ACKNOWLEDGEMENTS

The Medicines and Health Technologies Unit of the Health Systems and Services Department (HSS/MT) expresses its gratitude to the ministries of health and national blood programs that provided data to the Pan American Health Organization (PAHO). This report would not have been possible without their contributions and collaboration.

Data collection and the preparation of this report were coordinated by Mauricio Beltrán Durán, with the support of Roberto Carlos Garza Rodríguez (HSS/MT), and America Valdes (HSS).

SUMMARY

This document presents the data on availability, safety and use of blood and its components collected in 18 Caribbean countries and 18 Latin American countries. The results, in contrast to the data reported for 2014-2015, reflect an increase in blood collection in both the Caribbean and Latin America, where the regional average of blood units collected increased from 15 to 17 units per 1,000 population. These data indicate an increase in the availability of blood and blood components. Moreover, it was identified that the donation rate in the Region increases in a manner directly proportional to each country's income level, from less than two units per 1,000 population in low-income countries to 21 units per 1,000 population in high-income countries. In Latin America, a slight reduction is observed in the number of processing centers relative to the number reported in 2015. However, in the case of blood banks with annual processing higher than 5,000 units, no variation was observed between 2015 and 2017.

In contrast to the notable increase in the number of blood units collected, the percentage of donors that were volunteers increased slightly, from 44.2% in 2015 to 46.1% in 2017. In 2017, the Region obtained more than 1.6 million blood units from regular volunteer donors, which represents 34.9% of voluntary donations.

In 2017, a slight predominance of male (58.6%) relative to female (41.4%) donors is observed. More than 70% of the Region's blood donors are less than 44 years old. In both years analyzed, the predominant groups of donors were 24-44-year-olds (38.1% in 2016 and 41.9% in 2017), followed by those under 24 years of age (37.5% in 2016 and 30.6% in 2017).

With regard to screening coverage, all Latin American countries that reported data for 2016 and 2017 were able to achieve universal screening for the transfusion-transmitted infections (TTIs) recommended by PAHO/WHO (i.e., HIV, HBV, HCV, syphilis, and *T. cruzi*). In the Caribbean, only one country did not achieve universal screening for the HCV marker.

With regard to the deferral of donors, causes associated with medical disorders were the most prevalent, followed by deferral due to alcohol consumption habits, presence of tattoos and low hemoglobin.

In both years, there were similar causes for the disposal of blood units, limiting the availability of units of blood for transfusion (UBAT). The principal causes included insufficient volume, failed extraction, self-exclusion by the donor post-donation, open circuit, damaged bags, lipidemia, hemolysis, and loss of the cold chain between the extraction point and the processing center (68.4% in 2016 and 70.7% in 2017), followed by expiration (23.9% in 2016 and 25.9% in 2017) and, in a smaller proportion, reactivity to infectious markers (5.4% in 2016 and 5.7% in 2017).

With regard to mechanisms for the monitoring and control of blood systems, greater compliance with guidelines was observed among donors and the existence of performance evaluation programs for serology and TTI and inspection and hemovigilance programs was documented.

UBAT	Units of blood available for transfusion
WB	Whole blood

INTRODUCTION

This document updates the information found in *Supply of blood for transfusion in Latin American and Caribbean countries, 2014 and 2015*. Both documents present indicators on the availability, safety, and use of blood and blood components, as well as the organization of national blood systems.

The information presented in this document is based on the data provided by health authorities for 2016 and 2017. Information for both years was received from 18 countries and territories in the Caribbean and 18 countries in Latin America. The statistical data were compiled through a standard Excel form that was sent to countries.

The data consolidated and analyzed here make it possible to monitor and periodically report to Governing Bodies on progress and limitations in implementing the Plan of Action for Universal Access to Safe Blood 2014-2019 (CD53/6), approved in October 2014. The Plan has four strategic lines:

- effective and sustainable integration of national blood programs and services into the national health system to achieve self-sufficiency, safety, efficiency, availability, and universal access to blood and blood products;
- self-sufficiency in safe blood and blood products through 100% voluntary non-remunerated donations;
- quality management in the national blood system and screening for transfusion transmitted infections;
- health surveillance, hemovigilance, risk management, monitoring, and evaluation

The results presented here provide an overview of aspects related to coverage, access to and availability of safe blood, compliance with serological screening for infectious diseases, fractionation into components, and mechanisms for the orientation, surveillance and control of the entire process. This makes it possible to better characterize the donation, processing, and use of blood in the Region and subregions through a comparative analysis for the two reporting years.

It is anticipated that this publication will continue to be a reference for national authorities to monitor the performance of their national plans for access to safe blood, in the context of the blood systems of the countries in the Region of the Americas.

This publication should also serve professionals working in this field and other people and institutions involved in voluntary blood donation, with the objective of achieving safe blood that is sufficient for and accessible to the patients who require it.

1 GLOBAL DESCRIPTION OF BLOOD COLLECTION

According to the information reported by 36 countries for the years 2016 and 2017, there were 20,939,468 blood donations. Of these, 49.6% (10,385,927) correspond to 2016 and 50.4% (10,553,541) to 2017, representing very similar behavior for both years, with a slight increase in 2017 (0.8%), when 167,164 additional units were collected. It should be considered that for the Andean subregion, one of the countries reported no data.

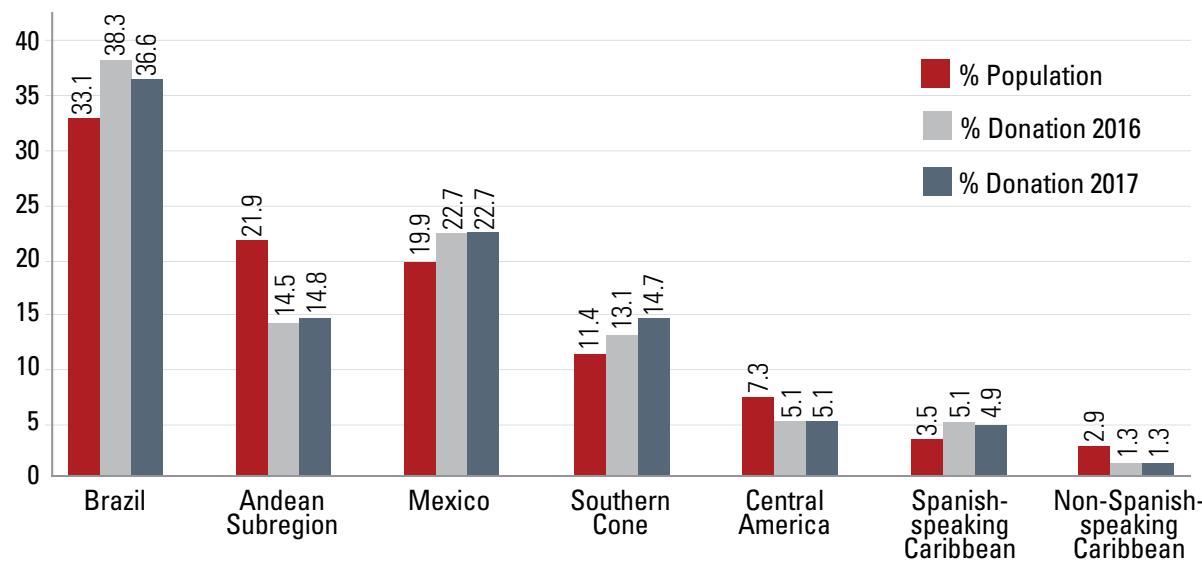

These donations came from non-remunerated, family or replacement volunteers and, in very few cases, from remunerated volunteers. The percentage of units obtained using phlebotomy was 98.0% in 2016 and 98.9% in 2017.

Table 1. Estimated total of blood units collected by Latin American and Caribbean countries for the 2016 2017 period

Region	Number of units collected by procedure				Total per year		Total	
	Phlebotomy		Apheresis		2016	2017		
	2016	2017	2016	2017				
Mexico	2,356,388	2,394,836	0	0	2,356,388	2,394,836	4,751,224	
Central America	518,895	532,526	12,352	3,088	531,247	535,614	1,066,861	
Spanish-speaking Caribbean	510,848	517,083	13,711	0	524,559	517,083	1,041,642	
Non-Spanish-speaking Caribbean	133,738	135,585	347	508	134,085	136,093	270,178	
Andean Subregion	1,428,929	1,512,395	76,574	46,370	1,505,503	1,558,765	3,064,268	
Brazil	3,892,753	3,860,850	82,479	0	3,975,232	3,860,850	7,836,082	
Southern Cone	1,334,109	1,486,050	24,804	64,250	1,358,913	1,550,300	2,909,213	
Total	10,175,660	10,439,325	210,267	114,216	10,385,927	10,553,541	20,939,468	

In both 2016 and 2017, Brazil had the highest percentage of donations, with 38.3% in 2016 and 36.6% in 2017; and Mexico has the second highest, with 22.7% for each of the two years. These data reflect that fact that these two countries are the most populated in Latin America and Caribbean. The Andean subregion is in third place, with 14.5% for 2016 and 14.8% for 2017. The Southern Cone countries are in fourth place, with contributions of 13.1% for 2016 and 14.7% for 2017. The Central American subregion countries contributed 5.1% for the mentioned years; the Spanish-speaking Caribbean represents 5.1% in 2016 and 4.9% in 2017; and the non-Spanish-speaking Caribbean contributed 1.3% for each of the two years.

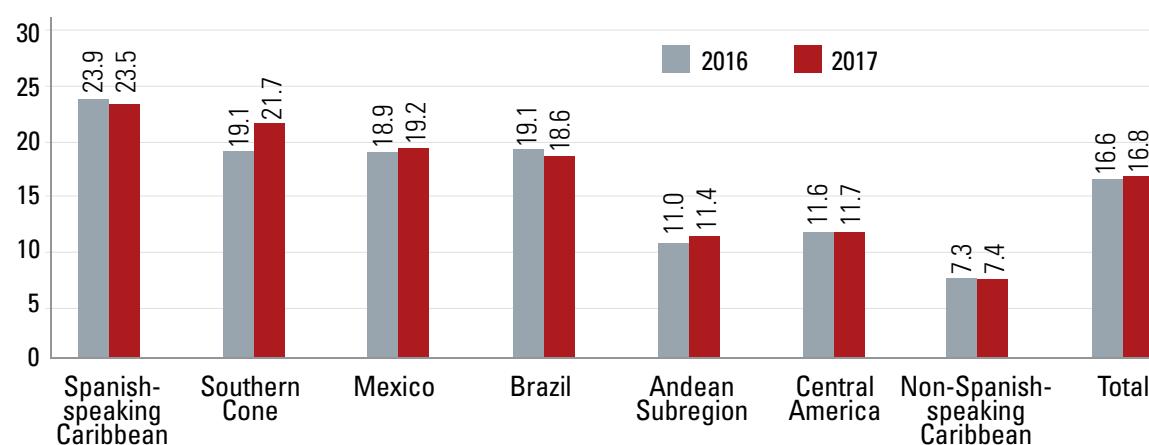

Figure 1. Subregional distribution of blood donations relative to the population, 2016 - 2017

For the period analyzed, the highest donation rate corresponds to the Spanish-speaking Caribbean, with 23.9 per 1,000 population in 2016 and 23.6 in 2017, both higher than the regional rate (16.6 per 1,000 population in 2016 and 16.8 in 2017). The other countries and regions followed: the Southern Cone (19.1 and 21.7), Mexico (18.9 and 19.2), Brazil (19.1 and 18.6), the Andean subregion (11.0 and 11.4), Central America (11.6 and 11.7), and finally, the non-Spanish-speaking Caribbean (7.3 and 7.4).

Very similar values are observed in both years studied, at the regional and subregional levels, with slight increases in the Southern Cone, the Andean subregion, Mexico, the non-Spanish-speaking Caribbean, and Central America in 2017, and slight reductions in Brazil and the Spanish-speaking Caribbean.

Figure 2. Donation rate by subregion, 2016 - 2017

For countries, the donation rate ranged from 2.4 to 39.7 per 1,000 population in 2016 and from 2.6 to 35.0 per 1,000 population in 2017. Rates below the regional average were documented in 70.3% of countries in 2016 and 64.9% in 2017.

