-teaching programs.

**The cochlear implant program: an overview.**  
Berliner KI; House WF  
Ann Otol Rhinol Laryngol [Suppl] ,Mar-Apr 1982, 91 (2 Pt  
3 Suppl 91) p11-4, Journal Code: 503  
Languages: ENGLISH

The single-electrode cochlear implant used at the House Ear  
Institute is undergoing clinical trials under Food and Drug  
Administration regulations governing medical devices. The  
program involves selection and evaluation of suitable  
subjects, surgery, basic guidance or training in implant use,  
and regular follow-up. As of November 1, 1981, 199 deaf  
subjects have had cochlear implant surgery. They range in age  
from 3.5 to 75 years old. Subjects with a wide variety of  
etiologies have been successfully implanted. The vast majority  
use their device on a daily basis, and subjects as a group  
have received more than 800,000 hours of electrical  
stimulation. Fifteen other otologists in the United States  
have implanted one or more subjects as coinvestigators in this  
clinical trials program. The otologists and their implant  
teams are trained by the House Ear Institute. Results indicate  
that the implant program can be performed adequately in a  
variety of clinical settings.

**Community-based cardiopulmonary resuscitation: what have we  
learned?**

Cobb LA; Hallstrom AP  
Ann NY Acad Sci ,1982, 382 p330-42, ISSN 0077-8923  
Journal Code: 5NM  
Contract/Grant No.: HL 18805  
Languages: ENGLISH

During the past 9 years, more than 175,000 residents of  
Seattle have received basic training in cardiopulmonary  
resuscitation (CPR). On the basis of experience in that city  
and of observations from three other communities, there is  
little doubt that early initiation of CPA by a bystander is  
associated with a substantially improved survival. In one  
year, 43% of patients (47/109) found in a state of ventricular  
fibrillation survived to hospital discharge when bystanders  
initiated CPR. In comparison, only 21% (43/207) lived when CPR  
was delayed until fire department personnel arrived on the  
scene (p less than 0.001). As expected, there are questions  
regarding community CPR programs, particularly concerning the  
level of skills attained and retained. However, in the setting  
of a rapid-response emergency-care system, we have been unable  
to relate survival to the apparent quality of CPR as judged by  
the bystanders' training and occupation or by assessment of  
what was done on the scene. This discrepancy is likely related  
to the rapid initial response of the fire department,  
averaging 3 minutes from dispatch to arrival on the scene. It  
is important to emphasize that CPR is almost always a  
temporizing measure and that most victims who require CPR will  
also need defibrillation, special airway management, and  
administration of medications. In patients with  
out-of-hospital ventricular fibrillation, the factors that  
determine survival are predominantly related to the rapidity  
with which care is provided, namely, the time from collapse to  
initiation of CPR and the time to provision of advanced  
life-support measure. In many communities a 50% survival rate  
from ventricular fibrillation is probably attainable. Further  
improvement might accrue from the extensive deployment of  
inexpensive defibrillators capable of detecting ventricular  
fibrillation and suitable for use by the general public.

A survey of nurses and anaesthetists in a 500-bed teaching hospital set out to discover how they located a drug container in order to read its label and verify its contents. Members of each group assessed the value of seven factors thought to help in this location and answered questions on personal errors in drug administration. The nurses found the expected position of the drug container in the trolley or cupboard to be the most important factor, followed by the size of the container. The anaesthetists placed the colour of the container as most important, followed by the manufacturer's distinctive container as their second best guide to drug location. This preference for colour and a distinctive container can be used to reduce the chance of confusing drugs locally. A scheme for colour-coding ampoules in broad groups to reduce gross mistakes in the future is presented.

**Assessing whether a clinical pharmacy program is meeting its goals.**

Fink A; Kosecoff J; Oppenheimer PR; Smith WE; Brodie DC

Am J Hosp Pharm, May 1982, 39 (5) pR06-10. ISSN

0002-9289 Journal Code: 310

Languages: ENGLISH

An assessment of whether the clinical pharmacy program at Memorial Hospital Medical Center (MHMC), Long Beach CA, was meeting its goals is presented. MHMC is a 858-bed, nonprofit teaching hospital that initiated a clinical pharmacy program in 1967. The program's three foremost goals were to: (1) establish cohesive and standardized clinical services, (2) promote the acceptance of the roles and functions of clinical pharmacists by physicians and nurses, and (3) assure the provision of good quality care. The evaluation data were collected over a six-week period using questionnaire surveys of approximately 28 pharmacists, 146 physicians, and 389 nurses; pharmacist service reports from 5991 drug monitorings; 228 medical record audits for six drugs; 68 guideline compliance records for three drugs; interviews with 131 users of the drug information services; and logs of 3946 pharmacist encounters with other health-care providers. Generally, the clinical pharmacy program was found to be meeting its goals. Most of the monitorings (81.6%) were initiated by pharmacists, and 20% resulted in changes in drug therapy. The pharmacists adhered to the pharmacy department's monitoring and dosing guidelines. There was unanimous satisfaction among users of the drug information service with the response received from pharmacists, and 99% satisfaction with the promptness of response and accuracy of the information. Sixty-eight percent of the pharmacists reported discussing general issues with physicians, and 72% answered patient-specific questions from physicians. The physicians (96%) and nurses (97%) thought that

there was an improvement in the quality of patient care as a result of pharmacist involvement. Pharmacists at MHMC are providing useful clinical services.

**[Alcoholism in young people (author's transl)]**

Les jeunes et l'alcool.

Zourbas J

Sem Hop Paris, Apr 8 1982, 58 (14) p881-5. ISSN

0037-1777 Journal Code: ULD

Languages: FRENCH Summary Languages: ENGLISH

Epidemiology should be used for studying teenagers' attitudes and behaviours concerning alcoholic beverages in order to develop health education programs designed to induce temperance in adolescence and, subsequently, in adulthood. We report on five studies carried out in France, including 5,481 subjects, both male and female, aged 13 to 26, belonging to various communities, and living in different conditions. Answers to questionnaires showed that both the first ingestion of alcohol (usually with the family) and the first inebriation (usually with friends) occur very early (at ages 10 to 12 and 15 to 16 respectively). Alcohol intake increases with age, parents' permissiveness, money allowance, and pub attendance. Health education should be undertaken very early, in kindergarten, and subsequently included in school programs each year. Cooperation among school teachers and with the school's medical staff and the childrens' parents is essential.

**Competencies in physical therapy: a resource for written self-assessment and clinical performance evaluation and a component of a department's quality assurance program.**

Ellingham CT; Fleischaker K

Phys Ther, Jun 1982, 62 (6) p845-9. ISSN 0031-9023

Journal Code: P6W

Languages: ENGLISH

This article was written to demonstrate how clinical competence in ultrasound administration can be reviewed. A team of two members of the Minnesota Competency Consortium developed two tests: 1) a written examination that could be used as a tool to assess the knowledge of physical therapists in physical therapy departments and 2) a skills-mastery check list to assess ultrasound treatment skills. Both tests followed the competency hierarchy of Competencies in Physical Therapy: An Analysis of Practice. As one component of a physical therapy department's quality assurance program, the tests also were used to identify educational needs in order to develop programs to meet those needs.

**A proposal: primary nursing for the mother-baby dyad.**  
Vestal KW  
Nurs Clin North Am ,Mar 1982, 17 (1) p3-9, ISSN  
0029-6465 Journal Code: 092  
Languages: ENGLISH

Nurses who work in a maternity setting must define their role in terms of the families for whom they care. Care of the childbearing family includes the social, cultural, and economic environment in which the new baby and his family are a part. The postpartum period is an ideal time for the primary nurse to influence the care of the baby and family in a way that supports their unique family system. The nurse who utilizes this opportunity to care for the family can contribute positively to the start of a new member of society.

The interactional system of the infant and family can be viewed as a mutually dependent dyad that is best supported by consistent and knowledgeable nursing care. It is no longer reasonable to deny such care to maternity clients. Family-centered care has been shown to be successful in a variety of hospital maternity settings, improving care for the mother-baby dyad and promoting cost-effective staffing. The process of proposing such a change is challenging. Obstacles to change can be overcome and, although painful, they often lead to clearer definition of the proposal. Nursing must provide the impetus to sound family-centered care. The alternatives are no longer acceptable to consumers, and fragmented nursing care is seldom satisfying to nurses. There is much to be gained by fulfilling the true sense of family-centered postpartum care.

**Effects of parent training on teenage mother and their infants.**  
Field T; Widmayer S; Greenberg R; Stoller S  
Pediatrics ,Jun 1982, 69 (6) p703-7, ISSN 0031-4005  
Journal Code: 0XV  
Languages: ENGLISH

Parent training was provided for 80 low-income, black teenage mothers during their infants' first six months. Half of the mothers were visited biweekly in their homes to be instructed in caregiving and in sensorimotor and interaction exercises, and half were trained as CETA (Comprehensive Employment Training ACT)-paid, teacher's aides in a medical school infant nursery that provided care for their infants and infants of medical faculty. Growth and development during the first two years were superior for the infants whose mothers received training, particularly those who received paid parent training as teacher's aides in the infant nursery. Repeat pregnancy rates were lower and return to work/school rates were higher for the infant nursery mothers, most of whom subsequently pursued nurse's aide training.

**Continuity reexamined: differential impact on satisfaction with medical care for disabled and normal children.**

Breslau N

Med Care ,Apr 1982, 20 (4) p347-60, ISSN 0025-7079 Journal Code: LSM

Languages: ENGLISH

The satisfaction with medical care of families with disabled children and of randomly selected families is compared to test the hypothesis that the impact of continuity of physician on parental satisfaction is greater when disabled children are patients than is the case among the general population of children. A multiple regression approach for the study of interaction was used. The results provide general confirmation for the hypothesis that the weights of continuity in producing change in all three patient satisfaction areas studied were greater in the sample of families with disabled children than in the random sample of families. Controlling for maternal education, family income, race and waiting time did not alter these results. It is suggested that a continuous doctor-patient relationship, conducive to the expression and resolution of psychological needs, is of special importance when a patient's illness is severe. Implications for the organization of medical care in specialty clinics, which serve the disabled and chronically ill, are discussed.

**Primary care and medical education.**

Ross M; Willer B

Med Care ,Feb 1982, 20 (2) p235-41, ISSN 0025-7079 Journal Code: LSM

Languages: ENGLISH

There is considerable argument for the value of educating medical students in the basics of primary care, comprehensive care and concern for psychological needs of patients. However, medical schools do not place much emphasis on primary care. Most clinical experiences take place in tertiary care centers, and most teaching is provided by specialists. Relatively little attention is paid to psychological issues of care and development of interpersonal skills among would-be physicians.

The impact of the tertiary care orientation is widespread. Medical students are expected to adopt the role of the physician-specialist or technologist. Those who want to be primary care physicians have to face value conflicts with the establishment, and some develop emotional problems. The effects carry over into practice. Physicians who do not

develop adequate personal skills are less likely to be viewed as competent by their patients. They are also more likely to develop mental health problems themselves. This article argues for a modification of the medical school curriculum to reflect the orientation of the primary care model.

**Development of a cancer prevention-detection clinic.**

Mettlin C; Boyle M; Michalek A

J Surg Oncol ,Apr 1982, 19 (4) p211-5, ISSN 0022-4790 Journal Code: K79

Contract/Grant No.: CA 16411

Languages: ENGLISH

Control of cancer through risk reduction and early detection has great potential. Roswell Park Memorial Institute's Prevention-Detection Center addresses a community need for health promotion, disease prevention, and cancer detection as well as providing opportunity for research on the efficacy of such a program. The Prevention-Detection Center offers a range of services including education, genetic counseling, risk assessment, counseling in smoking cessation and other means of risk reduction, and screening for cancer. It is also involved in evaluation of new technologies of cancer detection such as the ultrasonic examination of the breast. A community outreach program is aimed at attracting high-risk populations. In its first eighteen months of operation, the Prevention-Detection Center detected 24 confirmed cancers. The Center is used by approximately 60 persons each week. Interviews with persons using the clinic over a two-week period indicate that most are motivated to attend because a relative has had cancer or because of a belief in the importance of regular checkups. Client satisfaction with the clinic is high. Although many of the activities of the prevention-Detection Center have a research dimension, many of its activities and services are suited to the community ambulatory health care setting.

In order to get the information about prevention issues to "go through" and to foster behavior modifications in the individuals, there is a need to disseminate in with the communication techniques used in the commercial sector in particular; in a way, the matter is to make prevention fashionable. At the institutional level, it is important to remove the obstacles which hinder or delay the availability and use to preventive services. This should be done in obtaining a real transparency of the health care system, especially as regards the type of care given, the equipment and the costs involved.

The new Mental Health Program for Physicians in Training, at UCLA, offers free psychiatric evaluation and short-term psychotherapy to UCLA medical students and house officers, utilizing a large group of physician volunteers from the clinical and regular faculties. The program features complete confidentiality and an off-campus setting and provides help in a number of specialized areas. It also conducts research on stress in medical education. A basic aim is to promote a sense of community in the medical profession by demonstrating the concern of mature practitioners for their young colleagues. It also seeks to foster greater sensitivity among young physicians by educating them about the importance of their own psychological needs. The UCLA program provides a model for mental health services that are low in cost, both to medical trainees and to the training institution, at a time of severe budget shrinkage.

Systems for prehospital care, emergency medical care, and trauma care clearly overlap educationally, medically, financially, and politically. Most systems have not accomplished separation of this interdisciplinary tangle. To solve this dilemma we have customized an Emergency Medicine and Trauma Service (EM & TS) at a regional trauma medical center. The program (annually): 1) treats 32,000 patients (11,330 are trauma); 2) educates 140 paramedics, residents, students. Physician personnel: Members are fully trained in Internal Medicine, Surgery, or Pediatrics; are members of other academic departments. Each is approved by three chairmen: Emergency Department, The physician's specialty, and Surgery. Structure: Board-qualified trauma surgeon always present; other faculty supplement surgical manpower; physicians are salaried; each is responsible to Director of EM & TS; trainees are not included as patient-care manpower. Organization: Academically, EM & TS is a Section of the Department of Surgery; the Section Chief is Director of EM & TS, and is responsible for Emergency Department, prehospital care, and trauma admissions. The solution: A vertical responsibility structure to this multidisciplinary system has provided a successful solution and may be tailored to other systems.

Journal Code: G20

Contract/Grant No.: No. 5T324L07180-04

Languages: ENGLISH

To develop strong health education programs, health educators working in complex medical care organizations must often secure professional cooperation across disciplines, coordination of services, and orientation of policies, procedures, and personnel toward patient preferences and needs. Frequently, they undertake these tasks against the tide, within a problematic organizational structure. The present case study illustrates the difficulties posed by introducing change in medical care organizations in the context of an education program to acquaint employees of a large HMO with a consumer bill of rights mandated by the consumer Board of Trustees. The underlying assumption was that in a bureaucratic institution, an employee-centered and modest system reform strategy would be effective in bringing about client-centered outcomes in this case, increased recognition of client rights. The case analysis and results of a post-intervention, cross-sectional survey suggest that in units where a threshold level of participation was reached, there were improvements in knowledge about the Bill and employee attitudes. The program was less successful with hospital nurses whose feelings about physicians were not taken into account fully, and with physicians whose relative lack of integration into the policy and managerial domains made them harder to reach.

Languages: ENGLISH

To determine the impact of a primary prevention project at the community level, a feeder area approach has been implemented for a period of 2 years. The operational objective

of the approach has been to concentrate most of the prevention agency's programs in one small area rather than scattering its resources throughout the country at large. It has been assumed that the country as a whole is too large a unit to have a measurable impact in a short period of time. The feeder area chosen therefore is used as an experimental group while the rest of the country is viewed as a control group in a natural social setting. Through countrywide drug surveys implemented before and after the project, it has been determined that there is a significant reduction in the current users of various drugs in the selected feeder area when compared to the rest of the country.

Blind nasal intubation often results in esophageal placement of the tube because reflex swallowing and supralaryngeal structures direct the tube posteriorly. Extrusion of the tongue, which inhibits swallowing and shifts the supralaryngeal structures anteriorly, facilitated blind placement of a nasotracheal tube in 14 of 16 critically ill patients. The technique avoids manipulation of the neck, the use of heavy sedation or anesthesia, and requires no specialized training or equipment.

**The longitudinal study of findings in childhood. Analysis of an interdisciplinary process.**

Levine MD; Wolman R; Oberklaid F; Pierson DE

Am J Dis Child ,Apr 1982, 136 (4) p303-9, ISSN

0002-922X Journal Code: 3GS

Languages: ENGLISH

The Brookline Early Education Project provided periodic diagnostic assessments and individualized educational programs for approximately 300 children enrolled at birth in an attempt to reduce the prevalence of neglected health needs and school problems. A method, The Longitudinal Study of Findings, was developed to monitor and document diagnostic findings (determinations suggesting a possible service need). Each finding was rated for severity, treatability, and predictive value (potential impact on future function). At the 42-month-old check-point, 87% of children had at least one finding; there was a mean of 3.4 findings per child. Only 15% of findings had a high likelihood of treatability, and 12% were rated as highly predictive of later problems. Only 1.1% of findings were highly predictive and highly treatable. While certain categories of findings tended to prevail in isolation, others tended to coexist in the same child.

Languages: GERMAN Summary Languages: ENGLISH

With decrease of tuberculosis among children GDR to nearly insignificant numbers nonspecific respiratory diseases have taken precedence in the health care of children. Nevertheless tuberculosis must not be forgotten in differential diagnostic consideration. Prophylaxis of tuberculosis exposition is becoming a predominant task. Immunoprophylaxis by BCG-vaccination should be carried on, yet treatment of tuberculous children should be started centrally at the children's hospital for pulmonary diseases at Harzgerode (GDR) also further on. The following ambulatory therapy should be done under the control of the district centres for respiratory diseases among children in close cooperation with the appropriate policlinical department for pulmonary disease (PALT) and the hospital at Harzgerode. Tuberculosis has to

remain an important component of medical education of students and postgraduate education of pediatricians in spite of its low incidence, in future too.

West M; O'Donnell M

Med Educ ,Mar 1982, 16 (2) p94-6, ISSN 0308-0110

Journal Code: MZ3

Languages: ENGLISH

The study was conducted to examine the impact which personality types may have on the selection process of two preclinical medical school curricula. The two curricula run concurrently at the University of New Mexico School of Medicine. One curriculum has a conventional-lecture format, and the other a new student-centered curriculum, which is designed to graduate students planning careers in rural primary-care. Results indicated that those students preferring the innovative curriculum were personality types unlikely to enter rural primary-care, whereas students preferring the conventional curriculum had personality profiles more consistent with those making rural primary-care career choices. Discussion deals with the implications of personality type and curriculum choice in terms of the curriculum goals and educational method.

**The community mental health nurse: a new professional role.**

Hall V; Russell D

J Adv Nurs ,Jan 1982, 7 (1) p3-10, ISSN 0309-2402

Journal Code: H3L

Languages: ENGLISH

This review of recent literature explores the similarities and differences between the work of community psychiatric nurses and their mental handicap counterparts. The comparisons which have been made between these groups of nurses are related to the authors' own research studies. These included an observational study of one community mental handicap nursing team and a national survey of all such teams in England and Wales. The importance of trade union membership, the place of the Community Psychiatric Nursing Association and the implications of joint training courses are discussed. The emergence of a new professional role, that of the "community mental health nurse" is discussed and the implications which this might have for the future organization of community psychiatric nursing services is outlined.

Languages: ENGLISH

School screening for scoliosis is a well accepted technique for the early detection of spinal deformities. We reviewed the experience in Minnesota over the past eight years, with an average of one-quarter of a million children being screened yearly. Of the children screened, 3.4 per cent were referred for evaluation and scoliosis was found in 1.2 per cent. The number of children requiring operations for adolescent idiopathic scoliosis has diminished since 1970. The average curve for which a surgical procedure was done has also diminished from 60 to 42 degrees. The cost of the program is low, averaging 6.6 cents per student screened. This compares with a so-called time cost averaging thirty-five cents. Voluntary scoliosis screening in Minnesota is an efficient and cost-effective program.

**Standards for physician training in sports medicine.**

Ryan AJ  
Clin Orthop ,Apr 1982, 164 p13-7, ISSN 0009-921X  
Journal Code: DFY  
Languages: ENGLISH

Modern interest in sports medicine dates to the founding of the International Federation of Sports Medicine in 1928. Formal training in this field has been offered in a number of European countries for many years, but only for one five-year period in the United States at one University. Medical schools in this country may offer short elective periods, but there is no residency training program and only a few fellowships available to the orthopedic surgeon. Physicians seeking postgraduate training must seek out short conferences and read the growing volume of literature. Sports medicine clinics and centers, however, have increased rapidly in number. A group of 80 physicians organized themselves to develop the basis for a curriculum in sports medicine which could be applied to both undergraduate and graduate training. It is divided into basic sciences, organ systems, clinical systems, and miscellaneous topics, and when completed, the outline will be presented to interested medical bodies for their use.

**A formal audit as continuing medical education: anaesthesia for neurosurgery.**

McIntyre JW; Purdell-Lewis JG  
Can Anaesth Soc J ,Mar 1982, 29 (2) p174-80, ISSN 0008-2856  
Journal Code: CG7  
Languages: ENGLISH

A brief description of the change from a normative evaluation to a formal audit of anaesthesia for neurosurgery is described. The criteria to be applied and their significance for clinical practise are listed. It is emphasized that these items are not presented as criteria for the standard of anaesthesia practised but as matters deserving debate among anaesthetists participating in a formal audit, particularly where the case load does not permit statistical analysis of patient outcome and only discussion of individual patients or small groups is possible. It is suggested, as it has been by others, that formal audit in a department of anaesthesia can be developed as the form of continuing medical education most closely related to the clinical work of the anaesthetists working within it.

**University of Manchester sports injury clinic.**

Galasko CS; Menon TJ; Lemon GJ; Banks AJ; Morris MA; Bourne MS; Bentley S  
Br J Sports Med ,Mar 1982, 16 (1) p23-6, ISSN 0306-3674  
Journal Code: B2W  
Languages: ENGLISH

This paper reviews the work of the sports injury clinic based at the Student Health Centre, University of Manchester during its first eighteen months. A total of 852 patients including 46 Centre of Excellence athletes were treated. The results indicate that the establishment of such a specialised clinic is worthwhile, that the injured sportsmen should be treated by individuals trained and interested in the treatment of injured patients in general and that the commonest injuries are soft tissue injuries to the knee or ankle joint. A record card, designed for future computer analysis, is illustrated. It includes details of the sport, training, mechanism of injury, pathology and treatment.

A national survey of CMHC directors and program evaluators yielded responses by both directors and evaluators from 323 CMHCs (60% response rate). The majority of centers reported only one full-time equivalent evaluator or less. Evaluators generally had little or no specific formal education in program evaluation and the majority had a master's degree or less as their highest degree. However, consultants were widely used and evaluators expressed much interest in hearing about conferences, continuing education opportunities, and publications dealing with program evaluation.

**Problems of psychiatric practice in community mental health centers.**  
Donovan CM  
Am J Psychiatry ,Apr 1982, 139 (4) p456-60, ISSN 0002-953X  
Journal Code: 3VG  
Languages: ENGLISH  
Initial enthusiasm about community mental health centers (CMHCs) has diminished. The participation of psychiatrists in CMHCs declined in the 1970s and may decline further. The author describes one center to highlight problems encountered by community psychiatrists: 1) unrealistic treatment expectations, 2) limitations of psychiatric knowledge, 3) need for a broad range of clinical expertise, 4) supervision of other CMHC clinicians, 5) limited funds and rehabilitation facilities, 6) complex medical and legal problems, and 7) lack of adequate training in administration. She suggests that the public be reeducated regarding realistic treatment goals, that CMHCs be allied with university departments of psychiatry, that funding be stabilized, and that community psychiatrists be given more support.

**[Comparison between the mobile emergency care systems of the Free University of Brussels and the Catholic University of**

**Leuven]**

Comparaison entre les services d'aide medicale urgente de l'Universite Libre de Bruxelles et la Katholieke Universiteit Leuven.

Askenasi R; Lignian H; Dufaye P; Chiarotto P; Rommes M  
Acta Chir Belg ,Jan-Feb 1982, 82 (1) p25-31, ISSN 0001-5458  
Journal Code: OH8

Languages: FRENCH Summary Languages: ENGLISH  
Populations concerned with mobile emergency care systems have the same age distribution in Leuven and in Brussels. Interventions for trauma are more frequent in Leuven and cardiac emergencies more frequent in Brussels, but these differences decrease when only critical patients are taken into consideration. The origin of calls is quite different in Brussels and in Leuven. The mobile emergency care system is underused in Brussels. The distribution of emergencies is influenced by the information and the formation of firemen, physicians and public.