Figure 3. Number of blood donations per 1,000 population, by country and PAHO subregion, 2016

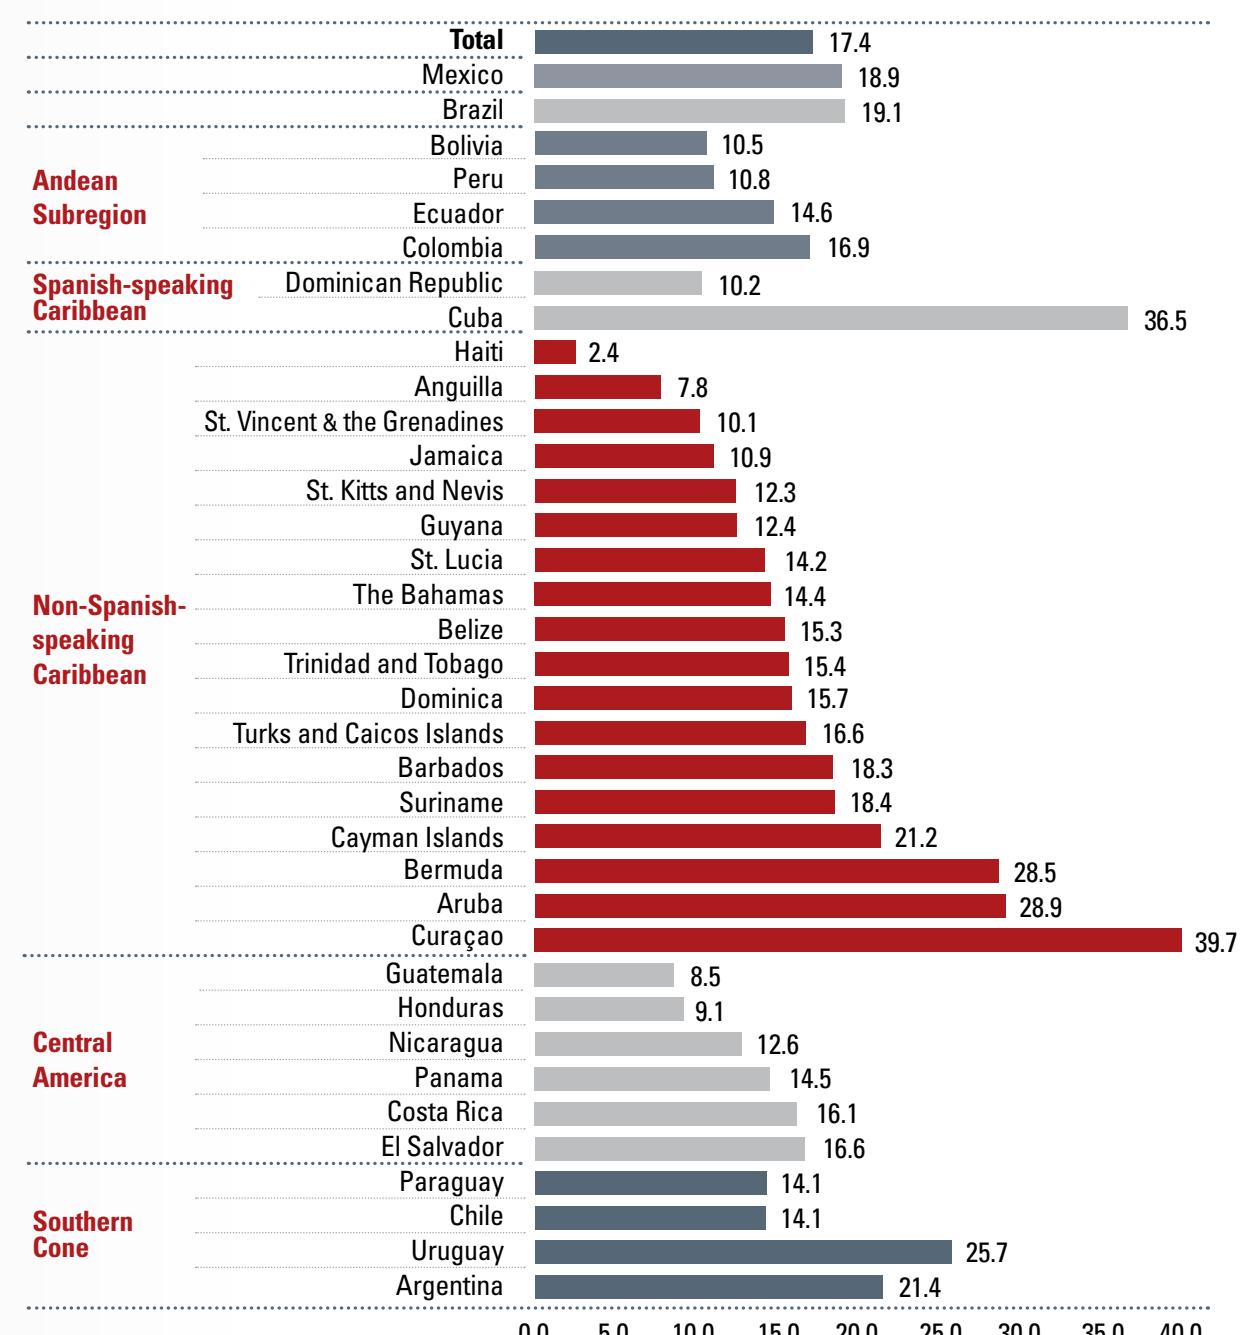

Figure 4. Number of blood donations per 1,000 population, by country and PAHO subregion, 2017

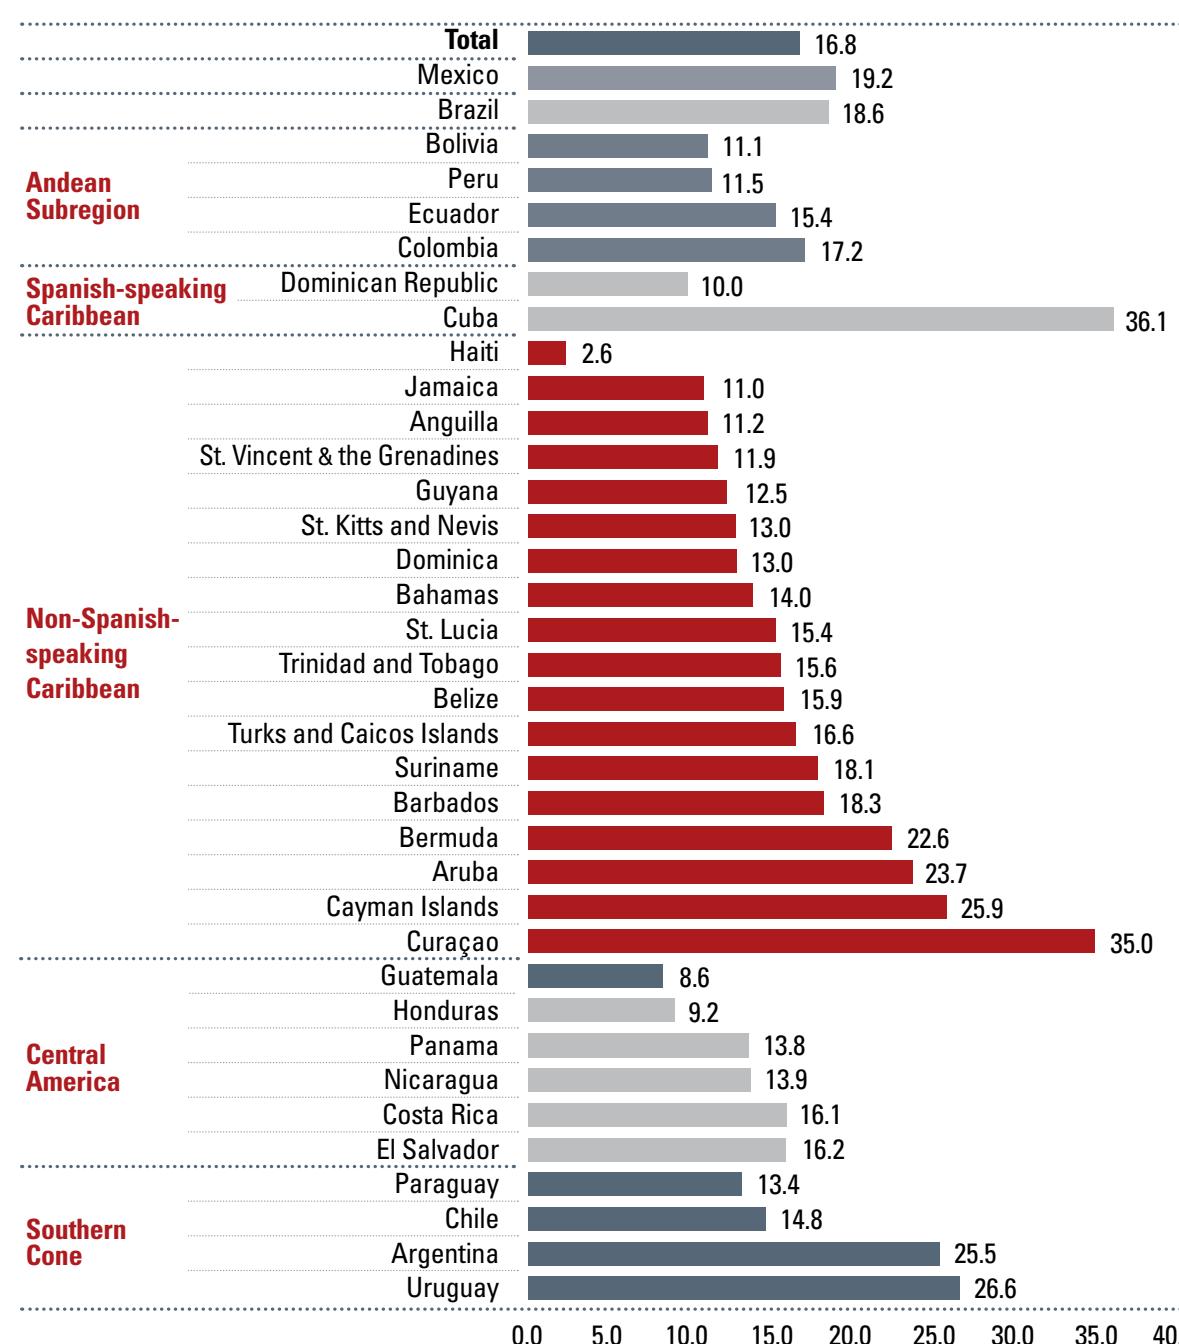

Table 2. Blood units collected in 2017, by income level and population

Income level	Units 2017	Population 2017	% of Total population 2017	% of Total donations 2017	Rate 2017
High	1,560,517	71,120,617	11.3	14.8	21.9
Upper middle	8,578,002	482,553,673	81.8	81.3	17.8
Lower middle	387,004	31,935,302	5.1	3.7	12.1
Low	28,018	10,749,642	1.7	0.3	2.6
Total	10,553,541	596,359,234	100	100	17.7

When comparing the donation rate to the distribution of countries by income level, it is observed that the donation rate increases in a manner directly proportional to the country's income level, with the highest donation rates in the highest income strata.

2 COLLECTION OF BLOOD COMPONENTS THROUGH THE Apheresis Procedure

The collection method that predominated in both 2016 and 2017 is whole blood, with 98.0% and 98.9%, respectively. A slight reduction was seen in the use of the apheresis procedure, which declined from 2.0% in 2016 to 1.1% in 2017.

In 2016, the percentage of blood units obtained through apheresis ranged between subregions, with 0.3% in the non-Spanish-speaking Caribbean and 5.1% in the Andean subregion. In 2017, the greatest difference observed was between the non-Spanish-speaking Caribbean (0.4%) and the Southern Cone (4.1%). The subregions where no units were obtained using this method were Mexico, in 2016 and 2017, and Brazil and the Spanish-speaking Caribbean in 2017.

Table 3. Blood units obtained according to the collection method, by subregion, 2016-2017

Region	2016		2017		2016		2017	
	Whole Blood	Apheresis	Whole Blood	Apheresis	% Whole Blood	% Apheresis	% Whole Blood	% Apheresis
Spanish-speaking Caribbean	510,848	13,711	517,083	0	97	2.6	100	0
Non-Spanish-speaking Caribbean	133,738	347	135,585	508	99.7	0.3	99.6	0.4
Central America	518,895	12,352	532,526	3088	97.7	2.3	99.4	0.6
Mexico	2,356,388	0	2,394,836	0	100.0	0.0	100.0	0.0
Brazil	3,892,753	82,479	3,860,850	0	97.9	2.1	100.0	0.0
Southern Cone	1,334,109	24,804	1,486,050	64250	98.2	1.8	95.9	4.1
Andean Subregion	1,428,929	76,574	1,512,395	46370	94.9	5.1	97.0	3.0
Total	10,175,660	210,267	10,439,325	114216	98.0	2.0	98.9	1.1

The percentage of donations obtained through phlebotomy was similar for all income levels. Collection through apheresis was higher in high-income countries, where an increasing trend was observed, from 2.2% to 4.1%. A direct proportional relationship was observed between the income level and use of the apheresis procedure.