**[Dying patients and medical problems from the family doctors point of view (author's transl)]**  
Probleme bei der Betreuung Sterbender aus der Sicht des Facharztes fur Allgemeinmedizin.  
Dan J  
ZFA (Dresden) ,Jan-Feb 1982, 37 (1) p35-40, Journal Code: XSR

Languages: GERMAN Summary Languages: ENGLISH  
Problems appearing to the confrontation with dying patients concern the family doctor as well as the clinician. To our computation 55,3% all men did not die in the hospital. Near 38% all at home dying men have had a more or less long sick bed and did care by the family doctor. In opposite to the hospital the general practitioner may cooperate only with medical laymans. The community nurse can many help but she has a lot of other tasks. According to our view, the enlightenment hopelessly ill patients is a very difficult problem solving of which we can on consideration of all conditions only. We should keep the straight talk not too early, otherwise we take the patients hope and paralyse all kinds of activities. There are some cases with complications in which we don't avoid hospitalisation in spite of very good home cars. All our troubles we may terminate not till after definite death.

Languages: ENGLISH

Little is known about the therapies that people initiate for their health problems, and the available research on self-medication has focused primarily on adult populations. Only a few studies have specifically addressed mothers' independent use of medications for their children, and none has described such behavior in depth (for example, relating-perceived symptoms and conditions in the child or attempting to provide an explanation for mothers' decisions in these situations). A stratified systematic random sample of 100 mothers of children between 6 months and 12 years old was obtained at each of 3 pediatric ambulatory care clinics. Mothers were interviewed about their use of medications for their children, their concerns about their children's health, and their medication-related attitudes. The study results suggest that income and education are related to the types of medication and medical appliances mothers keep to treat the various health problems of their children. Mothers' perceptions of their children's potential susceptibility to health problems are related to possession of what they believe are relevant remedies for those problems (as well as to keeping a greater variety of medications on hand). Socioeconomic status appears to be one determinant of the number of different remedies (and especially the number of different medical appliances) that are purchased. Certain attitudes held by mothers about medications also play a role in explaining how great a variety of remedies are kept available for children in the event that they become ill, and these medication-related attitudes are highly correlated with socioeconomic status.

Contract/Grant No.: 1-HV-72986; 5P32-HL-97180-05

Languages: ENGLISH

As part of a statewide effort to coordinate existing resources for high blood pressure (HBP) control, a public health HBP control program was planned and implemented in two high-risk communities in Maryland. The selection of the two communities was based on epidemiologic data. The planning of the educational intervention program in these communities (urban and rural) was guided by organizational theory and health education principles. The framework for development, implementation, and evaluation of the program utilizes an educational assessment model which identified factors that predispose, reinforce, and enable individual persons to practice positive health behavior. Multiple data sources were used in assessing the extent of the problem and relevant approaches in the development of the coordinated HBP control program. These include statewide vital statistics and a random statewide household survey to assess the prevalence rates of awareness, treatment, and control of HBP. To supplement these data, telephone surveys were carried out in the two communities to assess knowledge, beliefs, and practices related to HBP control. Medical record reviews provided baseline information on appointment keeping behavior and BP correlates of hypertensive patients. The planning and implementation of the program was carried out under the direction of representatives of the health care systems, community leaders, and residents, and representatives of communitywide organizations involved in HBP control.

Journal Code: KFR  
Languages: ENGLISH  
Information about comprehensive rehabilitation for patients  
with cancer is limited. Only a few descriptions of existing  
models are found in the literature. A survey questionnaire  
concerning the description and operation of cancer

rehabilitation programs was developed and mailed to identified  
programs in 95 facilities throughout the country. Thirty-six  
facilities responded with data appropriate for analysis of  
their method of organization, treatment approaches, team  
composition, program emphasis, evaluation procedures, and  
program results. A literature and survey analysis provide  
support for an interdisciplinary team approach for  
rehabilitation of cancer patients disabled by the disease or  
its treatment. In addition, the survey shows favorable  
acceptance and success of cancer rehabilitation programs,  
especially in community hospital settings.

Epidemiology should be used for studying teenagers'  
attitudes and behaviours concerning alcoholic beverages in  
order to develop health education programs designed to induce  
temperance in adolescence and, subsequently, in adulthood. We  
report on five studies carried out in France, including 5,481  
subjects, both male and female, aged 13 to 26, belonging to  
various communities, and living in different conditions.  
Answers to questionnaires showed that both the first ingestion  
of alcohol (usually with the family) and the first inebriation  
(usually with friends) occur very early (at ages 10 to 12 and  
15 to 16 respectively). Alcohol intake increases with age,  
parents' permissiveness, money allowance, and pub attendance.  
Health education should be undertaken very early, in  
kindergarten, and subsequently included in school programs  
each year. Cooperation among school teachers and with the  
school's medical staff and the childrens' parents is  
essential.

**What's a medication group?**

Larkin AR

J Psychosoc Nurs Ment Health Serv .Feb 1982, 20 (2)  
p35-7, ISSN 0279-3695 Journal Code: JUW

Languages: ENGLISH

For therapists interested in a didactic model, a Medication Group can be an ideal vehicle for patient education. Our patients are remarkably well informed on dopamine, tardive dyskinesia, side effects, types and levels of drugs, early symptoms, individual stressors and coping mechanisms. They request and titrate drug levels according to their own identification of symptom distress. There is no question that the ability to control their symptoms and medications is a positive and important experience for them. The focus for this paper, however, has been an exploration of a group therapeutic strategy which deals with the phenomenological needs of chronic schizophrenics to address the residual or negative symptoms of schizophrenia, and not their educational needs.

Languages: ENGLISH

The majority of patients care calls referred to practitioners at each of two family practice office study sites were related to medications. However, there were significant differences in the proportion of patient care calls managed by staff physicians, family practice residents, and clinical pharmacists which involved discussion of medication. There were also significant differences in the callers and types of medication related calls managed by each practitioner group. Calls initiated by patients and those classified as refill requests accounted for the largest proportion of calls managed by staff physicians, residents, and clinical pharmacists. The majority of calls received by each practitioner group were managed without consultation. A follow-up office visit was recommended in approximately one half of all medication related calls. The findings of this study may be useful in determining the personnel required to manage medication related telephone calls and in identifying potential areas for education and training of personnel in family practice.

In September, 1974, the Kaiser-Permanente Medical Center in Santa Clara, California, and the West Valley Community College District entered into cooperative planning for delivery of consumer health education. Two months later, the first five classes commenced with a total enrollment of 53 persons, all of whom were HMO members. Seven years later, this joining HMO-community college health education program entitled More Effective Living (MEL) contains over 50 different class titles, is offered cooperatively by two Kaiser-Permanente facilities and three locally-based community colleges, is scheduled in three academic semester time periods spanning 12 months and, is expected to serve an estimated 760 HMO members and community residents in the Spring 1981 semester. Although this paper addresses the HMO-community college partnership primarily from an administrative perspective, some background information is given to explain the basic concepts of the program design. For health educators, particularly those working in medical care, partnership with a community organization can be an effective way to deliver health education to a target population at minimal cost.

A multicentre phase III clinical trial has been undertaken to compare norethisterone enantate (NET-EN) given by two different treatment regimens and depot-medroxyprogesterone acetate (DMPA). After 18 months of observation, preliminary findings are reported for 1,589 women who received DMPA 150mg every 90 days; 790 women who received NET-EN 200mg every 60 days; and 796 women who received NET-EN, 200mg every 60 days for 6 months, then 200mg every 84 days. The overall discontinuation rates per 100 women were similar for all three treatment groups over the 18 months observation (61.8 - 63.5 per 100 women). The discontinuation rates for bleeding

problems and for personal reasons were also similar for all three treatment groups. However, terminations due to amenorrhoea were significantly higher among DMPA users (12.1 and 17.4 per 100 women at 12 and 18 months) as compared with both NET-EN groups (6.8 - 8.2 per 100 women at 12 months and 10.4 - 10.9 per 100 women at 18 months). The only significant difference in pregnancy rates observed between the three groups was a higher rate at 18 months among NET-EN (84 days) users (1.6 per 100 women), as compared with DMPA users (0.2 per 100 women). There was no overall significant difference between the two NET-EN groups, although between the 6 and 18 month's follow-up when the two NET-EN regimens diverged, the NET-EN (84 days) users' pregnancy rate rose significantly, whereas in the NET-EN (60 days) group the pregnancy rate did not change. There was a significantly higher weight gain in those subjects using NET-EN at 60-day intervals compared with those using it at 84-day intervals.

**General internal medicine units in academic medical centers: their emergence and functions.**

Friedman RH; Pozen JT; Rosencrans AL; Eisenberg JM; Gertman PM

Ann Intern Med ,Feb 1982, 96 (2) p233-8, ISSN 0003-4819  
Journal Code: 5A6

Languages: ENGLISH

By 1979, 77% of medical school primary teaching hospitals had functioning general internal medicine units; less than 5% had existed before 1970. These units were established to meet institutional needs for primary care internal medicine teachers and clinicians. By the end of the decade they had achieved major administrative and staffing responsibility for a wide variety of general education and service activities. The scope of general internal medicine units goes beyond the narrow definition of primary care internal medicine, to include activities traditionally considered those of the entire department of medicine.

Languages: ENGLISH

The first year of existence of the Peninsula Maternity and Neonatal Service (PMNS) is reviewed. Some 21000 deliveries per annum fall under the Service. The ethnic distribution in 1980 was 27% Black, 69% Coloured and 4% White. The perinatal mortality rates per 1000 births were 31.2 for Blacks, 29.4 for Coloureds and 15.0 for Whites, with an overall perinatal mortality rate for the PMNS of 29.2. The administration of the PMNS is described. The Midwife Obstetric Units are discussed under the following headings: function, workload, advantages, and continuing education. Research opportunities and the main problems in the PMNS are outlined.

Willoughby ML; Dunlap DB

South Med J ,Feb 1982, 75 (2) p197-202, ISSN 0038-4348  
Journal Code: UVH

Languages: ENGLISH

We have outlined a comprehensive approach to the periodic examination of adults. We do not discuss reasons for excluding specific practices. The approach outlined eliminates many practices that have become part of the "routine examination" and focuses on specific key areas. Our recommendations are practical and somewhat more inclusive than those of the others. We have not addressed mass screening, but have instead defined a periodic health examination applicable to the unique physician-patient relationship.

**Projecting physician requirements for child health care-1990.**

Morgan BC  
Pediatrics ,Feb 1982. 69 (2) p150-6. ISSN 0031-4005  
Journal Code: OXV

Languages: ENGLISH

In 1976 the Secretary of the Department of Health, Education and Welfare appointed the Graduate Medical Education National Advisory Committee (GMENAC) with the charge to advise the Secretary on five national health planning objectives, including estimates of the numbers of physicians required to meet the health care needs of the nation, recommendations regarding the most appropriate specialty distribution of these physicians, and development of strategies to achieve the recommendations formulated by the committee. GMENAC evaluated projected supply and requirements for all major specialties, including child health care, for 1990, and recommended strategies to bring supply and requirement into reasonable balance. Despite the range of error of the methodology used, these data represent the most detailed scientific study to date on this subject. Pediatrics, the portion of child health care accruing to the pediatrician in 1990 was projected to be in "near balance" for supply/requirement ratio. Inasmuch as GMENAC recommended that larger surpluses be created deliberately in the three primary care fields, it is unlikely that the numbers of pediatric residency training programs will be decreased. As several hundred pediatric residency positions are unfilled each year, a concomitant decrease in residency offerings in oversupplied fields would be required to accomplish the recommended subspecialty distribution.

**Socioeconomic evaluation of a state-funded comprehensive hemophilia-care program.**

Smith PS; Keyes NC; Forman EN  
N Engl J Med ,Mar 11 1982, 306 (10) p575-9. ISSN  
0028-4793 Journal Code: NOW

Languages: ENGLISH

To assess the effectiveness, cost, and socioeconomic gains associated with a comprehensive state-funded hemophilia program, we compared data from a three-year experience with such a program in Rhode Island with those from the preceding year. Self-treatment, integration of children into school, and achieving satisfying employment of adults are the main goals of the program. During the most recent year, 77 per cent of the patients with severe hemophilia in the state received total care through the Hemophilia Center. Twenty-eight of the 43 patients now treat themselves, the annual number of hospital days per patient has decreased from 12.6 to 3.5, and the number of visits to hospital facilities has fallen from 34 to 2.4, while the yearly cost of clotting factor per patient has remained about \$7,000. Altogether, this has saved more than \$10,000 each year for treatment, despite the cost of rehabilitative surgery. Numbers of days lost from school and work have decreased twofold and threefold, respectively. Best of all, comprehensive care has vastly improved the quality of life for patients with hemophilia in Rhode Island.

Governance of academic medical centers is in a process of change. This essay reviews some of the historical factors that have affected the present status of academic medical center governance and describes the functions of the four individuals who are most involved in the operation of academic medical centers: vice-presidents for health affairs, deans of relationships between these four individuals are analyzed, and points of conflict are identified. Some suggestion about how these individuals can work together more effectively are made.

**Therapeutic use of albumin: 2.**

Alexander MR; Alexander B; Mustion AL; Spector R; Wright CB  
JAMA ,Feb 12 1982, 247 (6) p831-3, ISSN 0098-7484  
Journal Code: KFR

Languages: ENGLISH

It has previously been shown that albumin costs in a Veterans Administration Hospital constituted a large portion of the pharmacy drug budget and that much albumin was prescribed inappropriately. Therefore, a program of education and use monitoring was instituted to improve understanding and prescribing of this product. Inappropriate use declined from 41% to 26% of total albumin units and, more dramatically, total cost of albumin used had decreased by 90% one year after this program was initiated. Projected yearly savings from decreased use was more than \$85,000. These results demonstrate that such a program can promote more appropriate use of albumin and effect a cost savings for hospitals.

0002-8614 Journal Code: H6V

Languages: ENGLISH

Twenty-seven projects for the development of interdisciplinary geriatric curricula were supported by the Health Resources Administration's Bureau of Health Professions in fiscal 1979. A variety of clinical training sites were used (e.g., university gerontology centers, VA medical centers, senior citizen facilities, adult health care centers), and innovative teaching approaches were developed. For example, a combined medical/dental/optometry clinic is conducted by students at the three professional schools; medical students accompany volunteers serving Meals on Wheels; and dental students treat patients in nursing homes in a mobile dental unit. Students have gained insights into the problems of the elderly and the roles of other health professionals through the interdisciplinary-team training courses. Nurse-practitioner programs to prepare nurses to provide primary health care to the elderly were also supported by the Bureau, as were special projects to develop short-term in-service basic training programs for nurses' aides and orderlies in nursing homes, to upgrade the skills of the paraprofessionals who care for the elderly. In other projects, the geriatric educational needs of pharmacy students were assessed, and dental schools promoted remote-site training to improve access to dental care

**Team approach to the problem-oriented record in a long-term care facility.**

Beattie BL; Crawshaw ML  
J Am Geriatr Soc ,Feb 1982, 30 (2) p109-13, ISSN  
0002-8614 Journal Code: H6V

Languages: ENGLISH

At the Extended Care Unit of the Health Sciences Centre Hospital at the University of British Columbia, team participation in the care of 300 elderly patients includes the team's ability to facilitate use of the problem-oriented record (POR). The key to making the POR a functional communication tool was the development of a useful Problem List. In establishing this system, many difficulties arose. It was imperative to recognize that many staff members had not been trained in problem-solving techniques, and that they had varying degrees of knowledge about the data base. Active physician involvement was mandatory. Employment of a half-time POR Coordinator working with a supporting interdisciplinary POR Committee was needed to make the system work. Guidelines for defining problems were developed, and Problem Lists gradually acquired significance for the entire health care team. Examples are included. Concurrent continuing education was started in pathophysiology, problem-solving, and use of the POR.

**The use of microfiche in testing clinical judgment.**

Mackenzie RS; Javid NS; Weldy PL

J Dent Educ ,Mar 1982, 46 (3) p143-6, ISSN 0022-0337

Journal Code: HY7

Contract/Grant No.: 1 G08 LM 03244-02

Languages: ENGLISH

This paper reports an investigation of the use of microfiche to replace other more bulky clinical materials in testing clinical judgment. Twenty-three students were administered two versions of tests of clinical judgment (micro-fiche and nonmicrofiche) regarding the treatment of partial edentulism. Each student served as both experimental subject and control. Results indicated that under the conditions of testing used, students preferred the nonmicrofiche version of the test. However, there was no significant difference in time of administration or grades resulting from the microfiche medium.

Whether the test was given first or fourth in a series of five made a difference in time to take the test (p less than .01), and in the grade received (p less than .01). Tests taken in the first position took more time to complete and resulted in a higher grade. The rate of agreement in grading between the first and second grading session was 70 percent.

**Impact of a drug bulletin on prescribing oral analgesics in a teaching hospital.**

Berbatis CG; Maher MJ; Plumridge RJ; Stoelwinder JU; Zubrick SR

Am J Hosp Pharm ,Jan 1982, 39 (1) p98-100, ISSN 0002-9289 Journal Code: 310

Languages: ENGLISH

The impact of a drug bulletin on prescribing oral analgesics in a teaching hospital was studied. Using an abbreviated time-series design, prescriptions for oral analgesics for all inpatients were surveyed one, three, and five weeks before and one, three, five, and seven weeks after the distribution of one of the hospital's regular drug bulletins. This bulletin contained guidelines for the treatment of minor, moderate, and severe pain. The 493 patients included in the study were classified by drug category, pain severity, and timer period. The drug categories were: (1) propoxyphene, (2) aspirin or acetaminophen alone or with codeine 8 mg or less, and (3) codeine alone or in combination products with more than codeine 8 mg, or other oral narcotic drugs. Each patient's pain severity was determined by interviewing attendant nursing staff; the validity of this approach was confirmed by correlating nurse and physician perception of pain at one time point. Multivariate contingency table analysis revealed that the drug bulletin significantly ( $p$  less than or equal to 0.05) reduced the prescribing of propoxyphene hydrochloride across both the minor and moderate pain categories. An increased use of aspirin and acetaminophen was significant three weeks after the release of the drug bulletin. This effect, however, was not significant at other time points. Drug bulletins can be used to achieve a temporary change in physician prescribing patterns of oral analgesics. For a sustained effect, alternative strategies are needed.

**Analysis of information provided by clinical pharmacists.**

Lipman AG; Devenport JK; Page BC

Am J Hosp Pharm ,Jan 1982, 39 (1) p71-3, ISSN 0002-9289

Journal Code: 310

Languages: ENGLISH

Data were collected to characterize the interactions between clinical pharmacists and other health professionals in a university hospital with decentralized pharmaceutical services. A self-report data collection form was developed. Six faculty pharmacists participated in the study. Each pharmacist collected data by recording all clinical interactions that occurred in his normal activities for a one-month period. The pharmacists' practice sites were inpatient internal medicine, inpatient pediatrics (two pharmacists), family practice clinic, pediatric clinic, and inpatient physical medicine and rehabilitation. A computer program was written to provide correlation data among the locations, contents, and participants of the interactions. Data were collected on the time required for a literature search and on the outcomes of the interactions. Four hundred ninety-nine interactions were documented. Work rounds were the most common location for these interactions, and the housestaff physicians were the most frequent participants. Patients' dosage schedule was the most common topic discussed (17%). Pharmacokinetics accounted for only 6% of the communications; drug interactions, only 3%. Ninety-six percent of the pharmacists' recommendations were adopted within 24 hours. More than half of the interactions (56%) required no literature search by the pharmacists and nearly half (249) required less than one minute of pharmacist time.

**Fluoride supplementation in Harris County, Texas.**

Siegel C; Gutgesell ME

Am J Dis Child ,Jan 1982, 136 (1) p61-3, ISSN 0002-922X

Journal Code: 3GS

Languages: ENGLISH

We sent questionnaires to 421 physicians in Harris County, Texas, to determine the use of oral fluoride supplementation. The response rate was 56%. Although 95% of the physicians practice in fluoride-deficient areas (less than 0.7 ppm), 36% of those responding stated that the fluoride content of the water was adequate; 25% were unsure. Of those who thought that the fluoride content was adequate, 79% stated that the actual fluoride content was less than 0.7 ppm or were unsure. Only 35% of the responding physicians prescribed fluoride, only 45% knew the correct dose. Only 50% of the responders made routine dental referrals in the 3- and 4-year age group. More physician education is needed to ensure oral fluoride supplementation in communities with inadequately fluoridated water supplies.

**Resident preferences for the clinical teaching of ambulatory care.**

Stritter FT; Baker RM

J Med Educ ,Jan 1982, 57 (1) p33-41, ISSN 0022-2577

Journal Code: J13

Languages: ENGLISH

The content and teaching behaviors of clinical teaching in ambulatory care and, in particular, in family practice centers are important to residents as they attempt to learn the varied aspects of patient care. This paper is based on a study of family medicine residents' preferences for the content areas of family medicine emphasized by those attending physicians perceived by the residents as the "best" clinical teachers in their respective centers. Also included in the study were the specific teaching behaviors of those same clinical teachers. A statistical analysis of the preferences of residents provided an indication of the dimensions of clinical teaching in resident education. Further, certain individual characteristics of residents were found to influence their perceptions. It was concluded that selected content areas should receive more emphasis and that the human aspects of clinical teaching are more important than technical teaching skills. These perceptions were helpful in suggesting ways of improving the teaching of residents and faculty development.

J Fam Pract ,Jan 1982, 14 (1) p105-113, ISSN 0094-3509

Journal Code: 14L

Languages: ENGLISH

The challenge of research in family medicine is addressed in this paper by describing the rationale for research,

appropriate content areas, resources available, and needs for the future. Family medicine has the opportunity to study health and disease in humans within their natural habitat over long periods of time, and to examine the multiple aspects of personal and family health care delivery. Resources for research include large primary care study populations, practitioner and faculty researchers, and technical support systems. The basic needs for the future are to increase the quantity and quality of researchers and to attract more funds designed for research. It is recommended that family medicine practitioners and teachers support research and participate more actively; that family medicine academic units provide their learners more research curricular time and their faculties more research activity time, and that they develop Family Medicine Research Centers; that family medicine professional organizations raise funds to support research, promote research opportunities for their members, and communicate to others the research activities, resources, and needs of family medicine; and that the requirements for residency training be modified to include elective research opportunities.

**The entry-level generalist dietitian: I. Employer's general opinions of the adequacy of educational preparation in administration.**

Rinke WJ; David BD; Bjoraker WT

J Am Diet Assoc ,Feb 1982, 80 (2) p132-9, ISSN

0002-8223 Journal Code: H6F

Languages: ENGLISH

Data were collected from 350 hospital food service directors regarding their general perceptions of the adequacy of preparation in administration provided in the internship (I), coordinated undergraduate (C), traineeship (T), and advanced degree (A) programs. Most employers (93 percent) said that they believed that the educational preparation varied in the four routes. Differences among the routes were highly significant for the measures theoretical, practical, and overall preparation. The direction of the proportions for these measures was A greater than I greater than C greater than T, I greater than T greater than C greater than A, and I much greater than C greater than T greater than A, respectively. Significant differences were observed for the employers' hiring preferences (I greater than greater than T greater than A approximately C) and their opinions about the least amount of on-the-job training required (I much greater than T greater than C approximately A). Findings also indicated that a significant majority (76 percent) would not vary the starting salary of the entry-level dietitian regardless of the route of attainment.

**The "hospital epidemiologist" in U.S. hospitals, 1976-1977: a description of the head of the infection surveillance and control program. Report from the SENIC project.**

Haley RW

Infect Control ,Jan-Feb 1980, 1 (1) p21-32. ISSN 0195-9417 Journal Code: GTM  
Languages: ENGLISH

As part of the first two phases of the SENIC Project (Study on the Efficacy of Nosocomial Infection Control), information was collected from the heads of the infection surveillance and control programs (ISCPs) in U.S. hospitals. The data were analyzed to describe these respondents and to determine whether differences among them were related to their areas of professional training or to characteristics of the hospitals where they were located. The findings indicate that the ISCP heads constitute a very heterogeneous group, with substantial differences in age, professional training (40% are pathologists), characteristics of their medical practices, memberships in professional organizations related to infection control, time spent in ISCP activities, approach to epidemiologic problems, and opinions on the preventability of nosocomial infections and the seriousness of infection problems in their hospitals. These differences are related strongly to the ISCP heads' professional training, size of hospital, and, to a lesser extent, medical school affiliation, but there is little evidence that the differences are related to regional or urban-rural location or type of ownership of the hospitals. The average ISCP head estimates that about half of all nosocomial infections are preventable, but these estimates vary inversely with tenure in the position and the tendency to approach a clinical problem epidemiologically.

**A comparison of various types of patient instruction in the proper administration of metered inhalers.**

Roberts RJ; Robinson JD; Doering PL; Dailman JJ; Steeves RA

Drug Intell Clin Pharm ,Jan 1982, 16 (1) p53-5. 59,

ISSN 0012-6578 Journal Code: EBU

Languages: ENGLISH

The administration technique employed by 42 inpatients using metered inhalers were observed. Proper performance of the six steps recommended by the manufacturer provided the guidelines for correct administration. The degree of compliance with proper technique was defined as the number of steps correctly executed by the patient. The mean number of steps correctly performed was 2.9 out of the possible six (48.3 percent). Twenty-four patients were then randomized into one of three groups. Group 1 received the manufacturer's instruction sheet, Group 2 received counseling from a pharmacist, and Group 3 received both the manufacturer's instruction sheet and counseling from a pharmacist. There was a significant improvement in the postinstruction technique in Groups 2 and 3, while Groups 1 failed to demonstrate any significant improvement. Comparisons were then made among the three groups. No significant difference was found between Group 2 and Group 3. However, both Groups 2 and 3 were found to be significantly different (p less than 0.05) from Group 1. This study shows that pharmacist counseling can significantly improve the degree of patient compliance in the administration of metered inhalers.