Table 4. Blood units obtained according to the collection method, by income level, 2016-2017

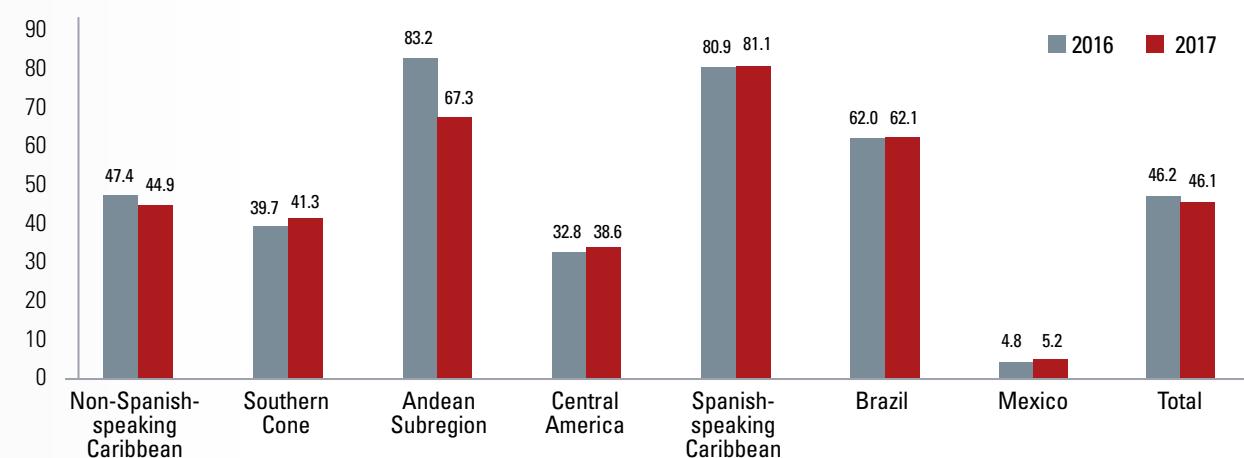

Income level	2016		2017		2016		2017	
	Whole Blood	Apheresis	Whole Blood	Apheresis	% Whole Blood	% Apheresis	% Whole Blood	% Apheresis

2.1 TYPES OF BLOOD DONATIONS

In Latin America and the Caribbean, voluntary and non-remunerated donations accounted, on average, for 46.1% of donations over the two years analyzed. By subregion, the lowest percentage was reported in Mexico, with 4.8% in 2016 and 5.2% in 2017. Central America reported an average of 33.2% voluntary donations, followed by the Southern Cone with 39.7% in 2016 and 41.3% in 2017. The data were similar for the non-Spanish-speaking Caribbean (47.4% in 2016 and 44.9% in 2017). The highest percentages of voluntary donations were identified in Brazil (62.1%), the Andean subregion (83.2% in 2016 and 67.3% in 2017) and the Spanish-speaking Caribbean (81.0%).

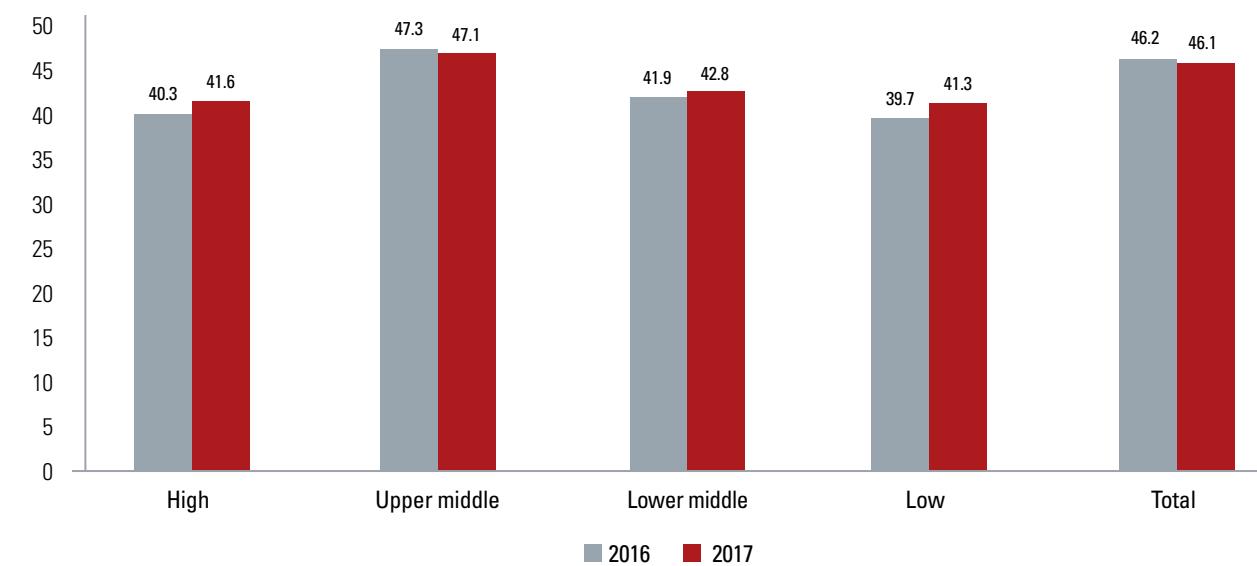

Sixteen countries were identified where voluntary donations surpassed the regional average of 46.1% for both years: Anguilla, Argentina, Costa Rica, Ecuador, Saint Lucia, and Uruguay. Other countries such as, Aruba, Bermuda, Colombia, Cuba, Curaçao, Guyana, Nicaragua, Turks and Caicos Islands, Cayman Islands, and Suriname surpassed 90% voluntary donations. In seven countries, the percentage of voluntary donations was less than 10%: Saint Kitts and Nevis and Saint Vincent and the Grenadines (non-Spanish-speaking Caribbean); Guatemala and Panama (Central America); Mexico; Peru (Andean subregion); and the Dominican Republic (Spanish-speaking Caribbean).

Figure 5. Proportion of donations that were voluntary and non-remunerated, by PAHO subregion, 2016-2017

When the data are broken down by income level, the results are relatively uniform across levels and similar to the regional average. The highest percentages of voluntary donations correspond to the upper middle-income level (47% on average for the two years), followed by the middle-low level (42.4%), high (41%), and low (40.5%).

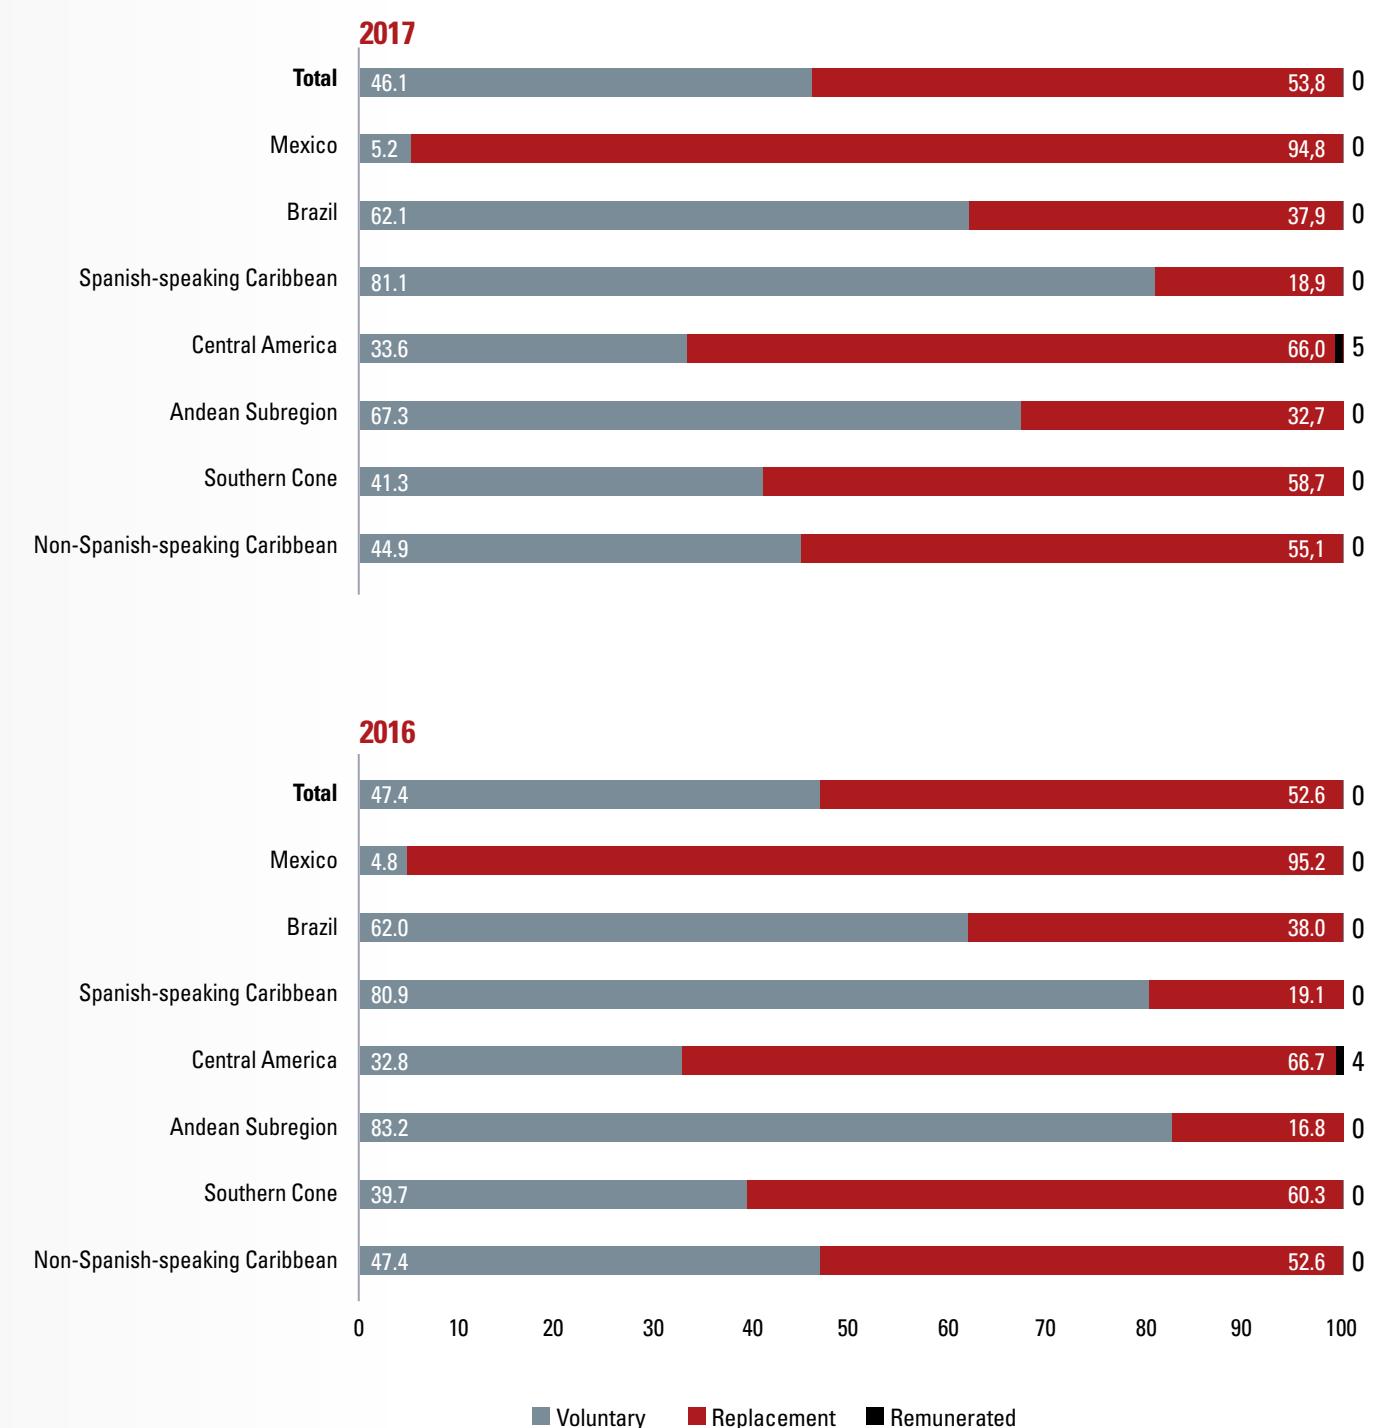

Figure 6. Proportion of donations that were voluntary and non-remunerated, by income levels as defined by the World Bank, 2016-2017

In the Latin American and Caribbean region, replacement allogeneic donations predominated in both 2016 and 2017, with 53.8% and 52.6% of total donations, respectively. In both years analyzed, the percentage of allogeneic donations that were replacement was documented at greater than 50% in Mexico (95.2% and 94.8%), Central America (66.7% and 66.0%), the Southern Cone (60.3% and 58.7%), and the non-Spanish-speaking Caribbean (52.6% and 55.1%). Voluntary allogeneic donations predominated in the Andean subregion (83.2% and 67.3%), the Spanish-speaking Caribbean (80.9% and 81.1%), and Brazil (62.0% and 62.1%).