Through efficient staff scheduling our 481-bed community teaching hospital has been able to expand its pharmacy services. This paper describes how a clinical pharmacy service program for cardiology and cardiac surgery patients was developed and defines the service components. After over two years of experience with the cardiology program, we have found this pharmacy service area to be very successful and well received. Various forms and proposals are provided to assist other pharmacists interested in expanding into this area of practice.

**Nursing care for the severely obese patient.**  
Vaughan MS  
Contemp Anesth Pract .1982, 5 p111-34. ISSN 0191-247X  
Journal Code: DQY  
Languages: ENGLISH

Care of the morbidly obese person (BMI greater than or equal to 30) during the perioperative period is specific and differs from routine nursing care. Effective communication, preplanning, and psychologic and physiologic assessment, with appropriate intervention (pulmonary and circulatory), result in positive care outcomes. Preoperative care emphasizes both psychologic and physiologic support concurrent with evaluation of vital signs, fluid status, teaching, and administration of preoperative medications (see Table 1). Intra- and postoperative care incorporates the necessity of additional personnel, transport precautions, physical protection, positioning, oxygenation, and early ambulation coupled with accurate arterial blood gas sampling, intraarterial line care, and cardiopulmonary and fluid status monitoring (see Tables 2 and 5). New information regarding hypothermia and shivering documented to occur in the recovery room underlines the need for accurate core temperature monitoring (see Tables 3 and 4; Figs. 1 and 2). An assessment tool (see Fig. 3)--an effective reminder of important aspects of patient care in the recovery room and until hospital discharge--provides a systematic guide to facilitate nursing care, recording, and reporting.

Languages: ENGLISH

The failure to plan the health education component of a health service program together with the total planning effort has severely limited the contribution education could make to program goals. This case study illustrates the use of the systematic observation of behavior to identify factors which facilitated or hindered the development of a hypertension control program in ambulatory facilities and boards of health. The relationship of these factors to the planning process is discussed. Although this project deals with hypertension, the factors identified as facilitating or hindering change are applicable to any public health program.

**Terminal care: present services and future priorities.**

Lunt B; Hillier R

Br Med J [Clin Res] ,Aug 29 1981, 283 (6291) p595-8,  
Journal Code: B4X

Languages: ENGLISH

Since 1975 hospices and other specialist services for terminal cancer have expanded rapidly. In December 1980 this survey found 72 such services in Britain providing 58 inpatient units, 32 home care teams, and eight hospital support teams. Many were outside the NHS. Inpatient units provided 1297 beds (modal size 21-25 beds) and dealt with under 7% of deaths from cancer. Home care teams provided 76.5 full-time equivalent nurses (modal size two nurses). Regional variations were considerable: from 10.9 beds/million population in Trent to 48.5 beds/million in South-west Thames; no home care nurses in Mersey and Wales, and 5.1 nurses/million in Wessex. Of 58 more services being planned, the 17 starting in 1981 will not substantially alter these regional imbalances. Respondents' opinions suggest a target of 40-50 inpatient unit beds/million population. This might be reduced if hospitals were better equipped to deal with these patients. Suggested priorities are to redress regional inequalities, develop home care and hospital support teams rather than inpatient units, and improve teaching and training. Co-ordination of plans between the NHS and the voluntary sector is needed.

**Prescribing psychotropic drugs: whose responsibility?**

Miller RS; Wiedeman GH; Linn L

Soc Work Health Care ,Fall 1980, 6 (1) p51-61, ISSN  
0098-1389 Journal Code: U95

Languages: ENGLISH

Through the use of a questionnaire it has been ascertained that a significant number of second-year graduate school social work students at the Columbia University School of

Social Work are called upon to monitor and dispense psychotropic drugs in various placements where they receive their practical clinical training. In some instances they may even fill out prescription blanks that are signed by psychiatrists who do not have the time to see the patients personally. This situation not only represents the abdication of medical responsibility, frequently leaving non-medical personnel with functions beyond their training and professional competence, but also raises important ethical and legal problems. Non-medical professionals in mental health settings should receive appropriate instruction in the essentials of psychopharmacology. Such training should not be left to chance as apparently is the case now. Non-medically trained members of the mental health team, if properly instructed, could cooperate more effectively with the psychiatrists who must in any event retain primary responsibility for pharmacotherapy.

The bewildering patchwork of organization and organizing principles involved in the delivery of services to the communicatively disadvantaged requires an amalgam of effort. Also helpful would be a clearer understanding of magnitudes, characteristics and habilitation needs of certain subgroups such as the language disabled, the multiply handicapped and the moderately handicapped. Since this conference is concerned primarily with scientific contribution, it is suggested that we are in a transition from intuitive approaches to habilitative procedures to those derived from scientific investigations. This is pointedly documented in the area of language which cuts across all types of communicative disorders, as well as in such areas as early identification, sensory aids, career education, parent guidance, media use and mental health. It is important, too, for scientists to communicate clearly with their many publics.

Andrews G; Brodaty H

Med J Aust ,Dec 13 1980, 2 (12) p655-9, ISSN 0025-729X  
Journal Code: M26

Languages: ENGLISH

The importance of general practitioners attending to the emotional problems of their patients is demonstrated. Evidence has been presented concerning the feasibility and cost effectiveness of general practitioners developing the skills required to manage such disorders. A model for training general practitioners in counselling and interviewing skills, and in the more complex psychological therapies, is presented.

It is argued that such an integrated approach would produce results superior to the present fragmented approach.

**Experiences from a winter camp for teenage diabetics.**

Akerblom HK; Koivukangas T; Ilkka J

Acta Paediatr Scand [Suppl] ,1980, (Suppl 283) p50-2, ISSN 0300-8843  
Journal Code: 1LX

Languages: ENGLISH

Experiences are described from a winter camp, where the main purpose was to show the campers how to handle diet and insulin in connection with strenuous, repeated exercise. Twelve diabetics, aged 12-17 years attended a 7 days long winter camp. The relative decrease in the daily insulin dose vs. pre-camp dose was 11.8 +/- 1.6% (mean +/- S.E.), and the relative increase in caloric intake was 31 +/- 4%. The balance of diabetes was in most cases fair to good at the start of the camp and remained unchanged. No severe hypoglycemias occurred. The physical fitness index improved during the camp (t-test, paired comparison, P less than 0.005), and the campers gained self-confidence.

A Registry Examination for optometric technicians was administered to 189 students and graduate optometric technicians on April 19, 1980. Those who passed this examination will be designated as members of the National paraoptometric Registry. A Registry Examination for optometric assistants is being developed for administration in April 1981. This article will outline how these Registry Examination were developed and what implications they have for the profession. A paraoptometric career ladder will also be presented.

**Strategies for enhancing patient compliance.**

Becker MH; Maiman LA

J Community Health ,Winter 1980. 6 (2) p113-35. ISSN

0094-5145 Journal Code: HUT

Contract/Grant No.: 5K04-HD00237

Languages: ENGLISH

Patient noncompliance is a substantial obstacle to the achievement of therapeutic goals. This paper reviews a number of practical interventions with demonstrated efficacy in enhancing patient adherence, including (1) improving patients' levels of information concerning the specifics of their regimens, reinforcing essential points with review, discussion, and written instruction, and emphasizing the importance of the therapeutic plan, (2) taking clinically appropriate steps to reduce the cost, complexity, duration, and amount of behavioral change required by the regimen and other approaches, (3) obtaining a compliance-oriented history of the patient's prior experiences and present health beliefs and, where necessary, employing strategies to modify those perceptions likely to inhibit compliance, (4) improving levels of patient satisfaction, particularly with the provider-patient relationship, (5) arranging for the continued monitoring of the patient's subsequent compliance to treatment, (6) increasing staff awareness of the magnitude and determinants of the noncompliance phenomenon and attempting to develop an "active influence orientation" in each member of the health care team, (7) using such techniques as patient-provider contracts to involve the patient in

therapeutic decisions and in the setting of treatment objectives and creating incentives (through rewards and reinforcements) for achieving these objectives, (8) arranging for as much continuity of provider (and other staff) as possible, (9) establishing methods of supervising the patient, including involvement of the patient's social support network, and (10) involving fully the assistance of all available health care providers, assigning specific roles and responsibilities for activities directed at improving adherence to treatment.

**When legislation precedes the state of the art in teacher training: problems and implications.**

Tymitz BL

Int J Rehabil Res ,1980. 3 (4) p485-95. ISSN 0342-5282

Journal Code: GRL

Languages: ENGLISH

Passage of Public Law 94-142, the Education for all Handicapped Children Act requires the development of an Individualized Education Program (IEP) for each handicapped child served. While administrators are inclined to view the IEP as a document intended to monitor the provision of special services, teachers focused on the potential instructional value of the IEP. Professionals agree that this has been one of the most difficult components of the law to implement. Policymakers designing the law posited that training technology was adequate to support the instructional requirements outlined in the legislation. The present study challenges that assumption. It is also argued that studies which attempt to integrate multiple operations to clarify findings can provide more accurate and consequently more useful data of critical value in the beginning stages of policy formation. The multiple data collection strategies employed in this study yielded increasingly specific information on the status of present training technology--particularly in relation to teacher skills related to the instructional aspects of the IEP planning process. Teacher perceptions of their training needs were compared with actual skill performances on selected IEP tasks. Data reveal the inadequacy of essential skills in formulating required goal and objective statements. Special education and regular classroom teachers show similar patterns in specific skills which are problematic. Statements from teacher interviews corroborated deficits in past training. Suggestions for future training are offered as are emphases for needed research. Implications for implementation of the IEP are also discussed.

**The delivery of genetic counseling services in Europe.**

Passarge E; Vogel F

Hum Genet .1980, 56 (1) p1-5, Journal Code: GED

Languages: ENGLISH

Organizational forms and the current status of genetic counseling within the health care system of 15 European countries were evaluated by questionnaire and at a symposium, with individuals present from Austria, Belgium, Czechoslovakia, Denmark, the Federal Republic of Germany, the German Democratic Republic, Finland, France, Hungary, Italy, the Netherlands, Norway, Switzerland, the United Kingdom, and the Soviet Union. In spite of wide differences between these countries, certain similarities with respect to the delivery of genetic counseling services could be observed: (i) most genetic counseling is done within university institutions or closely linked to it, (ii) governmental support of genetic counseling is developing slowly, and genetic counseling is usually not yet fully integrated into the health care system; (iii) there is lack of qualified personnel; (iv) no guide lines for formal education have been developed, but a postgraduate training period of no less than four years is considered a minimum; (v) without appropriate support, genetic counseling is a burden for research in human genetics; yet, a strict separation of genetic counseling and research activities is not recommended; (vi) on the average, a team providing genetic counseling for about 1-2 million people should consist of 3-4 physicians, 5-10 technicians, 2-3 secretaries, and other supportive personnel.

**Time-limited residential treatment: issues and evaluation.**

Archer RP; Amuso KF; Bedell JR

Hosp Community Psychiatry .Dec 1980, 31 (12) p837-40,

ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

The trends toward deinstitutionalization and community care have increased the need for short-term residential programs, and the literature supports their effectiveness as an alternative to longer-term care. The authors describe an innovative short-term residential treatment program at Florida Mental Health Institute. Called the Early Intervention Project and limited to nine weeks, it uses a combination of behavioral and psycho-educational techniques for building skills in younger patients who have not received extensive prior treatment. It includes training modules in assertiveness, communication, problem-solving, managing anxiety and depression, medication, relaxation, and nutrition, and also incorporates a peer-managed token economy. A series of research studies have demonstrated the program's effectiveness in changing patient behavior.

**The family-oriented home visiting program: a longitudinal**

**study.**

Gray SW; Ruttle K

Genet Psychol Monogr .Nov 1980, 102 (2) p299-316, ISSN

0016-6677 Journal Code: FMX

Languages: ENGLISH

Designed and tested a home-based intervention program for low-income mothers with toddler and at least one other child under five. Sex of toddlers and race (black or white) about equally divided. Nine months of weekly home visits were specifically planned for each mother to enhance her effectiveness as an educational change agent. Treatment was planned to promote skills and understandings applicable over range of ages. Pretests, immediate posttests, and posttests one and two years later were administered to 27 experimental families and to a randomly assigned control group of 20. At .05 level of significance or beyond, experimentals excelled controls on receptive language test (toddler), on the Caldwell HOME (mother was indirectly rated as an educational change agent), and on a measure of teaching style (mother). They were also significantly superior on the Binet (toddler) at second posttest. No differences found with older siblings on Slosson Intelligence Test. Differences at third posttest were at least as great as earlier ones on mother measures. Relationships among child and mother measures are discussed.

**Serving the mental health needs of the elderly: the case for removing barriers and improving service integration.**

Hagebak JE; Hagebak BR

Community Ment Health J .Winter 1980, 16 (4) p263-75,

ISSN 0010-3853 Journal Code: DNH

Languages: ENGLISH

Utilization rate information reveals that elderly persons are not adequately served by the existing mental health service system. The authors identify cultural, systems, and resource related barriers to full service, emphasizing psychological barriers which may be present in both the elderly client and the therapist. Overcoming these barriers will require, first, that professional training programs and local in-service training activities be modified to expand multi-disciplinary learning opportunities. Then, the authors advocate systems change to move through in-house outreach, advocacy and programming activities toward an integrated system of community services for the elderly. Mental health workers are seen as uniquely qualified to serve as standard-bearers in developing a locally integrated service delivery system.

Ethik und Bundesamt für Gesundheitswesen.

Frey U

Bull Schweiz Akad Med Wiss ,Nov 1980, 36 (4-6) p427-30.  
ISSN 0036-7494 Journal Code: BWV

Languages: GERMAN Summary Languages: ENGLISH

The Federal Office of Public Health is a governmental administration in charge of control and coordination measures related to the field of health protection. A rough 20% of the 220 officials and employees have university education prevailing in medicine or natural sciences. Any government is working for the benefit of the general public and ought not to end in itself. Although there is a potential danger of abuse of official authority and power and of corruption, such deviations have proved to be quite rare in Switzerland. The safety guarantees are sufficient and we furthermore dispose in general of a professionally and morally well qualified staff. A governmental institution is as good or as bad as the humans working for it. A careful selection of the civil servants is therefore of utmost importance. On the whole, the quality of our civil service is quite superior to its reputation. Negative global judgements are to be declined. The Federal Office of Public Health aims at respecting the principles of the medical ethics in all its activities.

**Quality assurance in surgical practice through auditing.**

Wong WT

Am J Surg ,May 1980, 139 (5) p669-72, ISSN 0002-9610  
Journal Code: 3Z4

Languages: ENGLISH

An efficient auditing method is presented which involves objective criteria-based numerical screening of medical process and treatment outcome by paramedical staff and detailed analysis of deviated cases by surgeons. If properly performed it requires the study of no more than 50 cases in a diagnostic category to provide sufficient information about the quality of care. Encouraging points as well as problems are communicated to the surgeons to induce the maintenance or improvement of the standard of care. Graphic documentation of case performance is possible, allowing surgeons to compare results with their colleagues. The general performance level of several consecutive studies can be compared at a glance. In addition, logical education programs to improve the medical process can be designed on the basis of the problems identified. As all the cases with an unacceptable outcome are traceable to inadequate medical process, improvement in this area will decrease outcome defects. With the use of auditing and the follow-up technique described, the quality of care in surgery may be assured.

**Problems and proposals for the surveillance and control of**

**sexually transmitted diseases associated with pelvic inflammatory disease in South America.**

de la Torre LA

Am J Obstet Gynecol ,Dec 1 1980, 138 (7 Pt 2) p1078-81.  
ISSN 0002-9378 Journal Code: 3NI

Languages: ENGLISH

In South America, the number of women at risk for gonococcal pelvic inflammatory disease has increased greatly along with the incidence rates for gonorrhoea. Further information is needed on the epidemiologic aspects of gonorrhoea and PID in order to develop programs for optimal control of sexually transmitted disease (STD). We think that the control of STD, including PID, requires improvement of four basic factors: professional training in STD, management of STD by all levels of health care services, laboratory diagnostic services, and public education in STD. (10 Refs.)

**Surveillance, prevention, and control of sexually transmitted agents associated with pelvic inflammatory disease.**

Meheus AZ

Am J Obstet Gynecol ,Dec 1 1980, 138 (7 Pt 2) p1064-70.  
ISSN 0002-9378 Journal Code: 3NI

Languages: ENGLISH

Control and prevention of pelvic inflammatory disease would result from successful control of Neisseria gonorrhoeae and genital Chlamydia trachomatis infections. The same control system applies to both, but while this system is well documented in gonorrhoea control, there is still no evidence that it is effective for C. trachomatis infections. Primary prevention of PID should be realized through a reduction of the incidence of gonorrhoea, and the available techniques--(1) contact tracing and epidemiologic treatment, (2) screening and case finding, (3) preventive measures, (4) health education, and (5) training of the health workers--are discussed. Secondary prevention of PID can be achieved through good management of uncomplicated infections due to N. gonorrhoeae and C. trachomatis. The approach must be adapted to local conditions and should be different in developing countries with a specialized health care system for sexually transmitted disease. Good management of PID is crucial in preventing sequelae and most important are tracing and treating the male contacts of patients with PID. Measures of tertiary prevention attempt to rehabilitate the patient; the main sequelae after PID are ectopic pregnancy and infertility. Surgical techniques can restore tubal function, but these methods are complicated and have a low success rate.

**Smoking cessation: a new approach through secondary prevention strategies in the Federal Republic of Germany.**

Welsch G

Int J Health Educ ,Oct-Dec 1980. 23 (4) p216-26. ISSN 0020-7306 Journal Code: YEE

Languages: ENGLISH

There are 15-16 million cigarette smokers in the Federal Republic of Germany. Of these, some 50% smoke over 5,500 cigarettes a year. Yet, according to Federal Centre for Health Education studies, over half would like to cut down or give up smoking and some 4-5 million smokers are prepared to accept external help. Although the FCHE operates basically in the area of primary prevention, such a situation called for an intervention at the secondary prevention level. Accordingly, a programme was developed, "Smokers! Here's your chance: quit in ten weeks!", which aimed at serving as a back-up strategy to primary prevention measures. One criterion used in developing the programme was that the therapy offered should be available to all. The FCHE turned therefore to institutions for adult education and to local institutions to organize courses based on the principles of learning theory and behaviour therapy on as broad a base as possible. This paper reviews problems encountered and presents the results of an initial survey of the interim situation after three years. It is based on built-in investigations regarding participant-related success in connection with all the courses undertaken in 1978. Findings indicate an absolute success rate, stable in the medium term, of 27% (zero consumption), and when stable reduction (1-50% of previous consumption) is included, a success rate of 43%. The author points out that the success rate per course, however encouraging, is not the only factor that should be taken into account. The real criterion for success is the contribution that the development and dissemination of a course system on an extensive scale can make to health education.

Catastrophe medicine is the organization of masses under difficult conditions. The present article is concerned with the competence and organization in the event of a catastrophe and describes the phasic course of a catastrophe situation. The most important element of effective first aid measures, screening for shock and pain treatment, and first surgical treatment and the principles of ballistic factors are dealt with. Particular attention is given to the evacuation of emergency patients from the scene of the catastrophe. A request is made for "Catastrophe medicine" to be included by the medical faculties and educational institutes in their course of study for paramedical personnel.

J Mal Vasc ,1980, 5 (3) p191-2, ISSN 0398-0499

Journal Code: IYN

Languages: FRENCH Summary Languages: ENGLISH

The treatment of intermittent claudication by physical re-training of a patient with lower limb arteriopathy is not new (Alpert 1969, Cachovan 1976, Kindler 1965, Schoop 1964). It gives an effective improvement of walking distance and of physical performance capacity. Most programs used need the patient to be kept in an hospital and thus entail a significant social cost. We have set up a program for the retraining of patients that are not hospitalized and have checked the short and long term action achieved. The walking distance, the maximum performance in specific exercises, the walking exercises on a treadmill, are studied during the clearance X133, the total leg blood flow before and after an arterial occlusive hyperhemic test is studied simultaneously.

**Dental health and the application of geographical methodology.**

Taylor PJ; Carmichael CL

Community Dent Oral Epidemiol ,Jun 1980, 8 (3) p117-22,

ISSN 0301-5661 Journal Code: DNF

Languages: ENGLISH

Reorganisation of dental services in Britain gives new opportunities for planning. Geographical methodology provides

new techniques. An elementary spatial analysis of variations in dental health in Newcastle Area Health Authority (Teaching) shows that dental health varies with availability and access to treatment facilities. Opposite types of geographical distribution of community (School) and general dental services are illustrated showing location biases for each type of service. The evaluation of the spatial distribution of dental services is shown to be basic to planning and a key to improved dental health.

**A clinical model for use in mental health centres.**

Gladkowski G

Can Ment Health ,Dec 1980, 28 (4) p9-11, 19, ISSN

0008-2791 Journal Code: C8R

Languages: ENGLISH

The model presented is an attempt to provide a way of viewing and organizing the clinical process. Major factors involved in the process, ranging from the common characteristics of the setting to basic treatment guidelines, are identified. Although the original purpose of the model was to provide order and direction for those directing inpatient units, it can, with minor modifications, be used in a variety of settings by various professionals. For example, it has been used for staff development purposes in educational and mental health facilities. The model is not intended to be a delineation to the nth detail but is to be suggestive. It is sufficiently flexible to accommodate different theoretical approaches and thus serve as the basis for ongoing staff development and direction. How the model is specifically used and/or adapted is left to the reader's discretion, although some suggestions for its use will be presented.

Selling health in the market place: the Araromi approach.  
Laoye JA  
Int J Health Educ ,1980, 23 (2) p87-93, ISSN 0020-7306  
Journal Code: YEE  
Languages: ENGLISH

This paper describes a village health education project in a disadvantaged community of 10,000 inhabitants located 100 kms north of Lagos, Nigeria. The object was to "sell" the concept of good health to the people. With this purpose in mind the health education team set up a health stall on the market place. Soon it was crowded with people and a neighbouring village asked for assistance in launching a similar project. This was the opportunity the team had been waiting for to start off the participation process. A village health committee was set up, including community leaders and health personnel as well as traditional healers and birth attendants. The group split up into three subcommittees, to involve a maximum number of people: the turning point in changing the community's attitudes and making the people look at health problems as their problems had been reached. Within a few months progress was recorded. Six covered pit-hole latrines were built, the stream was fenced on both sides, an incinerator was built, families became accustomed to boiling and filtering water, the dispensary recorded an increase of more than 300% in attendance, the maternity centre doubled its volume of work, and school weight charts reflected an improvement in nutrition practices. Teachers became quite cooperative in sending children to the dispensary and took on the supervision of hygiene on the school premises. Finally, volunteers personally checked on environmental cleanliness. In short, within nine months the village became an example to other communities--and a test case of the use of the primary health care approach.

**Teaching family planning management and evaluation skills.**

Gorosh ME; Helbig DW; Revson JE

Int J Health Educ .1980. 23 (2) p107-15. ISSN 0020-7306

Journal Code: YEE

Languages: ENGLISH

In the last several years the need for training schemes in family planning programme administration has become increasingly apparent with the rapid growth of family planning services throughout the world. This paper reports on the development and use of a series of 16 practical classroom training exercises designed for teaching planning, management and evaluation skills. Each exercise can be introduced, worked and discussed in a morning or an afternoon. It is available in an individual booklet, which contains worksheets, blank tables and step-by-step instructions for working the exercise, along with a discussion of the skills being taught. Topics covered include demographic rates and concepts, the Dryfoos-Polgar-Varkey formula, risk factor analysis, target-setting, case load forecasting, service statistics, contraceptive supplies, manpower planning, couple-year of protection, cost-effectiveness, contraceptive use-effectiveness, life table techniques, numerator analysis, fertility pattern method, sampling methods and questionnaire design. These curriculum materials concentrate on imparting through the medium of actual experience a series of specific management techniques of a quantitative nature that will enhance the ability of the trainees to plan, administer and evaluate any family planning programme anywhere in the world. The exercises in this series have been tested in the family planning training programmes at Columbia University and at Downstate Medical Center in New York. They have also been used in WHO workshops in Thailand and Tanzania and in training programmes in France, Kenya and Nicaragua.