The results were very uniform for both the region and subregions, except for the Andean subregion, where a notable reduction was observed in voluntary allogeneic donations from one year to the next.

Figure 7. Types of allogeneic donations, by PAHO region, 2017 and 2016

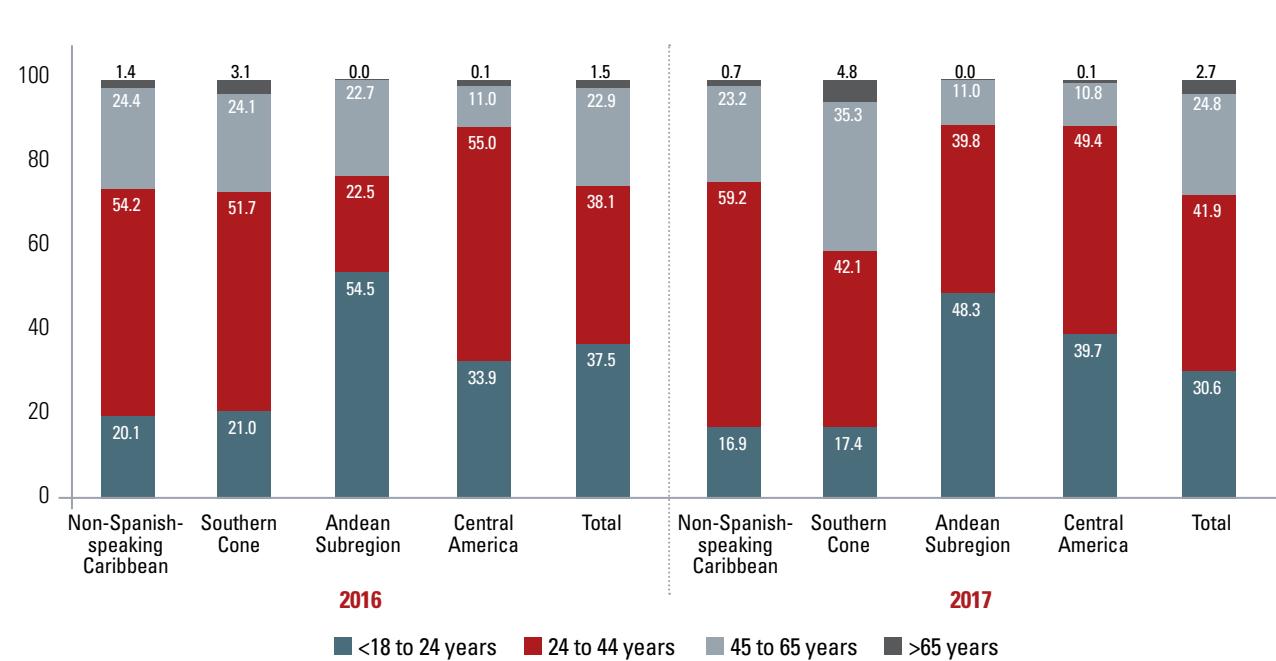

2.2 BLOOD DONOR PROFILE

2.2.1 Sex and age of donors

In the region, there were slightly more male donors in both 2016 (58.8%) and 2017 (58.6%), with a ratio of 1.4 male-to-female donors. Analysis by subregion reveals a similar pattern, with a predominance of male donors at a male-to-female ratio ranging from 1.1 in the Southern Cone to 2.1 in the non-Spanish-speaking Caribbean in 2016. For 2017, the male-to-female ratio for donors ranged from 1.1 in the Andean subregion and Southern Cone to 3.0 in the Spanish-speaking Caribbean. Mexico did not report these data.

With regard to donor age, in both years analyzed, the 24-44-year-old group predominated, with 38.1% in 2016 and 41.9% in 2017. The next most common group was donors under age 24, with 37.5% in 2016 and 30.6% in 2017. The 45-65-year-old group represented 22.9% of the region's donors in 2016 and 24.8% in 2017. The least common age group was those over 65 years, who represented 1.5% of donors in 2016 and 2.7% in 2017.

Figure 8. Donors by age group and subregion

The analysis by subregion shows uniformity with the regional data for the non-Spanish-speaking Caribbean, the Southern Cone, and Central America, where the predominance of the 24-to-44-year-old age group exceeded 50% in 2016 and 40% in 2017. In the Andean subregion, the under- 24 age group predominated in 2016 (54.6%) and 2017 (49.3%).

The proportion of donors represented by the 45-to-65-year-old age group in the non-Spanish-speaking Caribbean was very uniform for both years (24.4% in 2016 and 23.2% in 2017). A similar situation was observed in Central America (11.0% in 2016 and 10.8% in 2017), while in the Southern Cone, this age group experienced an increase, from 24.1% in 2016 to 35.6% in 2017.

The over-65 age group represents less than 5% of total donors in all subregions. The Southern Cone is the subregion where this percentage is highest (3.1% in 2016 and 4.8% in 2017), followed by the non-Spanish-speaking Caribbean (1.4% in 2016 and 0.7% in 2017), Central America (0.1% for each of the two years), and the Andean subregion (0% contribution from this age group).

2.2.2 First time and repeat donors

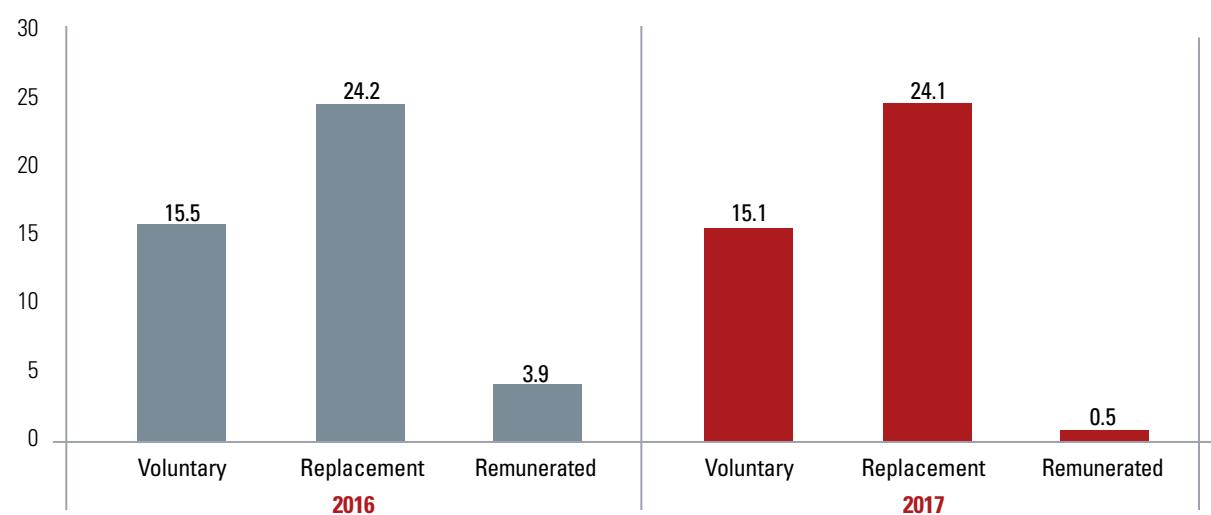

During 2017 in the Region, more than 1.6 million blood units were obtained from regular or repeat volunteer donors, who represented 34.9% of voluntary donations. However, a predominance of first-time donors (55.0%) was identified. At the subregion level, this predominance of first-time donors was also observed in the Andean subregion (63.9%), Brazil (60.4%), and the Southern Cone (54.1%). The Spanish-speaking Caribbean had the opposite situation: a greater presence of repeat donors was observed (58.9%). No comparative analysis between years could be done, due to 70% missing data for 2016. Likewise, no data for 2017 were analyzed for Central America, the non-Spanish-speaking Caribbean, or Mexico.

Table 5. Voluntary, non-remunerated donors, by first time/repeat donation and PAHO subregion, 2016 - 2017

Subregion	2016			2017		
	First time	Repeat	Without data	First time	Repeat	Without data
Non-Spanish-speaking Caribbean	8.8	29.0	62.2	7.5	19.7	72.9
Southern Cone	19.5	70.1	10.4	54.1	37.7	8.3
Andean Subregion	63.4	18.2	18.4	63.9	18.8	17.3
Brazil			100	60.4	39.6	0
Central America	26.9	30.3	42.8	29.7	30.8	39.4
Spanish-speaking Caribbean			100	39.3	58.9	1.8
Mexico			100	0	0	100
Total	16.7	13.2	70.0	55.0	34.9	10.1

2.2.3 Donor deferral

In the region, the deferral of replacement donors predominated (24.15% on average for the two years analyzed), followed by deferral of voluntary donors (15.4%) and finally, remunerated donors (3.9% in 2016 and 0.5% in 2017). The same pattern was observed for all subregions, except for the Spanish-speaking Caribbean, where 100% of deferrals were reported in remunerated donors.

Figure 9. Deferral rate by type of donor, 2016 - 2017

In 2016, the percentage of replacement donors that were deferred ranged from 10.9% in the Southern Cone to 29.6% in Mexico. In the case of voluntary donors, the deferral percentage was 0.1% in Mexico, followed by 4.2% in the Southern Cone, 4.9% in the Spanish-speaking Caribbean, 12.8% in Central America, 13.4% in the non-Spanish-speaking Caribbean, 16.6% in the Andean subregion, and 19.4% in Brazil.

In 2017, the percentage of replacement donors that were deferred ranged from 1.1% in the Spanish-speaking Caribbean to 29.7% in Mexico. Percentages over 20% were obtained in Brazil (20.2%), Central America (22.1%), the Andean subregion (26.3%), and the non-Spanish-speaking Caribbean (29.4%). The Southern Cone, with an average deferral of 16.1%, and the Spanish-speaking Caribbean, were the only subregions with a proportion lower than 20%.

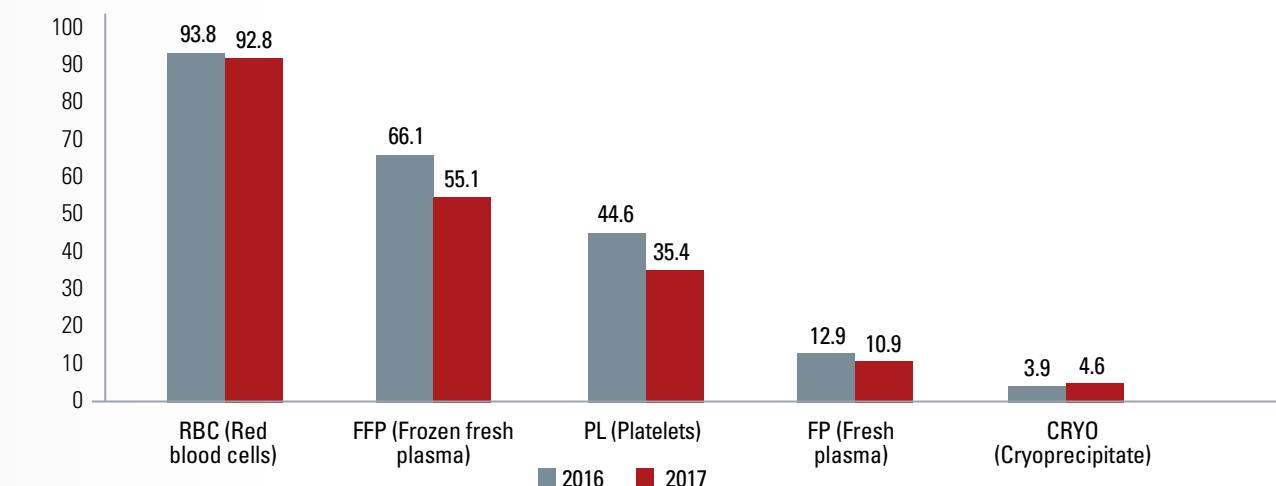

With regard to the deferral of voluntary donors in 2017, Mexico had the lowest deferral percentage (0.1%, the same as for 2016) and Brazil had the highest (19.1%). The Spanish-speaking Caribbean (2.9%) and the Southern Cone (5.3%) had a low deferral percentage. For voluntary donors, Central America presented a deferral percentage of 14.35% the Andean subregion, 16.9%, and the non-Spanish-speaking Caribbean, 16.2%.