**Identifying talented health administration students: a look at academic criteria.**

Quatrano LA  
Res Nurs Health ,Dec 1980, 3 (4) p129-35, ISSN  
0160-6891 Journal Code: RAQ  
Contract/Grant No.: 1-MB-44175  
Languages: ENGLISH

The objective of this study was to examine the relationships of undergraduate academic and admission test performance with graduate academic performance. Results could aid in selecting health service administration students in the future. The sample included 139 students (40 women and 99 men) entering seven health services administration programs during the fall of 1975 and graduating during the spring and summer of 1977. Participating programs were located in the Midwest, Northeast, South, and West Coast. Independent variables included undergraduate academic performance and admission test scores, while the dependent variable was graduate academic performance. Correlation analyses revealed that: (a) the verbal and quantitative subtest scores of the GRE were related to most aspects of graduate academic performance for men but only to selected aspects for women, (b) performance on the MAT was related to women's graduate academic performance in quantitative courses, and (c) men's and women's composite undergraduate grade point average was not related to composite graduate grade point average. These findings suggest that some of the standardized tests presently employed as admission screening devices should be used judiciously.

Journal Code: LSM  
Contract/Grant No.: MCR-420310  
Languages: ENGLISH

During the July 1975-June 1976 academic year, nonphysician abstractors collected data on 15,101 ambulatory patient visits managed by 175 residents in five pediatric training programs. The visits included in this study were those on which a general data base should be collected and visits for health maintenance, head trauma, impetigo, otitis media, tonsillopharyngitis and urinary tract infection. These data provided an opportunity to investigate the number of medical record audits required to obtain a stable estimate of resident performance for a given medical condition and the relationship of performance across a number of medical conditions. The standard errors of the mean for 844 distributions of per cent compliance scores for individual residents were calculated. The standard error was less than five in 97 per cent of the instances where ten or more records had been abstracted for a given resident. Although there was some variability of resident performance from case to case, these data indicate that ten records may be a lower bound on the number of abstracts required to provide a stable estimate of performance. The correlations across conditions showed a moderate amount of homogeneity of performance and a clustering of performance for the acute care conditions included in the study. The correlations across acute care conditions were all statistically significant and ranged in magnitude from .52 to .77. Although the relationships between general data base and health maintenance and the acute conditions were statistically significant in some instances, they were all of lower magnitude and ranged from -.20 to .36. Thus, a modest number of abstracts for only a few conditions may provide a reliable estimate of resident day-to-day performance in ambulatory care clinics.

**Clinical breast examination and breast self-examination experience in a family practice population.**

Keller K; George E; Podell RN  
J Fam Pract ,Nov 1980, 11 (6) p887-93, ISSN 0094-3509 Journal Code: I4L

Contract/Grant No.: 5 D15 PE12020-05 NSS  
Languages: ENGLISH

A patient questionnaire, chart audit, and resident questionnaire were used to assess clinical breast examination and breast self-examination experience in a family practice patient population. It was found that approximately 50 percent of the women studied reported annual routine breast examinations during a five-year study period. However, the residency program was responsible for providing or documenting annual clinical examinations in only ten percent of the

population. Although 99 percent of the women knew about Breast Self-Examination (BSE), only 19 percent practiced monthly BSE.

A positive association was found between the physician's active teaching of BSE and the patient's confidence in and regular practice of BSE. The low number of annual clinical examinations and low performance of BSE may be explained partially by the physician's setting too narrowly the parameters of when a clinical breast examination and BSE teaching could be done appropriately, ie, a pap smear/pelvic or general examination. A more aggressive approach by the physician may increase the number of women who get routine clinical breast examinations and who supplement them by monthly BSE.

**A statewide characterization of hospital infection control practices and practitioners.**

Booth AL; Weeks RM; Hutcheson RH Jr; Schaffner W  
Infect Control ,Jul-Aug 1980, 1 (4) p227-32, ISSN  
0195-9417 Journal Code: GTM  
Languages: ENGLISH

Selected features of infection control programs among the 163 general hospitals in Tennessee were surveyed in 1976 and 1979. Each hospital but one had a designated infection control practitioner. Three-fourths of the hospitals had fewer than 200 beds and most were in rural areas. The practitioners in these small hospitals worked in an isolated professional milieu: few (4%) had attended a basic training course or were members of a national (11%) or local (16%) infection control association. They also had significantly less access to standard infection control resource publications than did practitioners in large hospitals. Use of aqueous quaternary ammonium compounds for disinfection was reported by 37% of all hospitals in 1979; 68% of hospitals routinely performed bacteriologic cultures of personnel or the environment. In contrast, only 3% of hospitals did not have a policy specifying the use of sterile closed-system drainage of indwelling bladder catheters. Although these practices varied somewhat by hospital size, the differences were not statistically significant. Modest improvement in each parameter was noted since 1976. Pathology was the most common medical specialty (34%) among chairman of infection control committees; internal medicine and pediatrics accounted for only 13%. The practice of routine microbiologic monitoring was significantly more common among hospitals with chairmen who were pathologists. The implications of these findings for national priorities in hospital infection control are discussed.

**Computerized information system for ICU patient management.**

Manzano JL; Villalobos J; Church A; Manzano JJ  
Crit Care Med ,Dec 1980, 8 (12) p745-7, ISSN 0090-3493  
Journal Code: DTF  
Languages: ENGLISH

To solve the problem of data management, a digital computer was introduced in this ICU in 1977. Data are manually entered at the bedside alpha-numeric keyboards; two beds are directly connected to the computer. The system was especially designed to work in the 11-bed ICU; its functions are: (1) admission, discharge, and transfer data of patients; (2) management of doctors' and nurses' notes in a free text form; (3) management of the problem-oriented record; (4) management of physical and biochemical variables, medical disorders, and fluid balance; and (5) diagnostic and therapeutic decision-making. Since 1977, the authors have computerized over 2600 patients and now conclude: (1) data management and communication have improved, thus, allowing nurses more time for direct patient care; (2) teaching of the residents and nurses has been facilitated and minimizes disparities from their diverse experience; (3) it has contributed to the development of protocols for many of the procedures; and (4) it has led to a more systematic approach to patient care. The assistance of a professional computer programmer and continuous maintenance of the software are essential.

**Effect of patient education on medication compliance.**

Seltzer A; Roncari I; Garfinkel P  
Can J Psychiatry ,Dec 1980, 25 (8) p638-45, ISSN  
0706-7437 Journal Code: CLR  
Languages: ENGLISH

Noncompliance is a major contributing factor to therapeutic failure. Many complex variables have been reported to interfere with patient compliance. Though there are exceptions, educational techniques have been shown to be of value. Patients with diagnoses of schizophrenia, and bipolar and unipolar affective disorders were separated into control and experimental groups and studied to determine the factors associated with poor compliance and the potential value of educational techniques. Following a course of lectures and data sheets, the "educated" patients tended to be more compliant on outpatient follow-up. They were also less fearful of side effects and addiction. Factors associated with poor compliance were related to severity of illness, social isolation, fear of dependency and side effects (extra-pyramidal).

Languages: ENGLISH

A demonstration education and counselling project for cancer patients was developed in a community hospital. A team comprising a psychologist and a nurse patient educator were added to existing hospital staff. Based on this experience, we have defined the primary educational and emotional needs of the cancer patient and delineated the related functions and activities of project staff. The organization, nature, and volume of the education and counselling services are presented to provide a framework for others interested in embarking on similar efforts.

Money is ubiquitous, and individuals' attitudes to money are rife with ambivalence and dysphoria. Medical training neglects money issues; thus, many physicians remain with conflicts that interfere greatly with therapeutic potential and cost containment. Conflictful emotions about money appear throughout treatment. Guidance is given toward developing the attitudes, knowledge, and skills for dealing with money in a way that will avoid possible interference with optimal treatment.

This essay is a personal comparison of obstetrics in the 1930s and the 1970s. Maternal and perinatal mortality are contrasted for the two eras. Hospital delivery then and now, and hospital versus home delivery are compared. Changing patterns of operative delivery are presented with special reference to the increasing incidence of cesarean section. Continuing medical education and electronic fetal monitoring are discussed. The use of drugs during pregnancy, labor, and delivery is considered. Governmental and public intervention in obstetrics is lamented.

**Use, misuse, and cost of parenteral cephalosporins at a county hospital.**

Appleby DH; John JF Jr  
South Med J ,Nov 1980, 73 (11) p1473-5, ISSN 0038-4348  
Journal Code: UVH  
Languages: ENGLISH

We reviewed total usage of parenteral cephalosporins at a county hospital during 1978 with regard to appropriateness, pattern of use, and cost. In addition, we determined the impact of replacing cephalothin with cephapirin in the hospital formulary. During the 12-month study 366 patients received 409 courses of parenteral cephalosporins: 167 received cefazolin, 160 received cephapirin, and 35 received a combination of cefazolin and cephapirin. The surgical service prescribed 87% of the cephapirin and 92% of the cefazolin. Parenteral cephalosporins were used 62% of the time for prophylaxis and 38% of the time for therapy. Usage was judged inappropriate in 47% of all courses based on our criteria; 25% of the therapeutic courses were judged inappropriate, compared

to 60% of the prophylactic courses. Pharmacy costs of cefazolin used as prophylaxis were more than twice the cost for cephapirin. Cost of a mean therapeutic course for cefazolin was 43% higher than for cephapirin. Antibiotic audits and continued education combined with judicious substitution of therapeutic equivalents should limit the inappropriate use and expense of parenteral cephalosporins for large as well as small hospitals.

**[Continuous ambulatory peritoneal dialysis (author's transl)]**

La dialyse peritoneale continue ambulatoire.

Nouv Presse Med ,Nov 8 1980, 9 (42) p3153-63, ISSN 0301-1518 Journal Code: Q50

Languages: FRENCH Summary Languages: ENGLISH

Continuous ambulatory peritoneal dialysis (CAPD) required rapid technique and high quality material. This paper describes the material prepared and supplied by the Central Pharmacy of Paris Public Hospitals and the results obtained with this material in the Nephrology Department of the Pitie-Salpetriere Hospital. The peritoneal catheter, introduced under local anaesthesia, is the double-cuffed Tenckhoff catheter. The two dialysates routinely used mainly differ in glucose concentration (83 and 250 mmol/l respectively). The plastic bags are made of polyvinylchloride; those for adults have a capacity of 2.8 l and contain 2 l of dialysate; smaller bags are available for children and adolescents. The patients are trained in an independent out-patient unit opened from 8 a.m. to 9 p.m. The average duration of training is 10 days, and audio-visual aids are widely used. Between August, 1978 and February, 1980 forty-seven patients were accepted for training. Their mean age at the start of treatment was 65 years, and the follow-up was 308 patient-months. During this period there were 5 deaths, only one of which could be blamed on the dialysis technique. There was one peritonitis per 7.5 patient-months, and the mean duration of hospital treatment for all complications was 15 days per patient-year. In view of the patients' age and of the deliberate selection of high-risk patients (including 8 diabetics), these results are very encouraging. However, a longer follow-up is needed to determine the exact place of CAPD among the various treatments of end stage renal failure.

Intensivmedizin in der Padiatrie.

Wille L

Klin Paediatr ,Sep 1980, 192 (5) p399-407, ISSN 0300-8630 Journal Code: KWE

Languages: GERMAN Summary Languages: ENGLISH

Centralized treatment of critically ill pediatric patients and related problems are presented. Pediatric intensive care allows to overbridge deranged or interrupted organ functions while simultaneously treating the disease causing the disturbance. Its efficiency depends on continuity of medical care. Medical and nursing staff should be trained in the use of specialized equipment, especially monitoring equipment and ventilators. Medical and nursing staff must know who is responsible for the patients all the time. Undivided medical responsibility and coordinated specialist care are essential. Some general points concerning design features, equipment and organisation of a pediatric intensive care unit are made. Some special aspects such as staffing, transportation of high-risk neonates, economy of operation and personal training programm are discussed. Results of pediatric intensive care at the University Children's Hospital Heidelberg are documented. Regionalisation of neonatal care is discussed based on the actual situation in Baden-Wuerttemberg. **Home delivery and neonatal mortality in North Carolina.**

Burnett CA 3d; Jones JA; Rooks J; Chen CH; Tyler CW Jr; Miller CA

JAMA ,Dec 19 1980, 244 (24) p2741-5, ISSN 0098-7484  
Journal Code: KFR

Languages: ENGLISH

Neonatal mortality examined by place and circumstances of delivery in North Carolina during 1974 through 1976 with attention given to home delivery. Planned home deliveries by lay-midwives resulted in three neonatal deaths per 1,000 live births; planned home deliveries without a lay-midwife, 30 neonatal deaths per 1,000 live births; and unplanned home deliveries, 120 neonatal deaths per 1,000 live births. The women babies were delivered by lay-midwives were screened in county health departments and found to be medically at low risk of complication, despite having demographic characteristics associated with high-risk of neonatal mortality. Conversely, the women delivered at home without known prenatal screening or a trained attendant had low-risk demographic characteristics but experienced a high rate of neonatal mortality. Planning, prenatal screening, and attendant-training were important in differentiating the risk of neonatal mortality in this uncontrolled, observational study.

Languages: ENGLISH

Matrix organization has recently been employed in health care administration to integrate individuals from different disciplines in complex projects and tasks. As residency training in primary care develops and its leaders recognize the need for multidisciplinary inputs to medical education, similar integrative methods of organization will become necessary. Matrix organization offers a structure which can facilitate coordination, communication, and cooperation in health care educational administration as well as in service administration.

Osterweis M; Chickadonz G; Huntley RR; Spencer CD  
J Med Educ ,Sep 1980, 55 (9) p743-50, ISSN 0022-2577

Journal Code: J13

Languages: ENGLISH

This article describes a three-year effort to facilitate the development of a university health maintenance organization (HMO) into an effective clinical teaching site for the team practice of primary care. Project staff initiated several activities to promote team development in the HMO. These included review and development of algorithms to guide physician/nurse teams in the care of patients with common problems, workshops on communication and role negotiating skills, and preceptor training. A variety of objective and subjective methods were employed to assess HMO team development and the effectiveness of the HMO as a primary care teaching site. Initial resistance to both team practice and teaching have been overcome. Students who were trained in the project not only acquired good clinical skills but also, perhaps more importantly, developed skills in professional role negotiation and communication as well.

A model is presented for providing home care services for children dying from cancer and for their families. Forty-two families whose children were patients at the Midwest Children's Cancer Center received home care during the first two years of this program. Variations in patient age, diagnosis, or family structure did not preclude successful participation in home care. In all families, the medical and nonmedical financial burdens of inpatient and outpatient hospital care were reduced when the child died at home. Since this program was initiated, terminal care has shifted from hospital-based medical management to nursing support in the home for the majority of children at our cancer center.

A description is given of the efforts made in a typical dental practice to influence dental health behaviour in a positive manner. A consistent message has been given over the years involving adequate fluoride supplements, restriction in the frequency of sugar intake and thorough oral hygiene. In addition, emphasis is placed on constant repetition and the use of positive feedback.

**The relationship between the health belief model and compliance of persons with diabetes mellitus.**

Cerkoney KA; Hart LK  
Diabetes Care ,Sep-Oct 1980, 3 (5) p594-8, ISSN  
0149-5992 Journal Code: EAG  
Languages: ENGLISH

Thirty insulin-treated diabetic individuals were interviewed in their homes 6-12 mo after having attended diabetic education classes at a community hospital. Self-report as well as direct observation were used to measure these patients' level of compliance with their insulin administration, urine testing, diet, hypoglycemia management, and foot care prescriptions. All patients were complying with at least 59% of the points measured. Over one-half of the group indicated compliance with at least 70% of the 61 points measured. However, only 7% complied with every one of the 45 points considered to be necessary for good control of their disease. The group was most compliant with regard to insulin administration and least compliant regarding urine testing. The level of these patients' beliefs regarding their disease (severity and susceptibility, treatment benefits, and barriers) and cues to action were also measured. A correlation of 0.5 occurred between these patients' overall compliance levels and a composite of their level of health belief motivation. The highest levels of correlations between the areas of compliance and the motivators occurred with cues to action.

(1) Ambulatory (Holter monitor) electrocardiography is currently one of the most important noninvasive cardiac diagnostic tests in our daily practice. (2) The primary purpose of Holter monitor electrocardiography is to diagnose various cardiac arrhythmias with accuracy, especially when the routine 12-lead electrocardiogram fails to record the arrhythmia because of its transient and episodic nature. (3) A precise etiology of a dizzy spell or a fainting episode can be confirmed by the Holter monitor ECG, when various symptoms are directly related to either tachyarrhythmias or bradyarrhythmias. (4) Another very important role of the Holter monitor ECG is to assess the efficacy of various antiarrhythmic agents, digitalis, and antianginal drugs. (5) Another purpose for obtaining the Holter monitor ECG is to document ischemic events by recognizing S-T segment and/or T wave abnormalities, especially at rest or during sleep. This is particularly valuable when the chest pain is atypical and when the exercise electrocardiogram is equivocal. Conversely, the patient's complaints may be totally unrelated to ischemic manifestations or any cardiac arrhythmias. (6) In addition, the status of artificial pacemaker function can be assessed by the Holter monitor ECG. (7) Many other clinical applications of the Holter monitor ECG have been described also.

**Effect of restrictions on prescribing patterns for dextropropoxyphene.**

Shenfield GM; Jones AN; Paterson JW

Br Med J .Sep 6 1980. 281 (6241) p651-3. ISSN 0007-1447

Journal Code: B4W

Languages: ENGLISH

Prescribing of compound analgesics containing dextropropoxyphene was limited to consultants only in a teaching hospital. Inpatient prescribing (mainly by junior staff) fell immediately to very low levels but outpatient prescribing (by consultants) fell more slowly to about one-third of the original level, suggesting that patients and doctors find dextropropoxyphene compounds useful. Prescriptions for paracetamol increased but so did those for other compound analgesics, particularly those containing high doses of codeine, indicating a belief that compound analgesics have a role in treatment. Restrictions may produce unexpected results and monitoring is essential, but the method of audit used by pharmacies is not suitable for detailed analysis.

**Effect of a rheumatology elective on house officers' evaluation of rheumatoid arthritis.**

Eyanson S; Brandt KD

Arch Intern Med ,Nov 1980, 140 (11) p1449-52, ISSN

0003-9926 Journal Code: 7FS

Contract/Grant No.: AM 20582

Languages: ENGLISH

To ascertain whether a rheumatology elective (RE) increase the ability of house officers (HOs) to treat patients with rheumatic disease, 109 encounters involving patients with rheumatoid arthritis were audited. This permitted a comparison of 12 HOs who had had an RE with 55 HOs who had not. Results suggested that the RE led to better reporting of history and physical findings and increased the frequency with which relevant laboratory studies were ordered. During the 30-month period of the study, no increase was apparent in audit scores of HOs who had not had the elective, nor was any deterioration noted in scores of HOs who had participated in the elective with increasing length of the interval between the RE and the subsequent encounters.

**Patient-physician concordance in problem identification in the primary care setting.**

Freidin RB; Goldman L; Cecil RR

Ann Intern Med ,Sep 1980, 93 (3) p490-3, ISSN 0003-4819

Journal Code: 5A6

Contract/Grant No.: RR-05569

Languages: ENGLISH

We analyzed how often patients and physicians identified the same principal problem for 439 return primary care visits. Agreement between the patient and physician, called concordance, was scored as complete when both cited a problem in the same organ-system (208 visits; 47%); as partial when the patient cited a problem that was anywhere but first on the physician's problem list but both parties agreed on the biological or psychosocial nature of the principal problem

(114 visits; 26%); or as absent (117 visits; 27%). Concordance scores were significantly lower when physicians identified a principal psychosocial problem or when patients identified a principal problem related to psychosocial issues, preventive medicine, the musculoskeletal system, or accidents. Because physicians in the Primary Care Internal Medicine Training Program were significantly more likely to identify principal psychosocial problems, their concordance scores were significantly lower than those of standard internal medicine track physicians.

An open-ended information/support group program for cancer patients and family members is described. The leadership role of the social work authors in developing the program, facilitating the sessions, adapting it to the limitations of an acute care teaching hospital, coordinating and training the multidisciplinary staff, and dealing with problem behaviors within the group sessions are discussed. Consumer satisfaction survey results are presented. The authors believe the program provides a helpful service to patients and families and a valuable opportunity for staff and students to become more sensitive health professionals through increased understanding of the psychosocial aspects of chronic illness.

The changing character of the role of the CFO raises the question of whether the terminal role for someone starting in the financial track is the CFO position or whether the training received in financial management prepares an individual to accept the responsibility of the CEO position. An examination of the responsibilities of both roles comparing their similarities and differences is helpful in answering this question. Job descriptions will vary from institution to institution, depending upon the special needs and circumstances that exist. However, certain characteristics are common to both the CEO and the CFO. Table 2-1 presents a brief comparison of these two roles.

Dolan RC  
Top Health Care Financ ,Fall 1980, 7 (1) p39-46, ISSN  
0095-3814 Journal Code: VVG  
Languages: ENGLISH

An analysis of 53 searches for CFOs, conducted by Witt & Dolan between 1970 and 1979, reveals some startling changes in the requirements that have occurred for these key positions. These changes are largely responsible for the increased salary ranges of today's CFOs. The searches were conducted in all sections of the United States. Although bed size is no longer considered an accurate gauge for comparing the real size of one hospital with another (today budgets, admissions and other facts are usually included in determining the size of an institution), Witt & Dolan used it as a measure because inflationary factors would tend to distort figures with

**Socioeconomic status of Indochinese refugees in the United States: progress and problems.**

Marsh RE  
Soc Secur Bull ,Oct 1980, 43 (10) p11-20, ISSN  
0037-7910 Journal Code: U94  
Languages: ENGLISH

The Social Security Administration is responsible for administering assistance programs not only to needy citizens but also to lawfully admitted aliens who require such aid. It therefore is interested in the economic situation of all the Nation's inhabitants, including refugees. This article examines the status of one such group--the Indochinese refugees who came to this country following the fall of the South Vietnamese government in 1975. A series of sample surveys, commissioned by the Department of Health, Education, and Welfare, reveals that most members of the original group of 130,000 Indochinese had achieved a large measure of economic self-sufficiency by the end of 1978. In the fall of that year, however, a new wave of Indochinese refugees began emigrating to the United States. The latecomers--who now outnumber the original group--are generally poorer, less well educated, and less acclimated to urban living than were their predecessors. Such characteristics suggest higher future resettlement costs, which could well be exacerbated by the propensity of ethnic groups to cluster in a few areas.

**[Inadequate use of pressurized aerosols by asthmatic patients [author's trans]]**

Mauvaise utilisation des aerosol-doseurs par les  
asthmatiques.  
Gaynard P; Orehek J  
Respiration ,1980, 40 (1) p47-52, ISSN 0025-7931  
Journal Code: R8K

Languages: FRENCH Summary Languages: ENGLISH  
The purpose of this study was to determine in a population of asthmatics, the number of patients who correctly used the pressurized aerosols (bronchodilator drugs or steroids) spontaneously, or after training sessions. 115 asthmatics (in- or outpatients, 14-70 years old) were asked to use their inhaler in the presence of an observer. The inhalation technique was considered correct when (1) the puff release was coordinated with a deep inspiration and (2) when the inspiration was followed by a few seconds' breath-holding. The patients were divided into two groups: a trained group of 46 patients who were observed for 1 month or more after the two above-mentioned manuevres had been demonstrated to them by a physician and the need for correct use strongly emphasized. The other group (the untrained group) comprised 69 patients who were presumably using their inhalers according to the manufacturer's instructions: (1) expiration; (2) inspiration and actuation, and (3) apnea. In the trained group 52% of the patients were classified by the observer as correct users, as compared to 28% in the untrained group. The results were not influenced by sex, age or occupational differences. These

observations suggest that a majority of asthmatics probably derived incomplete benefit from the use of pressurized aerosols. Although training apparently results in a more efficient use of the canisters, this study shows that training sessions must be repeated, and the results checked at regular intervals by a member of the medical staff. In subjects who repeatedly fail to achieve a correct inhalation technique the drug should be given by another route.

**Needs assessment for hospital-based home care services.**

Inui TS; Stevenson KM; Plorde D; Murphy I  
Res Nurs Health ,Sep 1980, 3 (3) p101-6, ISSN 0160-6891  
Journal Code: RAQ  
Languages: ENGLISH

Careful needs assessment is a prerequisite to addressing issues of health care program effectiveness and program planning from a population-based perspective. Home care program evaluation literature is lacking in examples of strategies for such assessment. A nurse-screening of admissions was conducted at an acute care general hospital to estimate need for hospital-based home care (HBHC) services among the 2,613 patients discharged from medical and surgical services over a 5-month period. After careful delineation of inclusion and exclusion criteria for identifying HBHC patients and participant-observer training, the nurse's judgments on patient appropriateness for HBHC care were shown to agree reliably with those of the HBHC staff ( $k = + .45$ ). In the study hospital under current conditions, an estimated 64% of discharged patients appropriate for home care do not receive these services. A comparison of the incidence according to service of HBHC-appropriate patients and patient-referral rates to HBHC suggests that one service over-refers (neurology), but most under-refers. Screening nurse salary expenditures constitute the major costs of this approach to home care needs assessment, which is recommended only for addressing major, infrequent programmatic policy issues.

This study examined the relationship between nurses' improved attitudes toward the feasibility of primary nursing within the Veterans Administration setting and resultant behaviors directed at implementing primary nursing. Festinger's cognitive dissonance theory served as an explanatory model for observed outcomes. Improved attitudes motivated participants to engage in predicted behaviors. Findings implied that effective training is maximized in situations in which correspondence exists between the source of the behavioral deficiency and educational activities designed to remedy the deficiency.

Hein HA  
Pediatrics ,Oct 1980, 66 (4) p540-6, ISSN 0031-4005  
Journal Code: DXV  
Languages: ENGLISH

A voluntary system of regionalized perinatal health care was developed in Iowa to provide accessible services for a rural population. Larger community hospitals were upgraded to serve as level II regional centers and small obstetric units continued to provide maternity services for low risk patients. Consolidation of services was encouraged only when accessibility was not compromised. Education rather than legislative fiat was the stimulus for change. Evaluation by review of birth and mortality data suggests that a stratified system of care exists in Iowa. Judged by mortality statistics, perinatal outcome has improved since the inception of the program in 1973. The concept of a mortality risk ratio (neonatal deaths/<1,500 gm live births) is suggested as a method of reviewing mortality data from the perspective of risks inherent in the population served.

From inauspicious origins in laudable, but vague, legislation and diffident--even disorganized--implementation, the NHSC has evolved into a major federal program for delivering health care to underserved areas. Tying together the financing of medical education and the delivery of health services for the first time could enable responsiveness to both qualitative and quantitative changes in medical care. But competing demands, within the program and its administration, and in the communities to be served, have made evaluation of the NHSC effort and impact difficult, but all the more necessary for future planning.

What psychomotor tasks should baccalaureate graduates be able to perform when they arrive on the doorsteps of practice settings. This article describes a research study in which a representative sample of nursing educators and nursing service personnel provide their perceptions in regard to that question. The content offers a clear view of the expectations of both groups, emphasizes the need for dialogue on this topic between educational service, and raises important issues for nursing administrators regarding the role of staff development and the transition of new graduates to the work setting.

**A model for a health career information center.**

Bruhn JG; Rogers PJ; Torres MC  
J Allied Health ,Aug 1980, 9 (3) p169-75, ISSN  
0090-7421 Journal Code: HAB

Languages: ENGLISH

A model health career information center was developed and evaluated at a university health science center. One part of the information center is a statewide, toll-free health careers hotline which provides information about health careers to high school and college students, parents, counselors, and teachers, especially in small schools and rural areas, which are not usually included in recruiting circuits. Evaluation of the hotline after one year of operation has indicated that it fills a need, is considered useful by callers, and is of a relatively small cost, considering the geographical coverage. The model information system proposed can be implemented in phases with only slight modifications to meet the unique needs of specific health science centers or their geographical location.

**Characteristics of operators of adult psychiatric foster homes.**

Beatty LS; Seeley M  
Hosp Community Psychiatry ,Nov 1980, 31 (11) p774-6,  
ISSN 0022-1597 Journal Code: GCJ

Languages: ENGLISH

To discover characteristics of adult foster home operators that might improve future selection and training procedures, the authors studied 39 operators who lived and worked with chronic psychiatric patients from a VA hospital. The findings supported their hypothesis that foster home operators have higher behavioral expectations of the mentally ill than does the normative population, in this case a group of college sophomores. Other findings included the fact that the operators most preferred clients diagnosed as being depressed or anxious and least preferred those who were alcoholic. The reason most gave for being foster home operators was that they wanted to help people.

Languages: ENGLISH

Teams of state and local agency professionals responsible for mental health and aging services participated in a model project utilizing education and consultation to facilitate community mental health programming for the elderly. Participants identified both anticipated and actual barriers to programming. Competing program priorities and lack of staff knowledge about mental health and aging were anticipated and confirmed as major barriers. Agency-organizational barriers were unanticipated, yet there were severe problems in cooperative interagency programming.

**Quality of prescribing for children in general practice.**

Catford JC  
Br Med J ,Jun 14 1980, 280 (6229) p1435-7, ISSN  
0007-1447 Journal Code: B4W  
Languages: ENGLISH

In a feasibility study of how often doctors prescribe drugs inappropriately for children 6331 FP10 forms issued to children in September 1978 by a random sample of 72 general practitioners in Wessex were examined. Prescriptions for drugs long known to be contraindicated in children--for instance, chloramphenicol, barbiturates, tetracyclines, and those with effects on appetite--were not encountered. Most scripts were for one drug only. Only about 1% (80/6331) of prescriptions could legitimately be called into question on the basis of current modern specialist teaching, although 42% of the doctors used drugs that have recently been considered to be hazardous or undesirable. These were predominantly drugs to control the symptoms of diarrhoea, vomiting, and enuresis. It is concluded that aspects of prescribing for children are responsible in the main but that there is a lag in the availability or use of important information relevant to general practice. The approach used in this study is applicable to many other areas of clinical practice and does not threaten individual doctors. It may prove to be a convenient way of assessing the general quality of medical care for children.

**Involving and educating base station physicians in paramedic programs.**

Cooper MA; Ornatto JP  
Ann Emerg Med .Oct 1980. 9 (10) p524-6. ISSN 0196-0644  
Journal Code: 4Z7

Languages: ENGLISH

There is often misunderstanding and conflict between the emergency physician and paramedic team, particularly as a new system is being implemented. This paper outlines a four-pronged approach to reduce this conflict: 1) community physician involvement in protocol development by means of a Paramedic Policy and Procedures Committee; 2) clinical training of paramedics in community hospitals; 3) involvement of community physicians in primary training and by riding rescue squads; and 4) formulation of a base station physician course to familiarize physicians with radio technique, system operation, and paramedic field work. An outline of the base station physician course is given and discussed. The reactions and outcome of the course and the positive changes it made in both physician and paramedic attitudes are discussed.

**Changing house staff attitudes toward nurse practitioners during their residency training.**

Weinberger M; Greene JY; Mamlin JJ  
Am J Public Health .Nov 1980. 70 (11) p1204-6. ISSN  
0090-0036 Journal Code: 3XW

Languages: ENGLISH

This study examines the hypothesis that increased physician contact with nurse practitioners (NPs) during residency training would encourage positive house staff attitudes. House staff expectations of and attitudes toward NPs were assessed at three points during the residency. Data indicated a more positive evaluation of NPs by house staff later in the residency program, as shown by: 1) physician expectations and valuation of NPs, 2) attitudes concerning future employment of NPs, and 3) the extent and capacity of NP utilization by residents.

Information durch den Arzt.

Rothlisberger MF

Soz Praeventivmed .Mar 1980. 25 (1-2) p73-4. ISSN

0303-8408 Journal Code: YF1

Languages: GERMAN Summary Languages: ENGLISH

It appears that only one third of all information that a doctor gives, are understood by the patient. It has been observed that among patients discharged from hospital, only 50% follow the medical prescriptions. The physician cannot but consider this alarming fact. In addition, the patient is being made insecure by information from newspapers and other mass media, by pharmacists and friends, as well as by the well-meant campaigns against drug abuse. There is no typical non-compliance patient, yet some influences can be named: 1. Social characteristics of the patient; 2. General attitude toward health by the patient; 3. Attitude of the patient toward his present illness; 4. Attitude of the patient toward the treating physician; 5. Content and form of the medical prescriptions; 6. Type of disease. Information is indispensable for compliance. To reach compliance is an important task of the physician. When the family doctor succeeds in making an ally out of the patient, then the problem of noningestion of drugs is greatly reduced.

Antognini G

Soz Praeventivmed ,Mar 1980, 25 (1-2) p49-55, ISSN  
0303-8408 Journal Code: YF1

Languages: ITALIAN, GERMAN Summary Languages: ENGLISH

The pharmaceutical sciences have recently made great progresses towards a better knowledge of drug action. For the security of medication, it seems most important that said knowledge should be made available to specialists without delay. This means also that an adequate instruction in pharmacobiological branches is necessary. Cooperation of physicians and pharmacists should be intensified. The latter are in a position to give general information (i.e. critical evaluation of a new drug on the market) as well as specific information (required form of administration, mode of action, biopharmaceutical properties, adequate dosage, adverse effects and probable interactions, alternative medication in case of contraindications, etc.). The medical and pharmaceutical studies today do not sufficiently prepare both professions for such a cooperation. It is therefore highly advisable to coordinate in a better way the education in different sciences. For the time being, pharmacists already have at their disposals a good infrastructure, which comprises the scientific center of the national professional organization. The information of the patient himself should also be developed and intensified, especially with regard to the correct use of drugs, prescribed or OTC. Again, this specific activity needs the close cooperation of physicians and pharmacists. Steady relations between both health professions are thus to be deepened and reinforced for the benefit of the patient.

**Analysis of the reasons for the high turnover of clinicians in neighborhood health centers.**

Pantell RH; Reilly T; Liang MH

Public Health Rep ,Jul-Aug 1980, 95 (4) p344-50, ISSN  
0033-3549 Journal Code: QJA

Languages: ENGLISH

A high rate of turnover of professional personnel in a clinic is disruptive to patient care and organizational stability as well as to the individual clinician. The turnover rate for clinicians (physicians, nurse practitioners, and physician assistants) working in neighborhood health centers (NHCs) is considerably higher than that for clinicians in other forms of practices. All 10 of the neighborhood health centers in HEW (Department of Health, Education, and Welfare--now the Department of Health and Human Services) Region X (Alaska, Idaho, Washington, and Oregon) that offered a full range of medical services provided information about the clinicians that they had employed since their inception. One hundred and one clinicians were surveyed about their work experience. The vast majority of those clinicians who had left a neighborhood health center remained in the community; they cited organizational issues as being at the heart of their dissatisfaction with the centers. Clinicians who began work during the initiation of a clinic remained significantly longer. The results suggest the immediate need for a strategy directed at the smooth organizational evolution of each NHC right from its inception.

**Training and management for primary health care.**

Fendall NR

Proc R Soc Lond [Bio1] ,Jul 28 1980, 209 (1174) p97-109,  
ISSN 0080-4649 Journal Code: PXF

Languages: ENGLISH

Training depends for its success upon initial selection of both students and teacher, and secondly on the curriculum content relevance to realistic job designations, consequent upon community appraisal, epidemiological surveys, manpower studies and facilities analysis. Examination systems should not be an encumbrance to real learning and the acquisition of appropriate skills. Management in primary health care depends for its improvement upon accepting that the delivery system is supportive to the primary health care unit rather than the reverse; that the structure of the delivery system and educational programmes correlate and form a simple referral chain and that data gathering be designed for a community information system rather than for centralized statistics. The two aspects, manpower development and delivery system, can be made more relevant one to the other by reconsidering the overall roles of the teacher and the practitioner. Supervision is a key issue and is primarily an educational activity, not administrative. Teamwork, to be effective, must be learned and instilled from inception of training.

0162294 81032554

**A new approach to decision making in primary health care.**

Essex B

Proc R Soc Lond [Bio1] ,Jul 28 1980, 209 (1174) p89-96,  
ISSN 0080-4649 Journal Code: PXF

Languages: ENGLISH

The village health worker has two basic tasks: (1) to prevent health problems; (2) to identify and provide effective management of illness in the village. The village health worker has limited education and the length of basic health training is usually 12 weeks. This training can only be considered appropriate if it enables the village health worker to practise effectively within the cultural, social, economic and educational constraints of the village. How far does the training help this worker to work with other members of the village community to prevent illness? These others include mothers, children, school teachers, village leaders, religious leaders, traditional birth attendants, and traditional healers; training needs to be problem-oriented. The management decisions that have to be made in situations of shortage of resources are complex to analyse. A W.H.O. research project has been undertaken to determine the feasibility of developing and using flow charts to provide alternative and more appropriate methods to help the village health worker to provide optimal management in suboptimal situations. Some examples of these new methods are presented.

**Surgical care in the village.**

Roy AD

Proc R Soc Lond [Bio1] ,Jul 28 1980, 209 (1174) p147-51,  
ISSN 0080-4649 Journal Code: PXF

Languages: ENGLISH

The care of people suffering from surgical disease or injury is unique in requiring, even at its simplest level, a certain degree of psychomotor skill and technological support. This cannot be achieved and maintained in isolation with any consistency. Villages must therefore be interdependent and related to supervision from the district hospital. The responsibility for village care rests with the district physician. He must be adequately trained for this purpose and provided with the simple facilities that are required. He extends his reach into the villages through the auxiliary health workers, who must be taught the skills necessary for simple surgical procedures and be trained to stabilize those patients that they cannot treat for transport to the district hospital. Although the skills and facilities required must be determined locally, there is a need to define the broad principles of training and to develop simple and adequate technology at village and district levels.

0162277 81032536

**Laboratory support for rural health care.**

Brown SS

Proc R Soc Lond [Biol] ,Jul 28 1980. 209 (1174) p119-28.

ISSN 0080-4649 Journal Code: PXF

Languages: ENGLISH

Lack of technical facilities to support diagnostic and curative medicine discourages physicians from providing rural health care. In developing countries, therefore, the first decision on most health problems is often made by auxiliaries.

Such staff, in conducting basic community medicine, collect specimens for appropriate investigations. Simple tests performed by the auxiliaries themselves can assist in routine surveillance, in establishing priorities of medical care and in systematizing referrals to health centres. The simplest screening tests--of weight, temperature and haemoglobin--are the most useful. Serial weighing in childhood can monitor malnutrition, acute or chronic infections and infestations; in young adults, it can point to ill-health requiring further investigation. The finding of fever and examination of a blood film may reveal acute bacterial infection, malnutrition, malaria, hookworm, bilharzia and sickling, and thus be followed up by a thin blood film, or tests for sickle-cell and stool hookworm ova, pus cells or amoeba. The repertoire of simple laboratory investigations is largely completed by examination of sputum for acid-fast bacilli, or diplococci; by urine microscopy, with haematuria; and tests for protein or sugar, in cases of oedema or polyuria. A limited range of more elaborate tests may be available in the laboratories of district or regional hospitals. Human and technological factors which bear on the modus operandi of rural laboratories are identified and discussed.

0162174 81031708

**Behavioral observation and analysis of pain behavior in critically burned patients.**

Klein RM; Charlton JE

Pain ,Aug 1980, 9 (1) p27-40. ISSN 0304-3959 Journal

Code: OPF

Languages: ENGLISH

Although patients who have been critically burned obviously suffer significant levels of pain, they also appear to engage in adaptive behaviors with greater frequency than previously documented. Observers trained in the use of an objective, reliable coding system recorded 5 min samples of behavior during treatment procedures. Typically, patients report severe pain during procedures such as wound debridement, dressing changes, physical therapy, etc., and many dread having to undergo them. The coding system allowed for the concurrent recording of staff reactions to patients' pain behaviors, well-being behaviors (discussing progress, future plans, complying with therapeutic instructions, etc.), criticism and praise of the hospital and the staff, and focusing on other patient's problems. Results indicate that: (1) patients exhibit a significant higher frequency of psychological and somatic well-being than psychological and somatic complaints,

even in the context of an intense, typically painful, treatment procedure; (2) differences in the frequency of pain behaviors and of well-beings behaviors were not systematically related to the expected burn-related variables, e.g., total body surface area burned, site of burn, days since onset; and (3) nursing staff who have not received specific training in the behavioral analysis and treatment of pain respond to most patient behaviors with positive reinforcement regardless of whether such reinforcement is therapeutically indicated. Behavioral implications for the theory and treatment of pain are discussed.

**Standards of nursing performance. Tools for assuring quality care.**

Miller R; Drake M

QRB ,May 1980, 6 (5) p16-9. ISSN 0097-5990 Journal

Code: OKP

Languages: ENGLISH

By providing specific, job-related performance requirements, standards of nursing performance can play an important role in assuring the quality of nursing care. Nursing standards, such as those implemented at the Jewish Hospital of Cincinnati, help orient and educate new staff nurses; promote consistent, acceptable nursing care throughout the hospital; enhance communication between nursing staff and nurse managers; and form the basis of equitable, objective performance appraisal--all of which have an impact on the quality of nursing care. In addition, valuable quality assessment data can be gained from performance evaluations based on standards. When combined with information from other quality assurance mechanisms, such as patient care evaluation studies and nursing staff surveys, these data can contribute significantly to comprehensive assessment of nursing performance and lead to overall improvement in the quality of nursing care. To be most effective, however, the standards must be flexible so that they can be adapted to particular jobs and levels of training and experience and so that they can be appropriately modified as job requirements change. They will thus remain valuable tools for assuring the quality of nursing care.

**Strategies for a statewide approach to improving geographic distribution of health professionals.**

Fulton GP; Sylek JA; Evans CW; Mayes CR

J Med Educ ,Oct 1980, 55 (10) p865-71. ISSN 0022-2577  
Journal Code: J13

Languages: ENGLISH

A combination of several educational strategies for improving the distribution of physicians and other health professionals is proposed as a coordinated state-level approach designed to achieve equitable access to health care in rural areas. The strategies in place in South Carolina are described to exemplify the concept and potential of such an approach. A unique characteristic is the suggestion that state health planners and sparsely populated rural communities accept as reality that health professionals, in general, and physicians, in particular, are unlikely to remain permanently in such communities and that communities institute procedures for a planned turnover that will assure continuity of the service rather than of the individual practitioner. Rural practice fellowship and rural practice scholarship components are proposed.

**Preceptor development in residency training through a faculty facilitator.**

Stuart MR; Orzano AJ; Eidus R

J Fam Pract ,Oct 1980, 11 (4) p591-5. ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

To address the demand for training preceptors, a community hospital-based residency program is using a part-time preceptor in a consultative capacity as a faculty facilitator to model, assess skills, and generally improve the level of teaching. Direct observation of resident-patient interactions and subsequent preceptor critiques are followed by feedback to the preceptor on the cogency and effectiveness of comments made. Goals, objectives, and teaching style are jointly examined by the preceptor and faculty facilitator. Evaluation of videotaped resident-preceptor interactions before and after six months' experience with the faculty facilitator shows significant increases in preceptor skills. Greatest improvement is in comments related to resident's clinical assessments, the resident-patient relationship, and in the quality of the resident-preceptor interaction. Scores by the faculty facilitator are significantly lower but parallel those of an independent, blind evaluator. Preceptor, resident, and administration reactions to the project are all positive. This ongoing program assures the continued upgrading of preceptor skills and provides for faculty attrition. A faculty facilitator providing direct feedback in the clinical setting is a low-cost and viable alternative to workshops and conferences for training effective teachers of family medicine.

**Patient information and patient preparation in orthognathic surgery: a medical audit study.**

Rittersma J; Casparie AF; Reerink E

J Maxillofac Surg ,Aug 1980, 8 (3) p206-9. ISSN 0301-0503  
Journal Code: IYA

Languages: ENGLISH

In 110 patients who had undergone various kinds of orthognathic surgery, patient satisfaction was measured by means of a written questionnaire. Ninety-four percent expressed satisfaction, both with regard to total preparation and the final outcome of the surgical procedure itself. Twenty to forty percent of the patients, however, were not properly informed about postoperative complications. On the basis of the deficiencies, indicated in the questionnaire, appropriate written information was developed. In the near future the effect of the recently added information will be investigated.

**Hospital treatment of elderly neuropsychiatric patients. I. Initial clinical and administrative experience with a new teaching ward.**

Ford CV; Spar JE; Davis B; Liston EH  
J Am Geriatr Soc ,Oct 1980, 28 (10) p446-50, ISSN  
0002-8614 Journal Code: H6V  
Languages: ENGLISH

Program planning and the initial experience of a new teaching ward for geriatric psychiatry are described. Elderly psychiatric patients, with diagnoses predominantly of depression and dementia, demonstrate more self-centeredness and less group awareness than do younger patients. Ward staff members often experience frustration, sadness and anger in response to working with them. Major problems unique to a geriatric psychiatry service include the paucity of adequate resources for post-discharge care and the necessity to obtain excellent medical-surgical consultation and support.

**Gold Award: Reducing the admissions of high-risk chronic patients to state institutions. Gulf Coast Regional Mental Health-Mental Retardation Center, Galveston, Texas.**

Hosp Community Psychiatry ,Oct 1980, 31 (10) p690-2, ISSN 0022-1597 Journal Code: GCJ  
Languages: ENGLISH

A regional mental health-mental retardation center has reduced admissions to state institutions for the citizens of the Gulf Coast in Texas by 74 per cent over the past ten years. The center serves first those most in need, based on risk of institutionalization. Because it focuses on the clients' level of functioning rather than on diagnosis, retardation services are not separated from mental health services. There are outpatient programs, day treatment programs, and residential services. Treatment stress clients' acquisition of practical living skills. The center's innovative measures include the use of law enforcement officers who are trained to recognize and deal with mentally and emotionally disturbed clients and thus divert them from the criminal to the mental health system, a liaison team that assesses programs and support systems needed to bring institutionalized clients back to the community, and a local inpatient unit for clients in crisis that precludes commitment to state hospitals.

**Implementation and operation of a hospital pediatric satellite pharmacy.**

Castile JA; Castile RG; O'Connell EJ  
Hosp Pharm ,Sep 1980, 15 (9) p457-62, 466, 468-9, ISSN  
0018-5787 Journal Code: G98  
Languages: ENGLISH

The planning, implementation, operation, and evaluation of a hospital pediatric satellite pharmacy are described. An initial three-month project involving establishment of a pediatric satellite pharmacy that provided unit dose drug distribution, intravenous admixtures, and a few clinical services was completed and evaluated. Positive evaluations by the medical and nursing staffs resulted in continuation of the satellite as a permanent program. Clinical services initially provided by the pediatric pharmacist were expanded to include acquisition of admission drug histories, instruction on discharge medication, participation on pediatric medical rounds and on the pediatric cardiopulmonary arrest team, operation of the poison control center, distribution of pediatric drug information, preparation of chemotherapy and monitoring of investigational protocols, and provision of pediatric nursing inservice education and community education.

A five-year evaluation of the services provided by the pediatric satellite pharmacy was completed by 71 pediatric nurses and 27 Mayo Clinic physicians, all of whom had worked with the system regularly. The tabulated results are presented. Responses to overall services of the pediatric pharmacy were designated good to excellent by 100% of the physicians and by 98.6% of the nurses, indicating that the pediatric satellite pharmacy is a successful and beneficial program at this institution.

**Mexican Americans and mental health: a selected review and recommendations for mental health service delivery.**

Keefe SE; Casas JM  
Am J Community Psycho ,Jun 1980, 8 (3) p303-26, ISSN  
0091-0562 Journal Code: 3FV  
Languages: ENGLISH

Eight working assumptions are generated from the literature in three problem areas and evaluated with recently published quantitative data, paying particular attention to variation within the ethnic group. Assumptions that Mexican Americans have few emotional problems, primarily use a folk medical system, do not rely on clergymen for emotional support, and

have negative attitudes toward mental health services are rejected. Two assumptions are qualified: Mexican Americans have some emotional problems at different rates than Anglos and some Mexican subgroups are relatively unaware of mental health services. There is confirmation of the Mexican American extended family support system and mental health policies which variously discourage utilization by Mexican Americans. Implications for mental health service delivery are discussed.

Contract/Grant No.: No. 203-65-7H350-A4707

Languages: ENGLISH

The knowledge of diabetes mellitus held by allied health professionals in Kentucky and the short-term and long-term effectiveness of a symposium in altering this knowledge was studied. The groups investigated consisted of: 136 primary health workers (nurses, dieticians, health educators, and other health professionals) surveyed before and after the 12-hour symposium (group 1); 37 of these primary health professionals studied again one year after the first symposium (group 2); and 26 nurses who work at a university hospital, and who did not attend the symposium (group 3). Before training, all groups performed similarly on this survey. Group 1 scored 58.5 +/- 0.2% correct, group 2, 56.9 +/- 3.1% correct, and group 3, 52.7 +/- 5.0% correct. Performance did not correlate with educational level, job description, or geographic location within Kentucky. There was a negative correlation between performance and age for group 1 ( $r = -0.3494$ ,  $P < .001$ ). Follow-up studies immediately after the symposium showed that a significant improvement occurred in the performance of group 1 and group 2 on this knowledge survey (correct score +/- SEM = 82.5 +/- 0.3%, and 81.7 +/- 2.4% respectively,  $P < .005$ ) compared to pretraining scores. A repeat survey of group 2 one year later showed a significant deterioration of knowledge ( $P < .05$ ), but not to pretraining levels (mean correct score = 69.2 +/- 3.4% at one year versus 56.9 +/- 3.1% before training,  $P < .02$ ). These results suggest that more emphasis on professional education in diabetes and study of effective methods for providing this education is required.

Languages: ENGLISH

The need to broaden explicitly the biopsychosocial model to include the human environmental context is described. Lessons learned from past advocacy of a broad model of the human patient and his illnesses should guide us in a basic further extension of this fundamental frame of reference. Development of the biopsychosocial model of patient care as we now have it may well be the principal intellectual achievement of medicine in the last 30 years. The contributions of George Engel and his colleagues are gratefully acknowledged.