Table 6. Deferral by type of donor, by PAHO subregion, 2016-2017

Subregion	2016			2017		
	Voluntary	Replacement	Remunerated	Voluntary	Replacement	Remunerated
Non-Spanish-speaking Caribbean	13.4	27.7	0	16.2	29.4	0
Southern Cone	4.2	10.9	0	5.3	16.1	0
Andean Subregion	16.6	25.3	0	16.9	26.3	0
Central America	12.8	22.5	0.5	14.4	22.1	0.5
Spanish-speaking Caribbean	4.9	21.8	0	2.9	1.1	0
Brazil	19.4	20.3	0	19.1	20.2	0
Mexico	0	29.6	0	0.1	29.7	0
Total	15.6	24.2	3.9	15.1	24.1	0.5

3 PROCESSING OF WHOLE BLOOD INTO COMPONENTS

In the region, the component obtained in the greatest proportion is red blood cells, with 93.8% for 2016 and 92.8% for 2017. This is followed by frozen fresh plasma, blood platelets, frozen plasma, and cryoprecipitate. A reduction in the percentage of separation into components was observed between 2016 and 2017.

Figure 10. Median of percentage of separation into components in the region, 2016-2017

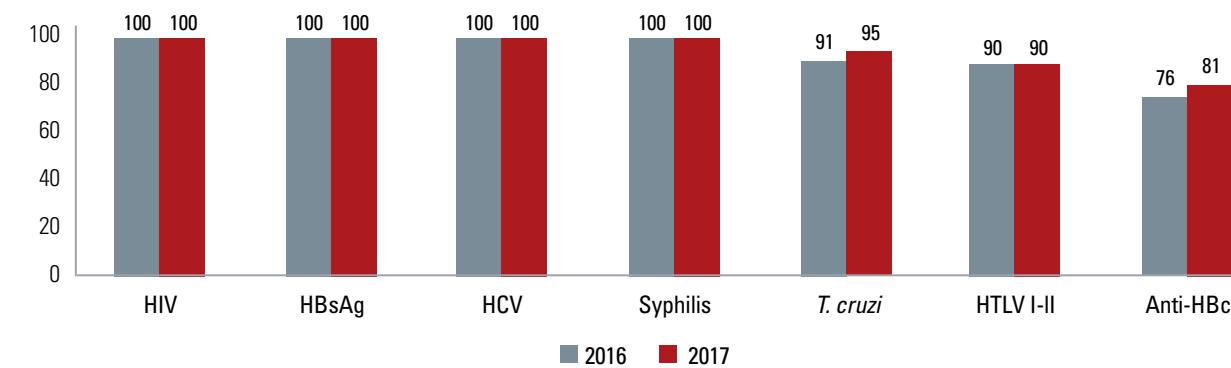

Red blood cells were the component with the highest percentage of separation at the regional level for both years. Percentages over 90% were observed in Central America, the Southern Cone, the Andean subregion, and the non-Spanish-speaking Caribbean. Mexico experienced a notable reduction, from 93.3% in 2016 to 74.8% in 2017. Brazil had percentages of 88.5% and 89.1% and the lowest result was found in the Spanish-speaking Caribbean. Over 50% of countries (20 in 2016 and 23 in 2017) reported ≥90% separation of red blood cells.

4 SEROLOGICAL SCREENING

4.1 SCREENING COVERAGE AND QUALITY OF LABORATORY TESTS

At the Regional level, there was full implementation of laboratory tests for the detection of HIV, the hepatitis B virus surface antigen, and antibodies against hepatitis C and syphilis. Regarding testing to detect *T. cruzi*, an increase was observed over the two years, rising from 90.9% in 2016 to 95.2% in 2017 for all endemic countries that need to screen their blood units. For HTLV I-II screening, 90% testing was achieved, and for anti-HBc tests, 76% in 2016 and 81% in 2017.

Figure 11. Regional average screening coverage of blood units collected (%), by infectious marker, 2016-2017

The data reported at the subregional level indicate full coverage for HIV, HBsAg, HCV, and syphilis in all subregions for both years.

In both 2016 and 2017, coverage for HTLV I-II screening tests was 100% in the non-Spanish-speaking Caribbean, the Southern Cone, Brazil, and the Spanish-speaking Caribbean. In Central America, screening coverage for this marker was 78.9% in 2016 and 75.1% in 2017, while in the Andean subregion, it was 52.2% in 2016 and 69.9% in 2017.

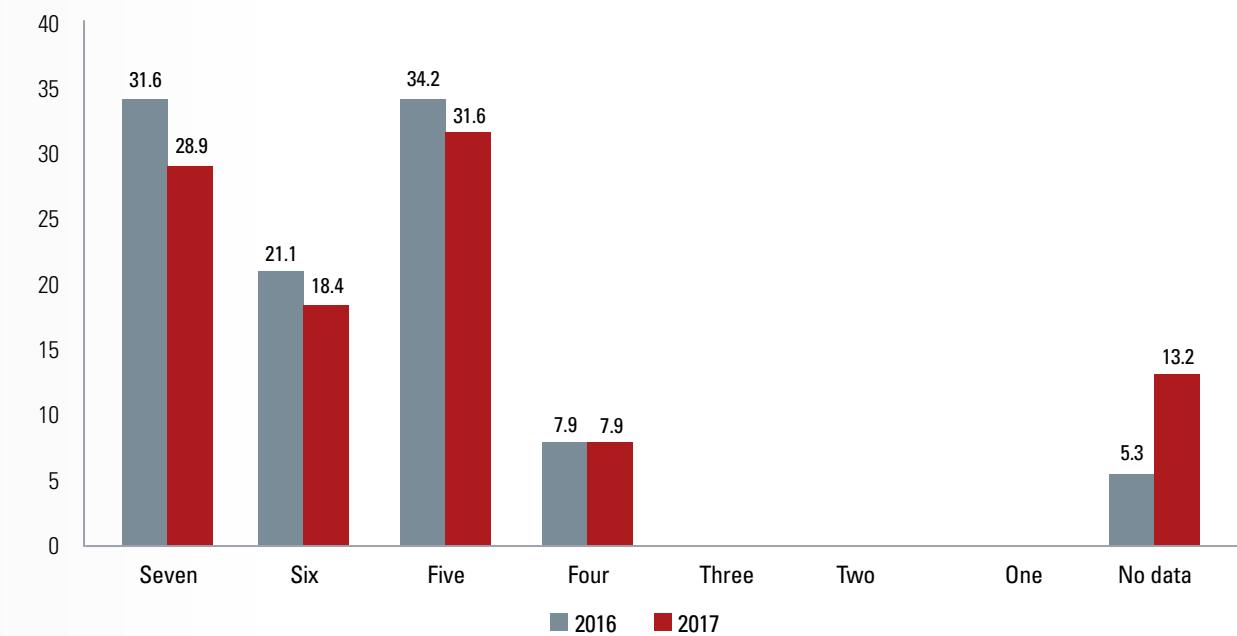

The only subregion with anti-HBc screening coverage of 100% was Brazil, followed by the non-Spanish-speaking Caribbean (100% in 2016 and 93.4% in 2017), the Southern Cone (75.0% in 2016 and 100% in 2017), Central America (74.6% in 2016 and 98.7% in 2017), the Andean subregion (56.3% in 2016 and 75.4% in 2017), and the Spanish-speaking Caribbean (15.0% for both years). Screening coverage for this infectious marker was 0% in Mexico.

When screening coverage for all infectious markers is analyzed, Brazil stands out as the only subregion with 100% implementation of all (7) tests, followed by the non-Spanish-speaking Caribbean, the Southern Cone, Central America, the Andean subregion, the Spanish-speaking Caribbean, and Mexico.

Table 7. Number of infectious markers analyzed, by number of countries

Num. of markers	Num. of countries		% of countries	
	2016	2017	2016	2017
Seven	12	11	31,6	28,9
Six	8	7	21,1	18,4
Five	13	12	34,2	31,6
Four	3	3	7,9	7,9
No data	2	5	5,3	13,2
Total	38	38	100	100

Figure 12. Distribution of countries by the number of markers analyzed (%)

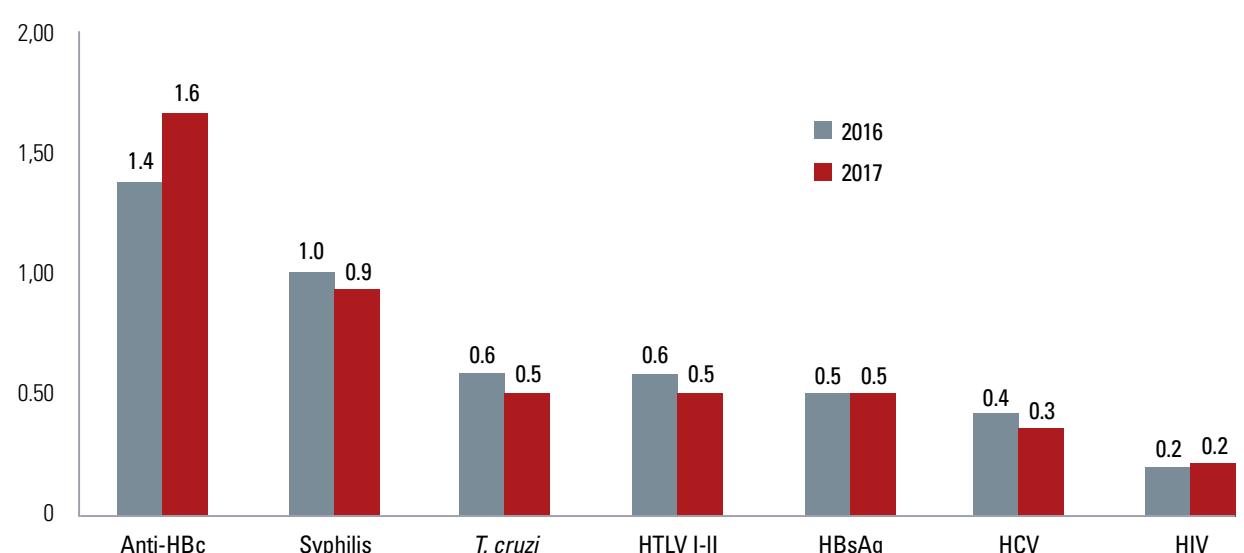

4.2 PREVALENCE OF INFECTIOUS MARKERS IN BLOOD DONATIONS

The infectious marker with the highest prevalence at the regional level was anti-HBc, with 1.6% in 2017 and 1.4% in 2016.

The average prevalence of HIV in the region was 0.2%, which was surpassed by the Andean subregion (0.3%) and Mexico (0.3%). The countries that presented a prevalence of HIV markers higher than the regional and subregional averages were: Ecuador (0.34%), Bolivia (0.31%), Peru (0.25%), and Colombia (0.21%) in the Andean subregion; Brazil (0.25%); Cuba (0.28%) in the Spanish-speaking Caribbean; Guatemala (0.43%) in Central America; and Guyana (0.81%), Haiti (0.57%), the Cayman Islands (0.33%) and Jamaica (0.30%) in the non-Spanish-speaking Caribbean.

Figure 13. Average prevalence of infectious markers

With regard to HBsAg, the average prevalence at the regional level was 0.3% and higher values were reported in: the Dominican Republic (1.12%) and Cuba (0.50%) in the Spanish-speaking Caribbean; Guatemala (0.40%) in Central America; and Saint Kitts and Nevis (3.22%), Haiti (2.80%), Guyana (1.65%), Saint Vincent and the Grenadines (0.83%), Jamaica (0.65%), Bahamas (0.52%), Saint Lucia (0.47%), Trinidad and Tobago (0.54%), and Turks and Caicos Islands (0.43%) in the non-Spanish-speaking Caribbean.

With regard to the infectious marker for HCV, results above the regional average (0.4%) were observed in the Spanish-speaking Caribbean (0.62%) and Mexico (0.53%). Countries with an average prevalence that was higher than the region and subregion were Guyana (1.07%), Cuba (1.06%), Haiti (0.62%), Guatemala (0.56%), Peru (0.52%), Paraguay (0.52%), Jamaica (0.47%), and Saint Kitts and Nevis (0.46%).

The regional prevalence of infectious markers for syphilis for 2016 and 2017 was 0.8%, a value surpassed by the subregions of Mexico (0.9%), Brazil (1.0%), the Andean subregion (1.1), and the Southern Cone (2.1%). Countries with an average prevalence higher than the region and subregion were: Ecuador (1.31%) and Colombia (1.25%) in the Andean subregion; El Salvador (1.37%) and Guatemala (1.2%) in Central America; Haiti (2.06%), Jamaica (1.63%), Barbados (1.47%), and Saint Kitts and Nevis (1.19%) in the non-Spanish-speaking Caribbean; and Paraguay (5.58%) in the Southern Cone.

An average regional prevalence of 0.6% was reported for infectious markers for *T. cruzi*. This value was surpassed in Bolivia (2.11%) in the Andean subregion, which also presented a higher prevalence as a subregion (0.8%). In Central America, El Salvador presented a prevalence of 2.97%, higher than the averages for the subregion (0.9%) and region. The same was observed in Paraguay (1.92%) and Argentina (1.75%) in the Southern Cone (1%), as well as in Guyana (0.96%) in the non-Spanish-speaking Caribbean.

The prevalence of infectious markers for HTLV I-II surpassed the regional and subregional (0.4%) averages in: Peru (0.77%) and Ecuador (0.53%) in the Andean subregion (0.5%); Guatemala (1.4%) in Central America (0.5%); and Saint Vincent and the Grenadines (1.99%), Saint Kitts and Nevis (1.73%), Jamaica (1.47%), Guyana (1.02%), Haiti (0.66%), Saint Lucia (0.52%), Bahamas (0.43%), and Barbados (0.40%) in the non-Spanish-speaking Caribbean (0.7%).

The prevalence of anti-HBc serological markers averaged 1.2% at the regional level. This value was surpassed in Peru (2.88%), which also surpassed the average for the Andean subregion (1.2%), and also in Turks and Caicos Islands (4.20%), Paraguay (4.20%), the Dominican Republic (3.24%), Honduras (1.78%), and Guatemala (1.72%).

Analysis by income level showed that low-income countries present higher prevalence rates for HIV, HBsAg, HCV, and syphilis than the regional average, and higher than the rates for other income levels. In 2016, the lower middle level presented the highest prevalence rates for *T. cruzi* and HTLV I-II. The highest prevalence values for anti-HBc serological markers were found at the high-income level in 2016 (1.57%), and at the upper middle level in 2017 (2.2%). Analysis of the average prevalence of all infectious markers showed the lowest values at the high-income level, followed by the upper middle, lower middle and low levels.

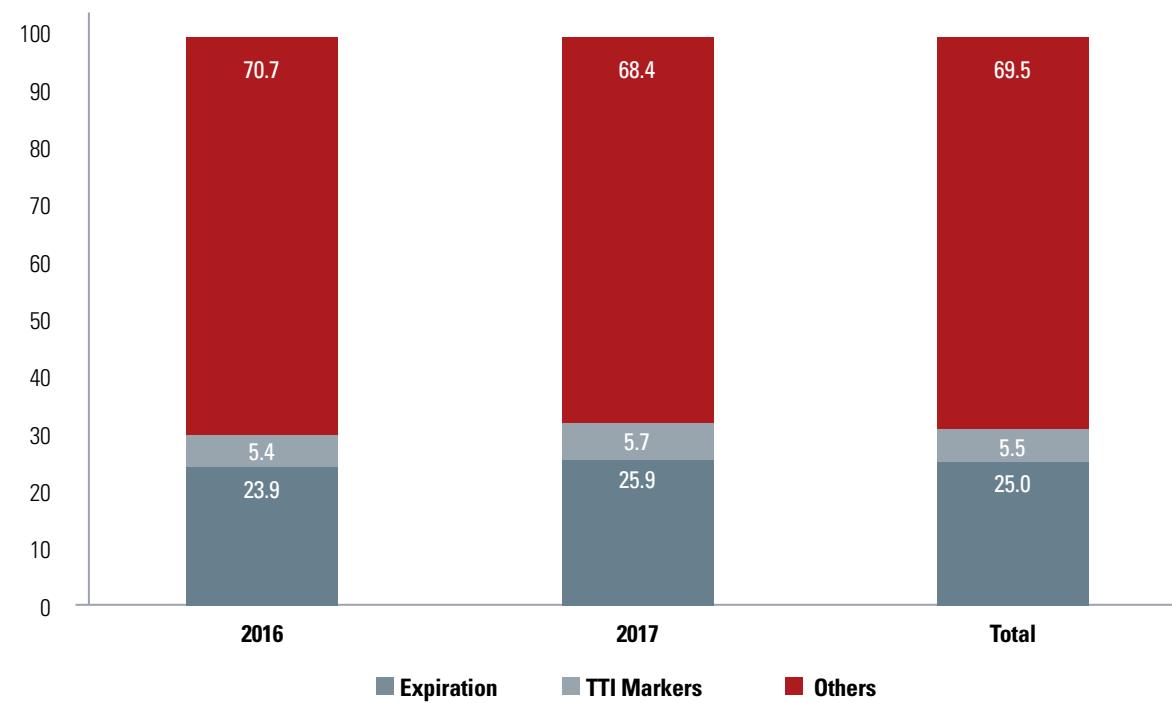

Table 8. Proportion of blood donations with positive results for infectious markers, by income levels as defined by the World Bank, 2016-2017

Income level	2016							2017						
	HIV	HBsAg	HCV	Syphilis	<i>T. cruzi</i>	HTLV I-II	Anti-HBc	HIV	HBsAg	HCV	Syphilis	<i>T. cruzi</i>	HTLV I-II	Anti-HBc
High	0.08	0.48	0.27	0.55	0.08	0.43	1.57	0.11	0.52	0.21	0.61	0.36	0.36	0.71

5 DISCARDING OF BLOOD

In both years analyzed, the same distribution of reasons for discarding whole blood is observed, with a predominance of discarding for "other reasons" (between 68.4% and 70.7%), followed by expiration (23.9-25.9%) and, in a small proportion, positivity for infectious markers (5.4-5.7%).

Figure 14. Discarding of whole blood, by reason given, 2016-2017

Regarding the discarding of components, discarding for "other reasons" continues to predominate for both years and all components. Other reasons ranged from 29.2% for the discarding of blood platelets in 2017 to 90.5% for the discarding of frozen plasma in 2016. "Other reasons" was also the leading cause cited in the case of frozen fresh plasma (84.5% in 2016 and 87.4% in 2017), frozen plasma (90.5% in 2016 and 90.0% in 2017), whole blood (80.0% in 2016 and 76.8% in 2017), and

cryoprecipitate (80.2% in 2016 and 55.1% in 2017). Finally, "other reasons" was cited for discarding red blood cells in less than 50% of cases (44.5% in 2016 and 33.3% in 2017), and this was also the case for blood platelets (40.3% in 2016 and 29.2% in 2017).

Table 9. Regional proportion of reasons for discarding blood components, 2016-2017

Component	2016			2017		
	Expiration	Infectious markers	Other reasons	Expiration	Infectious markers	Other reasons
Whole blood	3.5	16.1	80	4.5	18.7	76.8
Red blood cells	39.0	16.4	44.5	49.4	17.3	33.3
Frozen fresh plasma	11.7	3.8	84.5	9.3	3.3	87.4
Frozen plasma	7.9	1.6	90.5	8.6	1.4	90.0
Cryoprecipitate	17.3	2.5	80.2	41.7	3.2	55.1
Blood platelets	56.0	3.6	40.3	65.3	5.4	29.2

Blood platelets were the component discarded most frequently due to expiration, with 56.0% in 2016 and 65.3% in 2017, followed by red blood cells (39.0% in 2016, rising to 49.4% in 2017). In third place is cryoprecipitate, with 17.3% in 2016 and a notable increase to 41.7% in 2017. Discarding of FFP was due to expiration in 11.7% of cases in 2016 and 9.3% in 2017. Components with percentages lower than 10% are frozen plasma (7.9% in 2016 and 8.6% in 2017, respectively) and whole blood (3.5% in 2016 and 4.5% in 2017).

* This includes: insufficient volume, failed extraction/collection, self-exclusion, open circuit, damaged bags, lipemia, hemolysis, loss of the cold chain, among others)

6 TRANSFUSION OF BLOOD AND BLOOD COMPONENTS

The blood component transfused most frequently was red blood cells (RBC) (over 50% for both years: 54.9% in 2016 and 57.0% in 2017), followed by blood platelets (PL) (18.9% in 2016 and a slight increase to 21.6% in 2017), and frozen fresh plasma (FFP) (19.1% in 2016 and 14.0% in 2017).

Finally, components with percentages lower than 5% of total transfusions are: cryoprecipitate (CRYO), blood platelets obtained using apheresis (APH-PL), frozen plasma (FP), whole blood (WB), and red blood cells obtained using apheresis (APH-RBC).

Table 10. Components transfused, 2016-2017

Component	2016	2017	2016	2017
	N. ^o	N. ^o	%	%
RBC	6,598,253	5,587,315	54.9	57.0
PL	2,269,353	2,114,175	18.9	21.6
FFP	2,296,535	1,370,667	19.1	14.0
CRYO	366,360	297,543	3.1	3.0
APH-PL	287,100	338,177	2.4	3.5
FP	137,069	61,813	1.1	0.6
WB	53,037	25,391	0.4	0.3
APH-RBC	727	5,026	0.01	0.1
Total	12,008,434	9,800,107	100	100

In Latin America, 10 countries reported the number of patients transfused, with more than 3.4 million recipients. In the non-Spanish-speaking Caribbean, 11 countries reported this information, with more than 20,000 recipients.