**The management perspective of medical instrumentation.**

Buchmuller DP

Med Instrum , Jul-Aug 1980, 14 (4) p201-5, ISSN

0004-5446 Journal Code: M12

Languages: ENGLISH

With the health care environment growing increasingly stringent, hospitals are closely scrutinizing decisions regarding acquisition of medical technology. During this process, physicians and nurses should be involved with hospital management in an orderly, equitable decisionmaking process. Hospital resources should be allocated to those items of medical instrumentation that improve patient care and that can be cost justified. Therefore, hospital management must receive from physicians, nurses, and other medical technology users information concerning such factors as installation requirements and cost, projected utilization, and estimated useful life. Management also looks to physicians and nurses to ensure that mechanisms exist for approving the introduction of new medical instrumentation, training users, and ensuring that privileges are consistent with training. Careful planning, incorporating as much quantifiable data as possible, can benefit all concerned by enabling the hospital team to acquire the most useful medical instrumentation for its money.

Languages: ENGLISH

The inclusion of health education in high quality primary care has been suggested on the basis of 1) definitions and descriptions and descriptions of the content of primary care practice; 2) observational studies which have found that about 25 per cent of the direct patient-care time of the primary care physician is devoted to health education and counseling; and 3) surveys of physicians, who identified the most important "critical incidents" contributing to desired medical outcomes. This article reviews empirical studies of the role of health education in improving behavioral and medical outcomes for such conditions as hypertension, diabetes, congestive heart disease, streptococcal infections and others. Other contributions of health education in primary care in schools and other community settings are cited. Finally, the possible role of health education in medical education programs is described. The association of the new roles of the family physician and the family pharmacist in a model private practice is described. The pharmacist works closely with the family physician to offer personalized patient education and follow-up for therapeutic effectiveness. He also serves as a consultant to the physician for up-to-date drug information and assists in solving difficult therapeutic problems. Reimbursement for pharmacy services occurs for consultative time as well as by traditional methods. Initial response by the professionals themselves as well as the patients and staff has been very positive. An appropriate physical plant and ongoing communication between physician and pharmacist are mandatory for the success of this model. Some specifics of this practice at its present stage of development are included.

While the significance of continuity of care in medical practice has not yet been completely assessed, this concept has been espoused by the new specialty of family practice along with some other specialties. It is an integral component in family practice residency programs. The purpose of this paper is to identify several methods of measuring continuity of care in a residency setting and to demonstrate their application. Measurements called COC (Continuity of Care) and UPC (Usual Provider Continuity) will be described as they apply to overall patient visits, visits for chronic conditions, and visits by family members.

Management needs to support training efforts. The teacher needs to establish objectives for improving the overall quality of service for the dietary department (3). The supervisor or supervisors should think about areas in which improved methods would be useful and better service to patients could be achieved. If there were no patients to serve, there would be no jobs. The patients deserve the best the hospital personnel can give. The challenge is there. Employee training is the answer to achieving the goal.

**Development of a mental health programme in the Central Coast of New South Wales, Australia.**

Gallagher RM

J Adv Nurs ,Jul 1980, 5 (4) p397-407, ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH

The Central Coast Programme is considered to have begun in December 1969 with the arrival and commitment of Dr Donald Scott-Orr (specialist psychiatrist) in the Central Coast, and with the parallel commitment of the then Medical Superintendent of Morisset Hospital, Dr Howard Gorton to support the development of a regional programme for the Central Coast. It was decided not to re-establish any clinics and so avoid waiting lists. There was an emphasis on groups as a means of interaction and a family orientation in the work. In the early years the role of the nurse was changing. Initially, the extramural role was expected by the hospital to be 'following-up' patients. However, the service was based on commitment to a community rather than hospital. Increasingly the nurses' work was directly referred to them independently of hospital admissions. Staff visited general practitioners (GPs) on the Central Coast in their surgeries and regular letters were sent keeping the GPs informed of changes in the service. Consultations and transactions were recorded on referral forms and files were opened on all persons concerning whom the service was consulted. A client's name was always linked with the name of their general practitioner who was encouraged to make telephone contact freely to seek consultative support in connection with problems in their practice. Priority for crisis intervention and orientation towards family and group was backed up by domiciliary visits and widespread communication and consultation. The attempt was made to use therapeutic community principles for the in-patient programme. The processes of care were seen as being as important as the content of care in assuring an optimum quality care. There is a continuing need to focus on the flexible interchange between intra- and extra-mural staff in providing continuity for clients in care and integration with primary care services and agencies. In January 1978 Dr Max Chapman was appointed director of the psychiatric and mental health services on the Central Coast and he is currently in that position.

**Setting performance goals in geriatric nursing.**

Davies AD; Crisp AG

J Adv Nurs ,Jul 1980, 5 (4) p381-8, ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH

Behavioural techniques are increasingly being applied in the geriatric field as part of a broader emphasis on psychological and social treatments in the care of the elderly. The nurse is in the best position to analyse a patient's performance and manage an intervention programme; however, some nurses have had little experience of autonomously diagnosing problems and

setting performance goals. The authors argue that it is important to set such goals and give examples of how performance may be objectively specified, prerequisites made explicit, criteria for success defined and the consequences of goal attainment or non-attainment discussed with those most concerned. A complex situation drawn from the geriatric setting which was used as part of a teaching workshop to help nurses define suitable targets for intervention is described in the Appendix.

Bollag U

Int J Epidemiol ,Jun 1980, 9 (2) p121-2, ISSN 0300-5771

Journal Code: GR6

Languages: ENGLISH

An outbreak of typhoid fever in the largest refugee camp of the besieged capital of Phnom-Penh, Cambodia, and availability of a locally manufactured Anti-Tetanus-Typhoid-Paratyphoid vaccine prompted us to test the practicability of a mass immunization campaign by carrying out a trial in the smaller, well delineated refugee camp of Pochentong. Initial acceptance was good, due to a comprehensive service (information, health education and individual care of patients). Attendances by adults and children showed a steady decline with only 20% completing the course. It is concluded that multiinjection immunization campaigns against typhoid-paratyphoid are a waste of money in a war-torn situation with an unstable population.

**Self-management: an approach to patients with insulin-dependent diabetes mellitus.**

Peterson CM; Forhan SE; Jones RL

Diabetes Care ,Jan-Feb 1980, 3 (1) p82-7, ISSN

0149-5992 Journal Code: EAG

Languages: ENGLISH

Patients have been shown to be able to monitor their blood glucose and administer insulin to optimize and normalize blood glucose levels. There are now three reflectance meters available whose measurements correlate well with laboratory measurement of blood glucose, with a correlation coefficient between 0.92 and 0.97. A stepwise approach toward blood glucose control has been found to be most valuable. The initial phase of the program involves patients performing blood glucose measurements before and 1 h after each meal, in addition to times when patients feel hypo- or hyperglycemic. This phase of the program demonstrates the vagaries of glucose

control and emphasizes to the patients the dichotomy between symptoms and actual glucose levels. The patient is also taught during this period the risk factors associated with hyperglycemia that may contribute to vascular disease in the future. Subsequently, insulin is adjusted so that patients are given an insulin regimen that will coordinate peaks of insulin with peaks of blood glucose associated with a meal pattern. Patients are taught by health professionals and in a group setting to calibrate insulin calories and exercise depending on blood glucose readings. Such a program is received enthusiastically by patients and physicians. The major disadvantage lies in the cost of the meter and the reagent strips. Nevertheless, such programs may be cost effective because of the avoidance of diabetes-related hospitalizations.

**Blood glucose control during pregnancy.**

Skyler JS; O'Sullivan MJ; Robertson EG; Skyler DL; Holsinger KK; Lasky IA; McLeod AG; Burkett G; Mintz DH  
Diabetes Care ,Jan-Feb 1980, 3 (1) p69-76, ISSN  
0149-5992 Journal Code: EAG  
Languages: ENGLISH

Pregnant diabetic women represent a unique category of patient in whom diabetic control is most desirable, since even minor degrees of hyperglycemia have adverse effects on the conceptus. In 18 insulin-dependent pregnant diabetic women (White Class B, N = 4; C, N = 5; D, N = 7; and R, N = 2), we have utilized a therapeutic program consisting of intensive patient education, a multiple-component insulin regimen (two to four injections daily), careful dietary control, and meticulous balancing of food, activity, and insulin dosage, monitoring such balance with patient-determined blood glucose measurements four to seven times daily using the Dextrostix/Eyetone system. Our goals for blood glucose management have been to attain fasting levels of 60-90 mg/dl, preprandial levels less than 105 mg/dl, and postprandial levels less than 120 mg/dl, in the absence of significant hypoglycemia. We have been able to attain these goals for most of the period of monitoring in the majority of these patients, while in the others we have achieved marked improvement in diabetic control, although we did not consistently attain our goals. Despite this, there was not infrequent neonatal morbidity, including a 33% frequency of macrosomia, an 11% frequency of significant hypoglycemia, and a 22% frequency of congenital malformation. Nevertheless, all infants survived and are generally healthy, whereas only 38% of 21 previous pregnancies in these same women have eventuated in living offspring. Thus, although further refinement is clearly indicated, it appears that our approach has resulted in improved pregnancy outcome. Patient self-monitoring of blood glucose is a procedure that is relatively simple, practical, acceptable to patients, and facilitates the attainment of glycemic control.

**Teaching diabetic patients about self-management.**

Judd S; Sonksen PH  
Diabetes Care ,Jan-Feb 1980, 3 (1) p134-9, ISSN  
0149-5992 Journal Code: EAG  
Languages: ENGLISH

It takes approximately 20 min to teach a patient how to use Dextrostix reagent strips in conjunction with an Eyetone reflectance meter (or the more recently introduced Glucochek). Blood glucose monitoring is no more difficult or time consuming than conventional urine testing and can be learned and executed by patients of various levels of intelligence. It is important to emphasize the need for an adequate drop of blood and the use of Monolet blood lancets has greatly facilitated this. Emphasis is put on the most useful times to make recordings and the importance of good record-keeping. The more intelligent patients readily learn how to adjust their

insulin to improve their blood glucose readings while the less intelligent need help and advice. Experience has shown that not only are blood glucose levels improved but also hypoglycemic episodes are less common.

0159538 81003179

**Interpretation of glycosuria in the teenage diabetic patient.**

Moffitt PS  
Diabetes Care ,Jan-Feb 1980, 3 (1) p112-6, ISSN  
0149-5992 Journal Code: EAG  
Languages: ENGLISH

More than 700 insulin-dependent diabetic patients of both sexes and all ages have attended an education and stabilization course. Twelve adult females and four adult males were subsequently issued the means to monitor their blood glucose in their homes. Two of the adult females were pregnant, while the other 14 patients had one or more of the following: renal failure, an abnormal renal threshold, diabetic retinopathy, or continued and unexplained instability. A number of children were also issued Ames reflectometers. Eleven out of 13 male patients between the ages of 12 and 18 yr had no special difficulties except for a poor correlation between minor degrees of glycosuria and blood glucose estimations. One youth had a renal threshold of 17 mmol/L, while a recently diagnosed youth had a varying renal threshold. Eleven out of 17 teenage female diabetic patients had no correlation between urinary and blood glucose estimations with an apparent varying renal threshold being common. Four of these patients had a reflectometer on loan for 6--8 wk, but in three there was continued instability. Two others, who had continued use of home monitoring of blood glucose, had normoglycemia upon review. One of these patients had what appeared to be a varying renal threshold while unstable but a normal threshold with diabetic stability. Regardless of the cause of the disparity between blood and urinary glucose estimations, it appears that the unstable teenage female diabetic patient cannot rely upon urinalysis as a guide to insulin dosage.

**To be or not to be a psychiatric chief resident. Factors in selection.**

Lowy FH; Thornton JF  
Can J Psychiatry ,Mar 1980, 25 (2) p121-7, ISSN  
0706-7437 Journal Code: CLR  
Languages: ENGLISH

The issues involved in selecting a psychiatric chief resident have been examined. Problems associated with this position include poorly defined objectives and role; lack of training for the job; a marginal position at the interface of groups that at times are in conflict, leading to situations of divided loyalties and unrealistic performance expectations. Qualities seen as desirable in a chief resident have been discussed. In addition to the usual personal qualities which command respect these include organizing ability, leadership potential, mediation skills, the capacity for self direction and humour. Factors which make the position attractive and factors relevant to appropriate evaluation are considered. To improve the performance and job satisfaction of chief residents, the following points are suggested: The expectations related to the position should be clarified in terms of specific objectives when the candidate is selected or elected. Whom he reports to and whom he works for should be clear. Before, or soon after, assuming office the chief resident should have exposure to teaching or supervision in group dynamics, consultation skills and mental health administration.

**Computer interpretation of pulmonary function tests.**

Ballantyne D; Baigelman W  
Respir Ther ,Jul-Aug 1980, 10 (4) p19-24, ISSN  
0048-7392 Journal Code: R8L  
Languages: ENGLISH

A computer program for interpretation of pulmonary function tests, including flow-volume loops, lung volumes, and diffusing capacity, is described. Comparisons of data obtained before and after administration of bronchodilators and comparison with previous tests are also available as part of the program. Computer interpretation of pulmonary function testing accelerates the reporting of test data and may have a role in education in the discipline of respiratory medicine and related fields.

**Teaching parents with high-risk infants in the home.**

Isaacs PC  
Patient Couns Health Educ ,2d Quarter 1980, 2 (2) p84-6,  
ISSN 0190-2040 Journal Code: PAL  
Languages: ENGLISH

Forty families evaluated the effectiveness of the newborn intensive care coordinator's teaching in helping them to adjust to caring for their high-risk infants after discharge from a newborn intensive care center. The families described the coordinator as an effective teacher and a trusted person who was available, gave emotional support, and made them feel competent as parents. The families recommended that the newborn intensive care coordinator work with other families with similar problems.

**Counselling in a hospital-based newborn screening service.**

Headings V  
Patient Couns Health Educ ,2d Quarter 1980, 2 (2) p80-3,  
ISSN 0190-2040 Journal Code: PAL  
Languages: ENGLISH

The newborn screening and parent counselling service at Howard University Hospital is an integral component of services to newborn infants. The organization of this service presents a model that appears appropriately suited to the general organization of health-care delivery in the United States. Significant features of this service are: hospital-based planning and management of the service; integration of multiscreening components into a unified service; tight integration between screening, education, and counselling; a hospital-based team that provides coherent and in-depth counselling for all screening-related needs; a forum for orienting parents to the benefits of preventive health care; and a context in which to teach students the applied aspects of preventive health care based on early detection of disorders. If we are to have high quality newborn services in this area it may be incumbent on hospital-based health professionals to designate this as a required component of adequate hospital-based services for newborn infants rather than relinquishing the initiative to centralized health planners and legislators.

**Effects of an information booklet on well-being of hospital patients.**

Visser AP

Patient Couns Health Educ ,2d Quarter 1980, 2 (2) p51-64

ISSN 0190-2040 Journal Code: PAL

Languages: ENGLISH

Although informational booklets are being used increasingly in Dutch hospitals, little is known of their effects and the conditions for optimal use. Various aspects of the use and effects of a specially developed information booklet were investigated in two surgical wards of a general hospital. The booklet gave information about ward procedures, operative routines, narcosis, and psychosocial care possibilities. Both before and after introduction of the booklet we gathered data on the satisfaction, knowledge, and emotional state of patients on the two wards and their perception of the care climate. Patients on the control ward received just the booklet. On the experimental ward staff nurses were trained in nondirective therapeutic skills, and measurements were repeated on both wards after this intervention. In a third manipulation on the experimental ward, some of the patients had a supportive and informative talk with a trained nurse. Although patients appreciated and read the booklet better than a general hospital leaflet, the results show that the booklet and other supporting measures had no effect on the patients' perception of their well-being.

**Prescription medication practices of the elderly.**

Robinson AF

Contemp Pharm Pract ,Summer 1980, 3 (3) p131-6, ISSN

0162-3761 Journal Code: DQ9

Languages: ENGLISH

The prescription medication practices of 30 subjects, 65 years or older, were surveyed and compared to the actual physician's instructions indicated on the prescription label.

The study identified reasons for errors in administration and compliance or noncompliance with the prescribed regimen. The subjects were interviewed with a questionnaire developed by the author. The study revealed that more errors were made by subjects who were 65 to 69 years old, Protestant, and female. The error-prone individuals also lived alone and had less than 12 grades of education. Teaching about medications is typically a nursing or pharmacy function; a professional nurse or pharmacist could be employed to present instructional sessions periodically.

**Clopenthixol and flupenthixol depot preparations in outpatient schizophrenics. I. A one year double-blind study of clopenthixol decanoate and flupenthixol palmitate.**

Dencker SJ; Lepp M; Malm U  
Acta Psychiatr Scand [Suppl] ,1980, 279 p10-28, ISSN  
0065-1591 Journal Code: 1W3  
Languages: ENGLISH

Clopenthixol decanoate and flupenthixol palmitate, both depot neuroleptics belonging to the thioxanthene group, were studied during double-blind conditions for 12 months using four week intervals between injections. The 60 patients included in the study were chronic schizophrenics and treated as outpatients after earlier admission to hospital and rehabilitation training periods. They had all been treated with depot neuroleptics in the last three years and they had been free from relapse for at least 15 months. The main aim with this trial was to study the two depot drugs during maintenance treatment conditions in an outpatient setting. Ten patients dropped out, 7 because of unsatisfactory effect, mainly because only limited dose levels were accepted according to the design. In spite of the earlier long lasting neuroleptic treatment and the good social adaptation in this schizophrenic subgroup there was observed a symptom decrease in all the rating scales even in these symptom poor patients. This improvement in psychopathology with optimal results after half a year seems to be a combined result of the efficient neuroleptics tested and careful monitoring of the drug.

**An industrial council launches a co-operative venture into the field of industrial health.**

Erasmus CA

S Afr Med J ,Jan 5 1980, 57 (1) p21-6, ISSN 0038-2469  
Journal Code: U4R

Languages: ENGLISH

The Industrial Council for the Transvaal Chemical Manufacturing Industry decided to introduce additional benefits for the members of its Sick Benefit Fund. To establish the benefits which should receive priority, an industrial health survey was undertaken of 60 of the approximately 160 industries which form part of the group covered by this Council. The results of the survey revealed that very little occupational health care was available for the workers. It was concluded that very basic preventive health benefits should be introduced, and it was decided to initiate a health education programme and to undertake a health screening examination of each member with the object of reaching those individuals who rarely undergo a complete medical examination, thereby detecting and treating presymptomatic illness and establishing a basic medical record of each member. This would enhance the health of all the workers in the industry.

Der Sport in den Berufsbildungs- und und Berufsförderungswerken -- eine Bestandsaufnahme.

Schule K

Rehabilitation (Stuttg) ,Aug 1980, 19 (3) p164-9, ISSN

0034-3536 Journal Code: R3P

Languages: GERMAN Summary Languages: ENGLISH

The majority of disabilities are coupled with impairments of the motor system. In its action programme on rehabilitation, the Federal Government therefore recognises that sports should invariably be included in present-day rehabilitation as provided in the centres for vocational rehabilitation. This thesis was investigated on the basis of a study of 14 vocational re-training centres (= 93 percent) and 13 vocational training centres (= 81 percent) in operation in 1978/1979. It was found that there still is marked understaffing in this sector, especially as regards specifically trained personnel. The majority of sports facilities moreover are still in need of equipment capable of stimulating motivation. The organisational patterns found in the field of sport for the disabled widely lack uniformity, with solutions being rather unsatisfactory.

Padagogische Frühförderung behinderter Kinder unter den Aspekten der Regionalisierung und Interdisziplinarität.

Speck O

Rehabilitation (Stuttg) ,May 1980, 19 (2) p102-6, ISSN

0034-3536 Journal Code: R3P

Languages: GERMAN Summary Languages: ENGLISH

Early education of disabled children is presented as a specific and indispensable yet integrated part of a complex task which can be mastered solely by inter-disciplinary co-operation and interchange between educational, psychological, medical and clinical services. The author submits a concept - developed and put to the test at federal state level - of a regional and closely knit network of educationally-oriented education services. Statistical data obtained from 103 early education facilities in Bavaria give an insight into the work of such institutions.

**Psychosocial and psychosomatic diagnoses in primary care of children.**  
Starfield B; Gross E; Wood M; Pantell R; Allen C; Gordon IB; Moffatt P; Drachman R; Katz H  
Pediatrics ,Aug 1980, 66 (2) p159-67, ISSN 0031-4005  
Journal Code: QXV  
Languages: ENGLISH

In this study in seven primary care facilities the proportion of children recognized as having behavioral, educational, or social problems was much higher than generally assumed. Although there was great variability among the facilities, at least 5% and as many as 15% of children seen in one year were diagnosed as having these problems in all but the hospital teaching facilities. The prevalence was even higher among children from poor families. The variability among facilities was much less for psychosomatic problems, which were diagnosed in 8% to 10% of the children. For both psychosocial and psychosomatic types of problems, but especially for psychosocial ones, the proportion of visits with the diagnoses was much lower than the proportion of children with them, so that these problems engendered fewer visits for their management than might have been expected from their frequency in the population. However, available evidence suggests that individuals with unresolved psychosocial problems make more than their share of visits for other diagnoses. The findings of this study have implications for the content of educational programs for primary care practitioners, for the organization of primary care practice, and for the current debate over policy concerning reimbursement and benefit packages.

Journal Code: LSM  
Languages: ENGLISH

Six primary nurse practitioners were introduced into a large urban jail health service along with supportive organizational changes. The system's primary care volume capacity doubled. The average cost of each patient visit decreased by about one third. The technical quality of primary care improved continuously during a 3-year period of study while patient outcomes, patient satisfaction levels and overall mortality rates remained unchanged. The inmate suicide rate decreased after the introduction of a psychiatrically directed screening and treatment program, and cardiopulmonary resuscitation (CPR) training for correctional officers. Attribution of the decrease awaits further experience. The nurse practitioners delivered primary care equal in technical quality of care provided by medical subspecialty Fellows. A test of clinical knowledge proved to be a good predictor of the technical quality of care delivered by individual graduate nurse practitioners. One measure of the quality of management of illness episodes in the jail clinic correlated weakly with two measures of patient outcome. The addition of nurse practitioners into a well-organized, well-monitored jail health program was a cost-effective means of expanding the program's patient volume capacity. Screening and referral of inmates with high suicide potential, coupled with CPR training for correctional officers, may have been a factor in reducing the inmate suicide rate.

Journal Code: LSM  
Languages: ENGLISH

The ambulatory component of residency training jointly produces two products, namely, training and patient services. In costing educational programs of this type, two approaches are frequently taken. The first considers the total costs of the educational program, including training and patient services. These costs are usually constructed from historical

accounting records. The second approach attempts to cost the joint products separately, based upon estimates of future changes in program costs, if the product in question is added to or removed from the program. The second approach relates to typical decisions facing the managers of medical centers and practices used for teaching purposes. This article reports such a study of costs in a primary-care residency training program in a hospital outpatient setting. The costs of the product, i.e., on-the-job training, are evaluated using a replacement-cost concept under different levels of patient services. The results show that the cost of the product, training, is small at full clinical utilization and is sensitive to changes in the volume of services provided.

**The legality of nursing associations serving as collective bargaining agents: the Arundel case.**

Dolan AK

J Health Polit Policy Law ,Spring 1980, 5 (1) p25-54,  
ISSN 0361-6878 Journal Code: IBC

Languages: ENGLISH

Several recent legal developments have been analyzed which call into question the appropriateness of state nursing associations as collective bargaining agents for working nurses. A federal case ruled that because some state nursing associations are dominated by supervisors, they are inappropriate collective bargaining agents for nonsupervisory nurses. A review of the pertinent history and literature reveals that collective bargaining has tended to be a secondary concern of nursing leaders who have more resolutely pursued what they regard as a professional route to elevating the status of nurses. Therefore, the highly stratified nature of nursing practice and the highly disparate roads to improving the status of nursing held by various sectors within nursing have resulted in conflicts of interests which call into serious question whether umbrella groups like nursing associations can represent working nurses.

This paper examines the educational challenges created by the existence of complex health care delivery systems and the need to train analysts and problem solvers to work effectively within these systems. An undergraduate, interdisciplinary curriculum, based in the College of Engineering at the Georgia Institute of Technology, is described which addresses these challenges. One particular course is used to illustrate how cognitive and experiential learning approaches are combined to provide the student with a bridge between acquiring technical skills and applying them sensitively in a real world context.

**Surveillance: retrospective versus prospective.**  
Blake S; Cheate E; Mack B  
Am J Infect Control ,Aug 1980, 8 (3) p75-8, ISSN  
0196-6553 Journal Code: 4T6  
Languages: ENGLISH  
A survey was undertaken to determine if a retrospective  
review of charts for nosocomial infections could be as  
accurate as a prospective review of charts. The retrospective  
review was done by medical record technicians using criteria  
established by the Infection Control Committee and the medical  
staff. The infection control nurse reviewed the data collected  
by the Medical Records Department before the monthly report  
was completed. Surveillance was done prospectively by the  
infection control nurse and an R.N. helper. The study was  
carried out on two nursing units. The infection control team  
used the same criteria as the medical record technicians. At  
the end of the 4-month study period, infections found by  
medical record technicians were compared to those found by the  
infection control team. The Medical Records Department  
identified more nosocomial infections than did the nurse team.  
It was concluded that the Medical Records Department can do  
an accurate review of charts for nosocomial infection and that  
their report is reliable to show basic trends. The infection  
control nurse is then able to spend her time on special  
studies and investigations as well as employee education.