7 GOVERNANCE MECHANISMS

7.1 MONITORING SAFE AND APPROPRIATE BLOOD TRANSFUSION

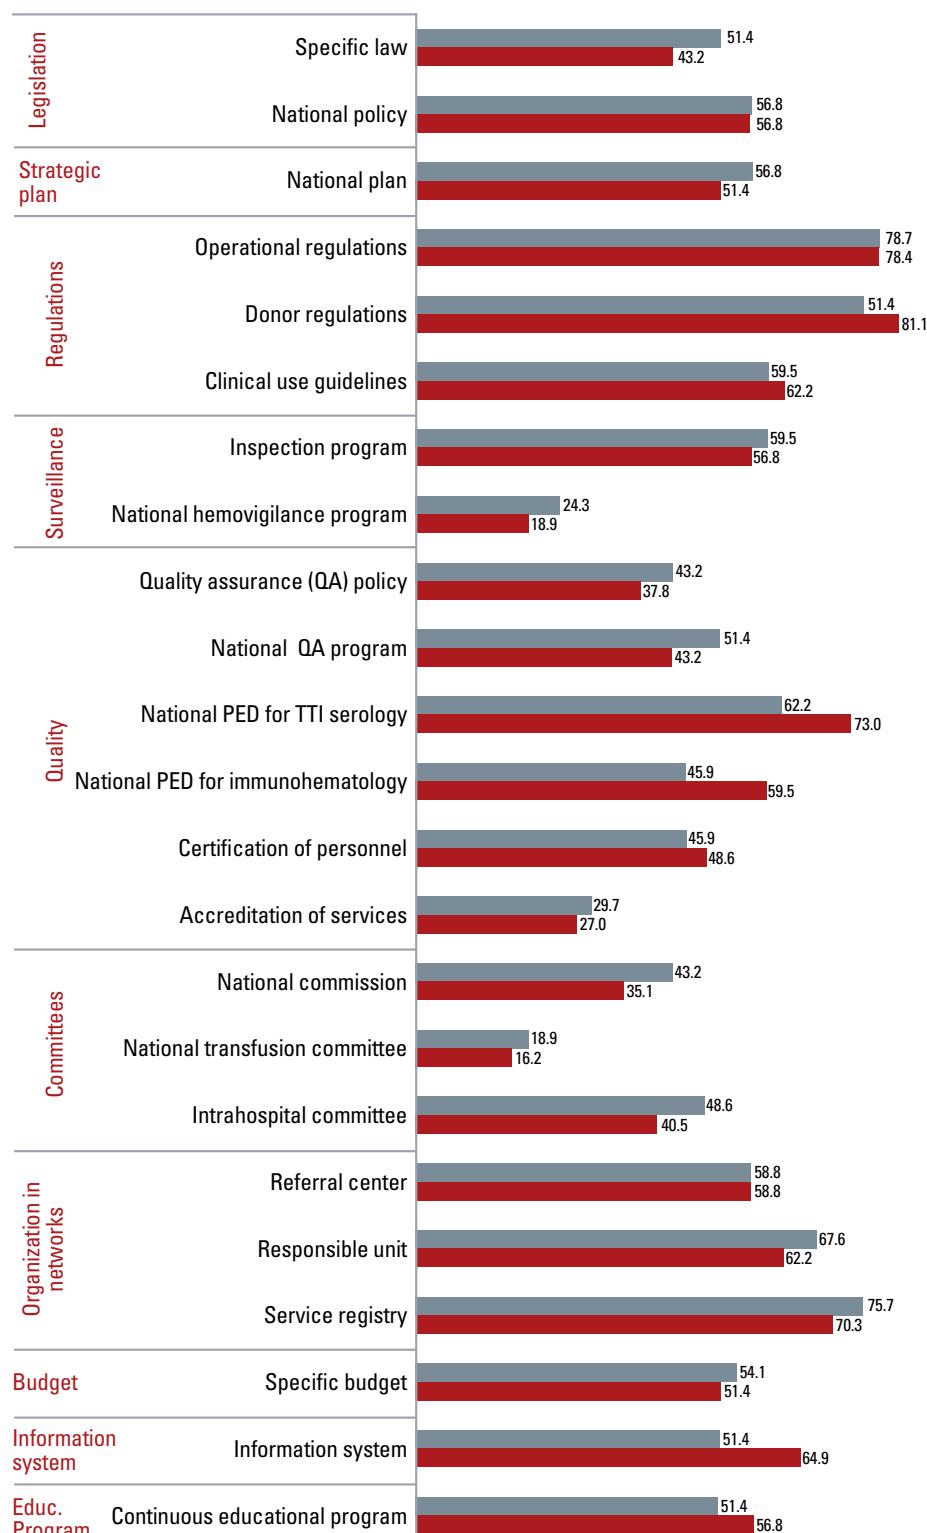

Ten aspects related to governance were analyzed in countries in the region. These aspects were composed, in turn, of subjects specifically related to safe blood transfusions, which were those with the highest level of compliance. Regarding standards for donors (in the "Regulations" section), the level of documented availability was 75.7% in 2016 and 81.1% in 2017. Under the heading of "Organization in a network", 70.3% of services reported this in 2017 and 75.7% in 2016. Finally, regarding "Quality", performance evaluation programs (PEPs) for serology and transfusion-transmitted infections existed in 62.2% of services in 2016 and 73.0% in 2017.

The remaining aspects included in the analysis of governance showed figures above 30%, with the exception of the existence of a national transfusion committee (17.6% on average), a national hemovigilance program (21.6% on average), and accreditation of services (28.4% on average).

The three aspects of governance with higher averages in both years analyzed were standardization (75.5%), organization in a network (63.1%), and the existence of a strategic plan (60.8%). These were followed by having a specific budget (56.1%), computer system (56.1%), legislation (52%), continuous education programs (54.1%), quality (41.9%), surveillance (39.9%), and the existence of committees (31.3%).

Regarding surveillance, it was observed that inspection programs were much more common (58.6% on average) than the existence of national hemovigilance programs (21.6% on average).

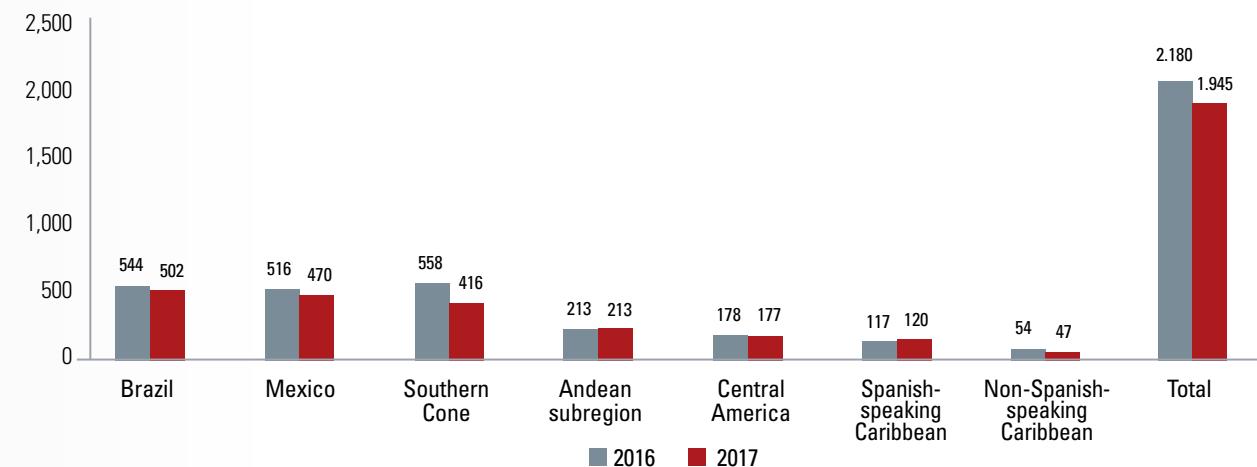

With regard to governance through committees (31.3%, on average), the area with the best performance was the existence of hospital transfusion committees (44.6% on average for both years analyzed), followed by the presence of a national commission (39.2%) and, finally, the existence of a national transfusion committee (17.6%).

Figure 15. Governance mechanisms for blood transfusions

■ 2016 ■ 2017

7.2 ORGANIZATION OF BLOOD COLLECTION AND PROCESSING FACILITIES

A total of 2,180 collection centers were reported in 2016, and 1,945 centers in 2017. The distribution of collection centers by subregion (average values for both years analyzed) was as follows: 25.4% in Brazil, followed by 23.9% in Mexico, 23.5% in the Southern Cone, 10.4% in the Andean subregion, 8.6% in Central America, 5.8% in the Spanish-speaking Caribbean, and 2.4% in the non-Spanish-speaking Caribbean.

Figure 16. Blood collection centers by PAHO subregion, 2016-2017

A total of 1,793 processing centers were reported in 2016 and 1,176 in 2017. Mexico and the Dominican Republic did not report on the number of processing centers for 2017. The number of processing centers dropped by 58 in Brazil, two in Jamaica, and one each in the Bolivia, Colombia, Costa Rica, Dominica, Ecuador, Panama and Saint Lucia. At the same time, an increase was observed in Argentina (23 centers), Uruguay (3), Peru (3), Guatemala (2), Honduras (2), Chile (1), Trinidad and Tobago (1), and Turks and Caicos Islands (1). In general, the distribution of collection and processing centers was similar, with the exception of the Andean subregion (one country from this subregion did not report data).

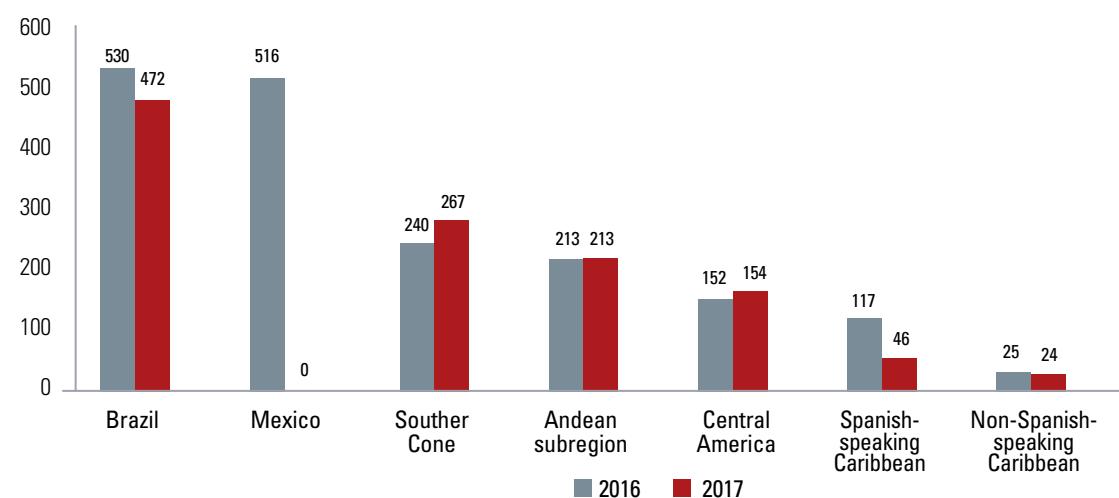

In 2016, the distribution of average yearly processing per blood bank for each subregion was as follows: 7,500 units in Brazil, 7,068 in the Andean subregion, 5,662 in the Southern Cone, 5,363 in the non-Spanish speaking Caribbean, 4,566 in Mexico, 4,483 in the Spanish-speaking Caribbean, and 3,495 in Central America.

In 2017, significant changes were documented in the distribution of the average yearly processing per blood bank, in Brazil it increased to 8,180 units, in the non-Spanish-speaking Caribbean it increased to 5,671, in the Andean subregion it increased to 7,318 and in the Southern Cone it increased to 5,806. The average yearly processing per blood bank decreased in the Spanish-speaking Caribbean to 4,420 and in Central America to 3,478.

The countries with over 10,000 average yearly units processed per bank were: Nicaragua (more than 42,000 units), Jamaica (32,000), Haiti (28,000), Chile (15,000), Paraguay (14,700), Ecuador (12,500), Colombia (10,200), and Suriname (10,000). Countries that processed less than 5,000 units per bank per year were Costa Rica, Guatemala, Honduras, Panama, Peru and Uruguay. Mexico and the Dominican Republic also had a yearly average under 5,000 units in 2016.

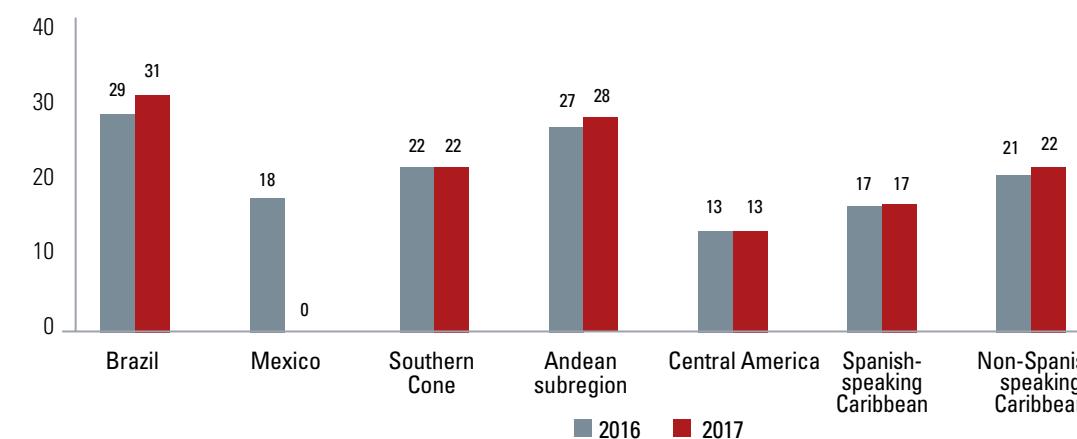

For the non-Spanish-speaking Caribbean, the total number of processing centers for the 18 countries that reported data for both years decreased from 25 to 24, with a variation of 1-3 centers per country. Similarly, the average yearly units processed per bank varied from 191 to 32,000 units processed per year by each bank.

Figure 17. Blood processing centers by PAHO subregion, 2016-2017

In both years analyzed, the subregion with the highest average daily blood processing values was Brazil (29 and 31), followed by the Andean subregion (27 and 28), the Southern Cone (22 and 22), and the non-Spanish-speaking Caribbean (21 and 22). The lowest results were documented in Mexico (18 and NR for 2017), the Spanish-speaking Caribbean (17 and 17) and Central America (13 and 13).

Figure 18. Daily blood processing by PAHO subregion, 2016-2017

7.3 HEALTH SURVEILLANCE AND HEMOVIGILANCE

Health surveillance and hemovigilance activities make it possible to assure the quality of the blood system and increase blood safety. In 2017, 56.3% of countries (21) reported implementation of activities to inspect and monitor blood services, while 18.9% of countries (7) had a national hemovigilance program in charge of monitoring and evaluating adverse events associated with the blood supply and the use of blood for transfusion. Only two countries submitted reports on hemovigilance that included broad coverage of blood services (Brazil and Colombia).

7.4 USE OF PLASMA FOR FRACTIONATION AND SUPPLY OF PLASMA DERIVATIVES

In 2017, Argentina, Brazil, Chile, Cuba, Mexico, Paraguay, and Uruguay reported fractionation of plasma to obtain plasma derivatives. In three of these countries, the plasma was fractionated in the country itself. In the four remaining countries, this process was outsourced and in three of the cases, through agreements with the same hemoderivative plant.

8 DISCUSSION

Analysis of the blood donation data reported by Latin American and Caribbean countries reveals that the country's level of donation is directly proportional to its income level. This conclusion explains why more than 96% of the 20,939,468 blood units collected in the region between 2016 and 2017 came from high- and upper middle-income countries (where 93% of the region's population lives). This conclusion is also consistent with the donation rates per 1,000 people, which were high in high-income (average rate of 21.9 units per 1000 population) and upper middle-income (17.8 per 1000) countries and very low in low-income countries (2.6 per 1000).

According to the World Health Organization (WHO) Global Status Report on Blood Safety and Availability (2013), 42% of the world's donations occur in high-income countries, where 16% of the population resides. Furthermore, the donation rates per 1,000 population are higher in high-income (32.6) and upper middle-income (15.1) countries. The report also points out that a rate lower than 10 donations per 1,000 population may suggest problems in the availability of and access to blood.

Despite the increase in the number of blood units collected in the Region, the percentage of voluntary donors increased very slightly, from 44.17% in 2015 to 46.1% in 2017. A worldwide analysis by WHO revealed that the highest rates of voluntary donations are in high-income countries. At the Regional level and in the Andean subregion, Brazil, and the Southern Cone, first-time donors predominated, in contrast to the Spanish-speaking Caribbean, where there was a higher proportion of repeat donors. One aspect to consider further based on the analyses in the current report is the increase in repeat voluntary donors, who represent 34.9% of voluntary donations for 2017, and the downward trend in the number of remunerated donations, which are considered to pose higher risk in transfusions.

Another relevant aspect that could play a considerable role in improving the statistics related to the availability of blood, increased voluntary donations, and rational costs is the fact that the Region still has fragmented blood services networks. These networks have low collection and processing capacity, low capacity to make progress on strategies to approach voluntary donors, and even lower capacity to retain donors for repeat donations. In Latin America, annual average processing per blood bank is only slightly higher than the 5,000 units proposed in the PAHO/WHO Plan of Action for Universal Access to Safe Blood 2014-2019. Only Brazil reported changing the structure of its services network and improving its average yearly collection per blood bank, some countries actually lowered their averages when they added new blood banks to their service networks since the new banks had a lower collection and processing capacity than those that already existed in the country.

With regard to donor profiles, male donors predominated in the region, in the subregions, and in all countries with the exception of Bermuda. Young donors (24 to 44 years old) also predominated, consistent with the predominance of young populations in the region, subregions, and respective countries.

There were broad variations in the regional percentage of deferral by country and type of donor, which may suggest variations in donor selection techniques and differences in donor motivations and donation-related risk factors. Moreover, in all subregions except the Southern Cone, deferral was higher in replacement donors than in voluntary donors. This situation, which may suggest greater presence of deferral factors in replacement donors, also means more work for blood services. These aspects should be considered as reasons to continue promoting voluntary donations, which have a lower percentage of deferral.

With regard to analysis of infectious markers in blood, a high level of compliance with the PAHO/WHO guidelines was observed at the regional level, both in the number of markers analyzed and in screening coverage. The region and all subregions achieved full compliance in the implementation of laboratory tests for the detection of HIV, HBsAg, HCV, and syphilis. The level of compliance with analysis for *T. cruzi* infectious markers included all countries that are considered endemic. Coverage for HTLV I-II and anti-HBc continues to grow in the majority of countries. Some countries have even incorporated nucleic acid detection technology (NAT).

The prevalence of each marker was relatively low and compatible with international data. The highest number of positive markers on the prevalence results was for anti-HBc, followed by *T. pallidum*, and detection of *T. cruzi* antibodies. It should be pointed out that the detection of HIV antibodies had the lowest prevalence in both years analyzed, and for other markers such as HBsAg, HCV and HTLV I-II the values were similar.

A higher number of positive markers was observed for HIV, HBsAg, HCV, and syphilis in low-income countries, and low percentage of voluntary donation. These findings align with the results of the WHO report.

The figures aligned for acquisition and transfusion of certain blood components (red blood cells, frozen fresh plasma and blood platelets). Red blood cells were the most frequently obtained component (higher than 92%) in the region and in the subregions of the non-Spanish-speaking Caribbean, the Southern Cone, the Andean subregion, Central America, and Mexico. It is important to highlight the values observed in subregions such as Brazil, where the percentage of fractionation was lower than 90%, and the Spanish-speaking Caribbean, where it was lower than 70% for both years. This is even though the use of red blood cells instead of whole blood has been suggested for many years. The percentage of fractionation exceeded 90% at all income levels, except for low-income countries.

Information on transfusions is a work in development in many countries, both regarding number of recipients and age groups. Similarly, minimal information was provided about transfusion-associated adverse events. However, some countries reported the existence of hemovigilance programs.

At the regional level, great progress was identified with regard to regulations, serological screening for markers of transfusion-associated infection, the existence of external performance evaluation programs particularly in serology, legislation, information systems, the existence of a strategic plan, training programs, and a specific budget.

Organization and improvement of the efficiency of the services and the increase in voluntary donation are considered related variables since the models of dispersed banks with low collection and processing capacity tend to be supplied by replacement donations, a large number of countries had low processing average per year per bank and in most countries the number of blood banks remained the same. The situation was similar for health surveillance and hemovigilance programs, where few countries showed progress, despite being key indicators of the PAHO/WHO Plan of Action for Universal Access to Safe Blood 2014-2019.

Finally, the availability and analysis of data for these indicators remains a pending task in most countries. This is a relevant component of the plan for access to safe blood, allowing the monitoring of blood systems and decision-making to improve management in each country.

9 CONCLUSIONS AND RECOMMENDATIONS

Several factors were identified that facilitate access to blood and blood components in the region:

- In Latin American and Caribbean countries, the level of blood donation is directly proportional to the country's income level.
- There was an increase in the number of blood units collected in the Region.
- The percentage of voluntary donors increased slightly from 2015 to 2017, from 44.2% to 46.1%.
- There was an increase in donations by repeat volunteers, who represented 34.9% of voluntary donations in 2017.
- In Latin America, the yearly processing level per blood bank is only slightly higher than the 5,000 units proposed in the PAHO/WHO Plan of Action for Universal Access to Safe Blood 2014-2019.
- In the region, the groups that predominated among donors were males and young donors aged 24 to 44 years.
- The regional deferral rate varied widely, by country and type of donor.
- There was a high level of compliance with PAHO/WHO guidelines at the regional level, for both the number of markers analyzed and screening coverage.
- The prevalence for each marker was relatively low and compatible with international data.
- The percentage of whole blood fractionation into blood components exceeded 90% at all income levels, with the exception of low-income countries.
- Information on transfusions remains a pending task in many countries.
- Great progress was noted at the regional level with regard to regulation, serological screening for transfusion infection markers, and the existence of programs for external evaluation of the quality of serology.
- In general, there has been great progress in the Region in blood accessibility and safety. However, there continue to be challenges in the organization and improved efficiency of services, voluntary donations, establishment of health surveillance and hemovigilance programs, and data availability and analysis of these indicators to enable monitoring of blood system management in each country.

Following analysis of the data provided by the countries of Latin America and the Caribbean, the following recommendations can be made:

- Continue to develop the strategies defined to improve Universal Access to Safe Blood.
- Continue to promote voluntary donation and donor self-responsibility in improving blood safety.
- Strengthen the reorganization of blood service networks to improve their efficiency.
- Integrate blood systems into health systems to improve strategies such as surveillance, hemovigilance, and coordination of the service network.
- Strengthen the analysis of variables such as blood availability, utilization and safety, and the existence of monitoring and control mechanisms.

2016

COL: data correspond to these age groups: children under 1 year old, between 1 and 14 years old, between 15 and 64 years old, over 64 years old.

PRY: data represents total transfusions, not total transfused patients.

URY: number of pediatric patients is 1,649 and that of adults is 25,630.

2017

ARG: The estimated number represents 10% of hospital discharges, transfused with an average of 2.5 GR per patient. The number of patients are an estimate, based on the amounts of GR transfused by age group.

BOL: Some services do not report the age of the recipient. However, the information is representative.

CHL: The transfusion age ranges are under and over 15 years.

COL: Data correspond to these age groups: under 1 year old, between 1 and 14 years old, between 15 and 64 years old and over 65 years old.

CRI: Partial data. Blood banks of the Costa Rican Social Security Fund do not report.

MEX: Estimated data.

PRY: Age ranges are different: under 5 years old, between 5 and 14, between 15 and 44, between 45 and 59, over 59 and without ages (110).

URY: There is no discrimination based on age, there are two groups: pediatric (8,153) and adults (125,091).

2016

BOL: Not all hospitals with transfusion services have an active committee.

CRI: It has the National Transfusion Safety Commission, which is not active at this time. It also has intra-hospital transfusion committees in some hospitals. Estimate of 100,000 units.

CUB: Data 2014.

GTM: In 2016, there were 12 hospital transfusion committees in the services of Ministry of Public Health and Social Assistance.

MEX: In the process of authorization of the registration documents.

NIC: Some hospitals.

PAN: Only 4 blood services have transfusion committees.

PRY: In process of implementation at the national level.

2017

ARG: Implemented in provinces with more complex hospitals.

BOL: Not all hospitals have an active committee.

CRI: There is an executive decree, but it is not active. They are not established in all the hospitals of the Costa Rican Social Security Fund.

HND: There are six intra-hospitals committees.

MEX: There are 5,010 hospitals that perform blood transfusions (estimated data), only 320 have hospital transfusion committees and mechanisms to report adverse incidents and adverse reactions related to transfusions. Mexican legislation stipulates that the intrahospital transfusion committee must establish those who regularly transfuse 50 or more units of blood or components per month.

NIC: Of the 43 hospitals that perform blood transfusions (estimated data), 13 have hospital transfusion committees.

PRY: There are committees, but they do not carry out activities.

AIA: Hemoglobin and blood pressure results.

BHS: Centers maintain individual records of their own.

BRB: Donor history-questionnaire. The blood center maintains an individual one, which in turn is part of the hospital's general computer system.

BLZ: National.

BMU: HTLV, Chagas and West Nile Virus.

CYM: Small celebration. Caribbean regional standards. Each center. HTLV and ZIKA.

CUW: HTLV I-II.

HTI: Only 20% of donors are notified.

JAM: National System. HTLV I-II.

LCA: National.

TTO: It does not work now because the lab can't confirm the diagnosis.

Blood transfusions are necessary to improve or save the lives of children with severe anemia, mothers in obstetric emergencies, patients with hemoglobinopathies, cancer patients, transplant patients, patients with chronic age-related diseases, such as bleeding caused by vascular problems and orthopedic surgeries, people injured in accidents, among other causes.

Supply and access to safe blood for transfusions are closely related to the organization and degree of development of blood services, with the governance and participation of society through voluntary unpaid donation.

Since 2004, the Pan American Health Organization (PAHO) has been collecting and publishing indicators related to blood supply in the countries of Latin America and the Caribbean. In 2014, the countries of the Region of the Americas reaffirmed their commitment to universal health through the approval of the Action Plan for Universal Access to Safe Blood 2014-2019, approved by the 53rd Directing Council held in October 2014 (CD53.6), this plan promotes universal access to safe blood for transfusion in the region, through unpaid voluntary donations, the organization of blood services, the implementation of quality and safety standards and the implementation of governance actions. The data presented here allows monitoring and reporting on progress and limitations in the implementation of the Action Plan for Universal Access to Safe Blood. Furthermore, it is hoped that these data will promote the analysis and evaluation of the indicators at the national and subregional levels, and that strategies that improve blood safety and accessibility to transfusions will be strengthened or modified. The information was provided by the authorities of the countries and corresponds to the years 2016 and 2017.