The Society of Thoracic Surgeons is the largest organization  
representing our specialty. At this time, escalating costs of  
medical care and the public demand for accountability have  
given rise to a number of issues that must be faced. The  
Society is in a position to lead the medical profession in  
addressing many of these issues. We must present a united  
front for our specialty and resolve problems involving our  
training programs, manpower, federal regulations regarding  
medical devices, and the Federal Trade Commission's position  
on advertising. Additionally, the organization must address  
the issue of a definition of physician competence as it  
relates to the certifying and recertifying process. Awareness  
of these problems by all members of the Society with the  
opportunity for open discussion is essential. It is vital that  
The Society of Thoracic Surgeons assume a visible positive  
position on these issues.

**Impressions of neurology and neurosurgery in the People's Republic of China.**  
Tower DB; Feindel W  
Ann Neurol ,May 1980, 7 (5) p395-405, Journal Code:  
6AE  
Languages: ENGLISH

During July, 1979, the authors visited the neurological and neurosurgical services of eight major hospitals and associated medical schools in Peking, Tientsin, and Shanghai, and viewed many of their teaching and research facilities. From these visits and our discussions with the staffs of these units, we came away with the impressions reported here. In the People's Republic of China today there are more than 2,000 neurologists and 1,300 neurosurgeons. At present there are two major clinical centers: the Peking Institute of Neurosurgery, directed by Prof Wang Chung-Cheng and located in the Xuan Wu Hospital affiliated with the Peking First Medical College; and the Shanghai Institute of Neurology, directed by Prof Chang Yuan-Cheng and located in the Hua San Hospital affiliated with the Shanghai First Medical College. In every hospital, patient loads are formidable (e.g., several thousand outpatients weekly), but the variety of clinical problems does not differ from those seen elsewhere in the world. The most common problems are head injuries, brain tumors, cerebrovascular disorders, infections, and epilepsy. Each of the centers is heavily engaged in undergraduate and postgraduate training, and research has been resumed after the major disruptions of the 1966-76 "Cultural Revolution." Research continues on acupuncture, but present emphasis is directed toward pain mechanisms, notably at the Shanghai Institute of Physiology, directed by Prof Feng De-Pei. We were most impressed by this, the principal neurophysiology and neuroscience research center in the country. Clearly, the People's Republic of China has a wealth of clinical material and many competent neurologists and neurosurgeons with stimulating research ideas-characteristics which offer real potentials for collaborative research.

**Computer system for a hospital microbiology laboratory.**  
Delorme J; Cournoyer G  
Am J Clin Pathol ,Jul 1980, 74 (1) p51-60, ISSN  
0002-9173 Journal Code: 3FK  
Languages: ENGLISH  
An online computer system has been developed for a university hospital laboratory in microbiology that processes more than 125,000 specimens yearly. The system performs activities such as the printing of reports, fiscal and administrative tasks, quality control of data and technics, epidemiologic assistance, germ identification, and teaching and research in the different subspecialties of microbiology. Features of interest are smooth sequential transmission of clinical microbiologic test results from the laboratory to medical records, instantaneous display of all results for as long as 16 months, and updating of patient status, room number, and attending physician before the printing of reports. All data stored in the computer-file can be retrieved by any data item or combination of such. The reports are normally produced in the laboratory area by a teleprinter or by batch at night in case of mechanical failure of the terminal. If the system breaks down, the manually completed request forms can be sent to medical records. Programs were written in COBOL and ASSEMBLY languages.

**Integrated maternal and child health services. A study at a Rural Health Centre in Kenya.**

Dissevelt AG

Trop Geogr Med ,Mar 1980, 32 (1) p57-69, ISSN 0041-3232

Journal Code: WGJ

Languages: ENGLISH

The increasing demand for maternal and child health care in developing countries and the constraints in terms of available resources to meet this demand result in a dysfunction of the existing services. To improve Maternal and Child Health Services on a short term it is the author's contention that available resources can be used more efficiently. The system of conventional Maternal and Child Health Services operating at health centres in Kenya until the early seventies is described and analyzed. An alternative system called the Integrated Maternal and Child Health Clinic--an extension of Morley's proposals for the Under-Fives Clinic--is described and its potential advantages and disadvantages reviewed. A study was carried out in 1971--1975 at a rural health centre where the new system was introduced in 1973. It was found that the new system has several advantages but some aspects did not come up to expectations; also some disadvantages were identified. Implications for planning and management of health services, for staff training and for health services research are discussed.

**The cost of medical student instruction in the practice setting.**

Pawlson LG; Watkins R; Donaldson M  
J Fam Pract ,May 1980, 10 (5) p847-52. ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

Using an incremental cost approach, the cost of instruction for medical students participating in a variety of ambulatory-care, chiefly family-practice, experiences in several clinical practice sites was examined. The costs ranged from \$5 per student per day for a first-year observational experience to \$112 per student per day for a second-year preceptorship with direct patient care involvement by the students. Factors such as the previous experience of the student, the baseline productivity of the site, the number of examining rooms, the income source of the preceptor (salary vs fee-for-service), and the clarity of preceptor role definition are discussed in relation to cost. The lack of defined, stable income to offset costs is noted. In view of the substantial costs of instruction in ambulatory family practice clerkships, clearly defined ongoing sources of income must be provided to ensure the continuation or expansion of these vital experiences.

**Breast self-examination in the primary care setting.**

Miller SL; Norcross WA; Bass RA  
J Fam Pract ,May 1980, 10 (5) p811-5. ISSN 0094-3509  
Journal Code: I4L

Languages: ENGLISH

Very little is known about breast self-examination (BSE), a health practice that has been found to be associated with better clinical and pathological breast cancer outcomes. Using data obtained from a sample of 260 women frequenting three primary care centers, this study investigates rates of BSE and how such rates are affected by social and medical factors. Results indicate that BSE practices are influenced to some extent by a woman's race and level of education, while they are significantly affected by her religion. In contrast, there was no evidence to suggest that a woman's knowledge of breast cancer risk factors, or her own level of risk for the disease, affect the extent to which she is likely to self-examine. These findings suggest the need to confirm these social influences on BSE practice using a larger, population based sample. Moreover, the values and attitudes affecting differential rates of BSE performance should be further investigated.

**Characteristics of family practitioners with large geriatric practices.**

Haas WH; Crandall LA; Bain DJ  
J Am Geriatr Soc ,Jul 1980, 28 (7) p289-94. ISSN

0002-8614 Journal Code: H6V

Languages: ENGLISH

Little has been reported on the characteristics of physicians presently serving the health needs of the elderly. In this report, generated from a survey of Florida family practitioners, physicians and with large geriatric practices are compared to physicians with practices composed primarily of younger patients. Family physicians with large geriatric practices are older, and treat more chronic disease than do their peers. However, they consult the same professional journals and texts in caring for their patients, refer patients to specialists at the same rate, and have the same office facilities as do their colleagues who treat chiefly younger patients. The family physician with a large geriatric case load is less likely to have a predominantly outpatient practice and more likely to be involved with hospitalized patients. Data from the census and health manpower studies suggest that family physicians will care for substantial number of elderly patients in the future. Continuing education which addresses issues in geriatrics may help to attain optimal health care for the elderly.

**The dietitian in community home programs.**

Oller JA  
J Am Diet Assoc ,Mar 1980, 76 (3) p267-9. ISSN  
0002-8223 Journal Code: H6F

Languages: ENGLISH

The dietitian is an important member of the health care team in the community and must be competent in the areas of administration, clinical nutrition, patient education, and human relations. Dietary follow-up care is essential in the community to evaluate existing facilities, assess economic levels, disseminate information to residents and sponsors, and ultimately provide good nutritional care to the patients. Responsibilities of the community care dietitian include participation in the initial evaluation of community homes under consideration for veteran placement and in determining the appropriateness of home placement for individual patients. Also, she/he makes follow-up visits to patients living in community residences.

**Documentation of nutritional care.**

Ometer JL

J Am Diet Assoc ,Jan 1980, 76 (1) p35-40, ISSN

0002-8223 Journal Code: H6F

Languages: ENGLISH

The results of a study designed to gather information concerning dietitians' charting practices suggest that The American Dietetic Association and hospitals themselves have recognized the importance of dietitians charting in medical records. The results also suggest that dietitians recognize their own adequacies and inadequacies in terms of charting frequency. The identification of lack of time as the factor most often preventing more frequent recording may indicate a need to adjust staffing patterns or to re-order priorities. Achievement of the latter may require more education concerning both the overall importance of charting and the importance of charting some specific categories of information. Due to less exposure to charting during professional programs, dietetic graduates prior to 1966 may need more help to improve their charting than later graduates.

**Graduate training of family practice residents in Israel.**

Miller ES

Isr J Med Sci ,Mar 1980, 16 (3) p206-11, ISSN 0021-2180

Journal Code: GYO

Languages: ENGLISH

The educational goals and the actual implementation of the Israeli residency program in family medicine are examined. Except for the lack of required training in gynecology, the program syllabus is based on a sophisticated concept of comprehensive care. The teaching clinics provide residents with excellent patient material and with generally adequate medical facilities; however, important equipment is occasionally lacking, and the administration of the clinic discourages thorough teaching. The instructors are experienced practitioners and highly motivated teachers; They provide excellent role models, but are unable to give the residents adequate feedback or to stimulate deeper personal insight. The residents have heavy service responsibility, but in such areas as the interview technique, pediatrics and gynecology, they fail to acquire necessary skills. Suggestions are made regarding an educational reform of the program that would entail the use of university departments of family practice to

support regional networks of teaching clinics.

**Patterns of psychotropic drug use in a Nigerian Psychiatric outpatient clinic.**

Odejide AO

Int Pharmacopsychiatry ,1980, 15 (1) p14-23, ISSN

0020-8272 Journal Code: GU2

Languages: ENGLISH

The prescription pattern of clinicians in a Nigerian psychiatric outpatient clinic was studied. The three major psychiatric disorders diagnosed at the centre were schizophrenia, affective disorders and psychoses associated with other cerebral conditions. The schizophrenics were treated essentially with neuroleptics in different combinations. Also, combinations of neuroleptics and antidepressants were employed in the few cases diagnosed as schizo-affective disorders. As for the cases of affective disorders, combination of neuroleptics and antidepressants was found to be the pattern. The reasons for this pattern of treatment were discussed. The average maintenance neuroleptic dose per day was 300 mg while those of the tricyclic antidepressants was 88 mg. In as much as psychopharmacotherapy is widely employed in treating the various psychiatric disorders in African countries, especially Nigeria, the need for more information on psychotropic drugs through training courses was suggested.

**Primary care in psychiatry residency training.**

Hales RE

Gen Hosp Psychiatry, Jun 1980, 2 (2) p148-55, ISSN  
0163-8343 Journal Code: FNK

Languages: ENGLISH

The author summarizes patient perspectives and government initiatives that have fostered closer medicine-psychiatry cooperation and more comprehensive treatment of patients. Despite the growing numbers of people requiring more formal mental health care, most patients are being treated by primary health care providers. This trend will continue as long as there is a decline in the number of medical students entering psychiatry. The author summarizes several general principles that psychiatry residency program directors should consider in designing primary care experiences for their residents and for medical students rotating on their services: longitudinal primary care experiences in organized medical care settings, training in basic medical principles and techniques, and instruction in the biopsychosocial model of disease. The author also recommends three specific training experiences for psychiatry residents that would enhance their ability to provide more effective mental health services to primary care physicians and their patients: consultation psychiatry, primary mental health care, and general psychiatry. The author concludes that medical students, through their contact with primary care-oriented psychiatry residency programs, would be more attracted to psychiatry as a specialty choice and that residents, upon completion of training, would be more inclined to practice in primary care settings.

**Deterioration of diabetic patients' knowledge and management skills as determined during outpatient visits.**

Lawrence PA; Cheely J

Diabetes Care, Mar-Apr 1980, 3 (2) p214-8, ISSN  
0149-5992 Journal Code: EAG

Languages: ENGLISH

A checklist of 22 items that diabetic persons need to perform correctly in order to carry out adequate home management was analyzed for 30 patients in an outpatient clinic. Both a recording of correct performance (baseline assessment) and a reassessment 3--17 mo later were obtained for each item included in the study. An 8 1/2% error rate occurred on reassessment. Approximately one-third of the patients had an error rate of 10% or more. No significant relationship was found between the percentage of error and age, interval between assessments, years of diabetes, or past performance on the checklist. Nor did a majority of the errors occur on items that showed an error immediately before the correct baseline assessment. This error rate is less than in reports not including a correct baseline performance. However, it is high enough to indicate that reassessment is needed more frequently than is generally done.

**House staff knowledge of blood component therapy: an evaluation.**

Kasprisin DO; Kasprisin L

Eval Health Prof, Jun 1980, 3 (2) p153-8, ISSN  
0163-2787 Journal Code: ENK

Languages: ENGLISH

It has been documented that most transfusion errors are either administrative or clerical. It is necessary to ascertain if those responsible for transfusing patients have the knowledge to do it properly. Since house staff are responsible for the proper administration of blood components at many teaching hospitals, a group of pediatric interns and residents were given a short examination to measure their knowledge of transfusion practices and to identify when, during their training, this knowledge is obtained. Transfusion techniques, inspection of blood bag labels, compatibility, and transfusion reactions were covered in the exam. It was found that the knowledge of transfusion therapy is learned by experience and that many house staff members have an adequate knowledge of present-day transfusion practices.

**The application of a freeze-microwave thaw technique to central admixture services.**

Ausman RK; Holmes CJ; Walter CW; Kundsinn RB  
Drug Intell Clin Pharm ,Apr 1980, 14 (4) p284-7, ISSN  
0012-6578 Journal Code: EBU

Languages: ENGLISH

The establishment of a centralized, intravenous solution/admixture drug program in a hospital enhances the quality of patient care. Costs for personnel, equipment, and space have constrained the growth of such a service in the past. A method of preparation for admixture units, which capitalizes on the economics of volume and employs personnel at levels of training consistent with need, is proposed. This technique, utilizing freezing, long-term storage at -20 degrees C, and thawing by exposure in a microwave oven minutes before intended use, surmounts the real and perceived difficulties in many planned or existing admixture programs. A strong element of prospective quality control can be introduced. Where demand is insufficient to justify a separate activity, cooperative arrangements among hospitals will bring all the advantages of central admixture to each. It appears that reductions can be made in the pharmacy hours devoted to admixture. Waste of any unused, reconstituted drugs or prepared units that were not administered may be diminished. Thus, there may be substantial savings for existing admixture programs, if the technique described is adopted. The ultimate form of implementation in each institution, as always, is dependent upon the special "personality" of the hospital.

**The Institute of Medicine report, "A Manpower Policy for Primary Health Care": a commentary from the American College of Physicians.**

Peterson ML  
Ann Intern Med ,Jun 1980, 92 (6) p843-51, ISSN  
0003-4819 Journal Code: 5A6

Languages: ENGLISH

In 1978 the Institute of Medicine issued "A Manpower Policy for Health Care," the report of a study of major issues bearing on the availability of an adequate number of physicians for provision of primary care and on potential strategies for an appropriate manpower policy. The report was analyzed by committees of the American College of Physicians, and they prepared a response to the Institute's recommendations that illuminates the position of the College on the fundamental principles of manpower policy. The "Commentary" that sets forth the College position is presented here. Some introductory comments and discussion provide a useful background to the "Commentary" for readers not familiar with these developments.

**Selection of primary care as a medical career: demographic and psychosocial correlates.**

Stefanu C; Korman M; Pate ML; Chapman JS  
South Med J ,Jul 1980, 73 (7) p924-7, ISSN 0038-4348  
Journal Code: UVH  
Languages: ENGLISH

A study analyzing demographic and psychosocial correlates associated with the selection of primary care as a medical career was conducted on 357 physicians who were graduated from medical school between 1963 and 1966. Results suggest that individuals who were reared in smaller communities, who were among the younger siblings of their family, and who exhibited a strong pattern of socialization at home and school tended to choose a primary care specialty. The findings also suggest that if all other factors are equal and if production of primary care physicians is an important goal, medical school admission committees might consider including cross-validated psychosocial and demographic variables in selecting applicants to medical schools.

**A community programme for rehabilitation and secondary prevention for patients with acute myocardial infarction as part of a comprehensive community programme for control of cardiovascular diseases (North Karelia Project).**

Salonen JT; Puska P  
Scand J Rehabil Med ,1980, 12 (1) p33-42, ISSN 0036-5505  
Journal Code: UD3  
Languages: ENGLISH

The comprehensive community programme for the control of cardiovascular diseases in North Karelia includes a special subprogramme for the rehabilitation and secondary prevention among patients with an acute myocardial infarction (AMI). The target group of the programme were persons under the age of 65 who had an AMI according to the community-based AMI register and had survived the acute phase of the disease. The programme consisted of systematic long-term medical follow-up at an

outpatient MI clinic and of decentralized local group-rehabilitation with special emphasis on secondary prevention. The main component of the programme were health education and submaximal physical exercise, aiming at the reduction of the known secondary risk factors and the improvement of the general well-being of the patients. The feasibility of this programme was good. During the five-year period from 1973 to 1977 a total of 1308 persons under the age of 65 survived an AMI. Out of these patients 515 visited the outpatient MI clinic and 575 took part in the rehabilitation groups. The participation rate in the rehabilitation groups in the whole community increased during the period from 24% to 63%. During the programme period there was a reduction in incidence of recurrent infarctions and new vocational invalidity pensions among the patients with AMI.

**Elementary-school pupils as health educators: role of school health programmes in primary health-care.**  
Rohde JE; Sadjimin T  
Lancet ,Jun 21 1980, 1 (8182) p1350-2, ISSN 0023-7507  
Journal Code: LOS  
Languages: ENGLISH  
The high proportion of children attending primary schools in

rural parts of Indonesia and the low health-care cover in these areas prompted a plan to involve schoolchildren in a health-education programme. Action-oriented health lessons aimed at modifying community-health-related behaviour were designed to suit the teaching format familiar to rural teachers. The lessons involved pupils in health activities in their own homes and neighbourhoods. Evaluation of the teaching module on diarrhoea showed a substantial improvement in knowledge, skills, and attitudes of rural families regarding this illness, and indicated how a vastly increased outreach of primary health-care activities is possible through a well-designed school-health programme.

Journal Code: J13

Languages: ENGLISH

Shared-schedule residency training has received more consideration recently as more people have become aware of the need and desirability of such programs. The details of one program, in the Department of Pediatrics of the University of Texas Medical Branch at Galveston, are reviewed. Some of the problems encountered in the execution of this type of program are presented, along with some suggestions for their alleviation. The benefits of a shared-schedule residency are also discussed. The authors suggest guidelines to use in planning a shared-schedule residency program.

**The use of slow-scan video for CME in a remote area.**

Dunn EV; Acton H; Conrath D; Higgins C; Bain H

J Med Educ Jun 1980, 55 (6) p493-5, ISSN 0022-2577

Journal Code: J13

Languages: ENGLISH

Since August 1977 a slow-scan video system has been operating in a remote area of northwestern Ontario, Canada. This system, using regular dial-up telephone lines, interconnects the local hospital, five remote communities, and two teaching hospitals in Toronto, 1,000 miles distant. Since August 1978 the system has been used on a regular basis for continuing medical education programs, graduate medical education including X-ray rounds, medical rounds, nursing rounds, in-service education, and patient education. These CME programs for physicians have been accepted for study credits by the College of Family Physicians of Canada.

The increased demand that mandatory continuing education requirements place on an academic physician's time and the conviction that continued learning is best when that learning is related to patient care were the impetus for developing a continuing education system in the University of Michigan Hospital for medical faculty and medical staff. Using the capability to co-sponsor continuing medical education, the University of Michigan Medical School established a quality assessment mechanism that enabled approval of a variety of ongoing instructional activities in the hospital setting for continuing education credit.

**Developing effective institutional managers in the 1980s--part 2: some new directions.**

Lees S

J Adv Nurs ,May 1980, 5 (3) p329-39, ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH

In the earlier paper (published in the March 1980 issue of the Journal of Advanced Nursing) two dominant themes were developed. One was that the organizational behaviour of nurse managers could be traced to the social defence system learned during early nursing, the other was that many of the assumptions which underpin much of the current thinking on nurse management training can do little either to help them unlearn these early behaviours or to prepare them to take more innovative action in their respective roles. Part 2 analyses some implications of this. The initial discussion examines the purpose of management training and what it is intended to achieve, which embraces the issues of the transfer of course learning back to the workplace and the greater involvement of line managers in the development of their staff. By redefining nursing in terms of open-system boundary management, some new directions are suggested which management trainers may find useful in clarifying and redefining their own task, as well as enabling nurse managers to be more innovative and effective within the constraints of their organizational situations. The implications go beyond just nursing and nurse management training. They are concerned with the wider range of institutions whose task is the throughput of people, and which tend to be managed by groups of professionals.

**Towards rational midwifery service planning.**

Moore B

J Adv Nurs ,May 1980, 5 (3) p301-11, ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH

Although the work reported here began at health district level, even a casual perusal of published statistics reveals a quite bizarre situation when viewed from a manpower planning perspective. The quite considerable effort involved in producing state-certified midwives seems, on the surface at least, to be excessive given the number gainfully employed in that profession. The national situation with respect to trends in the birth rate is examined and a somewhat surprising seasonal effect identified. This material is then used to estimate the likely situation to be encountered at local level and in particular the effect at different levels of bed provision. In an attempt to translate these estimated births into workload figures recourse was made to regression analysis. Data from 417 maternity units relating both to outputs and inputs were secured, but the subsequent analysis proved abortive due to the high correlation which exists between the variables. Estimates were therefore derived from the work of other authors.

**A model for establishment of educational programmes in developing countries: the nursing paradoxes in Kuwait.**

Meleis AI

J Adv Nurs ,May 1980, 5 (3) p285-300, ISSN 0309-2402  
Journal Code: H3L

Languages: ENGLISH

While American nursing attempts to deal with the multitude of dilemmas that have been plaguing it for decades, many developing countries look to the USA for a nursing model to emulate, and then become lost in this confusion of its nursing profession. However, these countries continue to reach out and seek consultants with educational and practical experience in nursing in the USA, as well as in other developed countries. A paradigm is proposed for use by educators and consultants to help delineate the major issues a developing country has to confront in establishing a stable nursing service. This paradigm is explicated by applying it to the situation in Kuwait, a Fourth World country with many social paradoxes (e.g., rich in economic resources but poor in human resources). Four major paradoxes in nursing are identified by using the proposed paradigm. They are: 1 educational needs vs. educational reality; 2 locals vs. cosmopolitans; 3 role congruency vs. role incongruency; and finally 4 medical vs. nursing conceptual models. Although these paradoxes became manifest through work done by the author in Kuwait, any international health care professional will quickly realize that the paradoxes are not unique to Kuwait but have parallels in many other countries which are at different stages of development.

**Characteristics of inner city heroin addicts applying for treatment in a Veteran Administration Hospital Drug Program (Chicago).**

Craig RJ

Int J Addict ,Apr 1980, 15 (3) p409-18, ISSN 0020-773X

Journal Code: G08

Languages: ENGLISH

Based on a total sample of 469 clients processed for admission to an inner city Veteran Drug Abuse Program, reliable information was obtained from a total of 322 heroin addicts. The following is a summary profile of the "average" narcotic addict prior to program entry: Black male, age 30, and unmarried. He has an 11th grade education, including 1/3 who completed the GED while in prison. He has been unemployed for over 1 year and receives \$383 per month in legitimate benefits. He began to use heroin at 21 and did not perceive himself to have a drug problem until a year later. He has been addicted for over 8 years and has made five attempts to autonomously detox while ambulatory without the benefit of a treatment program. He has been treated on two other occasions for drug abuse in formal programs. He uses heroin from 2 to 3 times per day at an average daily cost of \$68. He has spent 3 years in prison for committing crimes against property or narcotic crimes. He abuses alcohol and marijuana regularly, but has discontinued his use of amphetamines, barbiturates, and hallucinogens. These have been replaced with Talwin and Pyribenzamine. His personality tends to have traits associated with the Character Disorder or Schizoid Personalities. He has been refractory to past treatment efforts.

**The late life counseling service: a program for the elderly.**

Selan BH; Gold CA

Hosp Community Psychiatry .Jun 1980. 31 (6) p403-6.

ISSN 0022-1597 Journal Code: GCU

Languages: ENGLISH

Many old people who are trying to cope with crises in their lives at a time when their physical and emotional resources are lowered could benefit from mental health counseling. A special late counseling service was established for that population in Milwaukee County, despite initial cynicism about its usefulness from both senior citizens and mental health professionals. Minority, economically deprived, and handicapped clients are vigorously recruited. Services include initial and sometimes subsequent home visits; staff deal with such problems as strained family relationships, unhealthy dependencies, and depressions of varying degrees. The authors discuss the importance of home visits, thorough assessment of clients, and public education to overcome ageism in the community at large and among mental health professionals.

**Clinical audit of surgery in a large teaching hospital.**

Blanchard RJ; Downs AR

Can J Surg .May 1980. 23 (3) p278-82. ISSN 0008-428X

Journal Code: CKJ

Languages: ENGLISH

Practical peer review by means of a clinical audit requires complete documentation, critical assessment and open discussion of difficulties or errors in patient management. The quality of care in a large surgical department was monitored using weekly on-the-ward capture of complications and immediate feedback to involved surgeons. Retrospective peer review of surgical deaths judged the process of patient care in three categories--treatment, investigation and documentation; feedback was also provided. Seven of the 10 surgical services each collected morbidity data for at least 40 weeks in 1976 and 44 weeks in 1977. In 1978, 8 of the 10 services collected data for 50 weeks or more. The number of patients reviewed was 3520 in 1978. Of these, 822 (23%) had complications in 1976, 703 (16%) in 1977 and 918 (17%) in 1978. In 1976, 260 patients died; the quality of care was considered to have been adequate in 67%. In 1977, 278 patients died; in 76% the management was considered adequate. In 1978, 231 patients died; in 68% management was satisfactory. This clinical audit system is suitable for computer programming and can provide a complete and accurate report of the entire spectrum of complications.

Growing disillusionment among new members of organizations has been traced to inadequacies in approaches to organizational entry. Current directions of research on organizational entry and their limitations are described, and a new perspective is proposed. The new perspective identifies key features of newcomers' entry experiences, including surprise, contrast, and change, and describes the sense-making processes by which individuals cope with their entry experiences. Implications for research and practice on organizational entry are drawn.

**Analysis of dispensing activities before and after decentralization of pharmaceutical services.**

Bair JN; Cheminant RL

Hosp Pharm ,May 1980, 15 (5) p237-40, ISSN 0018-5787  
Journal Code: G98

Languages: ENGLISH

Changes in drug handling activities, revenue, and telephone communications were documented during a conversion from a centralized unit dose system to decentralized pharmacists and unit dose services in a 310-bed university teaching hospital. All decentralized services were mobile; no physical satellites were utilized. Computer programs were used to collect and analyze drug handling and revenue data during a prestudy control period and three equal-length study periods after decentralization of pharmaceutical services for five patient care areas of the hospital. All telephone calls to the central pharmacy were recorded and classified by type during 21 days of the prestudy period and were compared with 21 days of the second postimplementation period. The mean number of doses handled decreased for all patient care areas. After decentralization the number of telephone calls to the central pharmacy requesting clinical drug information, as well as distributive information, decreased sharply. Moving the pharmacist to the patient care unit decreased the time that pharmacists spent handling drugs and improved communication with the medical and nursing staffs.

**The American Board of Surgery in-training examination.**

Grosse ME; Cruft GE; Blaisdell FW  
Arch Surg ,May 1980, 115 (5) p654-7. ISSN 0004-0010  
Journal Code: 8IA

Languages: ENGLISH

Since 1975, the American Board of Surgery has annually offered a multiple-choice in-training examination to directors of accredited general surgery programs in the United States for administration to residents in their programs. Residents' scores for the total examination and the five body-system categories are provided to program directors, along with normative data for comparison of their residents' performance against that of all examinees. Each year, residents' scores have correlated well with their level of training. Reliability coefficients have verified that the examinations have functioned effectively as test instruments. The increasingly wide use of the examination and its favorable acceptance by program directors have indicated that the examination is making a significant contribution to surgical education in the United States.

**Evaluation of utilization of laboratory tests in a hospital emergency room.**

Bloomgarden Z; Sidel VW  
Am J Public Health ,May 1980, 70 (5) p525-8. ISSN  
0090-0036 Journal Code: 3XW

Languages: ENGLISH

Visits to a metropolitan teaching hospital emergency room were evaluated for laboratory test utilization and quality of care of chart review. Of 630 tests, 197 (32 per cent), clustered in 44 out of 476 (9 per cent) patient visits, were considered unnecessary. The number of tests per visit showed a strong negative correlation with the necessity of tests and with the quality of care. Results suggest the usefulness of

identifying a subgroup of patients with excessive tests and implementing measures to alter testing behavior for this subgroup.

**Alternative birthing center: experience in a teaching obstetric service.**

Barton JJ; Rovner S; Puls K; Read PA  
Am J Obstet Gynecol ,Jun 1 1980, 137 (3) p377-84. ISSN  
0002-9378 Journal Code: 3NI

Languages: ENGLISH

The Illinois Masonic Medical Center's (IMMC) experience with an Alternative Birthing Center (ABC), established as an integral part of the conventional obstetric suite, has proved to be a safe and efficacious method of providing a true alternative to high technology obstetric care to those carefully screened, low-risk patients who elect this form of childbirth experience. However, the high transfer rate (23.8%) and substantial cesarean birth rate (9.17%) in this low-risk group of patients do demonstrate the necessity for the immediate availability of conventional and high technology obstetric facilities, as well. The low incidence of neonatal morbidity demonstrates that the ABC is a safe environment for the neonate. Acceptance and utilization of the ABC by consumers and professionals is rapidly increasing as it is demonstrated to be a safe alternative to birth in a conventional delivery suite or home delivery.

**The role of lay workers in community health education: experiences of the North Karelia project.**

Neittaanmaki L; Koskela K; Puska P; McAlister AL  
Scand J Soc Med ,1980, 8 (1) p1-7. ISSN 0300-8037  
Journal Code: UD5

Languages: ENGLISH

The role of natural community leaders in serving as lay health workers in a comprehensive community health programme has been explored. In rural Finland, nearly 300 persons were trained to detect cardiovascular risk factors (smoking, high-cholesterol diet, high blood pressure) in their communities, and to advise community members of the desirability of lowering these risk factors. Initial data from studies of the lay health workers and their intervention work support the concept that carefully select community health workers who are to varying degrees representative of their local populations, can well act as intermediaries in preventive health care strategies.

**School dysfunction in the adolescent.**

Cannon IP; Compton CL  
Pediatr Clin North Am ,Feb 1980, 27 (1) p79-96. ISSN 0031-3955 Journal Code: OUM

Languages: ENGLISH

The adolescent with school dysfunction presents a multifaceted problem to his parents, to the school, to his physician, and to himself. He struggles with the developmental tasks of adolescence against great odds, entering this important period of life discouraged by school failure and poor self-esteem. Follow-up studies demonstrate that he is at high risk for social, emotional, and psychiatric problems. Despite the pessimistic nature of most of this research, the field holds much promise. New techniques of prevention, assessment, and teaching, as well as prediction of response to education and medication, are being explored and recent research has demonstrated that adolescents with learning disabilities and hyperactivity can continue to make progress and develop into successful, happy adults. (128 Refs.)

**Compliance with medical regimens during adolescence.**

Litt IF; Cuskey WR  
Pediatr Clin North Am ,Feb 1980, 27 (1) p3-15. ISSN 0031-3955 Journal Code: OUM

Languages: ENGLISH

In summary, compliance behavior among adolescents is complex and incompletely understood. Although the study of compliance is important for understanding the adolescent's stage of psychological development, relationships with authority figures, and the beginning of the youngster's career as a consumer of health care, its ultimate importance lies in the prospect of improving the likelihood that medication will be

utilized appropriately. The first step in the process involves systematic monitoring of compliance rather than doing so only when noncompliance is clinically suspected. When compliance is found to be problematic for an adolescent, resorting to "scare" techniques or re-education is rarely effective. A more positive outcome may be achieved by determining the circumstances under which the youngster was successful in complying and attempting to tailor-make the regimen accordingly. Barriers to compliance, such as the presence of side effects, previous negative experience with the medicine, and lack of conviction about the diagnosis of appropriateness of therapy, should always be explored. Other potential intervention strategies for improving compliance have been discussed. In the final analysis, however, as Jonson has noted, all strategies aimed at improving compliance must provide the patient with insight into his own situation and himself, as well as his capability of doing something other than conforming when he judges it best. (54 Refs.)

**A continuum of care for the inner city: assessment of its benefits for Boston's elderly and high-risk populations.**

Master RJ; Felton M; Jainchill J; Mark R; Kavesh WN; Rabkin MT; Turner B; Bachrach S; Lennox S  
N Engl J Med ,Jun 26 1980, 302 (26) p1434-40, ISSN 0028-4793  
Journal Code: NOW  
Languages: ENGLISH

We describe an approach to health care in the inner city: a multidisciplinary system of physicians and mid-level practitioners that provides individualized care to chronically ill, elderly, homebound, and nursing-home residents of urban Boston who would otherwise be forced into an inappropriate reliance on teaching hospitals. Linked to four neighborhood health centers, three home-care programs, and a teaching hospital, and financially self-supporting except for the home-care component, the system cared for 3000 ambulatory, 280 homebound, and 358 nursing-home patients in the representative year described. In-hospital use, particularly hospital days, was reduced when judged by existing data for comparable (though not identical) populations. Based on stable physician practices, the system offers a workable approach to the related problems of care, manpower, and cost in the urban core.

**The future need for geriatric manpower in the United States.**

Kane R; Solomon D; Beck J; Keeler E; Kane R  
N Engl J Med ,Jun 12 1980, 302 (24) p1327-32, ISSN 0028-4793  
Journal Code: NOW  
Languages: ENGLISH

Additional medical manpower will be required to meet the growth in the elderly segment of the United States population over the next 50 years. This paper provides estimates of the needs for medical geriatric manpower under four different models: continuation of the status quo; academic geriatricians

only; provision of care by academic and consultant geriatricians; and provision of care by academic, consultant, and primary-care geriatric practitioners. Each option is further analyzed in terms of three levels of delegation to nonphysician clinicians. We project the implications of these 12 patterns through the year 2030, assuming present usage levels and allowing for improved care of the elderly. The need for geropsychiatric care is explored separately. We think that geriatricians should provide improved care, including both consultant and primary care, to people aged 75 years and older, and that they should delegate a moderate amount of responsibility to nurse practitioners, physician assistants, and social workers. On the basis of these assumptions, and allowing for an academic role as well, we estimate that the United States will require between 7000 and 10,300 geriatricians by the year 1990; the best intermediate figure is about 8000.

**Support services in the school setting: the nursing model.**

Stenson CB; Sullivan AR

J Sch Health ,May 1980, 50 (5) p246-9, ISSN 0022-4391

Journal Code: K13

Languages: ENGLISH

The multiple components of the school-based services for the handicapped are collapsed into a support service/instructional intent matrix which gives visual expression to new dimensions in school health services. Student needs for care and coping skills are addressed by a network of professional joint-practice arrangements built into a nursing service delivery model. A challenge is made to providers for a reciprocal relationship, to improve professional preparedness and thus promote access, excellence and equity in programs for the handicapped.

**Some effects on house officers of an elective rheumatology rotation.**

Eyanson S; Brandt KD

J Rheumatol ,Mar-Apr 1980, 7 (2) p251-7, ISSN 0315-162X

Journal Code: JWX

Languages: ENGLISH

To ascertain whether a rheumatology elective (RE) increases the skills of house officers (HOs) managing patients with rheumatic disease, and whether these skills persist after the RE, medical records of 164 gouty patients, seen by 16 HOs who had had an RE and 73 who had not, were audited. The RE led to more complete documentation of history and physical examination and possibly to more frequent use of diagnostic arthrocentesis. Over the 30-month period of the study, no increase in scores of HOs not having a RE was apparent, while some deterioration, related to the interval between the RE and audit, was seen in scores of those who had an RE.

**Evaluation of an educational program on compliance with medication regimens in pediatric patients with renal transplants.**

Beck DE; Fennell RS; Yost RL; Robinson JD; Geary D; Richards

GA

J Pediatr ,Jun 1980, 96 (6) p1094-7, ISSN 0022-3476

Journal Code: JLZ

Languages: ENGLISH

An educational program was initiated in an attempt to improve compliance in taking medications among pediatric renal transplant patients. Compliance was assessed by pill counts and by knowledge about medications by interview and questionnaire before, during, and after a six-month study period. Forty-three percent of the population was initially found to be in some way noncompliant with medication regimens, and 19% remained so after extensive counseling and instruction. Factors associated with noncompliance were adolescence, female sex, and family instability. Compliance was associated with direct parental involvement and voluntary maintenance of medication calendars. Although knowledge about drugs significantly improved, there was no correlation with compliance; motivational factors appeared to be of greater importance.

**Factors influencing recruitment to an occupational fitness program.**

Shephard RJ; Morgan P; Finucane R; Schimmelfing L

JOM ,Jun 1980, 22 (6) p389-98, ISSN 0096-1736 Journal Code: JGN

Languages: ENGLISH

Factors influencing participation in an employee fitness program have been studied in a group of 535 early recruits for a Health Fitness Center established at the headquarters office of a larger corporation. The overall participation rate (20% of eligible staff with convenient access to the facility) was much as in previous reports. Interest was relatively equal in men and in women. Typical recruits were middle-aged non-smokers who had previously been active elsewhere. Men had an above average maximum oxygen intake and muscle strength, but were also somewhat overweight and fat. Women were closer to their actuarial ideal weight, but had relatively lower levels of cardiorespiratory and muscular fitness than the men. Program acceptability factors (traveling time, hours of work, and cost) had little effect on participation. Subjects perceived that they were active for health, fitness, competition (men), and appearance (women). General and specific health beliefs were well-developed, but bore surprisingly little relationship to health practices and outcomes. It is thus argued that the shaping of attitudes by trial of an exercise program may be a more effective tactic for increasing exercise participation than general campaigns designed to change attitudes and values.

This paper reviews identifying characteristics of the urban public hospital and discusses some of the chronic problems, such as funding, image, constituency and acceptance, that this institution has faced. Alternative courses of action for dealing with these problems are considered. No single solution is recommended for every community, but suggestions are made about how to address specific areas of concern.

**Providing preventive dental care in the community using the team approach: a comparison of five training programs.**

Balzer JA; Kleinman DV; Graves RC; Johnson RG; Mann ML; Nizel AE  
J Dent Educ ,Jun 1980, 44 (6) p322-7. ISSN 0022-0337  
Journal Code: HY7  
Languages: ENGLISH

Five dental schools developed training programs for dental and dental auxiliary students in planning and delivering preventive dental services in a community setting. The schools (1) designed a curriculum that would train dental students to plan, organize, and manage the delivery of community preventive services using a team approach; (2) developed a related curriculum for dental auxiliary students; (3) implemented the program intramurally and extramurally in selected community settings; and (4) planned and conducted an evaluation of the program. Each school individualized the program to the interests of its students, the constraints of its curriculum, and the needs of community groups. A total of 228 dental and 576 dental auxiliary students were trained. A full range of community sites and target populations were provided with preventive dentistry services.

**Creating critical consciousness in health: applications of Freire's philosophy and methods to the health care setting.**  
Minkler M; Cox K  
Int J Health Serv ,1980, 10 (2) p311-22, ISSN 0020-7314  
Journal Code: GRJ  
Languages: ENGLISH

Paulo Freire's philosophy of "education for critical consciousness" takes on special relevance within the context of the health care system. This dialogical approach to change, stressing action based on critical reflection by the people is seen here as importantly supplementing current efforts to deal with the "health care crisis" in the United States and many developing countries. Applications of the Freire approach in a health context of necessity involve the perception of health and medical care within the total oppressive structure of society. Viewed thusly, health "reform" cannot justifiably be envisioned except within the context of broader structural transformations. Two case studies are presented to illustrate the application of the Freire approach within a health context. Successful utilization of the methodology among peasants in rural Honduras and a relatively unsuccessful application among impoverished elderly residents of an urban United States ghetto are described and analyzed. Modifications of the approach to increase its usefulness in a variety of situational contexts are suggested. The potentials and limitations of this approach to radical change in the health field finally are described, along with lessons learned from initial work in the applications of conscientization to the health field.

**The proletarianization of nursing in the United States, 1932--1946.**  
Wagner D  
Int J Health Serv ,1980, 10 (2) p271-90, ISSN 0020-7314  
Journal Code: GRJ  
Languages: ENGLISH

There have been many studies of the development of an industrial work force with all its attendant hardships as newly proletarianized peasants were thrown off the land and into factory labor. The author postulates that a similar process occurred in the creation of at least one modern "profession"--nursing--as the traditional autonomy of private practice nursing was displaced by institutional nursing in hospitals and nursing homes. Prior to the Depression, most nurses worked in private duty--as independent entrepreneurs--without the regimentation, rigid division of labor, and intense supervision characteristic of modern hospitals. The collapse of the U.S. economy made it impossible for most nurses to continue to earn a living privately at the same time that hospitals required cheap labor power in order to develop as viable businesses. Despite the promise of job security in hospital work, most nurses resisted the change by criticism, sabotage, walking away from job, and attempts at unionization. Hospitals sought in response to inculcate loyalty by a variety of methods, including screening of applicants, in-service training, and professional ideology. In some instances, hospitals coerced private nurses into "staff" jobs by threatening their ability to secure business on their own. By the end of World War II, the majority of nurses were employed, for the first time, as wage earners for institutions. The entire period was marked by such discord and revolt on the part of nurses, however, that the American Nurses' Association was transformed as an organization in order to avoid massive unionization. The study points out that this unwritten history of nursing has been obscured by professional nursing leaders who are still suppressing revolts of rank-and-file nurses against the conditions of hospital work.

**A historical and socioeconomic analysis of occupational safety and health in India.**

Vilaniam JV

Int J Health Serv ,1980, 10 (2) p233-49, ISSN 0020-7314

Journal Code: GRJ

Languages: ENGLISH

Workers in poor countries of the so-called Third World are more likely to be affected by the dangers of high technology than their counterparts in wealthier countries. Owing to their lack of education, most workers in the "developing" world are unaware of the hazards of their occupations. Moreover, their general backwardness in sanitation and nutrition and climatic proneness of their geographic region to epidemics cause diseases contracted from the work environment to be aggravated. Occupational diseases are often misconstrued as diseases resulting from the general environment. Since unemployment in underdeveloped countries is of a very high order, workers are prepared to accept any job, irrespective of the dangers involved. Labor is cheap and easily replaceable, so employers see no need for improving occupational safety and health. Labor unions are mostly controlled by full-time politicians who consider health a political issue, especially when their party controls the country's government. The seriousness of all these factors is heightened by the existing socioeconomic order in poor countries, in which national medievalism and multinational modernism play a crucial role. In order to understand the prevailing socioeconomic order, one has to analyze the social structures of poor countries in the context of today's world economic structure. India is taken as an example of a "developing" country where all the above-mentioned factors and many others are in operation: backwardness of the worker; poor nutrition; lack of concern for public health; proneness to epidemics; and indifference on the part of employers, politicians, and unions toward occupational health; high unemployment, control of the local economy by multinational corporations; and control of the mass media by feudalistic vested interests. This article attempts to analyze the occupational health and safety issue in India from a historical perspective, and stresses the vital need of structural changes in various fields so that workers can have a safe and healthy working environment.

The purpose of the present study was to establish whether the number of intact teeth in Helsinki schoolchildren aged 7-13 years was rationally correlated with the wartime reduction in sugar consumption and, later, with dental health education programs in Finland. The period covered is 44 years. The results show that dental health education is effective in caries prevention and that enforced programs can lead to an improvement similar to that seen during the war.

**Planning for ambulatory pharmacy services.**

Gong WC; Floyd RA  
Contemp Pharm Pract ,Spring 1980, 3 (2) p78-81. ISSN  
0162-3761 Journal Code: DQ9  
Languages: ENGLISH

To aid in the planning of patient-oriented pharmacy services in an ambulatory care center, the demographic profile of the patients visiting the pharmacist at the Sunol Health Center (SHC) pharmacy in Los Angeles, California was studied. Analysis of the data collected over a 6-month period revealed that female patient visits were double the number of male patient visits. Ten disease conditions requiring drug therapy accounted for 75% of all problems presented by the patients. The mean number of prescribed medications received per patient was 1.7. The ratio of newly prescribed medications versus refill medications was 2.5 to 1 or 70% versus 30%. The proportion of new patient visits versus return patient visits was 55% versus 45%. With this information, the training of the pharmacist and the services of a pharmacy may be designed specifically to meet the needs of the patients in the community or the ambulatory care setting.

**Drug and psychosocial therapy in schizophrenia: current status and research needs.**

Goldberg SC  
Schizophr Bull ,1980, 6 (1) p117-21, ISSN 0586-7614  
Journal Code: UDH  
Languages: ENGLISH

The author assesses the current status of research on psychopharmacological and psychosocial interventions with schizophrenic patients. Among the issues discussed are the needs to validate the diagnosis of schizophrenia; to reduce sample heterogeneity by defining subgroups based on meaningful response to drug treatment, long-term course, family history, neurologic soft signs, etc.; to characterize the subgroup of patients who do not respond to or do not require neuroleptic treatment; to determine the prevalence of tardive dyskinesia on a national and regional basis; to use blood levels of neuroleptic drugs as indices of whether individual patients are receiving adequate dosages; to investigate further the question of drug compliance and optimal duration of maintenance therapy; and finally to demonstrate how drug treatment and social skills training interact with each other.

**[Patient cooperation in hypertensive therapy (author's transl)]**

Die Kooperation des Patienten bei der Hochdrucktherapie.  
Holzgreve H  
MMW ,Feb 22 1980, 122 (8) p267-70, ISSN 0341-3098  
Journal Code: NMM  
Languages: GERMAN Summary Languages: ENGLISH  
Patients with hypertension usually follow the medical recommendations only very inadequately. It can be assumed that perhaps 50-60% of hypertensives take less than 50-80% of the drugs prescribed. Improved cooperation will best be achieved when the nature of their illness, the necessity for prolonged treatment and the consequences of not being treated are carefully and intelligently explained to the patient. The plan of treatment should be simple and adapted to the living habits as closely as possible. The patient should be instructed on the possible side-effects of the drug as early as possible and strengthened in his own sense of responsibility (e.g. keeping a record and measuring his own blood pressure). Regular follow-up examinations possibly by the appointment system should be arranged. The legislators and the pharmaceutical industry are asked to produce package inserts which patients can understand.

**Nutritional support of the hospitalized patient. The team concept.**

Nehme AE

JAMA ,May 16 1980, 243 (19) p1906-8, ISSN 0098-7484

Journal Code: KFR

Languages: ENGLISH

Two groups of patients receiving total parenteral nutrition (TPN) were compared in a prospective study for a period of 24 months. The TPN in one group of 211 patients was exclusively managed by a nutrition support team. A variety of physicians managed the TPN of 164 patients in the other group. The complication rate of both groups was compared. The second group had a much higher incidence of all complications. The study concludes that a protocol strictly adhered to by knowledgeable persons is necessary for the proper administration of TPN in the hospitalized patient.

**The role of the children's nurse in the community.**

Gow M; Atwell J

J Pediatr Surg ,Feb 1980, 15 (1) p26-30, ISSN 0022-3468

Journal Code: JMJ

Languages: ENGLISH

In 1969 a pediatric home nursing service was started in Southampton to care for sick children at home. The primary role of the children's nurse in the community is discussed with particular reference to day case surgery, early discharge, care of the mentally and physically handicapped, pediatric medical care, prevention of a hospital admission, and care of the terminally ill. The secondary roles of teaching and liaison between the hospital and the primary health care team is discussed. After 10 yr experience with over 12,000 admissions to the day unit we believe that the majority of general surgical procedures such as circumcision, inguinal herniotomy, and orchidopexies can be safely undertaken on a day basis. The provision of adequate nursing care in the community which is closely linked with the hospital has been one of the main reasons for the success of the scheme.

**Health carnival: an experiment in health education.**

Wear RF Jr; Hawley RC; James M

JDM ,Apr 1980, 22 (4) p253-5, ISSN 0096-1736 Journal

Code: JGN

Languages: ENGLISH

Some common diseases or accidents that kill or disable persons prematurely are preventable, delayable or sometimes curable if detected early. Prevention, delay or cure requires that individuals be informed of the risks and of the ways they can avoid them, and that those with habits that increase their risks change their behavior. The authors decided to attempt health education of employees and their families by using a carnival setting to make it attractive and memorable. Active participation and demonstrations were used to stimulate interest and involvement to promote learning. Attendance was satisfactory and post-carnival conversations and questionnaires suggest that this might be a useful method of promoting health and safety with employees and their families.

Since 1972, Baylor College of Medicine, the University of Houston and Texas A&M University have jointly offered a graduate Program in Allied Health Teacher Education and Administration. The purpose of the program is to prepare faculty and administrative leaders for allied health education programs. As of December 1978, a total of 94 allied health professionals had completed master's or doctoral degrees and most of them are currently pursuing academic careers. This article describes the results of a follow-up study of these graduates to determine their current activities, locations and job satisfaction and to make decisions regarding the success of the program in reaching its goals.
